13. According to the latest return the number employed upon the relief works in the nine distressed districts of Bombay was 248,902 against 238,219, the number for the previous week. In Ratnagiri and Kanara, where hill-men and immigrants are employed

upon relief works, there was a decrease of 3,785. There was thus a net increase of 6,808 in the number of famine labourers in Bombay, which seems to be principally attributable to the gradual cessation of the strike, already alluded to, in the Sholapur district. In Madras there has been a considerable further diminution in the number of relief labourers. The number stated in our last Despatch was 767,281, which has fallen to 713,921.

We have, &c.

Telegram, dated 3rd March 1877.

From SIR R. TEMPLE, ARCONUM, to REVENUE ADDITIONAL SECRETARY, Calcutta.

Have returned from Nellore after a hard journey. Found numbers on relief not at all excessive compared to failure of crops. Saw signs of distress in western part of district. Was much pleased with East Coast Canal. Have recommended that 40,000 relief labourers be sent there from ceded districts and Kurnool. Have also suggested commencement of earth-work by relief labour on Sangum irrigation project from Pennair River near Nellore. Shall next proceed to Salem and Coimbatore.

Nellore district.

No. 135.

No. 170.

LI.—MINUTE by SIR RICHARD TEMPLE on the advisability of commencing the earth-work of the "Sungum" project in the Nellore District.

Arconum, 3rd March 1877.

During my recent visit to the Nellore district, I was much struck by the possible advantages of what is known as the "Sungum" project for the employment of relief labour.

Sungum irrigation project.

2. This project has, as I learnt, been professionally framed; the plans and estimates are ready, and the work could be put in hand at once, whereby many relief labourers now employed on village works could be at once employed under regular professional supervision.

3. The project is an excellent one for using the flood waters of the Pennair river to fill channels which carry the waters to tanks and other reservoirs for irrigation. The head works are situated at a point called "Sungum," near Atmakoor, on the Pennair River, about 30 miles above Aloor. The total cost is estimated at 27 lakhs of rupees (say 270,000 ₹); 94,000 acres would be irrigated, and the net returns in water tax are computed at 2½ lakhs (say 25,000 ₹) annually. The financial prospect is therefore fair enough.

4. Out of the total cost above set down—27 lakhs of rupees—the greater portion consists of earth-work and excavation, namely, 16 lakhs, as will be seen thus,—

	Lakhs.
Tanks and channels	16
Masonry distributaries	5
Anicut in Pennair	6
Total	27

5. Now, subject to correction, I understand from the District Engineer (with whom I had the advantage of travelling while in the Nellore district) that the earth-work, that is, the channels and tanks, might at once be undertaken by relief labour within the cost of 16 lakhs, which work would be useful so far as it goes, without the whole of the remaining expenditure, namely, 6 lakhs for anicuts and 5 lakhs for masonry distributaries, being necessarily undertaken. These works will, of course, be wanted for the complete project; but the project might be executed without them, and though in some degree incomplete, it might be useful without them. In this limited sense I learn that only 3 lakhs worth of masonry channels would be absolutely necessary. If executed in this manner, that is,—

with 16 lakhs, earth-work.
3 ,, masonry distributaries.

Total 19

the project might yield net $1\frac{3}{4}$ lakhs annually in revenue returns. It would employ 200,000 persons for four months.

6. Considering the large numbers that are being employed on comparatively unproductive district and village works, I think it is a pity that relief labour cannot be employed on the earth-work of this really useful and well-considered project.

7. I bear in mind that all available labour is wanted for the East Coast Canal, which is also in the Nellore District, as is shown in my minute of the 28th ultimo on the subject. But there is much difficulty in inducing the relief labourers to go there. And it is possible that thousands of persons who would not go to the East Coast Canal would be willing enough to work on this Sungum project, which is favourably situated as regards their homes. And some thousands of relief labourers might be sent from the ceded districts and Kurnool.

8. It is true that the earth-work for the channels and tanks will not produce a result without the addition at least of 3 lakhs of expenditure for the masonry distributaries, but for this also relief labour would be to some extent available. And something might be contributed from the ordinary irrigation grant of the presidency; of this point, however, the Madras Government would be the judge.

9. At all events, when so much stress is justly laid upon the employment of relief labour upon really good and reproductive projects, it seems proper to ask the notice of the Government of Madras to the merits, in this respect, which the Sungum project in Nellore possesses. If anything is to be attempted, then rapidity in commencing would be essential.

No. 136.

LXI.—MEMORANDUM by CAPTAIN W. S. S. BISSET, R.E., on the carriage of GRAIN for BANGALORE, *via* NEGAPATAM.

Bangalore, 3rd March 1877.

Grain supply
to Mysore *via*
Negapatam.

I have now visited Negapatam and ascertained by observation and personal inquiry the present and prospective possibilities of landing grain at Negapatam, forwarding it thence to Trichinopoly, transshipping it there to the broad-gauge waggons, delivering it by the South Indian Railway broad-gauge line to Erode on the Madras Railway for conveyance thence to Bangalore.

2. Yesterday, through the courtesy of the Chief Commissioner of Mysore, I had an opportunity of seeing the chief traders here, and of explaining to them the fears that are entertained that the amount of grain required at Bangalore cannot be supplied by the Madras route.

3. I learnt that the merchants were obliged to refuse heavy orders for grain from the interior, and that they could easily sell 100 to 150 tons a day in addition to the present supplies, which have amounted to 330 tons a day in November, 375 tons a day in December and January, and 390* tons a day up to the 22nd February. I endeavoured to explain the advantages which they could have in drawing from Negapatam as much of their supply as could find carriage by that route, and I informed them that I had just been to Negapatam, and that I had

* These figures are for the Bangalore station only. Kolar and other stations in Mysore on the Bangalore branch takes about 15 per cent. (or say 60 tons a day) on the Bangalore receipts.

ascertained as follows:—

1st. That grain sent to Negapatam can be landed easily to the extent of 200 tons a day after allowing for the landing of other general cargo.

2nd. That the boats can take the grain bags direct from the ship to the river bank, which is within 400 yards of the railway station.

3rd. That by the order of his Grace the Governor of Madras, the rates for the carriage of grain from Negapatam to Bangalore have been made the same as the rates from Madras to Bangalore.

4th. That the Agent and officers of the South Indian Railway are prepared † to carry from Negapatam during March 40 waggons or 250 tons, and during April and subsequent months 60 waggons or 375 tons a day, and that they can certainly carry at once 200 tons a day.

† For the free working of this traffic some transshipment arrangements are required and can be readily made if considered necessary.

5th. That fears are entertained that, with equally urgent demands from other distressed districts, the carrying powers of the railway from Madras to Arconum will be unequal to the pressure, and that if additional supplies are required for Bangalore it will be necessary to draw them from another source than Madras.

6th. That grain can be landed at Negapatam throughout May, June, and July, while the western ports will be closed by the burst of monsoon early in May.

4. The authoritative announcement of the reduction of rates had not then, and has not yet, reached the Chief Commissioner, the Railway Station-master or the traders, and my statement on this matter was with difficulty accepted. I assured the meeting that the orders had been received at Negapatam on Monday the 26th February, and that they would find on inquiry that my statement was correct.

5. The merchants said they would at once inquire and instruct their agents to send some of their grain *via* Negapatam, so that they might get as much as possible by using all routes.

They evidently had misgivings about the supply of waggons at Negapatam and Trichinopoly, and some of them said they had already been getting a few waggons from Negapatam, and that they had actually experienced this difficulty, and that their grain was much delayed in transit. I referred to the assurance given to me by the railway officers, and as regards delay I suggested that a few days' delay on the way was less objectionable than long detention on the Madras beach. Another merchant objected that he could get no *raggi* at Negapatam, and that *raggi* could only be got at Beypore, where it comes down the coast from the north. No answer could be given to this, for, as far as I am aware, *raggi* is not to be bought on the eastern side of India. But I endeavoured to explain that the object of my visit was not to desire them to use Negapatam port to the exclusion of other sources of supply, but to inform them of the means which were at their disposal for drawing supplementary supplies from Negapatam and of the reduction of railway rates, which his Grace the Governor of Madras had been pleased to authorise, in addition to the abolition of port dues at Negapatam on any vessels carrying a fourth part of their cargo in grain.

* Major T. Clarke, Secretary to the Chief Commissioner.

Colonel Pearse, Commissioner.

Colonel Puckle, Deputy Commissioner.

6. I am permitted to record that the officers of the Mysore Administration* who were present at the meeting concur with me in believing that the Native traders understood the explanations given, and that they intended to take advantage of the facilities offered.

7. I conclude by mentioning an incidental advantage which would arise if any considerable supply of dry grain were to be sent from Calcutta or other port to Negapatam. Karur or Caroor, the head-quarters of the taluk of that name in the Coimbatore district, draws about 100 tons of cholum a day from Beypore. If the landing powers at Negapatam were increased, this supply could be taken to Karur in addition to the supply for Bangalore; for the gradients between Trichinopoly and Karur are easy, and those from Karur to Erode heavy. It may be objected that the supply to Bangalore will diminish the supply to Madura; but Madura can be more easily supplied with sea-borne grain from Tuticorin, and there are, as far as I have learnt, no objections to sending grain there.

8. I would suggest further, that a corresponding reduction of rate be granted on grain consigned from Negapatam to Kolar road.

Grain supply to Mysore *via* Negapatam.

No. 137.

No. 170.

LVIII.—MINUTE by SIR RICHARD TEMPLE on his third visit to the North Arcot District.

Vellore, 5th March 1877.

In continuation of the minutes and memoranda regarding my first and second visits to the district of North Arcot,* I have to record the result of a further visit to that district. I was induced to pay this third visit because my information about the degree of distress in some parts of the district was conflicting, and because in other parts, especially zemindaris, there was reason to fear that distress might become serious.

2. On this occasion I visited the town of Tripetty, accompanied by the Native officials of the place, where the arrangements made by Veeraswamee Chetty, a Native gentleman, for charitable relief were inspected. Upwards of 1,000 persons were being fed gratuitously, of whom about one-fourth were certainly able to work and were unworthy of this form of relief, one-fourth were perhaps able to work, and the remainder were either destitute and depressed, or else were poor and weakly. The Native donor stated that this charitable work had been going on for many weeks, that the daily number often exceeded 1,200, and had been as high as 2,000, even sometimes 2,500.

3. I then proceeded to Chendragiri, 15 miles distant, to meet the Collector. All the way thither excellent spring crops were met with, watered by irrigation channels from the river Surnamukhi. At Chendragiri, ascending the hill, we saw that these ripening crops extended for miles, also along the other valley through which runs the road to Chittor.

North Arcot district.

* Part II. pp. 54-5.

No. 48.

North Arcot
district.

At the town of Chendragiri I saw some gangs of relief labourers and some few persons being fed gratuitously—some also when offered a reception at the relief camp at Arcot refused to go. Here were learnt the particulars of the distress undoubtedly prevailing in some 30 villages in that portion of the taluk in the neighbourhood Rungumpet and of the relief works provided there, which appeared to me to be sufficient. Otherwise in the rest of the Chendragiri taluk there is a fine crop on the ground, sufficing for the maintenance of the resident population.

4. Returning to Tripetty, we met the Agent of the Mahant of that well-known and wealthy shrine and the principal person of the place; he affirmed that all the destitute poor of that locality were being cared for. At Ranugunta, near the Tripetty railway station, there is a small relief work open under a European subordinate:

5. I then visited, in company with the Collector, the town of Trittany; saw some gangs of relief labourers and some recipients of charitable relief; heard the statement of the Police Inspector, who thought that there was severe and unrelieved distress in some of the neighbouring villages, and the counter-opinion of the Native Sub-Magistrate, who thought that there could not be such distress, as the relief works which he had opened were not well attended. This latter view was to some extent borne out by the sight of excellent crops on the ground at intervals for many miles round. The Police Inspector did not appear to have regularly reported to the Sub-Magistrate the result of the observations made. It was understood, however, that in future this want of intercommunication would be rectified.

6. I then proceeded to Puthoor, the railway station for Narayana-venum (apparently the same place as that called Nurnaverum in the police reports). There was not any charitable relief being administered, but 1,000 persons of the poorest classes were paraded by the Magistrate for my inspection, on the report of the Native Sub-Magistrate that these persons fairly represented those classes in the town. I picked out 24 persons who, from physical depression or emaciation, seemed fit subjects for inquiry; the Collector expressed his intention of dealing with these cases and of instituting a house-to-house inquiry to see whether any more similar cases could be found. The remainder, that is, the vast majority, were in fair condition, and did not at all complain of distress. Thereabouts also there was a considerable area under good crops. Though there was no relief work at the place, still the works open at or near Tripetty and Trittany would suffice to afford employment to those who might need it.

7. The towns of Narayana-venum and Trittany are the principal places in the Karwet-nagar zemindary. The eastern portion in the direction of Madoo Pauk is reported to have suffered much from drought. Otherwise this zemindary has been favoured by the seasons which elsewhere proved so disastrous. Autumnal showers gave it a fair winter crop. Irrigation from wells and from water courses will give it a good spring crop. So far then, this tract has not suffered from drought, and therefore there ought not to be distress among the cultivating peasantry. Still high prices may have caused employment in the fields to be narrowed and restricted (ryots working themselves instead of employing labour), and will have reduced the scanty means of such tribes as Yenadas, Irulas, Korchas, and others who wander about that part of the country. I carefully read the report by Mr. Austin, Sub-Collector, made after his visit. He is an officer of much humane zeal. On inquiry he stated that he could not discover any proof of famine, though there might be some partial distress and some individual misery.

8. I examined the returns of crime presented by the Magistrate. It appeared that towards the end of 1876 crime had been extraordinarily rife, but had since subsided. There do not seem to be any bad symptoms at the present time in this respect.

9. In the local reports previously made to Government I failed to find notice of the fact that for some time past extensive private charity had been dispensed daily at the town of Tripetty.

10. I then visited Kalustri, the head-quarters of the zemindar, who met me there, together with the Sub-Magistrate. The zemindar reported having employed a considerable number of persons on relief works which were just being closed on completion. But the Sub-Magistrate stated that he had received authority from the Collector to open some relief works, which had been opened. Out of 1,200 persons being fed daily by the zemindar, I carefully inspected 600. Many belonged to the Yenade tribe and seemed physically depressed. The worst of them were about to be despatched to the relief camp at Ranipet, near Arcot, by the Collector's direction, in order that they might be better cared for. The zemindar complained much of the drought, which complaint was confirmed by the Sub-Magistrate. My impression is, that the drought has been exceptionally severe in this zemindary.

11. After a few days' interval (for my visit to Nellore) I returned to the North Arcot district, and proceeded to Ranipet, near Arcot, and inspected the relief camp there,

which really was nearly all that could be desired, and was fairly well filled with persons deserving charitable relief. Some gangs of relief labourers were also inspected. Then, passing through the town of Arcot and seeing some relief gangs there, I drove to Arni, where a large number of poor are being fed by the jagirdar, most of whom are deserving, but some are not. A 10 anna crop (that is, a crop somewhat, but not much, below the average) is expected in the jagir. No relief works are open at present; if any are required, the jagirdar is prepared to open them. The spring harvest all round Arni is coming on. I had all the lower classes of the town of Arni, some 2,000 persons, paraded for inspection. They were found to be in good condition. I there met the Deputy Collector (a Muhamadan gentleman) and the tahsildars of the Wandewash and the Poloor taluks. The crop in Wandewash appears by the best evidence to be little below the average, and no relief works are at present proposed there. The crop in Poloor is not quite so good, and relief works are ready to be opened there if need should be apparent.

North Arcot
district.

12. I then proceeded to Vellore by the Kaneimbady pass. I found that the large numbers on the charitable outdoor relief which existed at the time of my previous visit had melted away on the opening of the relief camp. Without doubt there had been some abuses in connexion with this charity. I inspected the relief camp there, which was found to be nearly all that could be desired, and fairly well filled with persons deserving this kind of relief. The arrangements in this camp, as in the Ranipet camp, are creditable to Captain Harris, the Superintendent.

13. At Vellore I met the Sub-Magistrate of the zemindary of Kongonda. He reported much distress in that quarter, which would be met by the relief works which were being opened, and was partly being relieved by the private charity of the zemindar.

14. I then left the district for Coimbatore.

15. During this my third visit the following things seemed to me to be required:—

1st. The converting of the ill-regulated private charities at Tripetty, at Kalustri, at Arni, at Punganur, at Kongonda, and other places into well-regulated relief camps. The private contributions should be studiously maintained, it being so great an object to encourage private charity, but the donors might well be induced to consent to let their contributions be managed by Government officers, so that undeserving applicants may be rejected and only the deserving entertained. Otherwise experience shows that private charity in this country is so apt to mingle the undeserving with the deserving, wherefrom demoralisation ensues. The Collector is arranging to form a relief camp on this principle at a suitable place near Tripetty.

2ndly. The rendering of the relief camps more attractive or rather less repulsive to the poorer classes than they now seem to be. It is indeed an object to render them unattractive comparatively, as an indirect check upon people unduly availing themselves of the charity. But they do not fill so rapidly as might be expected under existing circumstances, and there must be some sort of prejudice arising against them, despite all the carefulness with which they are managed. I incline to attribute this to defective arrangements in respect to the allocation of the people in their several castes. This subject is being considered by the local authorities.

3rdly. The inspection by selected Government officials of every village throughout the several zemindaris existing in this district, namely—

Punganur	Kalustri,
Arni,	Kongonda,
Karvetnagar,	

in order to see whether the house-to-house visitation by the village headmen to search out cases of distress is carried on with the same precision and certainty as in the regular ryotwari villages. I understand that the collector intends to have this done.

4thly. A specially house-to-house visitation in the several towns,—Vellore, Arcot, Tripetty, and others,—not only to search for unrelieved distress among the lowest classes, but also to ascertain whether distressed persons of the better, though broken-down, classes who are too proud to come forward may not receive special relief. This, I believe, the Collector has ordered to be arranged by the several municipalities.

5thly. The arrangement of some light textile work on which the distressed weavers (so numerous in this district) might be employed, the digging and delving on ordinary relief works being unsuited to them. This also the Collector has under consideration.

North Arcot
district.

16. I have now at various times visited the following taluks in this district :—

Chittoor,	Chendragiri,
Vellore,	Wallaja,
Palmanair,	Arcot,
Gudathum,	

and the following zemindaris :

Punganur,	Kalustri,
Karvetnagar,	Arni.

The only taluks unvisited are Wandewash and Poloor, and the only zemindary Kongonda, but of all these I have met the Native officials.

17. I find that distress does not threaten the mass of the people ; that the numbers on relief works will probably not much exceed the comparatively small number now employed, if only the usual showers of April shall last ; that the numbers on charitable relief will probably increase considerably as the season advances ; that in the old town, scattered over the district, in the sacred haunts so much frequented by pilgrims and beggars from distant places, and in the jungle tracts fringing the edges of the district, there are classes among whom many cases of individual distress are to be expected ; that on the whole the relief measures taken in hand are sufficient to meet that degree of distress which is to be anticipated ; that the relief works are of a small description, the number of able-bodied relief labourers not being large enough to justify their congregation upon large works, but if such large works should be wanted, there are many tanks to be repaired ; that in some particular places the delay which at one time occurred was owing to technical and other reasons beyond the control of the local authorities ; that the arrangements for house-to-house visitation in every village (save the zemindaris, which are being separately arranged for) are very systematic and satisfactory. I have discussed with the Collector every measure of relief which I can think of. My impression is that he is now doing everything whichought to be done in this respect.

18. The Collector, Mr. Whiteside, appears to me to be a very able and experienced officer—on the one hand very anxious to spare the Government money and to prevent the Government being imposed upon, on the other hand equally anxious to prevent any accident occurring to human life and to relieve every person who really needs relief—specially acquainted with the ways of the people in this district, and alive to all the devices by which some might try to unduly benefit by the State bounty, yet fully aware of all their merits and virtues, and entirely sympathising with all distress which may actually occur. He is zealously and humanely seconded by his Sub-Collector, Mr. Austin, and the Assistant, Mr. Cox.

Nos. 139.

No. 138.

LII.—MINUTE by SIR RICHARD TEMPLE respecting the Nellore District.

Coimbatore, 6th March 1877.

Nellore dis-
trict.

In forwarding the memorandum of facts ascertained by me during my recent visit to the Nellore district, it will suffice to make only a few general remarks.

2. The failure of the rains during 1876 in this district appears to have been more utter than I had previously supposed. Hardly one-third of the average rainfall was vouchsafed. At no period of the year did any sufficing rain fall ; even the Pennair River failed to come down in flood ; and the dam across that river opposite the town of Nellore and the irrigation works dependent thereon have this year proved almost useless. Along the East Coast line, that is, in the villages immediately adjoining the margin of the sea, some rain fell ; but it dwindled away to the westwards, till almost nothing fell in the western parts of the district at the base of the Ghât range of hills. I found very serious drought prevailing and considerable distress, especially in the vicinity of the well-known hill fort of Udaigarh. The total out-turn of the district is still estimated by the local authorities to be under four annas, or less than one-fourth of the average out-turn. On the other hand, in some parts of the district, especially the eastern, the people, finding water to be near the surface, have, with commendable industry, made the most of this slender opportunity and have dug temporary wells or deepened old wells, and thus raised a certain amount of spring crops. Between Nellore and the East Coast Canal, I saw cultivation of this kind stretching for several miles. In a short time the result of the accession of new grain supply will be felt throughout the district.

3. Meanwhile, the markets are well supplied with grain, coming both by inland and by water routes.

4. Out of the large number of relief labourers whom I inspected carefully (about 17,000 in all), very few were found to be apparently in a condition to sustain themselves; the vast majority seemed to be persons of the right sort for these works, that is, persons who really needed this form of relief. Their physical condition was generally fair. But among them were found sprinkled here and there persons whose physical state was low and unsatisfactory. Every one of these I brought to the notice of the Collector. The total number at the time of my visit, 55,000 persons on district works and 30,000 on the East Coast Canal (of which latter most belong to the Nellore district), in all 85,000, amounts to 6 per cent. on the population of the district—a proportion which, though liberal and sufficient to meet the existing distress, is not excessive, considering the failure of harvests. Nellore district.

5. But I think that this number ought not, without careful consideration, to be permitted to materially increase, because the condition of the ryots generally is reported to be good and free from indebtedness, and because the spring crops shortly to be harvested will bring in a fresh supply. To this favourable description the peasantry of the western parts form the only exception.

6. On the whole, I think that much more discrimination in regard to admission of people must in the first instance have been exercised in the Nellore district than in the ceded districts. The difference in the condition of the gangs in Nellore presented in this respect a marked difference as compared to the ceded districts, which is, so far, very creditable to the Nellore authorities. We may venture to believe that no undue expenditure on relief (to any appreciable amount) has been incurred in Nellore, which redounds to the credit of the Acting Collector, Mr. Sharp.

7. On the other hand, the occasional appearance, even among the ranks of the relief gangs, of persons in a reduced or depressed condition indicates clearly the need of a house-to-house visitation, more systematic than heretofore, in the villages throughout the district. This inference I pressed on the consideration of the Collector, who seemed quite alive to it.

8. No relief camps in the improved style established near Madras have been opened in this district, though charitable relief is being administered at several places. Proper camps ought, I think, to be opened without the least avoidable delay.

9. The relief works have been sometimes useful, consisting of excavation of irrigation channels and reservoirs, but have often been of doubtful value, such as opening out roads which the local funds will hardly be able to keep in repairs in future. The task-work, though perhaps in some places fairly well exacted, has, I fear, often been little better than nominal; the relief labourers have been employed too near to their homes, and the matter has been allowed to become too easy and attractive. Doubtless the Collector will try to remedy this; and some remedy has already been applied in the western portion of the district through the praiseworthy exertions of Mr. Underwood, Assistant Collector.

10. In proof of the objectionable attractiveness of the petty district works, I may adduce the extreme difficulty of transferring relief labourers from these works to the East Coast Canal—an excellent work in a salubrious position, remarkably suited for purposes of relief, and distant only 30 miles on the average. Able-bodied relief labourers on the district works are being ordered to proceed to the East Coast Canal, but they refuse to obey and go on “strike,” remaining for days and days out of work sooner than proceed. It is to be hoped that these difficulties will be overcome by the firmness and patience of the local officers and by the people themselves being awakened to a sense of the necessity.

11. I have in a separate minute recorded my views regarding the East Coast Canal. Rumours unfavourable to the salubrity of the operations on this important project have from time to time been spread. I found, however, the position of the works very salubrious, and the arrangements, sanitary, engineering, and others, excellent, and very creditable to the District Engineer, Mr. O’Shaughnessy, of whose practical ability I am disposed to form a high estimate.

12. If the commencement of the Sungum irrigation project (from the River Pennair 30 miles above the town of Nellore) can be sanctioned, as recommended in my separate minute, that will afford a further field for the profitable employment of relief labour.

13. Though the state of affairs regarding the relief of distress in this district may be generally pronounced to be favourable, yet there is this cardinal defect, that although the district has the very best relief work in all Southern India (the East

Nellore district. Coast Canal) running through it, still the relief labour of the district is not brought to that work to anything like a sufficient extent. The management of this particular matter is the primary point to which the attention of the Collector should be given.

No. 170.

No. 139.

LIII.—MEMORANDUM on the Nellore District, visited by SIR RICHARD TEMPLE from the 27th February to the 1st March 1877.

From North Arcot, Sir Richard Temple entered the Nellore district, proceeding thither from Triputtty *via* Kalustri and Goodoor. At the last-named place he was met by the Collector, Mr. Sharp, C.S., and after inspecting the relief labourers there, drove into Nellore on Tuesday, the 27th February. The next day Sir Richard visited the East Coast Canal works at Maipad, Korutoor, and near the Pennair River, with the Collector and Mr. O'Shaughnessy, the District Engineer; there he also met Mr. Stevens, who is employed on the canal works. About 8,000 relief labourers on the canal, and in the evening some hundreds more on works near the Pennair anicut at Nellore, were inspected. On Wednesday night Sir Richard left Nellore, with the Collector and District Engineer, reaching Nellarpalem the next morning. Here he saw the tahsildar of the Atmakur taluk and inspected about 4,500 relief labourers who had been collected there by previous arrangement. Continuing his journey to Nandeveram, he met there Mr. Underwood, C.S., head assistant, who was on tour in the western taluks. Mr. Underwood accompanied Sir Richard, after seeing the labourers at Nandeveram, to Murripad, where more gangs were drawn up. From Murripad Mr. Underwood returned; Sir Richard and staff proceeded in palanquins by the Dornel, Ghât, Budvail, and Sinhout to the Wontimetta railway station in the Cuddapah district. At Nellore Sir Richard also met Mr. Goldingham, C.S., District Judge, and Mr. Christie, District Superintendent of Police.

2. The following facts were ascertained by inquiry, chiefly from the Collector, Mr. Sharp, C.S. :—

The district of Nellore has an area of 7,150* square miles, including zemindary tracts, and contains a population of 1,374,012 persons, according to the census of 1871. It is divided into nine Government taluks and four zemindary divisions, the extent and population of which are shown in the margin. Many zemindary villages, however, are scattered in all the Government taluks, except in Nellore and Rapur.

* In the Nellore district manual it is stated to be 8,751 square miles.

	Sq. miles.	Population.
Government taluks	4,626	897,845
Venkutgiri zemindary	1,853	348,970
Kalustri	526	100,866
Chundy	124	21,990
Mutyalpad	21	4,941
	<u>7,150</u>	<u>1,374,012</u>

3. The area of land in the Government taluks cultivated with the several food-grains, according to the returns sent to the Board of Revenue for Fusli 1285,

was 884,852 acres, and the statistics of the important grains sown are as under :

Area of crops sown in Fusli 1285.
Acres.

Rice	200,910
Jouna or cholum	360,063
Ragi (small millet)	41,327
Luzza	63,381
Aruga	74,361
Varigalu	115,316
Pulses, &c.	29,494
Total	<u>884,852</u>

The current year's details of *crops sown* are not to hand as yet, but, speaking generally of the whole district with respect to the cultivated yield, there is an almost general failure of wet crops, with the exception of isolated patches here and there, under wells, under some of the Pennair River channels, and spring-fed ponds. A great part of the wet area was not cultivated this year, owing to the drought, and the sowings in many places were fruitless. As regards dry crops, those cultivated under wells have grown fairly, while the yield on those depending entirely on rain varies from nothing in some parts of the upland taluks to four annas or one-third of the average standard estimate. It must be, however, stated that a fair out-turn is expected in a few villages of Ongole in the north of the district. The average yield of purely "dry crops" for the whole district may not

be more than three annas. The rain-fed tanks in the district are almost entirely dry, while those under the Pennair anicut received but a scanty supply, so that cultivation under them was unsuccessful. Nellore district.

4. Of the total holdings of nearly 766,960 acres under the head of "dry" lands, only an area of 2,24,433, or 29 per cent., have been actually cultivated, and the Government demand on this area is only Rs. 2,98,265. Besides the poor state of the crops in general, the many important and valuable "kanchas" or pasture farms are devoid of fodder.

5. The rainfall of this district, from the month of April up to the end of January, was very light, as will be seen from the following details:—

	In.	Cts.
Average of four years to Fusli 1285	37	40
Average rainfall for Fusli 1285, from 1st April 1875 to 31st March 1876	27	29
Average rainfall for Fusli 1286, or from 1st April 1876 to 21st January 1877	11	35

Portions of the district feel the effects of the different monsoons which sweep in from the south-west and north-east, Udaigiri and Kanigiri receiving less than any other part of the district.

6. Nellore suffered from famine in the years 1832, 1854, and 1866, but the scarcity was not so severe as in the present year. The harvest in the year 1875-76 was on the whole poor and much below an average yield for nearly the whole district, especially as regards wet crops. The rainfall of that year was only 26 inches 49 cents., against 44 inches 32 cents of the previous year. The year Fusli 1284 was marked by floods, when many important large tanks and river channels were breached, chiefly in Atmakur and in the principal rice-growing taluk, Nellore, on account of the Pennair floods. The two bad years succeeding the year of the floods have evidently tried the resources of the district generally. In ordinary good years the produce of the country not only supports Nellore itself, but much grain is generally exported both by land and sea to other districts.

7. The condition of the ryots and labouring classes is good in ordinary years. Many of them formerly acquired a good deal of wealth from the sale of indigo, rice, &c., but in Kanigiri and Udaigiri taluks the soil is very poor and the ryots proportionately so. The ryots of the Coast taluks are far better off than those of the western upland ranges. The number of pattadars registered as paying direct revenue to Government is 95,710; of those, 8,627 own pattas of Rs. 50 and upwards, and 87,083 below that amount. The actual cultivators and inamdars, with their families, amount to nearly five-eighths of the entire population of the district. The majority of the population of the district is agricultural, and the *bonâ fide* labouring classes who depend solely upon labour may be estimated at about a sixth of the population.

8. The markets of Nellore, Ongole, and most of the towns of the district are now well supplied with rice. The extraordinary demands of the western districts have much reduced the district stock. The unusually high prices have induced merchants and others to purchase and import grain both by sea from Cocanada and other places from the north, also by the East Coast Canal, and by land from Madras and from Guntoor, &c. Competition among the merchants has now resulted in a slight fall in the price of grain. The present prices of grain, as compared with ordinary prices, in seers per rupee, are given below:—

	1st Week, February.	2nd Week, February.	Average for the last six Years, up to January.
Rice	8·	8·36	16·67
Cholum	9·18	9·24	24·42
Ragi	9·57	9·82	27·39
Cumbu	9·58	9·12	19·33
Wheat	6·87	7·	10·17
Gram	8·33	8·65	18·79

It should be remarked that cholum, cumbu, and ragi are not easily obtainable in the local markets. In the upland taluks of the district the prices range one seer dearer than in Nellore itself; but owing to the public competition noticed above, and partly, the Collector thinks, owing to the example set by Government in importing grain by sea, prices fell. The country ryots send in their carts to Nellore and make purchases both for their own consumption and for purposes of trade. There is little fear that the supply will fail. Recently it appeared necessary to make special arrangements to purchase for the western taluks, but trade generally, the Collector thought, was in no way interfered with by this undertaking. The merchants of Nellore were ready enough to supply rice in Nellore itself, but were unwilling to cart it to the western taluks. This

Nellore district.

was the reason assigned for buying and transporting the grain already purchased, in anticipation of further want in the western taluks.

9. Owing to the scantiness of produce in Fusli, years 1285 and 1286, and exportation, it is feared that the local stocks in hand are small, and no great quantity can be available for sale, as seed-grain is wanted for the next Fusli.

10. The affected tracts of this district are now relieved to a great measure by the many relief works already opened. The relief works consist chiefly of making new roads, river embankments, and repairing Government irrigation courses. Wells are either being newly sunk or repaired wherever water may be scarce, and the East Coast Canal already employs about 300,000 coolies, a few of whom are from the ceded districts as well as Nellore.

11. The following return shows the numbers employed on the 10th February in the several taluks :—

Taluks.	No. employed.	Per-centage to the Population.
Gudur - - - - -	3,827	3
Rapur - - - - -	2,783	4
Nellore - - - - -	4,039	2
Atmakur - - - - -	5,662	5
Kavali - - - - -	5,610	7
Udaigiri - - - - -	13,111	13
Kandukur - - - - -	8,250	6
Kanirgiri - - - - -	6,299	5
Ongole - - - - -	1,526	1
Zemindary - - - - -	5,899	2
	57,006	4
East Coast Canal - - - - -	18,045	

If it be remarked that as the per-centages of population employed on relief work is very low, the district on the whole must be in a fair condition, it is answered that the idea of supporting himself as a coolie is held to be demeaning to a Nellore ryot. Malas and Madigas, who are in general exceedingly poor and have no such pride, form the majority of the present labourers. As there is no prospect of rain for the present, the numbers are expected to gradually increase. Task work is now exacted on the East Coast Canal range only, but in the remaining parts of the district the ordinary wage system is in force, or was up to a recent date. The names of all the labourers are duly registered by the subordinate officers, some of whom come from the Survey Department, others from the Settlement, and some have been temporarily appointed. All the tahsildars and some of the taluk subordinates are now supervising the relief works, and the divisional officers, moving about frequently, exercise supervision over them all.

12. The following are the rates of wages now paid or about to be paid in the district :—

	*1st. As. P.	2nd. As. P.
For adult males - - - - -	1 6	2 0
„ females - - - - -	1 4	1 6
Children above seven years of age - - - - -	0 9	0 10

* For lower standard of task-work, which is being gradually introduced.

The total expenditure up to the 17th February on relief works is stated to be Rs. 3,84,363, and on gratuitous relief, Rs. 26,406. The number fed gratuitously on that date was 11,025. Relief labourers were in the beginning employed solely on road works from want of professional assistance, but with increased facilities for supervision, efforts are now being made to carry out irrigation works in communication with the District Engineer, who has sent in his proposals for repairing many tanks, and as each work now under progress may be completed, irrigation works will be gradually undertaken. But it is hoped that by far the larger part of the able-bodied labourers will be gradually drafted to the East Coast Canal.

13. At first relief was afforded at Nellore at the poor-house. Objections were found to this plan. Three different relief houses were then opened in the outskirts of the town. These by their proximity to the town attracted undeserving recipients. To lessen the risk of disease, and to prevent imposition, two large relief camps have now

been opened, one on the north, the other on the south of the town. Superintendents on Rs. 40 and 30 respectively a month have been appointed to supervise the cooking and distribution of food, and separate sheds have been erected for accommodating the helpless, sick, cholera, and small-pox stricken paupers. There are in all 18 relief houses throughout the district. No attempt has yet been made to secure the people being detained in the camps, but the plan of compelling them to eat their food in the camps is being introduced. The taluk relief houses are under the direct superintendence of either a tahsildar or deputy tahsildar. The pauper recipients get their food only once a day, at the following rates:—

Each adult	-	-	-	One pound of uncooked food.
Children under 14 years	-	-	-	Half ditto, with salt.

14. The condition of the cattle is very poor. Very little fodder is now available as pasture. The harvest of ragi and cholum may relieve the sufferings of the cattle to a certain extent. The tahsildars and many ryots state that one-fourth of the number have already died from starvation, and that as many more are likely to die. Every effort is now being made to feed the most valuable cattle, and attempts are being made to use prickly-pear as fodder. Many ryots have sent their cattle to the Kistna district, Viligondas and Nanamalla hills, but the absence of water in these hills is a drawback. Locally, efforts are being made to keep the cattle alive by giving palmyra and date leaves and green leaves of trees, specially in the western taluks.

15. Except in the beds of rivers, where water can be obtained by sinking shallow wells, and in villages on the seaboard, drinking water is procurable only with difficulty everywhere, and more especially in the western taluks, Kanigiri, Udaigiri, Rapur, Darsi, Todeli, and Venkutgiri. If no rain falls for the next two or three months, the distress for water is expected to be very great. On both sides of the road between Goodoor and Nellore many large pools of water were to be seen. Efforts are now being made to improve and add to all sources of supply from funds placed at the disposal of the Collector by the Board of Revenue, and the digging of ponds and wells is to be undertaken from the jungle conservancy funds wherever emergent. Special consideration is also given to the wants of Malas, &c., who are generally prohibited from drawing water from the ordinary supply wells. The Board's orders regarding the advances to be made for wells have also been published, and many advances have already been granted by the tahsildars.

16. The Rajah of Venkutgiri has promised to spend two lakhs on relief works. Up to this date he is said to have spent Rs. 13,000 annually. The Rajah of Kolustri has done nothing for the Pamur range, which is south of Kanigiri, in a poor and distressed part.

17. Under the above circumstances it is feared that the average revenue will fall short in the Government taluks, and that even the realisation of arrears must be postponed to relieve the present distress of the poorer ryots. It is proposed to give liberal remissions under the head of "wet" lands, and some partial remissions in "dry," wherever the case is thought really emergent. Though the abkari contractors have suffered to a certain extent by low rates, the maximum guaranteed to Government is now being levied from them without the least difficulty. There is, it is said, a slight fall in their profits only, and that the Government demand should not therefore be foregone. In consequence of the loss of fodder and pasture, combined with the wants of the Jail and East Coast Canal authorities for palmyra leaves, trees, &c., the number of the palmyra and date trees is stated to have been much diminished, and it is proposed to reduce the demand on the toddy revenue. This will be considered in due course after obtaining the divisional officers' reports.

18. In the Collector's opinion the number of local applicants for relief work may reach 100,000 at the worst time. It is at present probably 70,000, viz., 55,000 on local relief works + 15,000 relief labourers out of the 30,000 on canal. The Collector calculates the remissions on last year's figures thus:—

			Acres.	Assessment.	Probable remission or suspension.
				Rs.	Rs.
Dry	-	-	766,960	8,97,790	5,98,500
Wet	-	-	193,255	10,24,514	8,19,600

19. Sir Richard Temple has separately recorded his views on the East Coast Canal and the "Sungun" irrigation project.

Nos. 141. No. LIV.—MINUTE by SIR RICHARD TEMPLE, reviewing his former Estimate of Famine
170. expenditure in the Madras and Bombay Presidencies.

Coimbatore, 6th March 1877.

Revised estimate of cost of famine in Bombay and Madras.

I have been invited by the Government of India to submit a revised estimate of the cost to Government of the famine in the presidencies of Madras and Bombay, so far as known facts and the inferences therefrom deducible may enable me to do so, with an intimation than any figures of mine must be submitted immediately, if they are to be of any use, inasmuch as the financial statement by the Government of India may be coming forward by a very early date. I therefore on receipt of this instruction, despatched immediately a telegram on the 3rd March, to the effect that, owing to the actual accounts of the month of February and the beginning of March being so much more favourable than had been anticipated, to the expectation of the spring harvest, and other favourable circumstances, the estimates given by me on the 5th and 13th February* must be reduced for the total of the Madras and Bombay Presidencies as follows:—

*Nos. 52, 79.

Estimates of 5th and 12th February.		Estimates of 3rd March.	
	£		£
Expenditure	4,180,000	Expenditure	3,336,000
Loss of revenue	2,115,000	Loss of revenue	2,115,000
Total	6,295,000	Total	5,451,000
Difference, less on the 3rd March			£844,000.

To this total must be added 180,000% under the heading of Military, as shown by the telegram from the Government of India, making up the grand total to 5,631,000%. From this, however, must be deducted 350,000% on account of extra traffic earnings on guaranteed railways as shown by telegram from the Government of India, making the net grand total 5,281,000%. But from this sum, it is still my opinion that it is proper to deduct the amount of probable recoveries of land revenue in future years, viz., 1,295,000%, which would make the net cost of the famine 3,986,000%; and this I submit as my revised estimate.

2. It was also stated by telegram that, whereas the estimate of the 5th February showed the maximum number of persons expected to come on relief as 1,840,000, the present estimate showed a maximum of only 1,196,000 persons.

3. To-day a memorandum is being despatched showing in detail the data on which the above statements by telegraph were founded.

4. In the estimate of the 5th February, it was stated that the main factor was the number of persons expected to come to the relief works. The maximum in April, 1,840,000 persons, was obtained from figures given me, district by district, by the Collector mostly after full conversations on the subject, which took place on various dates immediately following the 14th January. In these conversations much allowance was made for the reduction of the then existing numbers and the restriction of fresh admissions to the works in accordance with the principle which I knew the Government of India to have in mind and intention, and which I explained to the local officers. These principles, when thus explained to these officers, verbally, certainly seemed to commend themselves very much to the judgment of every Collector I met. And all the Collectors, almost without exception, seemed anxious to give effect thereto. I carefully avoided giving them authoritative advice or instructions, for which they were to look to the Madras Government alone. I confined myself to conferring with them and explaining to them for their own consideration principles and policy and the results of experience. I believe that in most cases they themselves, from their own observation, were prepared for these views, more or less, and proceeded to give effect thereto under the responsibility vested in them by their own Government. At the same time I submitted the same views officially to the Government of Madras on the 19th January, together with practical recommendations for system and economy.

5. On the 25th January the instructions of the Government of India (bearing date the 16th January) were received in the Madras Presidency, in which the above-mentioned principles were authoritatively laid down. The publication of these instructions doubtless stimulated all the local officers to further efforts in the direction of economy.

6. About the same time it appeared that the Madras Government had themselves formed the conclusion that the first outbreak of famine having been successfully met some systematic restrictions must be introduced. On the 28th January, they intimated to me their intention of adopting the substance of the recommendations which had been

made to them by me officially. On the 31st January, their orders were officially issued to the district officers, and again the efforts of these officers were stimulated in the direction of a just and reasonable economy.

7. I have since travelled about from place to place in the distressed districts, seeing how far the orders of the Government of Madras were or were not being carried out, avoiding, as before, the giving of any instructions or even of advice, but showing the local officers how they could best give effect to the orders of their own Government.

8. It seems necessary to state the course of the procedure in order to show the reasons why I venture upon an estimate lower than that given a month ago.

9. The effect of all this upon the numbers upon the relief works may be thus seen. On the 9th January the total numbers stood at 1,061,000. The number had been increasing weekly ever since the beginning of December. The beginning of January was thought by every one to be only the beginning of the trouble. No limit of relief had been in the first instance indicated, and no principle of restrictions had been prescribed, except the labour test, upon which reliance was placed. The people were availing themselves of the privilege to such an extent that ere long half, or more than half, the population of the ceded district and Kurnool seemed likely to come on relief. That alone would give two millions of persons, and the districts below the Ghauts seemed likely to yield another million. The necessity of making some fresh rules was forcing itself on the attention of the authorities. In the first instance, that is, in November and December, it was deemed best to let all have work who might ask for it, and to watch the result. But by January, the result showed that a rule must be promulgated to the effect that employment should not be given to those who seemed able to support themselves.

10. After making much allowance for the introduction of economy the sum of the calculations by the various Collectors showed a gradual increase, week by week, till the maximum of 1,840,000 was reached. Without such allowance for economy, the total would undoubtedly (according to the practice which was obtaining in the beginning of January) have reached two millions before April, and would have exceeded it after that date.

11. But, instead of increasing, the January number of 1,061,000 has been falling week by week, until the latest returns of February show only 713,000. The Madras Government and its officers may be congratulated on this result, considering the good condition of the people generally, the absence of mortality (subsequent to the mortality which occurred in some places at the outset before the introduction of the new rules), and the effective manner in which the distress has been met. In the face of this, however, it is impossible to maintain the estimates, which I had been before obliged to present for March, namely, 1,480,000; especially as there is a spring harvest ripening in several of the distressed districts, to an extent greater than the original anticipation. By parity of reasoning, it has become necessary to reduce the estimate for April and the subsequent months in the manner described in the memorandum, which will speak for itself. As time did not admit of a further reference to each Collector, it was thought best to make the alteration rateably all round. But although there is no present reason to apprehend that any district will show actually more than what is shown in this revised estimate, there is reason to expect that some districts will show even less, such as Cuddapah, North Arcot, Coimbatore, and Tinnevely. On the whole, however, I have deemed it better to submit the revised estimates in its present form, believing that it has within itself a margin to cover unforeseen contingencies.

12. The same remarks apply, *mutatis mutandis*, to the heading of charitable or gratuitous relief.

13. While system and economy have been considered, every precaution has been taken to prevent those considerations causing relief to be withheld from those who really need it.

14. From the very day of entering the Madras Presidency, I have been constant and urgent in pressing on all concerned the duty of saving human life from starvation; of preserving people from such emaciation as might be dangerous to health; of not only admitting all deserving and needy persons who might apply for relief, but also of searching for and relieving all those who, being in such need, might from any cause fail to apply for relief, and further of making this search in the most comprehensive manner, village to village, and house to house. This is the practice of humanity in relief operations in the highest and strictest sense of the term. This is the discriminating charity which, while rejecting those who are not in real need, succours those who are in such need, and takes care that none of them shall escape observation or fail to receive assistance. This most important subject was officially brought forward on the 16th January (two days after my arrival), again on the 19th January, on the 4th February,

Revised estimate of cost of famine in Bombay and Madras.

Revised estimate of cost of famine in Bombay and Madras.

on the 5th February, on the 8th February, on the 9th February, on the 11th February, on the 14th February, on the 26th February, on the 5th March, on the 6th March. This subject has formed the topic of more official representation on my part than any other subject whatever. And several of these representations are couched in the most forcible terms which I am able to employ. In every place which I have visited, and to every relief officer, European or Native, whom I have met, the matter has been explained by me in practical detail, and all those concerned have been shown exactly how they can most effectually compass this paramount object. In short, everything that can be thought of has been and is being done in this respect.

15. I can bear witness that this matter has always been thoroughly understood by the Madras Government and its officers, whose humane intentions can hardly be surpassed.

16. As regards the Madras Presidency, I must here reiterate what has been stated on previous occasions, that the revised estimate assumes that the usual spring showers of April be vouchsafed in Southern India, and that the checks and restrictions ordered by the Madras Government on the 31st January be steadily and faithfully maintained. If there be failure in any of these respects then the estimate may become exceeded, more or less seriously.

17. As regards the Bombay Presidency, I represented officially the expediency of economy in several respects on the 12th January and on various subsequent dates. The reduced estimate recently framed by the Government of Bombay has been embodied in my general estimates.

18. In respect to the searching out and relieving of all cases of serious distress, I addressed the Government of Bombay officially on the 12th January, and have repeated these representations on several subsequent dates. The Government have, I believe, been from the beginning fully alive to this consideration.

19. In the revised estimates I have adhered to the recommendation submitted with my minute No. XXX. of the 13th February, regarding the suspension, and not the remission, of only the land revenue from the dry or unirrigated lands in Southern India, because I find that so many of the most experienced Collectors in both the Madras and Bombay Presidencies are in favour of this plan. Here again the revised estimate assumes that the coming rains will be propitious and the harvests of the next season will be abundant. If there shall be failure in these respects then the estimate will be greatly disturbed.

No. 170.

No. 141.

LV.—MEMORANDUM of the REVISED ESTIMATE of the probable COST of the FAMINE in the BOMBAY and MADRAS PRESIDENCIES, with respect both to RELIEF EXPENDITURE and LOSS of REVENUE, by MR. C. E. BUCKLAND, Private Secretary to SIR R. TEMPLE.

It has now become possible to prepare from the figures available for the month of February a revised estimate, showing both the anticipated loss of revenue and the expenditure on relief in the Bombay and Madras Presidencies.

2. *Relief Works*.—In paragraph 5 of Mr. Bernard's memorandum attached to Sir Richard Temple's minute, No. XXVIII., of the 5th February, the estimated numbers on relief works for the six months from February to July inclusive were thus given :—

Total number of labourers in February	-	-	-	1,228,000
„ „ March	-	-	-	1,480,000
„ „ April	-	-	-	1,840,000
„ „ May	-	-	-	1,530,000
„ „ June	-	-	-	795,000
„ „ July	-	-	-	310,000
				<u>7,183,000</u>

Now the actual numbers on relief works in Madras were, according to the returns I have seen—

On the 10th February	-	-	-	-	868,423
„ 17th „	-	-	-	-	759,275
„ 27th „	-	-	-	-	713,821

which give an average of 780,500, and to make allowance for the higher number at the beginning of the month, the average for the whole of February may be taken at 800,000. The Board of Revenue, in their report for the week ending the 17th ultimo,

stated that the scale of wages ordered in Government order of 31st January 1877, No. 329, had not yet begun to take effect, and that the time for the introduction of the new scale must be counted from the receipt by Collectors of Government order of 12th February 1877. It will be safer for the purposes of this estimate not to assume that the orders of economy had taken effect to any great extent during the month of February. If this be granted, the 800,000 labourers of February must be considered to have cost an average of Rs. 3 for that month (*see* paragraph 6 of Mr. Bernard's memorandum, to which allusion was made above). The difference between the estimated number for February, viz., 1,228,000, and the actual number, viz., 800,000, is 428,000, *i.e.*, about 35 per cent. on the estimated number, 1,228,000.

3. It is not expected that the number on the relief works will rise in March above the average number given for February, 800,000; it is evident that even to attain that number a rise of over 80,000 must take place; but the settled tendency of late has been downwards. Instead, therefore, of the estimated number for March, viz., 1,480,000, it will be fair to take the number 800,000 as not likely to be exceeded.

4. For the remaining months, April to July inclusive, it will be safest to calculate upon the same per-centage of reduction in the estimated numbers that has actually taken place in February in the number for that month, viz., 35 per cent. on the estimated numbers. While, on the one hand, due allowance has been made in the previous estimates for the more trying circumstances of the months, April–July; on the other hand, the scrutinising of the gangs will be more strictly carried out, as experience is gained, as tests are enforced, and supervision improved; add to this that the district of Tinnevely, which was thought likely to have 100,000 labourers in April, and 50,000 in March, had on the 27th February only 1,295 persons on relief works; moreover, the improved prospects of the ragi crop in parts of the districts of Cuddapah and North Arcot have to be considered; and on the whole it may be permissible to take the same per-centage of reduction of numbers of labourers for the months April–July that has actually taken place in February, viz., 35 per cent. on the estimated number of labourers for the month. The result of this calculation will be found from the appended statement to give a total of 3,708,750 labourers from March–July inclusive; and as it may be assumed that the Government orders for the reduction of wages will have generally come into force from the beginning of March, this number of 3,708,750 labourers may be estimated to cost Rs. 8,653,750 (at the average rate of Rs. $2\frac{1}{3}$ a person for each month, according to paragraph 5 of Mr. Bernard's memorandum).

5. The cost of the labourers' wages for February being $800,000 \times \text{Rs. } 3 = 24,00,000$, and for March to July Rs. 86,53,750, the total cost of the relief work wages in Madras for the six months from February to July amounts to Rs. 1,10,53,750, say Rs. 1,10,53,000. These figures compared with the same item in the previous estimate, viz., Rs. 1,79,00,000, show a reduction of Rs. 68,47,000, *i.e.*, 684,000*l.*

6. In the Bombay Presidency, according to the Bombay Government's letter, No. 109a-460, dated 24th February, to the Government of India, the revised estimate of expenditure upon relief works, charity, &c. amounts to 116 lakhs; which sum, being compared with the former estimate of 126 lakhs, shows a saving of 10 lakhs in the Bombay expenditure.

7. *Gratuitous relief.*—The number of recipients of gratuitous relief amounted at the beginning of February to about 60,000 persons, *see* paragraph 9 of Mr. Bernard's memorandum. Whereas in that same paragraph 100,000 has been taken as the number of persons to receive such relief in February, the real number was on the 27th ultimo slightly over 40,000. If 50,000 then may be considered as the mean number of recipients of gratuitous relief in February, when 100,000 was the number estimated, a large margin for the increase in the recipients of charitable relief (which must occur as the supervision on relief works is more strictly enforced) will be left, if instead of a half, two-thirds (*i.e.*, Rs. 12,00,000) of the former estimate of the cost of gratuitous relief (*i.e.*, Rs. 18,00,000) are reckoned as the probable cost under the same heading. Thus the reduction in Madras will be six lakhs under this heading; and the aggregate of the probable saving under both headings is 744,000*l.* In Bombay the aggregate reduction under both headings of relief works and gratuitous relief has been given at 10 lakhs.

8. The figures will then stand thus:—

	£
The total relief expenditure for the Bombay Presidency	
was, according to the former estimate -	1,260,000
Deduct -	100,000
Revised estimate	1,160,000

Revised estimate of cost of famine in Bombay and Madras.

	£
The total relief expenditure for the Madras Presidency	
was according to the former estimate -	2,920,000
Deduct -	744,000
Revised estimate -	2,176,000
The total relief expenditure in both presidencies according to the revised estimate will be—	
In Bombay -	1,160,000
In Madras -	2,176,000
Total -	3,336,000

9. From the telegram received, it appears that the Government of India have taken the probable loss of revenue as 2,000,000*l.*, and have also debited to famine a charge of 18 lakhs (180,000*l.*) in the military department, an item which had not been previously included in Sir Richard Temple's calculations. These two items, added to the 3,336,000*l.* previously ascertained, give a total of 5,516,000*l.* On the other hand, the Government of India take credit for railway revenue amounting to 350,000*l.*; thus the net result would be reduced to a cost of 5,166,000*l.*

10. Sir Richard Temple's former estimate of the probable loss of revenue, which would occur if the Local Government shall promise remissions of the land revenue, amounted to 2,115,000*l.*, thus exceeding the estimate of the loss of revenue framed by the Government of India by 115,000*l.*; that is, the cost of the famine would be 5,166,000*l.* + 115,000*l.*, *i.e.*, 5,281,000*l.*

11. Sir Richard Temple's views on the important point of land revenue remissions were fully stated in the minute No. XXX of the 13th February and Mr. Bernard's memorandum which accompanied it. If those views meet with acceptance, it is not too much to hope that the sum of 1,295,000*l.* (*see* paragraph 15 of Mr. Bernard's memorandum) will represent the probable recoveries of land revenue in future years; and if this sum be deducted from the cost of the famine above given, *viz.*, 5,281,000*l.*, the net cost will be 3,986,000*l.*

12. This estimate, like the others, which have been framed and submitted by Sir Richard Temple, postulates that the checks which have been recently ordained for the reduction of expenditure will be maintained in full force, and that the usual showers in April and May will fall. It has not been overlooked that in such a district as Tinnevely, where severe distress was expected, it is a matter for consideration with the Board of Revenue whether the relief works should not be closed immediately, nor has the fact been disregarded that in some districts early spring crops are approaching maturity, which will before long afford work to the agriculturists, and a supply of food for a month or two to the population.

13. With respect to the distribution of the revised estimate of famine expenditure in Madras, *viz.*, 2,176,000*l.* between the years 1876–77 and 1877–78, the following statement may be offered in the order adopted in paragraph 11 of Mr. Bernard's memorandum appended to Sir Richard Temple's minute No. XXVIII. of the 5th February, thus:—

	Rs.
Relief works and other expenditure according to the Accountant-General's statement up to end of December -	37,25,000
Estimated expenditure on relief work wages during January -	31,17,000
Estimated expenditure on relief work wages during February -	24,00,000
Estimated expenditure on relief work wages during March -	18,67,000
Estimated cost of additional establishments and miscellaneous charges to 31st March 1877 -	6,00,000
Estimated cost of gratuitous relief to 31st March 1877 -	4,00,000
Cost of grain purchased by Government -	30,24,000
	1,51,33,000
Deduct cost of Government grain to be expended up to 31st March	7,22,000
Say -	1,44,11,000
	£1,441,000

For the year 1877-78. Rs.

Estimated expenditure on relief work wages, April to July 1877 -	67,86,000
Estimated cost of additional establishments and miscellaneous charges, April to July 1877 -	12,00,000
Estimated cost of gratuitous relief, April to July 1877 -	8,00,000

87,86,000

Deduct cost of Government grain to be expended, April to July 1877 14,44,000

73,42,000

£
1,441,000 Say - £735,000
735,000

Total estimate expenditure - £2,176,000

14. Some of the above figures require explanatory notice. The cost of the wages of relief labourers for February has been shown to be Rs. 24,00,000. For March the number of labourers given in the revised estimate is 800,000, who, at the average rate of Rs. 2 $\frac{1}{3}$ a month for each person, will cost Rs. 18,67,000,—

	Rs.
<i>i.e.</i> , for February -	24,00,000
for March -	18,67,000

42,67,000

The revised estimate of expenditure on relief works from February to July was given as Rs. 1,10,53,000. From this, deducting Rs. 42,67,000, the result is obtained of Rs. 67,86,000 as the revised estimate of cost of relief works from April to July.

15. For additional establishments and miscellaneous charges in the original estimate the sum of Rs. 18,00,000 was taken, as 10 per cent. on the original estimate of relief wages for the six months February to July (*see* paragraph 8 of Mr. Bernard's memorandum). These additional establishments and charges will not be materially affected by the variations in the numbers of relief labourers. Therefore one-third of the Rs. 18,00,000 may be estimated as the cost for the two months February and March; and two-thirds of the Rs. 18,00,000 as the cost for the four months April to July.

16. With regard to the gratuitous relief, in the revised estimate the sum of Rs. 12,00,000 has been taken as the cost. As in the preceding paragraph, this may be debited, one-third to February and March, and two-thirds to the four months April to July.

17. Similarly, in deducting as a set-off three-quarters of the cost of Government grain (as that grain will be used to pay labourers or relief paupers), it appears correct to credit one-third and two-thirds of the Rs. 21,66,000 to the years 1876-77 and 1877-78 respectively.

18. In the Bombay Government's letter, referred to in paragraph 6 above, the revised estimate of expenditure of 116 lakhs is distributed thus, viz., 47 lakhs to 31st March and 69 lakhs subsequent to 31st March.

STATEMENT referred to in paragraph 4 of the Memorandum dated 6th March 1877.

	Estimated Number of People on the Works during the Month of						Total.
	February.	March.	April.	May.	June.	July.	
According to minute of 5th February -	1,228,000	1,480,000	1,840,000	1,530,000	795,000	310,000	7,183,000
Revised estimate -	800,000	800,000	1,196,000	994,500	516,750	201,500	4,508,750
Difference -	428,000	680,000	644,000	535,500	278,250	108,500	2,674,250

No. 142.

No. 12,327 G.-243, dated Bangalore, 6th March 1877.

ORDER thereon* by the CHIEF COMMISSIONER OF MYSORE.

Order.—The wishes of the Government of Madras, that an officer of this Administration should be deputed to supervise the return of Mysore people to their own country,

Nos. 143.
221.

Mysore emigrants to return to their own country.

* V. Nos. 1, 6, 14, 35, 69, 91, 131.

will be complied with, and the Commissioner of the Nundydroog division is desired to detach Mr. Mahomed Ali, the Subdivision Officer at Chikballapur, Kolar district, to proceed at once, and in personal communication with the Head Assistant to the Collector of Bellary, ascertain the number of Mysore people receiving gratuitous or other relief from the Madras Government in the Hindupur, Madaksira, and Pennakonda taluks of that district. He will arrange for the return of all such as are capable of being moved into the several taluks of the Mysore districts adjoining, and, through the amildars of these taluks, provide means for deporting them from the Bellary district by easy stages, where food should be supplied. An advance of Rs. 500 should be made to Mr. Mahomed Ali by the Commissioner of Nundydroog to meet emergent requirements.

The Deputy Commissioners of Kolar, Tûmkûr, and Chitaldroog will instruct the amildars of the border taluks to comply promptly with the requisitions made upon them for the purpose by the Assistant Commissioner. Those who are able-bodied should be relegated to the special or other relief works in progress, and those who are physically unable to work should be properly admitted to the feeding kitchens, under arrangements to be made by the Deputy Commissioners and their Assistants.

Nos. 161.
221.

No. 143.

ORDERED—That the following letter be addressed to the Chief Secretary to the Government of Fort St. George, in reply to his letter above recorded :—

No. 12,335 G.-43, dated Bangalore, 6th March 1877.

From the OFFICIATING SECRETARY TO THE CHIEF COMMISSIONER of MYSORE, to the CHIEF SECRETARY TO THE GOVERNMENT of MADRAS.

Mysore State
not prepared
to bear
charge of
maintaining
its subjects
who mi-
grated to
British terri-
tory,

I am desired to acknowledge the receipt of your letter No. 767 of 1st March, in which his Grace the Governor in Council again presses upon the consideration of the Chief Commissioner the proposal that the Mysore State should bear the charge of maintaining those of its subjects who have resorted to the frontier districts of Her Majesty's territory, either to seek relief on easier terms than they could obtain it in their own taluks, or to evade the payment of the land revenue.

2. While desirous of according the deference which is due to this expression by the Madras Government of their views, the Chief Commissioner is unable, for the reasons fully stated in my letter of the 15th ultimo, to assent to the grounds on which the demand for a contribution from this State towards the outlay incurred for relief purposes in the adjoining territory is based.

3. Mr. Saunders has no desire to advert to the causes which had, as he conceives, led many hundreds of the people in this province to migrate across the frontier, and which though to a certain extent conjectural as you remark, have received much confirmation from what is stated in paragraph 3 of Sir Richard Temple's minute dated 16th of February 1877. But it is important, I am to remark, as affecting the consideration of the equity of the claims put forward by the Madras Government, to remember that, while what may be fairly termed extraordinary inducements were held out to the people on the eastern frontier of the province to resort to the relief works and kitchens in the Bellary district, this migration was neither desired nor encouraged in the interest of this Administration, whose local officers were fully prepared to provide employment for all who needed it, and on terms which, though not so liberal as prevailed over the border, were well adapted to the then existing circumstances of the people.

4. With regard to the Wynad frontier, the inducements which led the people to migrate to that locality in larger numbers than usual were somewhat different, but, as the Chief Commissioner has reason to believe, notwithstanding all that was done by the local officers and by the returning emigrants to dissuade them from leaving the province, the people have persisted in moving into Wynad, as they have done into the coffee-growing districts of Coorg and Manjarabad, long after the demand for their labour had ceased, the cause must be found in the same desire which has operated throughout of evading task-work however light, as well as the endeavours which are still advisedly made to recover a fair proportion of the Government revenue.

5. It must be obvious in this view, that the duty of the Chief Commissioner lies in setting his face resolutely against any encouragement to these people to persevere in a course demoralising to themselves and injurious to the interests of this Administration, and as the means are available to all of this class, as explained in paragraph 6 of my letter

the migra-
tion being
neither de-
sired nor
encouraged.

of 15th ultimo, of returning by easy stages, their immediate needs being provided for *en route*, Mr. Saunders would again urge upon the consideration of his Grace in Council that the humane intentions expressed in your letter can be fulfilled without recourse to the measure of maintaining the subjects of this State at the expense of this Government.

Migration
from Mysore
to British
territory.

6. On the other hand, the wish of his Grace the Governor in Council, that an officer should be deputed from this province to supervise the return of the people to their own country, will be at once complied with, and I am to state that Mr. Mahomed Ali, the Assistant Commissioner in charge of the Chikballapur Subdivision of the Kolar district, has been directed to proceed to Pennakonda, and after personal communication with the Head Assistant Collector, to arrange for the removal to their own taluks of all persons belonging to Mysore who may be receiving Government relief in the three taluks of Hindupur, Madaksir, and Pennakonda.

The Chief Commissioner will be willing, on receipt from you by telegraph of specific information as to other localities in which Mysore people are being maintained on Government works or relief houses, to make similar arrangements for the purpose of inducing their withdrawal.

7. The Chief Commissioner anticipates, however, that the number of "Mysore paupers" remaining in the Hindupur and other bordering taluks of the Bellary district will be small, for, on referring to the returns furnished to the Madras Government under date the 30th January last, and published in the Madras newspapers, it appears that between the 23rd and 30th January, the number on relief works and gratuitously fed in the Bellary district had fallen from 393,400 to 377,147, and that the Collector had officially reported that the reduction in these numbers was due "to a large number of Mysore coolies being sent away from Hindupur, Madaksira, and Pennakonda." It was further stated that there was a decrease of more than 11,000 in the numbers gratuitously fed, chiefly in Hindupur, "where Mysore paupers have been sent back." This return, it will be observed, is of a more recent date than that of the Head Assistant Collector's letter, No. 34, dated 23rd January 1877, an extract from which is appended to your letter under reply.

8. A more recent return, moreover, shows that between the 10th and 17th February 1877, the numbers on relief works in the Bellary district had been reduced from 344,343 to 307,509, and from the fact which has been recently reported, and communicated to you in my letter No. 12,055—G. 42, dated 27th February 1877, that the tide of immigration has now set in from the Bellary district into the neighbouring taluks of this province, the Chief Commissioner is probably right in assuming that there must be comparatively few of the Mysore people still remaining in the Madras districts.

9. As regards those who are reported to be "hanging on" at the Wynad coffee estates, the Chief Commissioner has no information as to the numbers congregated there, but as ample provision has been made, as already stated, for finding employment, as well as other needful relief for them in the Mysore and Hassan districts adjoining, the Government need feel no apprehension as to the consequences of withholding from those people the means of idly prolonging their stay in those localities. As large importations of grain continue to be made into the Wynad weekly from the south-western taluks of the Mysore district, it is evident to the Chief Commissioner that the supposition expressed by the District Engineer of Malabar as to the cause of the unwillingness of Mysore subjects to return to their own country is an erroneous one.

10. With reference to the last paragraph of your letter, I am desired to explain that the notice alluded to was issued by the Commissioner of the Ashtagram division, and had reference solely to works in progress in the Mysore and Hassan districts comprised in that division.

No. 144.

No. 170.

No. LVI.—MINUTE by SIR RICHARD TEMPLE, reviewing the objections of the SANITARY COMMISSIONER, Madras, to the reduced scale of wages.

Coimbatore, 7th March 1877.

I have examined and considered, with the attention due to the opinions of an officer so highly qualified and accomplished, the letter from Surgeon-Major Cornish, Sanitary Commissioner of Madras (addressed to the Chief Secretary to the Madras Government), in which he records various professional objections to the reduced scale of ration directed

The reduced
scale of
wages.
Reply to Dr.
Cornish.

The reduced
scale of
wages.

to be adopted by that Government in its Resolution of 31st January last. The particular point to which he objects is the allowance of 1 lb. avoirdupois per diem to an adult labourer (not performing severe task work), plus half anna in cash. Inasmuch as his views, if these were to be adopted without adequate deliberation, might involve a large and unnecessary expenditure of public money, I would submit, for the consideration of the Governments of India and Madras, a few remarks on these objections.

2. Into the purely professional part of his arguments I cannot enter, further than to note that, while no doubt abstract scientific theories of great value on the subject of public health are of modern growth, the Indian population with which we are now dealing have lived for centuries in disregard of them, and practically at the present date the poorer classes, even in countries much more civilised than India, do not actually obtain either in food, lodging, or ventilation the amount declared by scientific men to be necessary. I would further note particularly that most of Dr. Cornish's observations refer to Europeans living in a cold climate, where waste is greater, and largely exceeding the Natives of India in average weight, requiring therefore more food. The Edinburgh inquiries which he cites, however applicable to European cases, and however valuable in the abstract, are not strictly and exactly applicable to the poorer classes of the Madras Presidency.

3. The practical question, however, is this. Can, and does, the new scale of wages suffice to keep the people with whom we are now dealing in fair health under present conditions and circumstances? More than this, this Government has declared itself unable to undertake.

4. Dr. Cornish seems to object, on the ground that a diet sufficient to sustain a man's life when at rest may be "wholly inadequate to his needs when employed on tasks necessitating severe physical exertions," and again, that "a man engaged on task labour

NOTE.—I was informed at Vellore that indigent adults admitted to the relief camps in consequence of their inability to work, have improved considerably on a ration of a pound a day. Dr. Fox, Civil Surgeon, and Captain Harris, the Relief Officer, were agreed on this point.

flesh on a pound a day.

and paid at the rate of 1 lb. of grain and half an anna in cash" cannot "procure a sufficiency to eke out the defects of his grain ration." I do not know whether Dr. Cornish would admit that 1 lb. of grain is sufficient to maintain a Native of India; in a state of rest, perhaps, he would. The evidence of relief camps in the Madras Presidency, however, shows that a Native at rest can gain

5. But in paragraph 5 he says that the "combined testimony" of numerous observers showed that "the maximum grain allowance of a man in health and in work was not less than 24 ozs." or $1\frac{1}{2}$ lbs.

6. He apparently assumes that by the new scale a man cannot obtain $1\frac{1}{2}$ lbs.; but in the first place it is to be observed that at present prices throughout the greater part of the distressed district a man can, with the half anna which he receives in cash, buy an extra half pound of grain a day and still have a small margin over for condiments, that is, he earns sufficient to allow him the minimum quantity requisite to keep him in health while at work. More than this, I submit it is not in the power of Government to do.

7. Let it be assumed, however, that a man receives the 1 lb. plus the half anna, which will give him something over in grain, together with something for condiments. Then there is one defect in Dr. Cornish's line of argument which appears to me to invalidate his conclusions. I consider that the particular misapprehension to which I am about to advert renders his remarks inapplicable to the state of things as at present existing in the distressed districts. His argument is, that the present rate of wages (equal to 1 lb. in grain with half anna in cash), "will not permit of severe labour or task-work," is insufficient for men "employed on tasks necessitating severe physical exertion;" thereby implying that the bulk of the relief labourers in the Madras Presidency are employed on such tasks. This, however, is so far from being the case that the general condition of the people on the works approaches much more nearly to one of rest than to one of severe physical exertion. There are probably very few out of the thousands employed by Government who do nearly as much work as they do in ordinary seasons for their own support. In short, the reduced scale (1 lb. and a half anna) is not applied to persons undergoing severe physical exertions, but to persons who are on light work or are comparatively at rest. In many places task-work has not yet been introduced; in many others it is only nominally enforced, and where it is in actual operation the amount of labour exacted is extremely light.

8. It must be remembered that in the Madras Government Orders of 31st January, two rates of working pay are laid down, and that all persons who do work amounting to 75 per cent. of the Public Works rates receive 1 lb. of grain and one anna in cash; while those who receive a pound of grain plus half an anna (who alone are referred to by

Dr. Cornish) are only required to render task-work at half the Public Works rates. Now the Public Works labourers are paid by piecework, and no definite task is asked for; they do as much or as little as they like, and are paid accordingly. The reduced scale of wages.

9. The result is that those who really undergo the severe physical exertions described by Dr. Cornish do actually receive wages equal to $1\frac{1}{2}$, perhaps even 2 lbs. a day, which is tantamount to what he recommends. It is only for those who do not undergo such exertion that the lower scale recommended by me and ordered by the Government of Madras is intended. Practically, at this time, by Public Works rate is meant the amount of work done per rupee, and relief labourers on the first standard are expected to do three-quarters as much for a rupee as common labourers; that is, supposing the Public Works Department rate for earth-work to be eight cubic yards per rupee, then relief labourers of the first class have to do six cubic yards for the same money; and two annas being taken as the minimum wage on which they can be maintained in health, three-quarters of a cubic yard is the task assigned to enable men in this class to earn their two annas. It is considered (and this is in accordance with Dr. Cornish's views) that persons doing less work than this can live on less, so while the second class labourer does only half a cubic yard of earth-work daily he receives in return $1\frac{1}{2}$ anna. But, as observed, the Public Works rate is not a task but a scale, and ordinary labourers are not content to earn two annas daily by excavating one cubic yard, but, as a matter of fact, earn much more than this. I was informed by Mr. O'Shaughnessy, the District Engineer of Nellore, that some of the gangs at work on the East Coast Canal were earning five and even six annas a head daily, that is, were doing five or six times as much work as is demanded from the relief labourers on the lower scale.

10. The work of such relief labourers could, therefore, scarcely be described as "severe physical exertion," even if it were fairly rendered; and in many, if not in most districts, it is still little more than nominal. As more efficient supervision is introduced and task-work really exacted, all those willing to do the very moderate task asked for will gradually be admitted to the higher standard and receive full wages, while it is submitted that the lower rate is sufficient to maintain those employed on nominal tasks of extreme lightness.

11. The objection to the new scale, which Dr. Cornish states in detail, is popularly formulated by the phrase "a full day's wage (that is, something more than the 1 lb. and the half anna) for a fair day's work." But the phrase postulates that there is a fair day's work, which is just what the vast majority of the relief labourers do not render. Therefore they are not entitled to, and do not physically need, the full day's wage. Where they render a really fair day's work there they do receive under the new rules more than the reduced scale.

12. The rates were avowedly recommended by me as experimental, and if they shall be found insufficient they may be increased; but it appears to me that they have not yet been found so, and that Dr. Cornish argues from a mistaken premise, which undermines his conclusions. If the poor people were found to be falling off in condition then I would at once recommend an alteration in the rate; but at present we have no such experience.

13. As a matter of fact, I must repeat that payments are not made in grain but in cash. A pound of grain has been estimated as costing one anna, and in no cases have the wages paid been less than an anna and a half, the anna being the supposed equivalent of a pound of grain, and the half anna being available to eke out the ration. An anna, however, represents in most parts of the worst districts more than 1 lb. of grain. At Adoni, for instance, where nearly 50 per cent. of the population were recently on work, one anna will purchase about $1\frac{1}{2}$ lbs. of cholum, which is the staple food of the people, leaving each labourer half an anna to buy pulse, condiments, &c.

14. It is impossible over such a large tract of country as is now affected with scarcity, where prices vary to some extent in almost every district, to lay down any rule which may not be open to local criticism and inapplicable to certain localities, but the scale laid down appears to me to be on the whole sufficient to yield the people that subsistence which alone Government can afford. We would gladly give more if it were in our power, but we must content ourselves with saving life, and cannot pretend to prevent all forms of distress.

15. There is one point which I must concede to Dr. Cornish's argument. In laying down the minimum scale it was, of course, intended that each labourer should be able to consume his own wages, and not have to share them with other persons of his family. These members of the family should either work for themselves, or if unable to do so, should be admitted to gratuitous relief. The case of young children who accompany their parents to the works, but are too young to work, that is, children from one year to seven years of age, has already attracted my attention, and I have recommended in a State minute that subsistence allowance be granted to them.

The reduced
scale of
wages.

16. Further, I would urge as the one motive common to the Government of India and Madras, and to all connected with the famine relief works, is the preservation of life and the mitigation of extreme suffering at the smallest cost to the State, consistent with the attainment of the object in view, that the inquiry as to whether the reduced scale of wages is sufficient to enable the people to tide over the next few months without serious danger to themselves should be decided not by pre-conceived physiological theories, but by patient practical examination of the people themselves, with a view to ascertain whether there is in fact any or any serious change for the worse in their physical condition under the new scale, as compared with their average condition in ordinary times. Having carefully inspected during my tour in this presidency thousands of relief labourers, I give it as my opinion that with very few exceptions, which are not as a rule traceable to insufficient relief wages, the general physical condition of the labourers is as good now as in ordinary years. If, as already stated, I find after a little more experience that the new scale of wages does seem insufficient to maintain the people in health, I will be the first to say so; but so far this has not seemed to me to be the case.

17. In conclusion, it is not possible, I submit, to determine *à priori* on scientific data what amount of food is necessary to sustain the particular classes who come to our relief. The real point to be considered is whether in ordinary times they get more than 1lb. a day for a male adult. This is an economic question, which can be determined by calculating the rate of wages in the rural districts—not the wages of trained professional labourers employed by public bodies, not the wages of stalwart men of the professional class of workmen, but the men of lesser physique and lighter frame, such as that of the village poor, but the wages received by the labouring poor in the villages of the interior, and then by taking the prices of common grains in ordinary years. Now, from inquiries made in various districts of the Madras Presidency, I apprehend that the labouring poor in rural localities can hardly get more than 1lb. a day for a male adult in ordinary times. If this be so, then the reduced scale must be sufficient for these same people on the Government relief works and need not be increased.

LVII. MINUTE by SIR RICHARD TEMPLE, on the subject of giving Subsistence Allowance to the younger Children of Relief Labourers.

Subsistence
allowance to
children.

Since the introduction of the new scale of wages, complaints appear to be made that relief labourers are sometimes accompanied to the works by children too young to work, *i.e.*, below seven years of age, who have to be supported out of the earnings of their parents; and suggestions have been offered that a subsistence allowance should be made on account of such children.

2. The new scale is avowedly a minimum allowance sufficient for one person, and it is evident that if a labourer has to divide his wages with other persons they will not suffice either for himself or for them, and suffering must result. All persons who are able to do light work can earn subsistence on the works for themselves, all who are unable to work are entitled to gratuitous relief, so that it is only the young children who have to be considered. These cannot be separated from their parents even if it were desirable to send them to the relief camps, which, in my opinion, it is not. They accompany their parents to the works and have to depend for food on some small share of the family earnings. When several members of a family (father, mothers and elder children) are employed, it is probable that one or two small children could be sustained out of the joint wages; but in cases where there may be only one or two bread-winners, and perhaps three or four children, a supplementary allowance will be necessary.

3. I believe that in some way or other the local officers have the power to afford additional aid to persons burdened with young children, and that such children do in many places get something extra, but I think it is now time that relief officers should be formally vested with a discretionary power for the relief of all children between one and seven years of age. Up to a year the child is at the breast; at seven he is admitted to the works.

4. A child of six requires much more food than a child just weaned, and it might be expedient to have different rates for children of different ages, say one rate for babies from one to three years, and another for children from three to seven, but I think that any fixed rate would be so open to abuse that it would probably be better to leave the amount of aid to be granted to the discretion of the local officers, subject to a maximum limit not exceeding half the rates paid to working children.

4. I would also suggest that this aid should not be indiscriminately given to all children who may be brought to the works, as this would probably lead to large numbers of children being sent to the works by parents not on relief at all, and thus an abuse might spring up. It would be preferable that inquiry should be made into individual cases, and the aid extended to such cases only as seem to need it.

Subsistence allowance to children.

No. 146.

No. 147.

EXTRACT from the PROCEEDINGS of the GOVERNMENT OF INDIA, in the Department of Revenue, Agriculture, and Commerce, dated Calcutta, the 9th March 1877.

RESOLUTION.

The province of Mysore is undergoing, throughout a large portion of its area, the unusual misfortune of a second season of drought. The harvest of the year 1874-75 was abundant, but the south-west monsoon of 1875 failed so extensively as to cause a loss of the greater part of the dry crops, and the succeeding north-east monsoon was likewise scanty and insufficient to fill the tanks which are relied upon for the irrigation of about one-sixth of the province. The prevalence of distress was brought fully to the notice of the Government of India in January 1876, and aid was afforded by means of relief works and considerable remissions of the land revenue. During the present year both the south-west and north-east monsoons have been even more scanty than before, and distress has consequently been converted into a famine of much severity.

The Province of Mysore.

2. In October last the Chief Commissioner reported very fully on the condition of affairs up to date, obtained a grant for relief works, and was requested to submit statistical information regarding each taluk similar to that called for at the same time with reference to the distressed portions of the Madras and Bombay Presidencies. Subsequently, a complete review and forecast, resembling that required for those presidencies, was considered to be necessary. The submission of the information thus expected has been unavoidably delayed by various circumstances, and it has not in all cases been found possible to ascertain details with the precision which might have been desired. The result has, moreover, been to a considerable extent anticipated by the graphic sketch of the condition of the province very recently presented by the minute of Sir Richard Temple dated the 14th ultimo, and its accompanying memoranda by Mr. Bernard. At the same time his Excellency the Governor-General in Council considers that there may be much advantage in making public a review of the tract suffering from scarcity which is based upon a comprehensive series of facts, collected by the several local officers who are in actual contact with the people and their difficulties, and expressed as far as possible in their own words.

3. The area of Mysore is 27,077 square miles, and its population 5,055,412, and the province is divided into eight districts, comprising 68 taluks. The Shimoga, Kadur, Hassan, and Mysore districts, which lie in order from north to south along the edge of the Western Ghâts, have suffered less than the others, and the two first named have even afforded by the jungles and grazing grounds in certain of their taluks most material aid to the remainder of the province. Chitaldroog and Bangalore come next in order of failure, while Tumkur, lying between them, and Kolar, the easternmost of all, have virtually lost nearly the whole of their crops. The affected area and population as estimated by the Chief Commissioner are given in the margin, and amount to nearly

Area in square miles.	Population.
16,812	2,579,827

two-thirds of the whole area and one half the whole population of the province. If, however, all taluks be considered as affected in which the crop saved amounts to less than one half, the numbers will be 14,479 and 2,849,329, while if taluks with half crop saved be added the results will be raised to 16,160 and 3,141,747 respectively.

4. The rainfall during the past season is shown in the margin. As only one-third of the taluks have had less than half the average, and no less than 31 have received above one-half, the general result is more favourable than that of the rainfall in the distressed districts in the Bombay Presidency during the same period. The fact, however, of the present season being the second one of drought renders the deficiency far more serious in its consequences than it otherwise would have been. The Chief Commissioner reports that "the tanks generally are all " dry, and the gravity of the crisis is undoubted," and it is to be feared that a considerable increase of suffering to both

man and beast is inevitable.

5. The attempt to estimate with any approach to accuracy the failure of crops is in the present case surrounded with considerable difficulties. The province is subject to the influence of two monsoons, and there is also a considerable amount of land dependent on irrigation, which again proceeds from several sources, some of which are less affected by the rainfall than others. In the absence of correct statistics as to the proportions of the total area under each class of cultivation, it is obvious that a mere estimate of the

Total	9	6	10	4	8	5	8	8

suffered the heaviest loss; but is closely followed by Bangalore and Chitaldroog; Kolar and Kadur hold an intermediate position; Hassan and Mysore have failed but slightly, and Shimoga is almost untouched. Counting by taluks, the crop saved is above half in 25 taluks; the failure has been total in 10 and nearly so in eight more, while the intermediate number, losing from one-sixth to one-half both inclusive, is 25. These results are more extreme as regards both crop lost and crop saved, than those ascertained in the case of Bombay.

6. The estimates of probable remissions of land revenue which were formed in November amounted to no less than Rs. 25,64,956, the total demand for the year being Rs. 68,94,825, but further inquiry has reduced this figure to one half, or Rs. 12,76,672. It appears probable that still further reductions will be found practicable, especially in the Kolar district. The general principle laid down by the Chief Commissioner has been that eight annas in the rupee may be remitted on wet lands under tanks, if wholly unirrigated, and from four to six annas on dry land holdings, but that if any further concession be needed it must be in the form of postponement of recovery till next year.

7. The resources of Mysore in cattle and agricultural stock generally have not been reported, but they have already been most materially impaired, and it is to be feared that considerable further loss is unavoidable. The condition of the cattle may be said to be decidedly bad in 19 taluks, indifferent in 41, and good in eight only. The districts of Chitaldroog and Tumkur appear to be the worst, the reported losses being 79,700 and 97,600 head respectively. The remedial measures adopted have been the suspension of sales of grass on waste lands, the throwing open of the State forests, and above all, the removal of the cattle to the Ghât districts, particularly to the eight Mulnad taluks or hilly region in the Shimoga and Kadur districts. Prickly-pear has not found favour as fodder.

8. The scarcity of water is great through above two-thirds of the province; the condition in this respect of 17 taluks being bad and of 32 indifferent, and the suffering of the people and the cattle will be intensified in the event of no rain falling in the course of next month. The digging of temporary wells in the beds of nullas and tanks is the only measure which can be resorted to.

9. The course of prices during the three years months terminating at Christmas is chiefly remarkable as showing a general and gradual rise, rather than the sudden rise and subsequent recovery which was observable in the case of Bombay. Since that date there has been a decided amendment in the price of ragi, but that of rice has been more stationary. The condition and prospects of the grain trade have been so ably reviewed in the memoranda by Mr. Bernard, to which reference has already been made, that it is sufficient to say that in Mysore, as elsewhere, private trade has shown great activity, that the demand on the railway is, and will continue to be, in excess of its carrying power, and that there appear to be not inconsiderable stocks in the hands of the people which will not be drawn upon until June and July, when it is to be hoped that rain will have fallen and removed all anxiety regarding the coming season.

10. Mysore, like the west of India generally, does not possess a wealthy zemindari class, who can be relied on to pay their revenue regularly, notwithstanding occasional bad years, and to deal liberally with their tenantry. The population contains a rather larger per-centage than usual of high castes, but the majority are poor, excepting, perhaps, in the Mysore district. The Province of Mysore.

11. The number of persons reported to have emigrated is 334,248, or about 13 per cent. on the affected population, but the movement has for the most part been only to the Mulnad taluks of the Shimoga and Kadur districts, for the purpose of grazing cattle, or to the coffee plantations of Coorg and its vicinity, where labour is in request. It is doubtful whether the change of climate has usually been found advantageous.

12. Up to the period when the taluk reports now under consideration were sent in, the organisation of relief works had not attained any very large dimensions, and the Chief Commissioner was endeavouring, with equal caution and judgment to meet, without exceeding the exigencies of the situation. The projects which have been undertaken have, owing to the want of facilities for large undertakings, been of limited extent, and have in the great majority of instances consisted of tank repairs and clearances. As such projects are particularly appropriate to the circumstances of Mysore, and task-work is everywhere enforced, with the cordial co-operation of the Public Works Department, there is good reason to believe that the result will be a material improvement of the irrigational resources of the province. The totals of the general expenditure up to December 31st, by means of which much relief will be afforded, are given in the margin. The appropriations

	Rs.
District Fund Budget	1,85,323
Special relief works	1,19,269
Total	3,04,592
Imperial Public Works Irrigation Budget	3,56,234
Ditto roads and buildings ditto	8,36,533
Total	11,92,767
Civil Budget : petty repairs, &c.	76,831
Municipal Budget	1,19,713
Total	16,93,903

for relief works under civil officers were on February 17th Rs. 4,98,568, out of which Rs. 1,92,968 had been actually expended. The relief appears to have been sufficient without being excessive.

13. The organisation for charitable relief has been carefully developed throughout the various districts. Considerable sums have been privately raised for the support of the aged, helpless, and infirm, and the Chief Commissioner, in accordance with sanction accorded to him at his request on the 2nd November 1876, has made in all cases an equivalent grant on the part of Government. Recently arrangements have been commenced at the suggestion of Sir Richard Temple for a careful house to house visitation, with the view of preventing, as far as human agency can effect it, the mortality which might otherwise possibly occur among those who are from any cause prevented from seeking relief on the works.

14. The local officers estimate, as shown in the margin, the numbers likely to be in receipt of relief. As regards the first-mentioned date, it seems sufficient to say that, according to the latest information obtained by telegraph and relating to the latter part of February, the total on the works and receiving charitable relief was 94,596. The estimate, therefore, while beyond the mark was not altogether excessive, and it seems not improbable that the numbers on the 1st of May may come up to the local calculation. By the 1st of July, however, a considerable reduction in numbers may fairly be anticipated, especially if a favourable commencement of the rains has taken place.

15. In conclusion, his Excellency the Governor-General in Council has great pleasure in congratulating the Chief Commissioner and the officers of the Mysore Administration on the zeal, judgment, and humanity which have characterised their arrangements and exertions to meet the great calamity which has fallen upon the province, and the large measure of success which has hitherto attended them.

Ordered, that copies of this Resolution be communicated to the Secretary of State for India, the Chief Commissioner of Mysore, the Governments of Madras and Bombay, and Sir Richard Temple, and that it be published in the "Gazette of India."

Agriculture and Horticulture.—Famine.

From the GOVERNMENT OF INDIA, Department of Revenue, Agriculture, and Commerce,
to the SECRETARY OF STATE FOR INDIA.

Calcutta, 9th March 1877.

Insufficiency
of means of
transit for
grain.

The subject which has most particularly engaged our attention during the past week in connexion with the famine in the presidencies of Madras and Bombay, is the insufficiency of the means at present available for transporting grain from Madras to the interior, and more especially to the north-western districts of Cuddapah, Bellary, and Kurnool. The stock of grain at Madras awaiting removal by rail, including, we understand, some 26,000 tons of Government grain, is very large. Much of it is lying on the beach in bags exposed to the weather, and will be seriously damaged if rain should fall before it is removed. At present the Madras Railway is not able to carry more than 700 tons a day. It is of great importance that the carrying power of the railway should be increased with as little delay as possible, and with this view Sir Richard Temple has suggested, in a minute which we enclose, that the working of the Raichore section of the Madras Railway should, for a time, be made over to the Great Indian Peninsula Railway Company. On the 3rd instant we communicated to the Madras Government our concurrence in this proposal; but it now appears that there are difficulties in the way of its being carried out, owing, it is stated, to the rolling stock of the Great Indian Peninsula Railway not being more than sufficient to furnish haulage to Raichore. We hope to be able in the course of a few days to make arrangements for the supply of additional rolling-stock from the East Indian and other railways to the Great Indian Peninsula and Madras Railways. The strain on the railways for some months past has been undoubtedly very great, and the exertions of the railway officials have been most commendable; but still greater efforts will have to be made to avert disaster, and we trust that they will not be unsuccessful.

Grain purchases by
the Madras
Government.

2. Another matter which has caused us considerable anxiety, is the distrust which appears to be felt by members of the mercantile community, both at Madras and at Calcutta, in connexion with the purchases of grain made by the Madras Government some time ago. From letters which have appeared in the newspapers, and from information which has reached us from other quarters, there is evidently still an impression that the relations between the Madras Government and the firm which was employed by it to make its purchases, have not entirely ceased, and that there is danger of further similar purchases being made, and disarranging the calculations of the trade. Some colour was unfortunately given to the impression in question by a transaction which occurred at Bellary subsequent to the date on which the Madras Government brought to a close the arrangement with the firm alluded to for the purchase of grain. It appears that on the 12th of January, the arrangement with Messrs. Arbuthnot and Company having been terminated on the 5th, the Collector of Bellary purchased some grain for the relief works from a local firm without reference to the local agent of Messrs. Arbuthnot and Company, and was called upon by the Madras Government to explain why this particular transaction had been concluded without reference to the Government brokers, and it was not until the 29th January that the Government officers at Bellary became aware that Messrs. Arbuthnot and Company were no longer Government brokers. The fact that the firm in question had ceased to act for the Government in that capacity was not publicly notified by the Madras Government until the 8th February, a delay which was unfortunate, and which not improbably caused misapprehension in the minds of the mercantile community. From orders of the Madras Government which have recently been received, we learn that Messrs. Arbuthnot and Company were employed in issuing supplies of rice from the Government reserve, and in replacing in the reserve an equal quantity which apparently was supplied by them to the Government. In one of Sir Richard Temple's recent minutes, the same firm are alluded to under the designation of the Government grain agents. We are aware that the Madras Government have no intention of entering into further purchases of grain, similar to those made by them in November last; but it is so important that there should be no grounds whatever for misapprehension, either as to the action or intentions of the Government in this matter, that we have deemed it necessary to request that the Madras Government will lose no time in publicly notifying the quantity of grain now in its hands, both at Madras itself, and in the distressed districts, and its resolution to make no further purchases of grain outside of the distressed districts, unless it is satisfied that the trade is unable

To allay apprehensions
of mercantile
community,
Madras Government
will publicly

to supply the wants of those districts, in which case the grounds of that conclusion, and the exact intentions of the Government should be publicly made known. We have also instructed the Madras Government to notify that even in the distressed districts, the Government will abstain from making purchases except for the relief of localities which the trade is unable to reach; that all Government grain now in those districts will be removed to places at least 60 miles from the railway, and that no more Government grain will be sent to those districts from Madras so long as private trade is able to supply them.

notify intentions to make no further purchases.

3. In regard to the reserve of Government grain now at Madras, amounting, as we have said, to 26,000 tons, we have suggested, for the consideration of his Grace the Governor of Madras in Council, the expediency of disposing of this reserve by public sale to the trade. With reference to the large quantity of grain which appears to have accumulated at Madras, belonging to private traders, the retention of a Government reserve would seem to be unnecessary; and its existence is certainly calculated to keep alive the erroneous impressions which have taken possession of the public mind in regard to the probability of the Government again interfering with the grain market. We think that the reserve should be sold to the highest bidders in specified lots at intervals of, say, a fortnight, previous notification being given of the quantities to be sold, and of the dates on which the sales will take place. We feel sure that the adoption of these precautions will effectually dispel any apprehensions of interference on the part of the Government with private trade.

Government reserve at Madras should be sold to trade.

4. Among the enclosures of this Despatch will be found a minute by Sir Richard Temple on the expediency of drafting labourers from the relief works in the Nellore district, and also from the ceded districts and Kurnool, to the East Coast Navigation Canal, on which some 30,000 persons are now employed, but which will afford useful occupation to 60,000 more. This is one of the few relief works of magnitude at present in progress in the Madras Presidency. It is likely to prove a most useful work, passing, as it does, through the whole length of the Nellore district, connecting the delta of the Kistna River with Madras, and, as Sir Richard Temple observes, opening out "a large field for inland trade between the presidency town and some of the richest agricultural districts." It is a work which the Madras Government have long desired to carry out to completion, and it would have been completed under the Government of Lord Napier and Ettrick, who gave much attention to the project, had funds been available. It is very desirable that the present opportunity should not be lost. We have no doubt that in this, and in other cases, the difficulty of inducing people to leave their villages for a distant work on which a full day's work will be exacted can be overcome by patience and firmness on the part of the district officers and their subordinates.

East Coast Navigation Canal capable of employing 90,000 persons.

5. The following is Sir Richard Temple's telegraphic summary, received yesterday, of the present aspect of affairs in the Madras Presidency:—

Condition of Madras Presidency.

"Spring crop coming on in most of the distressed districts, tendency of prices slightly favourable, markets well supplied, but much anxiety about accumulation of grain at Madras. Great delay in doubling line to Arconum. Number on relief works further decreased by improved carefulness of local officers; task-work more strict from improved supervision. The reduction of wages is being introduced with much hesitation. Since letter reporting my inspection at various times of 97,000 relief labourers, I have inspected 30,000 more in districts of Cuddapah, Nellore, North Arcot, Coimbatore, and Salem. With some exceptions, physical condition of gangs inspected fairly good. In Nellore, relief labourers very reluctant to be transferred from petty village works under lax supervision to Coast Canal under professional control. Local rumours of mortality going on in Nellore district are without foundation. Applicants for charitable relief decreasing, because unwilling to submit to system of relief camps. General prospect tolerably favourable, with certain drawbacks only."

6. The number of persons employed in the relief works in the Madras Presidency, according to the latest returns, was 667,443, showing a decrease of 36,241 below the number of the previous week; 48,091 persons were gratuitously fed against 46,588, the corresponding number for the previous week.

Number in receipt of relief in Madras and Bombay.

7. In Bombay the number on the relief works during the week ending the 2nd instant was 263,053. As compared with the previous week, there was an increase of 11,630 persons; but the number on the works is enormously below the estimates referred to in the 10th paragraph of our Despatch of the 23rd ultimo, which gave the probable number for the 1st March at the respective figures of 750,000, 540,000, and 677,500. In Mysore the number on the works was 94,596.

The reduced
rate of
wages.

8. We have been furnished by the Madras Government with a copy of the letter addressed to them by their Sanitary Commissioner, which has been sent by them to your Lordship, regarding the alleged insufficiency of the reduced rate of wages lately prescribed for the relief works in the Madras Presidency. Sir Richard Temple has proceeded to Madras for the purpose of conferring with the Local Government on this subject. We shall probably be in a position to express our views upon it in our next Despatch.

No. 146.

9. We enclose a summary of the returns received from Mysore in reply to our call of the 30th October last, regarding the condition and prospects of the several talukas or subdivisions of districts in that province, together with our resolution reviewing them. As we have already noticed most of the salient facts connected with the famine in Mysore in our Despatch of the 23rd ultimo, we need not do more on the present occasion than draw your Lordship's attention to the papers now sent, which confirm the opinions we had previously formed from Sir Richard Temple's reports that the arrangements for dealing with the famine in that province have been characterised by zeal, judgment, and humanity.

10. When we deputed Sir Richard Temple in January last to visit the famine-stricken tracts and to confer with the Local Governments regarding the measures which were being carried out for the relief of distress, we had hoped that his mission would not occupy more than a few weeks; but it now seems probable that the arduous duty on which he is engaged will still occupy him for some time longer. It is impossible to over-estimate the value of the service which Sir Richard Temple is rendering to the State at the present juncture.

We have the honour to be, &c.

181.

No. 148.

No. 276, dated 9th March 1877.

From the ADDITIONAL SECRETARY TO THE GOVERNMENT OF INDIA to the ADDITIONAL SECRETARY TO THE GOVERNMENT OF MADRAS.

I am directed by the Governor-General in Council to communicate the following remarks with reference to the stock of grain purchased by the Government of Madras, a considerable portion of which is retained as a reserve.

2. The Madras Government are doubtless aware of the distrust which is felt by members of the mercantile community both at Madras and at Calcutta, and it is believed also at Rangoon, in connexion with the purchases of grain made by the Madras Government some time ago. This feeling has found expression from time to time in letters in the newspapers, and it is evident, from information which has reached the Government of India from other quarters, that there still exists an impression among persons interested in the grain trade that the relations between the Madras Government and the firm which it employed to make its purchases have not entirely ceased, and that there is a danger of other similar purchases being made, and disarranging the calculations of the trade. Some colour has unfortunately been given to the impression in question by the delay which occurred in notifying to the district officials at Bellary, and to the public generally, the termination of the appointment of Messrs. Arbuthnot & Co., as Government brokers for the purchase of grain; and from proceedings of the Madras Government which have recently been received, it would appear that Messrs. Arbuthnot & Co. were employed a few weeks ago in issuing supplies of rice from the Government reserve and in replacing in the reserve an equal quantity, which, apparently, was supplied by them to the Government. In one of Sir Richard Temple's recent minutes the same firm are alluded to under the designation of the Government grain agents.

3. The Governor-General in Council is aware that the Madras Government have no intention of entering into further purchases of grain similar to those made by them in November last, but it is so important that there should be no grounds whatever for misapprehension, either as to the action or intentions of the Government, that his Excellency

Grain pur-
chases by
Madras
Government.
Instructions
of Govern-
ment of India
in regard to.

in Council deems it necessary to request that the Madras Government will lose no time in publicly notifying the quantity of grain now in its hands, both at Madras itself and in the distressed districts, and its resolution to make no further purchases of grain outside of the distressed districts, unless it is satisfied that the trade is unable to supply the wants of those districts, in which case the grounds of that conclusion, and the exact intentions of the Government, will be publicly made known before action is taken.

Grain purchases by Madras Government.

4. This resolution should apply not only to additions to the reserve of grain now stored at Madras, but also to purchases made with the view of supplying the place of issues made from the reserve. It should also be notified that even in the distressed districts the Government will abstain from making purchases except for the relief of localities which the trade is unable to reach, that all Government grain now in those districts will be removed to places at least 60 miles from the railway, and that no more Government grain will be sent to them from Madras so long as private trade is able to supply them. I am to request that these instructions may be carried out with as little delay as possible.

5. In regard to the reserve of Government grain now at Madras, which, according to the latest information furnished to the Government of India, amounted to 26,000 tons, I am to suggest, for the consideration of his Grace in Council, the expediency of disposing of this reserve by public sale to the trade. With reference to the large quantity of grain which appears to have accumulated at Madras, belonging to private traders, the retention of a Government reserve would seem to be unnecessary, and its existence is certainly calculated to keep alive the erroneous impressions which have taken possession of the public mind in regard to the probability of the Government again interfering with the grain market. What the Government of India would suggest is that the reserve should be sold to the highest bidders in specified lots of, say, 5,000 tons each, at intervals of a fortnight, previous notification being given of the quantities to be sold, and of the dates on which the sales will take place.

No. 149.

No. 181.

LIX.—MINUTE by SIR RICHARD TEMPLE, dated Madras, 12th March 1877.

When recording my minute of the 19th February, upon the adoption of the Negapatam route for the supply of grain to Bangalore, I was under the impression that the rates for the carriage of grain from Negapatam to Bangalore had already been lowered, and that the effect would by this time have been apparent in considerable despatches of grain to Bangalore by this route.

Negapatam route, supply of grain to Mysore by.

2. It was hoped that the augmented stock of engines would, by the 1st of March, have put the Madras Railway in a position to despatch grain from Madras up to the full extent of the carrying power of the single line between Madras and Arconum, and in addition to this to carry to Bangalore all the grain despatched from Beypore or Negapatam. And I look forward with much anxiety to the early attainment of this object.

3. With the large amount of grain now on the Madras beach, the immediate importance of the fullest possible despatches of grain from Madras is manifest. But I am advised that with the best arrangements the despatches of grain by the single line of rail from Madras to Arconum are not likely to exceed 45,000 tons a month; while the requirements in all the distressed districts from Madras and other sources of supply may rise even to 90,000 tons a month; and I have therefore invited attention to the great importance of the subsidiary sources of supply, namely, Raichore, Beypore, and Negapatam.

Grain supply to Mysore.

4. Captain Bisset has now visited Negapatam and Bangalore, and in the record of his observations he shows that, even at present, 200 tons a day can be landed at Negapatam and forwarded to Bangalore; and that, with improved landing facilities at Negapatam and increased transshipping accommodation at Trichinopoly, a daily supply of 300 tons may be obtained at Bangalore by this route. He has noted, also, that the demand for grain in Bangalore is now put at over 500 tons a day, or nearly 100 tons a day above previous estimates.

5. On account of this growing demand, and because the progress of the doubling of the line of railway from Madras to Arconum is so much slower than I was led to expect when recommending this measure, the arrangements for developing traffic *via* Negapatam become even more important than before; and I would invite attention to

rain sup-
ply to My-
sore.

the several suggestions offered in Captain Bisset's narrative, and would make the following recommendations:—

- I. That increased landing facilities be provided at Negapatam to meet a traffic, which, on the closing of the western ports by the monsoon, will become of vital importance to the country.
- II. That the necessary measures be taken to avoid delays in the supply of waggons at Negapatam, and in the transshipment of grain at Trichinopoly.
- III. That the system of waggon-interchange at Erode be adopted as suggested by Captain Bisset.
- IV. That every publicity be given to the orders for the reduction of grain rates from Negapatam to Bangalore, and that a similar reduction be made in the rates from Negapatam to Kolar road, a station from which large supplies are sent to the northern parts of Mysore and the southern taluks of Bellary.

No. 150.

No. 115, dated Madras, 12th March 1877.

From the SECRETARY TO SIR RICHARD TEMPLE to the SECRETARY TO THE GOVERNMENT OF INDIA.

Forwarding
No. 149.

By direction of Sir Richard Temple I have the honour to submit copy of a minute recorded by him in regard to the utilisation of the Negapatam port and route for the supply of grain to Bangalore and the Mysore country. The desirability of working this route first attracted the notice of his Grace the Governor, and it was in accordance with his Grace's suggestion that Captain Bisset was deputed to look into the facts on the spot. It is believed that steps have already been or are now being taken, under the orders of his Grace the Governor in Council, to meet some of the requirements noticed in the appended minute.

No. 181.

No. 151.

LXII.—MINUTE by SIR RICHARD TEMPLE, dated Madras, 12th March 1877, on the employment of weavers in the Madras Presidency.

Light labour
required for
weavers and
spinners.

I desire to invite attention to the advisability of establishing some light labour test for the many thousands of weavers and spinners who are now coming upon the hands of Government in several of the famine-stricken districts of the Madras Presidency. It was proposed, as I understand some months ago by some of the Madras authorities, that Government should advance money to enable destitute weavers to buy material and carry on their trade. For several reasons it was then thought the plan might be deferred. But I submit that the time has come when this proposal might, with such modification as may be required by local circumstances, be resuscitated and carried into effect.

2. Near Bangalore, on a tank, I saw a special gang of poor weavers, who were allowed a higher rate for their piece-work than ordinary relief labourers, because their habits and the condition of their hands and fingers prevented their doing a full day's work. Some similar arrangements are, I believe, carried out in several places in the Madras Presidency also. And such arrangements may suffice for those weavers who make the coarser fabrics at Adoni, at Bellary, and other places.

3. But there are many weavers who work in silk or who do the finer kinds of cotton weaving; and such people might, if put upon tank or road work, become physically unfitted, for a time at any rate, to return to their usual employment after the end of the famine. Yet many of these poor people are undoubtedly in great straits; they can get no market for their products, and they can get no credit wherewith to buy materials. Yet they are many of them quite ready to work to the best of their power, in return for such relief as the State may give them. At Salem, for instance, I learnt that the silk weavers had reduced themselves to some extremity sooner than go on relief works, and at present they are subsisting on an organised private charity. Similar instances will ere long occur in Vellore, even if they are not already occurring.

4. In parts of Bengal (Burdwan and other places), during the famine of 1874, advances were made to weavers, and their manufactures were taken over by Government officers in return for the advances and for their support. At some of the relief houses also weavers were employed in making cotton and silk fabrics. The stores of such manu-

factures were kept till after the famine, and these were sold to the best advantage; and in the end the loss was not very large. I suggest that the Madras Government might see fit to authorise its officers to make similar arrangements at towns or in tracts where there is a large population of weavers who make the finer kinds of cotton or silk cloth. The Collectors, with the assistance and advice of Native officers and non-official Native gentlemen, would be able to carry out arrangements such as are now suggested with the least possible loss to the State, and with much advantage to a deserving and industrious class of the people.

Light labour
required for
weavers and
spinners.

No. 181.

LXIII.—MINUTE by SIR RICHARD TEMPLE, regarding relief camps and gratuitous relief in the Ceded Districts.

Madras, 12th March 1877.

In the distressed districts of the Madras Presidency below the ghâts there have been established relief camps for the reception and treatment of destitute persons who are unfit for labour on relief works. These camps consist of sheds erected in rows within large enclosures. They afford accommodation which is really good; indeed their accommodation ought not to be better than it is, otherwise a standard of comfort would be set up far superior to anything that could be obtained in the villages. They are organised and managed in a way that is most creditable to the officers concerned. Provided that the people were taken care of, their diseases treated and their necessities relieved, it was undoubtedly desirable at the outset that sojourn in these relief camps should not be made so agreeable and attractive as to lead to the pauperisation of the people. And so far the object has been attained.

Relief camps
well orga-
nised,

2. But as the season advances, it is evident that these camps are not so largely resorted to as might be expected under the circumstances of the people. There seems to be some prejudice against them among the poorest classes. And there is actually reason to fear that destitute persons may shrink from going to relief camps so long that meanwhile they may drift into dangerous distress. It is noticed that in some cases people will not resort to the camps; and paupers who are taken there run away for a few days only to return in a worse condition than ever. It may therefore become necessary for officers in charge of relief camps to make their camps somewhat more popular than they are now.

but not
popular.

3. After consulting various Native gentlemen of experience, I think that some concession might be made in relief camps to the caste feelings of the people. For the very poor classes, who in this presidency are often said to belong to no caste, the present system of public cooks in the camps might suffice. But for those who have grown up with caste feeling, some relaxation of the present arrangements might be permitted. Inmates might be allowed to cook their own food either for themselves or for self-arranged gangs, and they might be allowed to eat their meals apart and free from observation. In most of the camps there would be ample space for the enjoyment of such concessions. Then again, the sheds might be set apart for the principal castes; the casteless or very low caste people would in such case have sufficient shed accommodation for themselves. In most cases it would be possible to make these not very great (but still to Natives acceptable) concessions without any considerable increase of expenditure. If such concessions could be given, the relief camps would certainly become more efficient as safeguards against dangerous distress.

4. While the relief camp system has generally been adopted below the ghâts, different arrangements have been made for giving gratuitous relief in the ceded districts. In those districts outdoor relief, in the shape of cooked food, is distributed to ticket holders and to orphan children at relief houses. Ordinarily there is one such relief house at the head-quarters of each taluk, and five or six other subordinate relief houses in the interior of the taluk. Each such relief house is under the superintendence of a selected village official, or of a Revenue Inspector. At the outset there may have been, indeed in some cases there certainly were, abuses at relief houses of this kind; and gratuitous relief was occasionally given with undue liberality at towns where arrangements, begun from private charity, were afterwards taken over by Government officers. But now that adequate supervision has been or is being provided for every distressed taluk, these relief houses are inspected once or oftener in each week; abuses will be prevented, and the numbers on charitable relief are by no means excessive.

Gratuitous
reliefs.

Relief camps
and gratuitous relief.

5. The sad prevalence of cholera, and the practical* difficulties in the way of effective sanitation may prove obstacles to the extension of the relief camp system to the ceded districts. And under all the circumstances of the case, I would therefore now recommend that in those districts the present system of giving gratuitous relief be allowed to remain; and that the regular systematic inspection of all relief houses be enforced. One or two relief camps only in central places in the ceded districts might suffice.

* NOTE.—Persons of the sweeper caste are not readily procurable in the ceded districts.

No. 181.

No. 153.

LXIV.—MINUTE by SIR RICHARD TEMPLE, dated Madras, 12th March 1877, on his visit to the Coimbatore and Salem Districts.

Salem and
Coimbatore.

In forwarding the accompanying memorandum of my visit to the districts of Salem and Coimbatore, a few brief remarks from me will suffice.

2. There can be no doubt of the heavy losses suffered in the eastern and north-eastern part of the Coimbatore district, and of the serious distress among the labouring classes.

3. The relief has been confined as yet to those classes, and has not yet been extended to the purely cultivating classes. Some portions of these classes are no doubt straitened, and had the relief system been at all lax, many of these would by this time have been in receipt of State charity. But the district authorities are very justly alive to the importance of keeping the peasant proprietary off State charity as long as possible.

4. My inspection of the various gangs of relief labourers, about 7,500 persons in all, was highly satisfactory, that is to say, the men and women were almost all of the sort which one would expect to find properly on relief; very few were persons who seemed able to sustain themselves, very few were in a physically reduced condition; task-work was rigorously exacted; there were many signs of system and organisation. About each person, singly, whose appearance seemed at all reduced, special inquiries were made. The local authorities were confident that the village headmen do understand and act upon the Government orders about searching for every individual case of distress throughout the district.

5. It is very satisfactory to find that the Collector does not anticipate any large increase of numbers on relief. This must, however, greatly depend on the weather.

6. On the whole, I consider the Coimbatore gangs to be the most satisfactory gangs which I have yet inspected anywhere. My impression regarding the carefulness, vigilance, and economy exercised by the Collector, Mr. Wedderburn, is very favourable. He is manifestly a thoughtful and experienced officer. The same watchfulness on his part which guards against waste or demoralisation will also ensure that no case of real distress will escape unrelieved. His Assistant and Sub-Collector, Mr. MacWalters, is an excellent manager, indeed, he is one of the very best relief officers whom I have met in this presidency.

7. My visit in the Salem district was cut short by the necessity of proceeding to Madras to confer with the Government on certain points. But I had the advantage of carefully examining the Collector, Mr. Longley, regarding the relief operations of the district in the presence of Mr. Puckle of the Board of Revenue. Here also I have formed a very favourable impression of the care and management of the Collector. He seems to me to be exacting task-work more strictly and completely than in any other district in this presidency. Considering the undoubted distress in the northern portion of his district, I think that his numbers on relief are moderate, though I fear they must increase. He is most thoughtful too, about searching for individual misery in every village. I have not met any officer yet in this presidency with sounder ideas on this important matter than Mr. Longley.

8. I have the pleasure to express my unqualified satisfaction with the result of the proceedings of the Collectors of Salem and Coimbatore, and my belief that in both these districts the Madras Government is thoroughly well served.

LXV.—MEMORANDUM ON SIR RICHARD TEMPLE'S visit to COIMBATORE and SALEM on 6th, 7th, and 8th March, by MR. C. E. BUCKLAND, Private Secretary.

Salem and
Coimbatore.

Madras, 12th March 1877.

In the district of Coimbatore, on the 6th and 7th March, Sir Richard Temple met Mr. MacWalters, the Sub-Collector, the officer in charge of the relief works in the interior, the tahsildars of Bhowany, Parundoray, Pelladum, and Coimbatore. He observed on both days the aspects of the country between Erode and Coimbatore, which comprises the tracts that have most suffered from drought. At Coimbatore itself he stayed with Mr. Wedderburn, the Collector, from whom he learnt that on the 6th March there were on relief works 22,351 labourers, the number the week previous having been 22,900. The number of persons fed gratuitously was stated to be 1,312, of whom 600 were at Oodamalapetta, some at Suttymangulum, and some at Bhowany. He thought now that the numbers would not rise above 30,000 at the worst time. The labourers are only paid for six days in the week, and task-work is enforced at the rate of 10 cubic yards for the rupee.

2. All the markets in the district are well supplied, as trade is extraordinarily active; Coimbatore itself is full of grain. The imports by sea all come from the west coast (Beypore). Cholum and ragi are imported largely from Bombay, and even Bengal rice comes round to Beypore. Last week 322 tons of rice were brought in, and 299 tons of dry grains. The price of grain has not varied greatly since last December. About the end of October and beginning of November prices ran up suddenly, in consequence of the demand for Mysore. The ordinary and present prices of food may be thus compared, in Madras measures for a rupee—

	Ordinary.	Present.
Rice -	12·50	7·80
Cholum	20·50	9·33
Ragi -	23·50	10·20
Cumboo	24·	10·60

The Collector regards the stationary prices of food grain since November as evidence of the existence of old stocks in the district. In his opinion, generally, one or one-and-a-half year's supply is kept in hand, though he has no means of gauging the amount accurately. And the fact of any quantity of rice being available at the rate of 7·80 seers the rupee, he thinks, keeps down the prices of the other grains; rice is only consumed by the upper classes as a rule.

3. The harvest just reaped has averaged about three or four annas throughout the district. The rice crop from the wet lands is nearly all cut, and the out-turn will be a half crop. For two or three months no field-work or agriculture is expected.

The Collector anticipates no necessity to make any remissions of land revenue in the Coimbatore taluk. Of the five lakhs assessment on "wet" land, where there has been a half crop, he expects to have to remit one lakh, and four lakhs out of the 19 lakhs assessment on the "dry" land.

5. The estimated expenditure sanctioned for the district is Rs. 4,68,346, of which, up to date, Rs. 1,40,860 have been spent.

6. During the week there were 1,158 attacks of cholera and 748 deaths.

7. On his way to Coimbatore, Sir Richard inspected collections of relief labourers, amounting to more than 5,500, at the stations of Perandoorg, Ootakally, Loonanoor, and Coimbatore, and on the return journey about 2,800 more at Avenashy road and Erode. Their condition struck him as middling, though sufficiently good with some few exceptions. Very few seemed to be able to sustain themselves without relief. Most of them belonged to the poorest and lowest classes. The velalars or cultivating classes were but slightly represented in these gangs, and these were either field labourers or cultivators of the poorest class. On the whole, the gangs comprised persons who need relief and hardly any others. There were no signs of waste or abuses, and many signs of care, system, and organisation. As relief labourers, these people appeared to be in a satisfactory condition, just in the sort of condition we should reasonably expect to find. At Coimbatore itself a number of weavers presented themselves, and complained that they had to work at the rate of 10 cubic yards the rupee, which was beyond their power. They had struck work in consequence. The Collector had under consideration the lowering of the task for these people.

Salem and
Coimbatore. 8. At Salem, on the 8th, Sir Richard Temple met Mr. R. Puckle, member of the Board of Revenue, Mr. Longley, the Collector, and the Native Deputy Collector. He inspected the relief camp near the head-quarters of the district, and inspected one gang of relief labourers, who were in very fair condition. He examined some of the wells in the highly cultivated plain near Salem, and found most of them dry, although water might be reached by deepening them; these seemed cases for advances being made by Government. He again questioned Mr. Longley carefully on all the points comprised in the memorandum of the 25th January. Mr. Longley had just returned from a careful inspection of the most distressed taluk in the district, namely, Dhurumpuri. Its condition, by all accounts, is very bad, as bad as that of any taluk in the presidency; but the relief operations have been carefully inspected by the Collector, and he is confident of their success and sufficiency. Undoubtedly, those portions of the district which, geographically, form a part of the Mysore plateau must suffer severely. For the other part of the district there is not much anxiety. The Collector's answers to all questions in detail were highly satisfactory. Sir Richard Temple was himself about to visit the Dhurumpuri taluk when he was summoned to Madras on important financial business. He is bound to say that from no Collector in the presidency has he received more sound and explicit replies to all questions regarding relief than from Mr. Longley. The Collector is most strict and zealous in enforcing a full performance of work by the gangs, and most anxious that all cases of misery should be dealt with under the village relief system. He is in some difficulty in regard to finding suitable work for the silk-weavers, who are as a class much distressed. He also regrets that the excellent relief camp is not more largely attended. On the day of Sir Richard Temple's visit, the number of relief labourers was taken to be somewhat below 25,000; the question of this number remaining stationary or rising depended on the falling of the spring showers. In this district, as in Coimbatore, the relief comprises only the poorest and lowest castes, and the poorest stratum of the agriculturists. The numbers on charitable relief were now under 10,000, but these will probably increase. The Collector quite understands the importance of instructing the village headmen to seek out and care for all cases of distress.

9. Sir Richard Temple had the advantage of verifying all these matters with Mr. Puckle, who most forcibly drew attention to the drought and uncertainty of season caused by the rapid denudation of the hill sides once so richly clothed with forests.

No. 181.

No. 155.

Relief works
and gratui-
tous relief. LXVI.—MINUTE by SIR RICHARD TEMPLE, dated Madras, 12th March 1877, on relief works and gratuitous relief.

In continuation of my minute dated 24th February, and the statement thereto appended, I desire to submit a further statement of the numbers of relief labourers and recipients of gratuitous relief inspected by me between the 24th February and the 8th March, and some persons of the poorest classes, for the most part in the districts of North Arcot, Nellore, Cuddapah, and Coimbatore.

2. These inspections were conducted in the manner previously described. The analysis of the numbers shows that the physical condition of 14,330, 17,069, 2,428, and 1,300 may be considered as having been good, middling, indifferent, and bad respectively.

3. I wish to take this opportunity of correcting the description given of the physical condition of the gangs of 500 and 2,000 relief labourers and recipients of gratuitous relief inspected by me on the 26th and 27th of January at Madras and at Red Hills. Instead of the word "indifferent" I should have used the word "bad." It had been my wish to avoid minute distinctions and to group the gangs into broad classes, which would be readily numbered. But on reflection I think that the gangs mentioned were so inferior in physical condition to any other collection of such persons I have seen, that the word "bad" would have been more appropriately used to describe them.

STATEMENT showing the CLASSIFICATION of PERSONS on RELIEF WORK and RECIPIENTS of GRATUITOUS RELIEF inspected by SIR RICHARD TEMPLE between 24th February and 8th March 1877. Relief works and gratuitous relief.

No. 156.

No. 727R., dated 13th March 1877.

Nos. 157,
181.

From the SECRETARY TO THE GOVERNMENT OF INDIA, Public Works Department, to the SECRETARY TO THE GOVERNMENT OF BOMBAY, Public Works Department (Railway).

Referring to your No. 121 of 29th January and telegrams of 2nd and 3rd February 1877, I am directed to forward, for the information of the Government of Bombay, copy of a note,* dated 13th February 1877, on the accumulation of grain at stations on the East Indian Railway. Accumulation of grain on East Indian Railway.

2. It is evident that up to the date of this report the East Indian Railway was tendering to the Great Indian Peninsula Railway at Jubbulpore more waggons than the latter could take away. So long as this continues to be the case there can be no ground for intervention on behalf of the Great Indian Peninsula Company and its traffic in the manner desired by the traffic authorities of that line. The East Indian Railway meantime finds full use for its stock in transporting grain to the seaboard for export, and there is no apparent ground for the idea that this traffic has been favoured at the sacrifice of that to the Great Indian Peninsula Railway. To lock up an indefinite number of waggons at Jubbulpore waiting on the Great Indian Peninsula Railway would reduce, in this emergency, the useful effect of the East Indian Railway as a whole very materially.

3. The Great Indian Peninsula Railway Company returns the East Indian waggons within the limit provided in the working agreement.

* No. 83.

Grain accumulation on East Indian Railway.

4. For the accumulation at Jubbulpore and the long delay in clearing that station (paragraph 12) the Great Indian Peninsula is responsible.

5. The Government of Bombay will observe that it is reported that the strictest impartiality is being exercised in the despatch of consignments for the several stations of the East Indian Railway.

No. 181.

No. 157.

No. 728R., dated 13th March 1877.

From the GOVERNMENT OF INDIA, Public Works Department, to the CONSULTING ENGINEER TO THE GOVERNMENT OF INDIA for Guaranteed Railways.

I am directed to acknowledge receipt of your No. 440 of 23rd February 1877, submitting a note on the accumulation of grain at stations on the East Indian Railway.

2. It is evident that up to the date of this report the East Indian Railway was tendering to the Great Indian Peninsula Railway at Jubbulpore more waggons than the latter could take away. So long as this continues to be the case the Great Indian Peninsula Railway Company can have no just ground of complaint that its traffic is not fairly dealt with. The East Indian Railway, meantime, finds the fullest use for its stock in transporting grain to the seaboard for export, and there is no apparent ground for the idea that this traffic has been favoured at the sacrifice of that to the Great Indian Peninsula Railways. To lock up an indefinite number of waggons at Jubbulpore waiting on the Great Indian Peninsula Railway would reduce in this emergency the useful effect of the East Indian Railway, as a whole, very materially.

3. The Great Indian Peninsula Railway Company returns the East Indian waggons within the limit provided in the working agreements, and it has been confirmed from Madras that very few East Indian waggons have passed on to the Madras Railways. On the 21st January it had 21.

4. The accumulation of grain at Cawnpore, both for the Great Indian Peninsula Railway and for Howrah, was very large. At Atawa and Delhi also there were large accumulations. Goods registered at Jubbulpore so far back as the end of November were being sent off on February 4th; and at Jubbulpore, as also at the four adjacent stations of the Jubbulpore line of the East Indian Railway there were large accumulations. The Great Indian Peninsula Railway is apparently entirely responsible for the state of affairs at Jubbulpore.

5. It is reported that the heavy traffic on the East Indian Railway is being conducted with regularity, and that the strictest impartiality is being observed in the despatch of consignments from the several stations individually. This is satisfactory. It is presumed that the claims of all stations receive fair consideration in turn, even though in the case of some this may involve a very short lead.

6. The waggon mileage rate, (paragraph 15) on the East Indian and Great Indian Peninsula lines is irrespective of the capacity of the waggons. This point was reserved for consideration at the conference, but should probably receive earlier attention.

7. The accumulations on the loop line are considerable. The Nulhatti State Railway appears to have been subjected to summary, if not arbitrary, treatment in the matter of its through booked consignments.

No. 181.

No. 158.

LXVII.—MINUTE by SIR RICHARD TEMPLE, dated Madras, 13th March 1877.

Grain trade from Bombay to Madras.

I desire to invite the attention of the Government of Bombay to the following remarks regarding the grain trade from (and through) the Bombay Presidency into the distressed districts of the Madras Presidency.

2. In the districts of Bellary, Kurnool, and Cuddapah, where the recent failure of harvests has been extreme, cholum (or jowari) is the staple food of the people. During the month of December cholum was, in those districts, selling, at times, as dear as $7\frac{1}{2}$ seers (15 lbs.) per rupee, or even at still dearer rates. At that time the Madras Railway was not able to dispose promptly of all the grain which the Great Indian Peninsula Railway delivered at Raichore. During January much improvement was effected in this respect; and throughout the month of February an average of 105 waggons (about 683 tons) of cholum was daily carried from Raichore into the Madras Presidency. One result of this large and steady importation of food was that the price of white (*i.e.*, northern) cholum became much cheaper in the ceded districts, and was ruling at $10\frac{1}{2}$ to 12 seers (21 to 24 lbs.) in the markets close to the railway.

3. During the last ten days, however, the smaller despatches of grain through Raichore have attracted attention. And one consequence of this decrease in the importations is that the price of cholum is already beginning to grow dearer. The decrease in the importation is not due to any shortcomings on the part of the Madras Railway, for that company is now carrying away promptly all the grain waggons which it receives from the Great Indian Peninsular Railway. It was at first conjectured that the fall in prices at Bellary and Adoni might have left no margin of profit for importers. But on the other hand the excellent spring harvests, now coming under the sickle in Northern India, will throw an immense quantity of food into the market. And I am assured that there are still large stocks of jowari, rice, and wheat in the districts known as the Nagpore section of the Great Indian Peninsula Railway, and that the dealers there would send off much more jowari (as much as ever), if only they could get waggons to carry it.

Grain trade from Bombay to Madras.

4. The season of greatest pressure in the famine-stricken districts of Madras is now approaching. The best estimate I have been able to make shows that from 75,000 to 90,000 tons of imported grain per month may be wanted by those districts during the worst time. And it will be quite impossible to maintain that rate of supply if the grain traffic from the west should remain at an average of 85* waggons (550 tons) a day. I consider

* This is the average number of grain waggons taken out of Raichore during the first ten days of March. that for the due safety of the country the grain imports from the Great Indian Peninsula Railway should not permanently fall below 130 waggons a day, while they ought at the worst time to reach 150 waggons a day.

5. I am aware that there may at the present time be much pressure on the Great Indian Peninsula Railway to carry cotton, seeds, and other commodities down to Bombay for export by sea. But I am confident that the Governments of India and Bombay will be pleased to approve of the view that the safety of the lives of the people, and the food supply which secure that safety, is of paramount importance. And I would urge that such steps as the Government of Bombay may deem right be taken to secure that sufficient waggons be allotted to the grain traffic as will secure the delivery of at least 120 waggons of grain (on the average) daily at Raichore, so long as dealers may be ready to send food grains into the distressed districts of Madras. If it should hereafter appear that dealers do not come forward to fill with grain all the waggons allotted to the Madras grain traffic, then the position can be reconsidered. But so long as grain dealers are ready to send their grain, a sufficient number of waggons ought in my judgment to be allotted to the grain traffic for the Madras districts. The contingency must be kept in view, that hereafter the average requirement of 130 waggons may have to be raised to an average of 150 waggons per diem.

No. 159.

No. 181.

LXXIII.—MEMORANDUM by CAPTAIN BISSET on the present state of the engine stock of the Madras Railway, dated Madras, 13th March 1877.

I have to-day learnt from the Consulting Engineer for Railways the following about the engine-drivers and the engines of the Madras Railway.

Engine stock of Madras Railway.

2. Ten engine-drivers have been engaged in England and are expected to reach Madras by the 29th March. 34 engines now running are expected to require repairs during the year. Of these, 11 must be taken off work in the course of the month of March, and the others at intervals which cannot be specified.

3. Of the engines now undergoing repairs, seven will be sent out in March, one in April, and two or three in the following months. Of those to be sent out in March one is a shunting engine.

4. Twelve of the borrowed engines have arrived, and are probably now at work, but the six engines got from the East Indian Railway Company are old and are expected to need frequent repairs.

5. Colonel Shaw-Stewart believes that an application has been made on behalf of the Great Indian Peninsula Railway Company for the use of the six State Railway engines which have yet to be received from Bombay.

6. On these points I would submit the following observations :—

There is already a clear gain of about seven engines, and it may reasonably be expected that when the remaining six engines arrive the clear gain will remain at from 10 to 12 engines.

Engine stock
of Madras
Railway.

7. As far as engine power is concerned, the estimate submitted with my note of the

STATEMENT showing in parallel columns the present working (week ending 3rd March), and that which is possible with the additional engines:—

Despatched from	Present number of Waggon a Day.	Probable number of Waggon a Day.
Madras { to North-west line	73	90
to South-west line	68	90
Raichore - - -	104	140
Bey pore - - -	45	} 60
Erode - - -	—	
Total - - -	290	380
Or total tons a day -	2,030	2,660

7th March can be worked up to almost at once, and certainly after the arrival of the engine-drivers on the 29th March.

8. With reference to the supposed proposal to divert the six engines from Madras for the use of the Great Indian Peninsula Railway, I have already represented that, while the engines of the Great Indian Peninsula Railway Company are worked very hard, the work on that railway is not, as on the Madras Railway, almost entirely grain traffic for the prevention of famine, and that even with the six engines there will be no more than sufficient power to carry the requisite amount of grain, even if the daily supply from all sources

remains uniformly up to the full amount of the estimate.

9. It is true that 10 powerful engines have been ordered by the Madras Railway Company from England, but these cannot be expected to be at work here till the end of June at the earliest.

And up to that time, to be really secure against the fluctuations in traffic which leave trains empty one week and crowd them in the next, it is necessary in my opinion to have six powerful goods engines in addition to those already arrived and the six daily expected.

And the explanation of the need for these is as follows:—

The heavy goods engines now on the line are nearly all fully occupied on the numerous severe gradients on the north-west and the south-west lines, and on the Bangalore branch. And there are but a few of them left to work the trains on the Madras to Arconum section. It is only in Madras that stocks of grain exist large enough and near enough to the affected districts to meet a sudden demand, and until the line from Madras to Arconum is doubled (which I cannot consider possible before the 15th of June), it is only by running heavier trains on this section that supplies to the famine country can be largely increased. There is not the same immediate necessity for additional waggon stock, but if the supplies of grain in through waggons at Raichore are not more fully maintained, it will not improbably be necessary hereafter to borrow waggons also.

Dated Madras, the 13th March 1877.

DEMI-OFFICIAL from the SECRETARY TO SIR RICHARD TEMPLE to the COLLECTOR OF CHINGLEPUT DISTRICT.

Land reve-
nue remis-
sion.

I have received an official letter from you yesterday (it seems to have been waiting some time at the Madras Club), saying that your views as to the possibility of collecting in future years part of the uncollected land revenue of this year had been misapprehended.

I append extract copy of the memorandum on Chingleput affairs which was published in the "Gazette of India."

That extract represents correctly, so far as the memory of Sir Richard Temple, Bisset, and myself serve us, the answer you gave to the question whether, if succeeding seasons were good, it might not be possible to collect a part at any rate of this year's arrears. Of course Sir Richard knew (and the fact has frequently been noticed in his minutes and memoranda) that it would be contrary to the customs of the Madras revenue system so to collect arrears. But it was not necessary to repeat that general fact in each successive district memorandum.

If you are certain that you never gave any such answer as we understood, and if you feel satisfied that no collection of any part of this year's arrears would under any circumstances (even if the system were changed, which the Government of India have decided to be unadvisable), then it would seem that we may have been under a misapprehension. And I will take Sir Richard's orders as to the way in which he wishes the misapprehension to be corrected, as soon as I receive your reply to this.

No. 181.

No. 66, dated Hyderabad Residency, 13th March 1877.

From COLONEL SIR R. J. MEADE, K.C.S.I., the Resident at Hyderabad, to the ADDITIONAL
SECRETARY TO THE GOVERNMENT OF INDIA.

I have the honour to forward for submission to his Excellency the Viceroy and Governor-General in Council a summary of information furnished to me by the Nizam's Government on the state of affairs in those portions of the Hyderabad territory which are more or less affected by scarcity, together with a memorandum* embodying the same.

Hyderabad
State.

* No. 163.

2. It will be seen from these papers that the want in his Highness' dominions has never risen to a condition of actual famine, and that the area within which it prevails is much more circumscribed than was thought to be the case when the apprehensions of Government and the public were first excited on the subject.

3. So far as I can judge from the information now submitted, and from that I have from time to time verbally received from the Minister, there appears to be every reason to believe that the measures adopted by his Highness' Government for the relief of those needing assistance from the State are well adapted to the object in view, and will prove fairly efficacious.

4. His Excellency in Council will be gratified to learn from the enclosures that the conditions of the rabi harvest, now in course of being gathered, is generally fairly favourable, though there is more or less failure of the spring crops in all the affected taluks, and that no further extension of the area in which distress has hitherto prevailed is apprehended.

5. The maximum number of persons for whom it is estimated that relief will be required from the State during the remaining period of the scarcity is confidently limited to 43,000 per diem, and for that number the sanctioned relief works will probably provide ample employment.

6. The supplies of grain in the country are described as fully equal to all probable requirements for a lengthened period, and these will be largely supplemented by the out-turn of the present harvest.

7. The water supply is already very short in many parts of the country to which the scarcity of food-grains has not extended, or in which its effects are only felt from the great rise in prices of food that has taken place more or less throughout Hyderabad, and there is a good deal of anxiety as to how it may be further affected by the coming hot season.

8. Lastly, while there is, no doubt, a great want of fodder for the cattle in the taluks in which the monsoon failed, and it is deficient and high priced generally throughout the territory, the Government does not appear to entertain any serious apprehension as to the effect of this want or deficiency on the agricultural stock of the country.

9. It only remains for me to state for the information of his Excellency in Council, that the views and measures of his Highness' Government in connexion with the subject under report, so far as they have come to my knowledge, since the alarm of pending scarcity and famine was first raised, have been based on sound and liberal principles and have been directed with energy and judgment.

10. In all his proceedings on this occasion the able Minister, Sir Salar Jung, has acted in accordance with the principles enunciated by the British Government, as those by which its own officers should be guided in times of scarcity, and though, fortunately, the calamity has only extended to the districts under his administration in a comparatively

Hyderabad
State.

mild and mitigated form, his Excellency is, I venture to think, entitled to every credit for the measures that have been actually adopted, and for the manner in which his Highness' Government was prepared to grapple with the difficulties of the case if they had assumed the serious character that was at one time anticipated.

11. It is but right that I should add that the central committee and the State officials employed in the affected districts appear to have carried out the duties entrusted to them with much zeal and energy, and to have laboured earnestly to give full effect to the Minister's wishes and instructions. I have every reason to believe that Sir Salar Jung is well pleased with their conduct generally in this respect.

A.

STATEMENT showing EXTENT of FAMINE and NUMBER of FAMINE-STRICKEN PERSONS in the NIZAM'S TERRITORY.

Division.	District.	Area in square miles.	Population.	Estimate of famine-stricken persons requiring relief.	Remarks.
Southern division -	Gulburgah -	3,456	198,023	—	There is no famine in this district. State of crops generally fair.
Ditto -	Shorapur -	2,112	272,345	6,000	Distress in this district is confined to the western portion of it.
Ditto -	East Raichur -	2,752	295,848	10,000	Famine exists only in the Alpur taluk ; prices high in other taluks.
Ditto -	Western Lingsugur -	2,264	251,911	12,000	Crops scanty in taluks Sindnur and Kushtagi. Ryots and others suffering from famine.
Eastern division -	Khamam -	7,808	270,250	—	Neither famine nor distress at present exists.
Ditto -	Nulgunda -	7,424	226,619	5,000	Crops scanty in taluk Nalgunda, cultivators suffering. Grass, either green or dry, for cattle scarcely to be had.
Ditto -	Nagar Kurnool -	5,184	157,184	—	In none of the taluks in this district is there distress from famine, but high prices of grain prevail.
Western division -	Beder -	4,288	212,001	—	The rabi crops in good condition. The kharif crops above the average, and the cultivators considerably benefited.
Ditto -	Nuldroog -	3,420	267,180	10,000	In taluk Nelinga, the rabi season is good and the kharif also good, and according to expectations. In taluk Turjapur there is distress from scarcity of water, but no famine. In taluk Wasi, there is a scarcity of forage for cattle from want of rain. In taluk Nuldroog, season very favourable. In Dhara-seo, grain plentiful, but cattle suffering. In Parenda, owing to an almost total failure of rain, distress is felt from want of water, but there is sufficient supply of grain.
Northern division -	Nandair -	3,456	347,612	—	No famine. State of rabi and kharif crops fair.
Ditto -	Meduck -	4,032	156,080	—	No famine. Season good.
Ditto -	Indore -	3,328	243,298	—	State of agriculture very satisfactory, but apprehension entertained of high prices from exportations of grain and possible occurrence of famine. The state of this district, however, is better than all others.

STATEMENT showing the Extent of Famine and Number of Famine-stricken Persons in the Nizam's Territory—*cont.*Hyderabad
State.

Division.	District.	Area in square miles.	Population.	Estimate of famine stricken persons requiring relief.	Remarks.
Northern division -	Yelgundal -	6,400	460,610	—	No cause of complaint whatever. Grain plentiful. Crops flourishing.
Ditto -	Sirpur Tandore -	Not given.	147,973	—	
North-western division.	Aurangabad -	5,824	331,702	—	In some villages of taluks Baizapur and Kanhar crops failed from drought, but on the whole famine does not exist, though high prices of grain prevail.
Ditto -	Beer -	4,096	258,338	—	Famine does not exist in any of the taluks of this district; but in taluk Ashti distress is apprehended from failure of crops. There is, however, a sufficient quantity of grain in this taluk.
Ditto -	bb ani -	3,520	276,620	—	No cause of complaint whatever.
		69,364	4,373,594	43,000	

No. 163.

No. 181.

MEMORANDUM concerning the scarcity in his Highness the Nizam's Territory.

His Highness the Nizam's territory is divided into 17 districts, of which a list is given in the margin.* The pressure of want has been felt in seven taluks only of the districts, numbers 1 to 5. In four very severely, namely,—

- | | | |
|-------------------|-----------------------|--------------------|
| 1. Raichur. | } Affected districts. | 12. Meduck, |
| 2. Lingsugur. | | 13. Indore. |
| 3. Shorapur. | | 14. Elgundal. |
| 4. Nulgunda. | | 15. Sirpur Tandur. |
| 5. Bheer. | | 16. Aurungabad. |
| 6. Gulburgah. | | 17. Parbani. |
| 7. Khanram. | | |
| 8. Nagar Kurnool. | | |
| 9. Beder. | | |
| 10. Nuldrug. | | |
| 11. Nandair. | | |

NOTE.—The relief works in progress are shown on the map by red lines.

- (1.) Alumpur in Raichur, south.
 (2.) Sindnur in Lingsugur, south.
 (3.) Parainda in Nulgunda, east.
 (4.) Ashti in Bheer, north-west.
 And in three partially, namely,—
 (1.) Kustagi in Lingsugur, south.
 (2.) Indola, in Shorapur, south.
 (3.) Dewar Konda in Nulgunda, west.

In the first-named four taluks, the average crop was one of $4\frac{1}{2}$ annas, while in Alumpur it was of 2 annas only. In the last-named three taluks the average crop was as high at $10\frac{3}{4}$ annas. Over the rest of the country the harvests for the last year were fair, and though the partial failure of the monsoon may cause some distress during the ensuing hot season, there can be no doubt that, with the exception of the taluks above specified, no other part of his Highness' dominions has any cause to dread scarcity of a nature likely to cause serious distress.

The total area of the districts affected by the scarcity may be roughly calculated at 3,400 square miles, with a population of 360,000, or about 106 human beings to the square mile.

When the first reports of an approaching famine began to spread some six months ago, considerable alarm was manifested in the city and at the head-quarters of the Government, and relief measures were authorised, that have since, under the guidance of experience and a more intimate knowledge of the facts, been considerably modified. The whole of the relief proceedings are now entrusted to and directed by a central committee established at Hyderabad, under the presidency of the Revenue Minister, Nawab Mukarrum-ud-Dowlah, nephew to Sir Salar Jung. This committee is composed of men of all classes, creeds, and professions. It receives periodical reports of what is going on in the famine districts, and takes measures and issues orders accordingly. Its proceedings up to the present time appear to have been conducted with prudence and judgment, and to have inspired a general feeling of confidence.

Hyderabad
State.

The measures which the committee has principally addressed itself to have been the institution of relief works and the necessary arrangements for the supply in connexion therewith of a sufficient quantity of grain to feed the distressed and suffering poor seeking employment on these works.

Of actual starvation, no case has been reported to the capital, and it may be hoped that, however distressing the suffering inevitable from the high price of grain, death from sheer want of food will be warded off.

The relief works have been divided into two main heads, viz. :—

- (1.) The construction of roads and the repairing of tanks and canals; and
- (2.) The construction of new or the repair of old wells.

The total amount sanctioned for expenditure on relief works up to the 6th February 1877 was 4,22,021 H. S. rupees. The central relief committee is, however, authorised to recommend that an increase should be made to this grant if found necessary.

Of the above sum close on 1,20,000 H. S. rupees had been spent up to the 6th February, the total number of persons relieved being 941,377. The Minister's report only gives the daily average number relieved for the one week ending 6th February 1877, when it amounted to 26,558.

The wage allotted at the relief work is as follows per diem :—

	Rs.	A.	P.	Cts.	
A man 9 dubs=	-	0	1	8	Government coin.
A woman 6 dubs=	-	0	1	9	"
A child 4 dubs=	-	0	1	10	"

A male adult can purchase at the works about 1 seer of jawari with his day's wage as above.

The Government has not up to the present interfered in any way with the grain trade, and it is not probable that it will be called upon to do so. The trade in all species of grain is particularly lively. From the Southern Railway Station, between Gulburga and Raichur, in his Highness' dominion, no less than 40,000 tons of grain were exported within the five months up to February 1877, and those and the other stations along the line are still crammed with grain waiting to be removed. During the four months immediately preceding the commencement of the present year, the grain exports were 4,79,483 maunds against 1,57,676 maunds imports, while for the preceding year the figures show for the same period 2,13,601 maunds exports and 83,926 maunds imports, or less than half the quantities that have lately been transported under pressure of the existing partial scarcity. The grain, it may be mentioned, has up to the present time found its way into the affected districts by the ordinary modes of transit, carts, and brinjarah bullocks. The only complaints that have been made have had reference to the delays that have unavoidably taken place on the railway, and these complaints the railway authorities have ever done their best to rectify.

The system of transport by brinjarah bullocks works well, and will doubtless continue to do so should the very scanty fall of rain in many parts of the country not render the main lines of communication impracticable to beasts of burden from want of water.

The Government has not considered it necessary to issue any special instructions with the object of endeavouring to save the best of the stock of agricultural cattle in the affected localities. It is found that precautionary measures are generally taken by the owners themselves in behalf of the more valuable animals, and that Government interference is not needed. The value of the prickly-pear as an article of fodder has however been made known as widely as possible.

The state of the water supply in the various districts has not received the special attention of Government, beyond the issue of injunctions to the district officials to have wells dug and to improve the appliances at command for increasing the supply of water wherever feasible, and they have been authorised to spend money as required for this purpose at their discretion.

The measures taken for the preservation of health at the various relief works appear to be as satisfactory as circumstances will admit of; some few cases of cholera and small-pox have been reported, but there has been nothing like an epidemic, and the rules in force for the prevention of the spread of disease are satisfactory, and will doubtless prove effective if properly carried out.

Much care is now enjoined by the rules that have been laid down to obviate any individuals finding employment on the relief works who are not in actual want. The distribution of relief from private sources is as yet very limited, but may be expected to increase as the season advances.

His Highness' Government proposes, with the help of private aid, to establish generally throughout the affected districts poor-houses where relief may be distributed locally to such sufferers as are either unable to reach, or are not fit for employment on, the relief works, but from whom light labour will be taken, when found practicable. Hyderabad State.

On a rough estimate it is calculated that up to the 6th February 1877 the total number of the Nizam's subjects that had passed from Hyderabad territory into British limits aggregated about some 10,000 persons, and that this efflux was counterbalanced by an influx of no less than 29,000 emigrants from British territory, while it is also represented that over 11,000 of the latter were employed on the relief works in his Highness' territory during the week ending 6th ultimo. The extraordinary rise in the number of this class of persons from 1,663 in the week ending 29th January, to 11,149 during

*NOTE.—Inquiry has been made on this point.

that ending 6th February is worthy* of attention. It should, however, be added that it is acknowledged by his Highness' officials that these figures cannot be depended

on, and that nothing in the nature of a complaint regarding the advent of immigrants from the British districts in search of employment has been made by his Highness' Government.

In the parts of his Highness' territories most affected by the famine, the prospects of the crops now in the ground are generally good, and in some few places unusually so, and it may, indeed, be stated generally that the grave apprehensions of famine in his Highness' dominions which so generally existed some months ago have not been realised, either as to the intensity or extent of the threatened severity. It has been ascertained beyond a doubt that there is far more than sufficient grain in the country to meet any want that the Government is now likely to have to deal with. The scarcity is in fact well in hand, and the Government entertains, it is believed, a well-founded confidence that the measures that have been organised will suffice to stand the strain that may be put upon them, and that these measures are meeting the difficulty in as efficacious a manner as could have been looked for. The estimate of the maximum number that may have to be provided for on the relief works during the coming hot season does not exceed a daily average of 43,000 persons, and his Highness' Government appears to be satisfied that that estimate may be accepted as reliable.

The accompanying abstract statements of information supplied by his Highness' Government give full information on the several points briefly touched on above. They also include a list of the various prices of grain ruling in the capital and the districts.

LXVIII.—MINUTE by SIR RICHARD TEMPLE, reviewing DR. CORNISH'S objections to the REDUCED SCALE of WAGES.

Madras, 14th March 1877.

In my minute dated 6th March, I refrained from commenting on the scientific argument used by the Sanitary Commissioner of Madras, Dr. Cornish; but having since had the opportunity of making some inquiry on the subject, I have to make the following remarks. The reduced scale of wages.

The reduced
scale of
wages. Sir
Richard
Temple
in reply to
Dr. Cornish.

2. Dr. Cornish's scientific propositions are as follows :—

That (paragraph 4) the carboniferous and nitrogenous principles of food should be in the proportion of three of the former to one of the latter.

That (paragraph 6) according to all scientific investigators, 140 to 180 grains of nitrogen are required, in a state of rest, to oil the human machine, so to speak, while it is not working.

That in ordinary labour 300, and under great physical exertions 500 to 600 grains of nitrogen will be necessary.

That if such quantities are not provided under the corresponding circumstances, "the body must prey on its own tissues so long as any remain to be preyed upon."

That (paragraph 13) "in regard to this question of a pound of grain being "enough or not enough, we should never know the result until the mischiefs "resulting from a deficient supply of nitrogenous food have gone so far that a "retracing of our steps would be powerless to save life."

3. This last statement is made with much confidence. From its nature it can hardly be disproved, but it seems to me that it may be regarded as a mere expression of opinion, if we can show that Dr. Cornish's other propositions given with equal precision and arguable, perhaps, in theory, are not applicable, or but very partially applicable, to the circumstances of Native life and Native diets.

4. In the Madras Manual of Hygiene, compiled under the orders of Government, and published in 1875, the main parts of Dr. Cornish's theories are adopted. It is stated, page 96, "The unavoidable internal work of the body of an adult human being, that is, "the movements necessary for respiration, circulation, and digestion, require a minimum "of 138 grains of nitrogen in 24 hours for their maintenance. In a state of idleness of "mind and body, the least amount compatible with health may be stated as 200 grains "for a man and 180 for a woman. In the ordinary circumstances of the soldier, the "artizan, the field-labourer, and the prisoner in most of our jails, 300 grains will be a "fair minimum. Very great physical exertion will demand 500 grains or even more."

5. Sir Robert Christison's theory, founded, as I understand, on careful experiment on Scotch labourers, and possibly applicable to them, is therefore adopted in its entirety by the Sanitary Commissioner, and by the author of the Madras Manual of Hygiene, as applicable to the natives of Southern India. It is on this assumption that Dr. Cornish's whole argument is based, and in the Manual it is expressly applied to the "prisoners in "most of our jails." Its application, in fact and in practice, has now to be considered.

6. The opinion that 1 lb. a day of grain might suffice for a relief labourer, together with some allowance for condiments and the like, or some nutritious substance, was not, indeed, based on scientific theory. It was founded rather on probabilities practically deduced from the condition of the poorer classes in ordinary times, and on the results of general experience. It was not put forth with absolute confidence. It was to be subjected to trial, not by theoretical data, but by the observation of its actual results.

7. Dr. Cornish protests against this opinion as "in direct contradiction to the accumulated testimony of scientific observers in every country in which this question of the "quantity and variety of food essential to keep a labouring man in health and strength "has been the subject of investigation."

8. Certainly this opinion was not based on so called scientific evidence, apparently taken as proved on the strength of experiments made on men of different race and habits, living under different circumstances, in an altogether different climate, and probably exceeding by a third in average weight the people to whom the results of the experiments are with such confidence applied. For administrative and financial purposes I should not base my recommendations on such data, inasmuch as the question must be one extremely difficult of scientific ascertainment, and in respect to which even the best conducted experiments, if made in different parts of the world, might lead to varying results. And in order to show how little these data can be accepted for these purposes, it is sufficient for me to refer to the Madras Manual of Hygiene itself.

9. In an appendix from pages 361 to 380 are given the whole range of Madras dietaries for soldiers, sepoy, and prisoners, military and civil, under various circumstances, in sickness and in health. The quantity of each food is given, together with an elaborate analysis of its composition, and the proportion of each of the physiologically essential elements, one column showing the amount of nitrogen, another the quantity of carbon in each diet.

10. Had those quantities corresponded to, or even approximated to, the amounts so authoritatively declared to be necessary, it would still have been open to me to say that

the dietaries have been decided by European committees by the advice and with the assistance of Sanitary Commissioners; that they are intended for persons from whom full work is demanded, and who receive in return not a subsistence allowance, but a full ration; that rations are avowedly fixed on a liberal scale so as to suffice for persons who consume more than the average; that it is matter of common reproach, both in this country and in England, that prisoners are better fed than paupers, whose poverty is their only crime; and that it is absurd to suppose that the poorer classes in this or any country get as much to eat as prisoners or soldiers, or that they cannot live on much less.

The reduced
scale of
wages. Sir
Richard
Temple
in reply to
Dr. Cornish.

11. All these arguments might, however, be set aside, for an examination of the dietaries in the book itself prove conclusively not only that the theories advanced by the Sanitary Commissioner have very little application in practice, but that the reduced scale of wages suffices to supply the relief labourer with more than sufficient nitrogen and carbon to keep him in health. They prove, first, that, as regards Natives of this country, the carboniferous bear to the nitrogenous elements of food the ratio of about 7 to 1 instead of 3 to 1 as in the English dietaries [in the ration of the sepoy on foreign service the proportion is 10 to 1, 26·70 oz. to 2·68 (page 3,791)]; and as the absolute weight of food taken daily by Natives and Europeans is probably about the same, it follows that the amount of nitrogen required by Natives must be much less than that required by Europeans; and when the diets are examined, this is found to be the case. The Madras sepoy, when ordered on foreign service, during which he may be, and often is called upon to undergo severe physical exertion, receives a full ration from Government. According to the theory he requires a minimum of 300 grains of nitrogen when performing ordinary duties, but when marching or undergoing severe labour he needs 500 or 600 grains. As a matter of fact he gets (page 379) only 178 grains, little more than half the minimum required, and only about a third of what is declared necessary to support him when called upon to do strenuous work. According to this theory, then, the Madras sepoy would be undergoing starvation at the hands of the Government which employs him. But in fact, he is not so reduced physically, nor does he fail that Government when it calls on him for exertions compared to which the labour demanded from most of our relief labourers is as nothing. This case, I submit, makes very strongly against Dr. Cornish's theory, but a still stronger one yet remains behind.

12. The British soldier, to whom if to any one the theory should apply, requiring, like the sepoy, 300 to 600 grains under like circumstances, receives 242 grains of nitrogen in his full ration, that is, 25 per cent. less than the minimum required to keep him in health when in garrison, and less than half what he ought to have when marching or on service. But this is not all, for when his ordinary work is not demanded of him, as when he is in prison or at sea, he receives only a reduced ration, and singularly enough, though the details of the two rations are altogether different (Madras Manual, pages 364 and 369). The amount of nitrogen contained in each is identical, namely, 155 grains, about half of the amount declared to be the minimum necessary to maintain him in health, a quarter of what he should have when on service, and considerably less than the least amount compatible with health in a state of rest of mind and body, as laid down in the quotation from the Madras Manual already cited. According to this theory, we should have to imagine that the British soldier is half starved on boardship, or that he is landed in India in a reduced condition physically, or in a state of health which could hardly be restored by subsequent nutrition. The actual fact is, of course, the reverse.

13. This instance appears to be a crucial one. This British soldier is not reduced by a diet containing 155 grains of nitrogen. His average weight is probably a third greater than that of the average relief labourer, and it would seem to follow that the relief labourer could be maintained in health by the same proportion, *i.e.*, two-thirds of the absolute quantity of nitrogen required by the European soldier. But 1 lb. of the cholum contains, according to Dr. Cornish (paragraph 7), 100 grains of nitrogen, therefore, a pound of cholum should suffice to keep him in moderate condition when something in the way of condiments and nutritious substance is added.

14. I need not press the argument so far, however. The labourer's allowance is not a pound of cholum, but a pound of grain *plus* half an anna, or in practice $1\frac{1}{2}$ annas, in cash. Taking grain at an anna a pound (it is 25 per cent. cheaper in many places), he can buy with this amount as much nitrogenous food as is allowed to the British soldier on board ship. According to the facts furnished by the Madras Manual (but not its theories), the above allowance would appear sufficient to keep him from starvation.

15. With regard to the carbonaceous element of food, the result is the same. The Manual lays down (page 98) that 3,500 grains of carbon are required in a state of rest,

The reduced
scale of
wages. Sir
Richard
Temple
in reply to
Dr. Cornish.

and that 5,000 "may be safely taken as a maximum under any circumstances of exertion." The dietaries show that the European soldier gets 4,307 grains in his full ration, and 2,986 when on board ship, while sepoys get 6,659 when on foreign service, and Native prisoners 5,616, or rather less, according to the particular constituents of their diet. A pound of cholum contains 2,764 grains (page 376), so that on a pound a day the relief labourer gets much more in proportion to his weight than the soldier on board ship, and can purchase with the wages given him almost as much as the soldier gets in his full ration.

16. These statements and estimates of the chemical constituents of the military rations, both for European and Native troops, are not (be it remembered) made by me, but they have been furnished by the Madras Manual of Hygiene; they are put in the simplest possible form, and can be verified by any one though he may not be versed in the chemistry of food or the data on which the calculation are made. And I submit that they prove conclusively that the theories enunciated by English authorities, however eminent, and apparently adopted without additional experiments by the Manual, do not apply to Natives of this country; only, in fact, apply in the most general way to Englishmen themselves, and cannot be at all accepted as valid reasons why Government should desist from a trial suggested by experience, which, if successful, will conduce to saving the people on the one hand, and to preventing unnecessary expenditure on the other.

17. I should not have discussed this matter at all had not the scientific theory been propounded with so much precision, and with so strongly-worded remonstrance against the disregard of it. But we see that the theory is not applicable, and cannot be implicitly accepted. If, as stated in my minute of the 6th current, it is found on a deliberate and dispassionate trial that the new scale is insufficient, and that the labourers do not maintain their health, it can, of course, be revised. I have sufficiently shown that this is a matter which may be left to careful observation of the condition of the people, and not deduced, *à priori*, from theoretical considerations which break down when subjected to plain criticism, and are shown to be inapplicable to the case in hand.

18. Though constrained to demur to the manner in which the Sanitary Commissioner applies certain theories to the proposed practice in our relief operations, I am fully conscious of the benevolent and charitable motives by which Dr. Cornish is actuated, and of his meritorious labours for the welfare of the people in this presidency.

No. 166.

MEMORANDUM by MR. BERNARD and CAPTAIN BISSET on the points raised by HIS GRACE the GOVERNOR OF MADRAS respecting Mysore grain supply.

Madras, 14th March 1877.

Mysore
grain supply.

According to the best computation that we can make, the Mysore country ought to get and actually requires* 500 tons of grain a day at stations on the Bangalore branch. This quantity will suffice for the wants of the Mysore districts of Bangalore, Kolar, Tumkur, and part of Chitaldroog, containing about 2½ millions of people. Part of the Chitaldroog district with a population of perhaps 350,000 persons will and now does draw its supplies of foreign grain from Bellary. But then, as a compensation, the taluks of Pennekonda, Hindupore, and part of Madaksirra in the Bellary district now get and will continue to get their supplies from Bangalore. The population of these two taluks and part of the third may be about 200,000 persons. The districts of Shimoga, Hassan, and Kadur, with a population of 1½ millions, are said to be living on their own produce, eked out by food imported from the western coast. Shimoga and Hassan, with a population of 1,170,000 between them, had an 8-anna and 9-anna harvest. Kadur had only a 4-anna harvest. When the monsoon closes the ports on the western coast, then these three last districts cannot draw supplies from the seaboard, and we do not know how far the stocks of Canara and Malabar can afford to contribute to the support of Western Mysore. Looking to the Board's returns of grain imports into the western ports and to the large railway despatches from Beypore, we cannot think that any very large quantity of grain from beyond the sea has hitherto regularly found its way into Western Mysore. Much of the import shown in the margin goes to Coorg and the Mulnaad coffee districts. We should not put

Rice importations into West Coast ports other than Beypore and Calicut—	
September 1876	- 2,000 tons.
October "	- 3,800 "
November "	- 4,100 "
December "	- 2,800 "
January 1877	- 7,000 "

the demand of these districts for foreign grain at above 1,500 to 2,000 tons a month, or Mysore say about 50 tons a day. But of course this estimate is little else than a guess, and may grain supply. be beyond the truth.

2. According to the estimate in the foregoing paragraph, the demand of Mysore may be summarised thus :—

Bangalore branch demand -	-	-	500 tons of grain daily.
Western Mysore demand which, after the 15th May, may have to be drawn through Bangalore.	50	" "	
Chittaldroog demand on Bellary for 350,000 people, less the Bellary supply for 200,000 people now drawn from Bangalore.	20	" "	
Total	-	-	<u>570</u>

3. His Grace the Governor asks for an opinion whether there is in Mysore any accumulation of imported grain sufficient to enable the province to tide over a short interruption of imports such as any accident might cause. To this question we can give no precise reply. But we note the following points as bearing upon this subject: the Bangalore traders told Sir Richard Temple early in February that their demands would continue constant until next crop came in; they told Captain Bisset that they now had to refuse grain orders from the interior, because they could not get enough grain from Madras; and they said they could take 100 tons a day more than they now receive, if only it could be carried to them from Madras by railway. On the other hand there are certainly considerable stocks in the country, which will begin to come out into the market as soon as the tanks fill and next season's crop is tolerably secure. The net result is that there is not, so far as we believe, any considerable accumulation of imported grain in the Mysore markets. And a daily supply nearly equal to the total given at paragraph 2 ought to be regularly carried into Mysore.

4. The question then arises whether this full supply of * 570 tons can or cannot be maintained. And the answer to this question involves the general question of the demand of, and supply to, all the Madras famine districts. We think that for the purposes of the present question we may reckon that the districts of Nellore, Chingleput,† South Arcot, Trichinopoly, Madura, part of Kurnool, and Tinnevely, will get what foreign grain they may require without throwing any

* 500 tons from East coast.
50 " West "
20 " Bellary.

† NOTE.—Parts of Chingleput may perhaps draw their supplies from the railway. But then parts of North Arcot may be supplied from the sea.

work on the Madras Railway. There remain, then—

Class A.

	Population.
Bellary - - - - -	} 3,800,000
Cuddapah - - - - -	
Kurnool ($\frac{4}{5}$ th of) - - - - -	

Class B.

Coimbatore - - - - -	} 5,500,000
Salem - - - - -	
North Arcot - - - - -	

According to the estimate made in the memorandum of the 27th January, the districts in Class A. will require :—

	Tons.
Imported food for two-thirds of their population, or per diem	1,040
While the districts in Class B. will require imported food for one-half their population, or per diem.	1,100
Add the Mysore demand as previously worked out -	570
	<u>2,710</u>

5. This total quantity is, so far as we are able to judge, the largest quantity which will be required, and we believe that this quantity can and will (if the grain comes

Grain
supply.

forward) be carried by the railway. The subjoined table of Captain Bisset's explains this:—

	Number of Waggons despatched daily.	
	Present Working.	Probable or Promised Working.
From Madras to North-western line	- 73	90
„ „ to South-western line	- 68	90
„ Raichore, south-east ward -	- 104	140
„ Beypore -	- 45	—
„ Negapatam and Erode -	- —	60
Total	- 290 waggons.	380 waggons.
Or in tons a day	- 2,030 tons.	2,660 tons.

6. Thus the Madras Railway can, if it works well, send into the distressed districts daily the full amount of grain which they could according to our estimate require. But it is to be noted that the famine districts have as yet never received, and presumably have not absolutely required the full amount of grain shown in the estimate. The spring crops in irrigated lands of Kurnool, Cuddapah, and North Arcot do, no doubt, to some extent supply the wants of their immediate neighbourhoods. And perhaps the full demand shown in our estimate may be required only for a very short time, if at all.

7. The statement in paragraph 5 (above) provides for working to their full power all the 18 borrowed engines, but does not reckon on the 10 new engines ordered by the Madras Railway coming into work before the 15th June. Also, it does not reckon on the Madras to Arconum length being doubled before the 15th June. The doubling of the line to Avady, 13 miles from Madras, may however be done by the 1st April, and will considerably facilitate the grain traffic on the Arconum section. Still if our estimate of the possible demand be accepted, then it seems necessary to have some reserve of engine power available. For this purpose it will be necessary either to borrow, or to have power to borrow, six heavy engines able to draw trains of 30 waggons each on the Arconum section.

P.S.—We have not discussed in detail the way in which the Negapatam and Erode route ought to take the place of the Beypore route when the monsoon breaks, because Captain Bisset's Negapatam notes and Sir Richard Temple's minute thereon go fully into that question.

No. 181.

No. 167.

LXXII.—MINUTE by SIR RICHARD TEMPLE, dated Madras, 14th March 1877.

Necessity for
reserve of
carrying
power.
Madras Rail-
way engine
stock weak.

The amount of sea-borne grain remaining in Madras is so great, and the existence of large surplus stocks of food-grains in the Berars and in Hindustan is so well known, that no anxiety exists about the sufficiency of the distant markets to provide the necessary supplies.

2. But while well-founded hopes exist that with an absolutely regular traffic the necessary amount of food may be carried to the people, it cannot be forgotten that both from variations in prices and from irregularities or mishaps on the railways themselves, this perfect regularity cannot be attained.

3. To provide against these irregularities a reserve of power is absolutely necessary. And on the Madras Railway the condition of much of the engine stock is doubtful, and the number of engines, and particularly of goods engines is small, so that even after the receipt of the 18 borrowed engines there is no such reserve of power.

4. The accompanying memorandum * by Captain Bisset, which has been prepared under my instructions, embodies the result of his inquiries into the present state of the engine stock of the Madras Railway, and into the amount of grain which these engines, with the 18 already borrowed, can carry from all sources into the distressed districts.

5. A consideration of the facts and opinions recorded in this memorandum leads me to recommend earnestly that arrangements be made by the Government of India for borrowing and placing at the disposal of the Madras Railway Company six of the most powerful goods engines which can be found in India.

* No. 159.

6. Since recording the above remarks I have had the advantage of discussing the question of railway carriage with his Grace the Governor of Madras, and of ascertaining that the foregoing recommendation meets the views which his Grace had already taken of the further requirements of the Madras Railways.

No. 168.

No. 181.

LXXIV.—MINUTE by SIR RICHARD TEMPLE, on the Red Hills and Palaveram Relief Camps.

Madras, 14th March 1877.

Red Hills
and Palave-
ram Relief
Camps.

Having inspected the relief camps at the Red Hills at Yerroocancherry and at Palaveram, I desire to record the following observations :—

2. The improvement in the appearance and physical condition of the inmates of the Red Hills camp, since my first visit at the end of January, is very marked. On the day of my visit about 2,000 of these poor people were so far recovered as to be able to work, and were about to be drafted on the relief works in the neighbourhood.

3. Among the new arrivals I observed some from the north-east portions of the North Arcot district, especially the zemindaris of Kalustri and the eastern part of Karváttnagar, and from the Nellore district, especially the zemindari of Venkutgiri. This circumstance affords additional proof of the necessity of the increased precaution for ensuring house-to-house visitation, village to village, which necessity was mentioned in my minutes of the 5th March and the 6th March regarding those districts, and which is, I believe, now practically recognised and acted upon by the district authorities themselves.

4. Though the same facilities for such visitation exist in the zemindaris as in the regular ryotwari tracts, yet my visit to those zemindaris compels me to report to the Madras Government that the zemindars are either not able or not prepared to do all that is needful, unless further pressure be put upon them. I have suggested that in such zemindaris the Collector should depute some trustworthy and experienced official, European or Native, to see that this visitation is so conducted that all persons in distress are really brought forward for relief. If this were done, then these wandering poor would not be straying away from their homes, and finding their weary way to the relief camps near Madras itself. So long as new arrivals at the Red Hills camp are people of the Chingleput district in which the camp is situate, there is no occasion for remark; but when they hail from North Arcot or from Nellore, then occasion arises for inquiring as to how and why they left their homes, and why they were not picked up near their own villages, or cared for in their own districts. The occurrence of such cases is calculated to throw doubt on the arrangements for charitable relief in those districts. I trust, however, that it will be found that recently these arrangements have been so far perfected in both these districts that no more people will come from there, at least no appreciable numbers, to the relief camps near Madras.

5. At the Yerroocancherry camp I observed a system of housing and lodging different from that in the other relief camps. In those camps the people are accommodated in long barrack-like rows of huts. In this camp, however, there are separate huts for each group of two or three families. And there was an air of cheerfulness about the inmates, several hundreds of whom were paraded for my inspection, very different from the air which is generally to be perceived in those camps. Evidently this sort of camp is much more popular with the poorest classes than the other camps. And the cause appears to lie in the plan of having separate family huts. Inasmuch as the rendering the relief camps less distasteful than they now are to the poorest classes and to the destitute wanderers,—who still have some pride of caste remaining—is one of the problems in the organisation of charitable relief, I would commend the practice of the Yerroocancherry camp to the consideration of the Government of Madras.

6. The Palaveram camp appeared to me to be in very fair order, and the separation of those who have caste from those who are pariahs and below caste, was more complete than in some of the camps which have been visited, though even here the arrangements might in this respect be improved.

From C. E. BUCKLAND, Esq., Private Secretary to Sir Richard Temple, to the
ADDITIONAL SECRETARY TO THE GOVERNMENT OF INDIA.

Taluks and
zemindaris
visited by Sir
Richard
Temple.

I am directed to submit, for the information of the Government of India, a copy of the list of taluks and zemindaris visited by Sir Richard Temple in the districts of the Madras Presidency and in the Mysore State between the 14th January and the 14th March.

LIST of the Taluks and Zemindaris visited by SIR RICHARD TEMPLE in the districts of the Madras Presidency and of the Mysore State.

Month.	From 14th January to 14th March 1877.	Condition of affairs at time of visit, as observed by Sir Richard Temple.
<i>In the Karnool District</i> (8 taluks).		
January - -	Ramalkota taluk - -	Relief works excessive and beyond control, but being brought under. Tehsildar and Deputy Collector moderate in ability.
February - -	Pattikonda „ - -	Relief works in fair order; tehsildar of good ability.
<i>In the Bellary District</i> (15 taluks, 1 zemindari).		
January - -	Gooty taluk - -	Relief work not well in hand.
Ditto - -	Bellary „ - -	Relief work open to objection during my first visit; better during my second visit.
and		
February - -	Alur „ - -	Relief work not under control; great want of discrimination; tehsildar indifferent.
February - -	Adoni „ - -	Relief work excessive and uncontrolled; but reform being introduced by Mr. Glenny, C.S., and Captain Hamilton; tehsildar pretty good.
Ditto - -	Hospett „ - -	Relief operations in fair order; Native Deputy Collector and tehsildar good.
Ditto - -	Tadputri „ - -	Ditto ditto; tehsildar good.
Ditto - -	Anantapur „ - -	Ditto ditto; Native Deputy Collector and tehsildar good.
Ditto - -	Dharmaveram „ - -	No particular remarks.
Ditto - -	Pennekonda „ - -	Under Mr. Ross, C.S.; relief operations had been much out of control, but were improving.
Ditto - -	Hindupore „ - -	Relief operations not well in hand; tehsildar very indifferent.
Ditto - -	Sundoor zemindari - -	Under Mr. Macarthy; relief works fairly under control.
<i>In the Cuddapah District</i> (11 taluks).		
January - -	Cuddapah taluk - -	Relief operations had been somewhat out of hand, but were improving.
March - -	Sedhout „ - -	Relief works under control; tehsildar good.
Ditto - -	Budnail „ - -	Relief works appear to be in control.
February - -	Madnapalli „ - -	Under Mr. Gribble, C.S.; relief operations had been out of hand, but were fast improving.

Month.	From 14th January to 14th March 1877.		Condition of affairs at time of visit, as observed by Sir Richard Temple.	
<i>In the Nellore District</i> (9 taluks, 4 zemindaris).				
February	-	Nellore taluk	-	Relief operations chiefly confined to East Coast Canal.
March	-	Atmakur „	-	Relief works fairly under control; tehsildar good.
Ditto	-	Udayagiri „	-	Under Mr. Underwood, C.S.; signs of poverty; doubtful whether village relief sufficient.
February	-	Goodoor „	-	Tehsildar moderately good; doubt about sufficiency of village relief.
Ditto	-	Venkatagiri Zemindari	-	Relief apparently not sufficient; three zemindars not doing enough.
<i>In the North Arcot District</i> (9 taluks and 13 zemindaris).				
February	-	Chandragiri taluk	-	In good case, save one corner which was bad but under relief; tehsildar good.
January	-	Chittore „	-	No particular remark.
Ditto	-	Palmanair „	-	No particular remark; tehsildar good.
February	-	Gourittam „	-	Not in bad case.
January	-	Wallajah „	-	No particular remark.
Ditto	-	Arcot „	-	Tehsildar good.
Ditto	-	Vellore „	-	Town relief in a doubtful condition.
Ditto	-	Poonganoor Zemindari	-	Relief operations well under control; zemindar good.
February	-	Carvátanagar „	-	Western part pretty good; eastern part bad.
Ditto	-	Kalustri „	-	One of the worst parts; relief insufficient, but further orders issued by Collector.
March	-	Arni „	-	No particular remark.
<i>In the Chingleput District</i> (6 taluks).				
January	-	Sydapet taluk	-	Village relief apparently not adequate.
Ditto	-	Chingleput „	-	No particular remark.
Ditto	-	Conjeveram „	-	Ditto ditto.
<i>In the Trichinopoly District</i> (5 taluks).				
January	-	Trichinopoly taluk	-	No particular remark.
Ditto	-	Kullitalel „	-	Ditto ditto.
<i>In the Madura District</i> (6 taluks, 26 zemindaris).				
January	-	Dindigul taluk	-	Drought; some relief operations.
Ditto	-	Madura „	-	Drought; relief kept down, as not yet needed.
Ditto	-	Tiroomungalum taluk	-	Ditto ditto.
<i>In the Tinnevelly District</i> (9 taluks, 22 zemindaris).				
January	-	Tinnevelly taluk	-	Drought; but relief very moderate.
Ditto	-	Ottapadaram „	-	Ditto ditto.
Ditto	-	Suttoor „	-	Ditto ditto.
<i>In the Coimbatore District</i> (10 taluks).				
March	-	Perundoria taluk	-	Relief work satisfactory; good tehsildar.
Ditto	-	Palladum „	-	Ditto ditto.
Ditto	-	Coimbatore „	-	Ditto ditto.
January	-	Kunoor „	-	No particular remark.
Taluku. Zemindaris.				
In the 10 districts named there are - - 88 66*				
Sir Richard Temple has visited - - 42 6†				

* Many of these are petty.

† The visited are all large and important.

Month.	From 14th January to 14th March 1877.	Condition of affairs at time of visit, as observed by Sir Richard Temple.
IN THE MYSORE STATE.		
<i>In the Bangalore District.</i>		
Taluks and Zemindaris visited by Sir Richard Temple.	February - - Bangalore taluk - -	Relief works well under control; doubt only about village relief.
	Ditto - - Dooda Bullubpore taluk - -	Ditto ditto.
<i>In the Kolar District.</i>		
	February - - Chik Bullubpore taluk - -	Ditto ditto.
	Ditto - - Baggapally taluk - -	Ditto ditto.

Grand total of 46 taluks } Visited by Sir Richard Temple.

 to the SECRETARY OF STATE FOR INDIA.

Calcutta, 16th March 1877.

Reviewing
 Sir Richard
 Temple's
 minutes
 * Nos.138-9.

We enclose copies of minutes and memoranda which we have received from Sir Richard Temple during the past week, regarding various matters connected with the famine in the Madras and Bombay Presidencies.

2. Among these papers will be found an interesting report on the district of Nellore,* together with a separate minute proposing the early commencement, as a famine work, of an irrigation work in that district known as the Sangam project. Nellore is a large district on the east coast, of which the southern boundary is about 50 miles to the north of Madras. Its area is 7,150 square miles, and its population, according to the last census, 1,374,012. During the 10 months ending with the 31st January last, the rainfall was only 11 inches 35 cents. In the previous year, 1875-76, the rainfall had been scanty, amounting to 26 inches 49 cents., against 37 inches 40 cents., the average rainfall of the preceding four years. In 1874-75 there had been heavy floods, and many important tanks and channels had been breached. Two years of drought following a year of floods had greatly tried the resources of the district. The total yield of the crops of the district for the present year is estimated at less than one-fourth of the average out-turn, although the people with commendable industry have in some parts of it dug temporary wells and deepened old wells, and thus raised a spring crop. The drought was worst in the western taluks, at the base of the Eastern Ghâts, and adjoining the district of Cuddapah. The number of persons on the relief works at the time of Sir Richard Temple's visit was 85,000, or about 6 per cent. of the population of the district. Sir Richard Temple inspected about 17,000 labourers, and found very few who appeared to be in a condition to sustain themselves. He considered that much more discrimination had been exercised by the Nellore authorities in admitting persons to the relief works than had been the case in the ceded districts; but that the depressed condition of some of the persons he had seen on the works, indicated the necessity of a house-to-house visitation more systematic than had been as yet introduced. Some of the relief works were useful, but many were of doubtful value, and task-work had often been little better than nominal. The small local works, in fact, had been made too easy and too attractive, and as we noticed in our last Despatch, great difficulty was in consequence experienced in inducing the people to go to the one large relief work, the East Coast Canal, which runs through the district, and which Sir Richard Temple describes as the very best relief work in all Southern India. The markets are well supplied with grain, coming both by inland and by water routes.

Sangam
 project.
 † No. 135.

3. Of the Sangam project, Sir Richard Temple writes † that the plans and estimates are ready, and the work could be put in hand at once. Its estimated cost is 27 lakhs, the irrigable area 94,000 acres, and the estimated return from water tax 2½ lakhs. Sir

Richard Temple considers, from the information supplied to him by the District Engineer Sangam that, of the entire project, works estimated to cost 19 lakhs, and to yield an annual revenue of $1\frac{3}{4}$ lakhs, might be executed in a great part, at all events, by relief labour. He has suggested the work to the Madras Government as one which is deserving of consideration, at a time when so much stress is laid upon the expediency of employing relief labour upon really good and reproductive works. The suggestion is doubtless receiving the consideration of the Government of Madras, with whom we shall communicate upon the subject.

4. Sir Richard Temple has paid a third visit to the district of North Arcot,* having received conflicting accounts regarding the degree of distress in certain parts of it, and having had reasons to fear that in other parts, and especially in the zemindari tracts, chiefly in the north-east of the district, the distress might become serious. The results of his inspection appear to have been more satisfactory than he had anticipated. In a great part of the Chandragiri taluk the spring crops were good. The Kárvetnagar zemindari, with the exception of the eastern portion of it, had not suffered from drought. The autumnal showers had given it a fair winter crop. Irrigation from wells and from watercourses was giving it a good spring crop. In Kálahasti, on the other hand, which is the other great zemindari in North Arcot, the drought had been exceptionally severe. Sir Richard Temple made suggestions for improving the system of gratuitous relief, and extending that of house-to-house visitation, and also for arranging some light textile work on which the distressed weavers (a numerous class in the North Arcot district) might be employed.

North Arcot.
* No. 137.

5. The results of Sir Richard Temple's visits to North Arcot are summarised in the following terms:—

"I find that distress does not threaten the mass of the people; that the numbers on relief works will probably not much exceed the comparatively small number now employed, if only the usual showers of April shall last; that the numbers on charitable relief will probably increase considerably as the season advances; that in the old towns scattered over the district, in the sacred haunts so much frequented by pilgrims and beggars from distant places, and in the jungle tracts fringing the edges of the district, there are classes among whom many cases of individual distress are to be expected; that on the whole the relief measures taken in hand are sufficient to meet that degree of distress which is to be anticipated; that the relief works are of a small description, the number of able-bodied relief labourers not being large enough to justify their congregation upon large works, but if such large works should be wanted, there are many tanks to be repaired; that in some particular places the delay which at one time occurred was owing to technical and other reasons beyond the control of the local authorities; that the arrangement for house-to-house visitation in every village (save the zemindaris, which are being separately arranged for) are very systematic and satisfactory. I have discussed with the Collector every measure of relief which I can think of. My impression is, that he is now doing everything which ought to be done in this respect."

6. Among the enclosed papers will be found a review by Sir Richard Temple † of the objections advanced by the Sanitary Commissioner at Madras to the reduced scale of wages lately prescribed for the relief works in that presidency. The gist of Sir Richard Temple's remarks is, that the present rate of wages appears, so far as experience goes, to be sufficient to maintain in health people employed on the very light work which is enforced on most of the relief works in the Madras Presidency, and provides as much food as the labouring poor in rural localities get in ordinary times; that it is not possible to determine *à priori* on scientific data what amount of food is necessary to sustain the particular classes who come to the relief works; that the effect of the present rates should be tested by careful practical examination of the people themselves; and that, if it should appear that there is a change for the worse in their physical condition, the rates should be raised, but not otherwise, and that wherever really hard labour is exacted a higher rate of wages should be given. This is practically what is now being done in the Bombay Presidency. Sir Richard Temple has, within the last few days, had a personal conference on this subject with the Government of Madras; and from a telegram from his Grace the Governor which reached us on the 14th instant, we learn that "the Governor in Council having considered various reports" (from district officers) "has decided to defer the consideration of the general adequacy of the scale for further report; the special attention of officers being directed to securing that labourers receive full benefit of allowances, and to scrutinising all cases of apparent weakness; children under 10 being relieved from test work, and weakly persons being formed into special gangs with special nourishment where necessary."

The reduced
scale of
wages.
† No. 144.

Insufficient
grain trans-
port.

7. In our Despatch of the 9th instant we adverted to the insufficiency of the means at present available for transporting grain from Madras into the interior, the Madras Railway not being able to carry more than 700 tons a day. The subject has been engaging the careful attention of our Public Works Department, and arrangements have been made, which it is hoped, will have enabled or will speedily enable the Madras Railway Company to carry 1,400 tons a day. Satisfactory arrangements have been made for sheltering and housing the grain, both public and private, on the Madras beach.

Estimated
cost of
famine.

* No. 140-1.

8. In his Minute of the 6th instant, No. 54,* and the memorandum* annexed to it, Sir Richard Temple has furnished a revised estimate of the expenditure on and loss of revenue from the famine. The result is a total estimated loss of five crores and Rs. 281,000. In the financial statement made yesterday in the Legislative Council by our colleague Sir John Strachey, the net cost of the famine is set down at five and a quarter crores of rupees, or five millions and a quarter, according to the old calculation of 2s. for the rupee, of which sum 3,100,000% will fall on this year, and 2,150,000% on 1877-78. This estimate does not take into account future recoveries of land revenue suspended for the present, which Sir Richard Temple estimates at the considerable sum of Rs. 1,29,50,000 out of Rs. 1,87,96,000, which must for the time be left uncollected. The question whether these balances should be held in suspense or entirely remitted, is one which, as stated in our Despatch of the 16th ultimo, we have deemed it proper to leave to the unfettered discretion of the Local Governments. Sir Richard Temple states in his present minute (paragraph 19) that many of the most experienced Collectors in both the Madras and Bombay Presidencies are in favour of the plan of suspending only, and not entirely remitting, the land revenue on the dry or unirrigated lands. These opinions and the grounds upon which they are based will doubtless receive due consideration from both the Governments concerned. For the present, however, we have deemed it safer to exclude from our calculations any reduction of the cost of the famine from this source.

9. We have this day received the following telegrams from Sir Richard Temple:—

Telegram, dated 15th March.

"I proceed for few days to Bombay Presidency. Throughout Madras Presidency the relief works are now fully controlled and carefully restricted to dimensions of actual distress. Much credit due to local officers in districts. The organisation of charitable relief not equally successful, but further efforts being put forth. Destitute people often unwilling to resort to relief camps. Some casual deaths near Madras itself still happen, chiefly owing to insufficiency of measures in three large remindaries. Remedy being applied. Reduced wages still being tried. Spring crops good in many parts of distressed districts; prices somewhat stiffening. Condition of people good generally, but cholera breaks out temporarily in many places. Large accumulation of grain at Madras well housed. Anxiety about railway arrangement on Madras and Bombay lines. Still hope that these two lines will supply the large and active demands of inland grain trade. Markets continue well supplied."

Telegram, dated 16th March.

"In continuation of yesterday's telegram for mail. It was ordered a month ago throughout Madras Presidency that if any children below seven years of age, belonging to persons employed on relief works, cannot be supported, they shall receive special relief. This is being carried out with my full concurrence. Children above seven have from beginning received relief wages. It has also been ordered, with my full concurrence, that if any relief labourer shall be found to suffer physically from reduced wages, he shall receive special allowance, or else be put to light work. Have complete evidence that most of the large gangs are standing the reduced wage without suffering. Whether they can bear it, as the season advances, remains to be seen. Having inspected in the presence of many officers about one hundred and thirty thousand relief labourers in scattered gangs throughout Madras Presidency, I have reason to believe the physical condition of these people to be generally good. I picked out in every gang every person who seemed below par, and suggested special measures regarding each individual."

10. There has been a further decrease in the number of persons on the relief works both in Madras and Bombay. In the former presidency the number, according to the latest return, was 657,365 against 667,443, the number for the previous week. In Bombay the number was 223,865 against 263,053, the total reduction in the two presidencies

being thus 49,266. In Bombay, however, there were also children under seven years of age, and women in charge of them, to the number of 44,150.

In the number charitably relieved there was an increase of 10,226 in Madras, and a decrease of 999 in Bombay, the totals for the two presidencies being 58,317 and 5,566 respectively.

The Mysore returns give 38,808 persons as employed on the relief works under civil officers, in addition to 30,794 employed by Public Works agency, and 30,097 in the receipt of charitable relief, making a total of 99,699.

We have the honour to be, &c.

(Signed)

LYTTON.

No. 131, dated Sholapur, 16th March 1877.

From the SECRETARY TO SIR RICHARD TEMPLE to the REVENUE ADDITIONAL SECRETARY
TO THE GOVERNMENT OF INDIA.

I am directed to submit a minute * recorded by Sir Richard Temple regarding the need for maintaining a steady and sufficient importation of northern grains into the famine districts of the Madras Presidency.

* No. 158.
Grain supply
from north-
ern India.

2. Sir Richard Temple has directed Captain Bisset of the Railway Department, who is attached to his staff, to visit Bombay and the Nagpore section of the Great Indian Peninsula Railway, with a view to consulting with the Consulting Engineer of the Bombay Government, and the Great Indian Peninsula Railway authorities as to the best means of securing the result to which Sir Richard Temple attaches such great importance.

No. 172.

LXX.—MINUTE by SIR RICHARD TEMPLE, dated Sholapur, 16th March 1877.

When I was at Madras this week, his Excellency the Governor expressed anxiety as to the requirements of and the supply of grain to the province of Mysore. His Grace was apprehensive lest, if any accident should temporarily arrest the daily supply of railway-borne grain to Mysore, the demand of the Mysore population might cause sudden depletion and dearth in the bordering districts of the Madras Presidency. His Grace therefore asked me to let him know whether Mysore had any accumulation of imported grain and to review my calculation on the Mysore supply question, and to consider whether that calculation was ample, and whether it was within the power of the railways according to the practical working thereof, at the time when the western ports shall have been closed by the monsoon.

Mysore grain
supply.

2. I have caused the appended memorandum † to be drawn up, stating in detail how matters are, according to the latest available information, believed to stand. I do not think there is in Mysore any considerable accumulation of imported grain. Such grain as comes to the railway stations is either consumed or despatched into the interior. I estimate the outside Mysore requirement at about 570 tons of imported grain per diem; and I believe that the railways can maintain this supply together with sufficient supplies for the Madras districts, even after the western ports are closed, provided:—

No. 166.

(1.) That the Negapatam route is fully worked.

(2.) That six additional goods engines can be borrowed and placed upon the Madras Railway.

Regarding these two provisos, I have recorded separate minutes, and I therefore need not dwell upon them again.

3. A copy of this minute will be laid before the Chief Commissioner of Mysore, with my recommendation that his Government should investigate the accuracy of the estimates offered in the enclosed memorandum; should watch the importations closely so as to take steps in case they decrease; and should urge very strongly on Bangalore dealers the need for employing the Negapatam route.

Dated Elphinstone Park, Madras, 16 March 1877.

DEMI-OFFICIAL from the COLLECTOR OF CHINGLEPUT DISTRICT to the SECRETARY TO SIR RICHARD TEMPLE.

Land revenue remissions.
* No. 160.

In reply to yours of the 13th,* I would observe that, when I conversed with you and Sir Richard Temple, I was unaware that it was even in contemplation to suspend collections, and had no idea whatever of being "able to realise much of the balance due on "dry crop lands next year if the seasons are favourable." I have since on the 1st February 1877 requested the Board of Revenue to remit all dry waste absolutely.

As to the possibility of collecting such arrears "under any circumstances," I do not recollect expressing an opinion; but if I did, it would have been that to do so would entail coercive process, was unadvisable, and would ruin the ryots already impoverished by an almost unprecedented succession of bad seasons.

No. 174.

LXIX. — MEMORANDUM by MR. C. E. BUCKLAND, Private Secretary to Sir Richard Temple, on the CONDITION of the ALUR and TADPATRI TALUKS of the BELLARY DISTRICT in the latter part of February 1877.

Alur and Tadpatri taluks.
(Bellary.)

About the middle of February Sir Richard Temple was much struck with the excessively large numbers of relief labourers in the taluk of Alur in the Bellary district, in which 47,000 persons were receiving relief out of a total population of 95,000. He had a conversation with Mr. Glenny, the Sub-Collector, who stated that the number was apparently much too high, but that Mr. Maltby, the Relief Officer, and the tahsildar, would endeavour to reduce the number, and to limit relief to those who really needed it. Sir Richard accordingly made inquiry from Mr. Maltby and the mamlatdar, and ascertained the following facts.

2. There had been no rainfall in the taluk since last July, only a few showers; many of the cattle were dying. There was plenty of grain throughout the taluk, and no need to import any in behalf of Government. There were stocks in the country, though the amount could not be stated. Every market-day some 50 cart loads of rice and cholum are brought in. The price of cholum was 8 seers (of 80 tolas) the rupee; on market-day 9 seers. Rice was $7\frac{1}{4}$ seers the rupee; on market day $7\frac{1}{2}$ seers. The ordinary food of the people is cholum.

3. On the 10th February the then last returns showed 46,643 on the relief works out of a population of 94,995, viz., 19,206 men, 20,277 women, and 7,160 children, distributed on six roads thus: (I.) Alur-Bellary, 6,117; (II.) Alur-Auspri, 8,264; (III.) Alur-Goondakul, 14,212; (IV.) Alur-Adoni, 4,599; (V.) Alur-Sirgoopa, 4,803; (VI.) Adoni-Sirgoopa, 8,648. The road from Auspri to Alur had lately been closed under orders from the Sub-Collector, who had directed that only two roads should be open in the taluk, viz., (I.) from Alur to Goondakul, and (II.) from Alur to Sirgoopa (*via* Raveri on the Haggari River). About 1,500 relief labourers on the Auspri-Alur road had lately "struck"; they were inhabitants of neighbouring villages, and said that they could not go to the Goondakul road. On the Goondakul road there were at that time from 15,000 to 16,000 labourers, chiefly of the Chukla, Bhoya, and Pariah castes, most of whom had been for three or four months on the works and were said to have improved in appearance during that time. The daily wage had lately been reduced from 2 annas, 1 anna 6 pie, and 9 pie, to 1 anna 6 pie; 1 anna, and 6 pie, for a man, woman, and child respectively. The numbers were gradually diminishing on account of the closing of all but two roads. Orders had some time before been received in the taluka to turn off coolies who had got landed interests, ornaments, or grain. Orders to admit no new labourers, except those who appeared to be really in need, had also reached the tahsildar.

4. The numbers on relief works had risen from 20th to 27th January from 38,528 to 49,257 in consequence of the transfer from the Adoni taluk of labourers on the Adoni-Sirgoopa road, which took place on the 15th January, but was then first brought into account.

5. The sum of Rs. 2,49,268 had been spent on relief works, and Rs. 347 on gratuitous relief up to date. Task-work was not exacted. Government tools were supplied, but apparently not in sufficient quantities.

6. For famine relief work the tahsildar had under him one sheristadar, three famine inspectors, one revenue gomashta, five paymasters, and throughout the taluk 132 mistries (gangmen) at Rs. 8 a month, and 1,015 kolkars at 4 annas a day. The coolies were paid twice a week, and did no work and received no pay on Sundays. They were supposed to work from 7 a.m. to 5 p.m., stopping for an hour during the day. They declined to bivouac out at night. Cases were known of people going 20 to 25 miles to work, and the refusal of the labourers on the Auspri-Alur road was recognised as a sign of their being in no great want. Two months before orders had been received to stop the small works, such as the small tanks and wells; also the orders to make the labourers bivouac near the roads had reached the tahsildar.

Alur and
Tadpatri
taluks.

7. No death from starvation had been heard of. One hospital assistant had been specially sent, and there was previously one hospital assistant. There was no cholera prevalent and very little small-pox. There had only been eight cases of cholera since the 20th January.

8. Gratuitous relief was being given at seven places in the taluk, viz., Hoolagundy, Teddahotoor, Auspri, Alur, Nuggurdroog, Santicooloor, Halhuroy, each of them the centre of a circle containing about 20 villages. There was a reddy in charge of each poor-house. The Alur poor-house had been open some two months; the others had recently been opened. There were altogether on gratuitous relief perhaps 150 persons, of whom some 75 were in Alur. The orders of Government to the effect that the village authorities were responsible for relieving any person found to be in a badly reduced condition had been received in the taluk two months before, and the reddies were said to be aware of their duties.

9. There had been no dacoities since last September, and crime hardly existed. The people were quiet, as the road-works were open; if they had not been opened there would have been many crimes.

10. On the whole, looking at all the facts, Sir Richard Temple was of opinion that the numbers in this taluk were excessive as compared with any standard of relief that had been allowed in the Madras Presidency; that the excess was calculated to demoralise the peasantry of the taluk; that the main causes were the non-exaction of anything like real task-work, and the employment of the people too near to their homes, they being employed on lines of roads running through their own villages; that the judicious orders given by the Sub-Collector, Mr. Glenny, had not been carried out by the tahsildar, and Mr. Maltby, though willing to do his best, was not sufficiently experienced to be able to keep the tahsildar in order; that Mr. Glenny was himself aware of these defects, and would doubtless take the earliest opportunity of rectifying them after personal visitation.

11. At Tadpatri Sir Richard Temple ascertained the following facts:—The population of the Tadpatri taluk is 115,000. About 12,000 persons were on the relief works, and 1,565 in receipt of gratuitous relief. On the 17th February there were 10,501 on relief works; on the 19th there were 11,600; the increase had taken place on the Yadaki and Bellary roads, under the orders of Mr. Sharkey, the Deputy Collector, and two road superintendents. On the tahsildar's roads, those to Cuddapah and Anantipur, there had been no increase.

Two months previous there were 13,000 persons on the works. On the 2nd February orders were received to turn off all respectable people, pattadars, those with ornaments, on which 2,000 had been rejected.

12. On each of the Anantipur and Cuddapah roads there were about 2,500 relief labourers, for the most part engaged in stone-breaking, as they sat in gangs under the trees while a number of them collected the stones from the fields. There was a kolkar in charge of each gang. Since the 17th of February the men had been receiving 1 anna 6 pie, the women 1 anna, the children 6 pie, instead of the 2 annas, 1 anna and 6 pie, and 9 pie they obtained formerly. On the Cuddapah road there had been 4,000 labourers in January. The gangmen had been directed to take on nobody without the tahsildar's orders. No child was admitted to the works under seven years old, nor to the poor-house if they had parents alive. Up to the 19th February Rs. 2,500 had been spent on gratuitous relief, and Rs. 80,000 on works in the taluk. There were 351 recipients of gratuitous relief.

13. There was plenty of grain in the markets in the taluk. Jowari was at 9½ to 10 seers the rupee. In November it was at 7 seers (never less), and the owners were disposed to hold their stocks; but importations made them produce the grain, and the prices fell. There were no crops on the dry land, and not more than 4 annas on the wet. There were two inches of rain in August and one inch last September.

Tadpatri
taluk.

14. Under the tahsildars there were four revenue inspectors and four paymasters in the taluk, one for each road, the four roads being (1) to Anantipur, (2) to Cuddapah, (3) to Bellary, (4) to Yadaker.

15. The tahsildar was aware of the necessity of simultaneously enforcing their responsibility for the villages on the reddies, and he expressed himself as able to manage the people without difficulty.

16. On the whole, Sir Richard Temple was of opinion that the tahsildar's proceedings were fairly satisfactory, but that Mr. Glenny might with advantage inquire why the number increased on Mr. Sharkey's road when there was no increase on the tahsildar's road. This might have occurred through Mr. Sharkey's want of local experience.

Telegram, dated 17th March 1877.

From REVENUE ADDITIONAL SECRETARY, Madras, to REVENUE ADDITIONAL SECRETARY, Calcutta.

Government
grain reserve.

Government consider it imprudent to vary distribution of reserve grain at well-considered places. Suggested sale of grain now remaining in Madras would necessarily interfere with trade, and would be a breach of faith after public pledge that it was strictly held for emergencies. Government, therefore, cannot accept either of these suggestions, and have announced this decision, as publication of suggestion in Gazette has much unsettled trade. Your announcement of this decision to Calcutta and Burma will be useful to re-assure trade.

LXXVII.—MINUTE by SIR RICHARD TEMPLE, respecting the present condition of Relief Operations in Kurnool.

Sholapur, 17th March 1877.

Relief opera-
tions in
Kurnool.

In my minute dated the 20th January last, it was mentioned that Mr. R. Davidson, who had recently been appointed to the Kurnool district, was doing all he could to bring affairs into order; but that before his arrival, relief operations must have passed beyond control locally, and had been apparently conducted in a manner calculated to cause a heavy drain upon the Treasury and to render the people too dependent upon the State.

2. I have recently ascertained the condition of relief operations and the character of relief administration, as they now exist in the Kurnool district. I find that matters have very greatly improved, and the present state of affairs is as follows: Order and system have been introduced, a competent and energetic officer has been placed in full relief charge of every taluk, the gangs of relief labourers have been concentrated on a few works, and task-work is in many cases exacted; persons who could support themselves have gone to their homes; the revised wage rate, with the prescribed allowance for the infants of workpeople, has been fully adopted; the total numbers on relief works have fallen from 330,000 to 195,000; from five to eight relief houses have been opened in each taluk, whence cooked food is distributed to about 4,500* destitute people; these relief houses are inspected by the taluk relief officer, and abuses are prevented; the village officers are sending paupers into the relief houses, and the village relief organisation is being roused into activity by the constant supervision of European officers. So far as the local officers can ascertain, deaths from starvation are not occurring in the villages. The physical condition of the people on the relief works continues fairly good; private trade continues to be active, and the supply of imported grain is more plentiful than it was in January. System and economy were not enforced so early in the Cumbum division as elsewhere; but even there, also, matters are now brought into conformity with the instructions of the Madras Government. The local officers expect that the numbers on relief works and on charitable relief may reach 250,000 and 25,000 respectively, as the season advances and pressure on the people increases.

* NOTE.—The 2,200 persons who receive gratuitous relief in Kurnool city from private sources are outside this number.

3. Much of this result is due to the exertions of Mr. Davidson, the Collector, who, since the middle of January, has visited every part of the district, and has seen matters with his own eyes. Mr. Davidson is assisted by an efficient staff of Civil, Military, and Native assistants; he appears to be employing his assistants to advantage; but he asks

for additional engineering subordinates, and also for the services of selected officers and men of the Native army. The officials of the engineering staff are now co-operating with the relief officers. Relief operations in Kurnool.

4. Although much improvement has thus been achieved, and though the Madras Government has been so far well served by Mr. Davidson and his assistants, yet I am not able to report that every economy which, under other circumstances might be practicable, has been attained in Kurnool. It is noteworthy that the proportion of the population receiving relief is now much higher in Kurnool than in either Bellary or Cuddapah.

5. In my minute of the 20th January, I drew attention to the contrast between relief operations as conducted in Kurnool, and as conducted in the similarly circumstanced Bombay district of Sholapur. A renewal of the comparison between these two districts makes me believe that the relief operations in Kurnool may still be beyond the actual necessities of the case. I do not say that the scale of relief in Kurnool can, after all that has been done and permitted, come down to the Sholapur scale. But still I think the contrast is, both for our present information and for our future guidance, worth making, thus:—

—	Proportion of Crops saved in 1876-77, according to the Collector's Estimate.	Total Population.	Number of Persons on Relief Works.		Number on charitable Relief on 1st March.	Number of Relief Works opened 1st March.
			10th January.	1st March.		
Kurnool	1½ annas out of 16	917,000	330,000	194,000	3,651	About 24 works.
Sholapur	1 anna out of 16 -	718,000	93,000	48,000	500	16 Public Works Department works, besides 45 works for the 4,000 civil agency relief people.

A much wider and more general private charity is practised by the people of Sholapur and its towns than has been shown by the people of Kurnool and its towns. But, with this exception, I am unable to point to any sufficient explanation of the very great difference between the extent of relief operations in the two districts. Probably there may be some undetected differences in the circumstances of the two districts; still I cannot think such difference could be sufficient to account for the great excess of Kurnool relief expenditure over Sholapur. In the Sholapur district the staff of relief officials is very ample; each village has its patel (headman), and its kulkarni (accountant); over each circle of 10 villages has been placed a special relief inspector; and in every taluk is stationed a European or Native assistant and a mamlutdar (tahsildar), whose whole time is given to relief work and to village inspection. On the information furnished by this chain of relief officials, the Collector is able to say that the condition of the village people is (17th March) fair everywhere, and that the people are not starving at their homes. It is, therefore, reasonable to conclude that the Sholapur relief operations suffice for the necessities of the case.

6. I believe one great cause of the difference in the numbers on relief works in the two districts is, that for several weeks work has not been offered to Sholapur villagers close to their homes; while in Kurnool everybody could at first, and very many can even now, find easy relief work at fair wages close to their homes. The attention of the Collector might still be given to this point. It is probable that when the Kurnool relief officers pick out gangs of 20,000 stalwart relief labourers for transfer to Nellore, many may decline to go, and in this way the numbers will decrease by the act of the people themselves.

7. It may be well to draw attention to the necessity for keeping one point in view. The Government grain reserve in Kurnool amounts, so far as I could ascertain, to from 10,000 to 12,000 tons. This grain is being housed and protected, and it is not now being used at all. Grain for relief-house expenditure is bought in the local markets. But it will have to be considered at what season and in what manner this grain ought to be disposed, so that large quantities may not be kept on the hands of Government when the next season's crop ripens.

No. 181. LXXV.—MINUTE by SIR RICHARD TEMPLE, on the Labour Test and the Wage Test.

Sholapur, March 18, 1877.

Labour test
and wage
test.

I desire to offer certain remarks on the labour test and the wage test, which remarks are suggested by my experience of two months spent amidst the thick of the relief operations in the Madras Presidency.

2. At the outset of the affair, that is, in the last week of December and the first week of January, there was an extraordinarily large number of persons of both sexes on relief

*Bellary	-	420,000
Kurnool	-	320,000
Cuddapah	-	210,000
Total	-	950,000

works in the districts of Bellary, Kurnool, and Cuddapah; about 950,000* persons out of a population of four millions, or about one-fourth of the whole people. No doubt the failure in 1876 of the south-east or later monsoon, following a failure of the south-west or earlier monsoon, did cause distress to come on with unusual rapidity, and, as it were, precipitated the outbreak of famine. Still, in reference to the early period of the season, to the length of time which had to run before the next coming rains of 1877, the accession of such great numbers was calculated to excite surprise and alarm. If these districts, it may be asked, showed as many as 950,000 persons in the first or second week of January, what would they be showing in March, and still worse, what might they show in May?

3. At the beginning of January 1874, the relief works in the worst districts of Bengal, Behar, showed hardly more than a few hundreds, or at the most but a very few thousands. The numbers remained low till the middle of March. They reached their culminating point hardly before the end of April. If then Bellary, Kurnool, and Cuddapah had nearly a million by the middle of January, what, it was anxiously inquired, would be the enormous muster roll of April and May? No doubt there is a difference of at least one month of season between these districts and Bengal, which difference might bring on the outbreak of famine a month earlier in these districts than in Bengal. Still this would not fully account for the remarkable haste with which the famine seemed to be approaching in the Madras Presidency. There must have been something in the system which had begun to be pursued to encourage people to resort to the relief works.

As a matter of fact, the numbers on relief works in these three districts have fortunately not gone on rising and rising in the manner which was to have been feared; on the contrary, they have been falling and falling. The necessity of additional precautions was immediately represented to the Madras Government, who promptly took various measures accordingly. The execution of these measures has since been diligently watched. The total for the three districts is now under 500,000, thus:—

Bellary	-	240,000
Kurnool	-	195,000
Cuddapah	-	58,000

And it may now be said (though with various qualifications), that the relief works in these three districts are on the whole supervised tolerably well, and that the numbers are reduced in a manner partly in some degree (though far from exactly) proportionate to the dimensions of actual distress. So far the Madras Government may be congratulated on the result. But the ideas in the minds of the people, which produced the original excess in numbers, are still existing, and would again burst into activity, if vigilance were to be relaxed even for a moment. It is therefore practically useful to consider what those causes were, and how they have been or are to be remedied.

5. The causes were—

Offering of work close to the homes of the people;

Rendering the work light and easy;

Making the wages worth having irrespective of bare subsistence;

Admitting all comers, without any question as to whether they were able to sustain themselves for a time;

Allowing all applications for employment without exception.

These several concessions are deemed by the rural country people to be considerable advantages.

6. The remedy has been, withholding these advantages, making the scene of work more distant from home, causing the labour to be more hard and irksome, rendering the wage less advantageous, and besides, rejecting all those who appeared able to support themselves for a time, at least.

7. It was at the outset held in the Madras Presidency that the wage offered, though liberal enough in ordinary times, would be thought low in reference to the high prices of scarcity time, and that the rural and agricultural classes would not resort to the works

under such circumstances unless really pressed by want. It was doubtless hoped that the works would be so distributed as not to be too near and handy to the relief labourers, and that task-work would by degrees be enforced. It was probably difficult, under the pressure of last December, to fulfil this hope. At all events, from one cause or other, it was not fulfilled; the works were easily accessible, and the task-work was nominal.

Labour test
and wage
test.

8. Then an important circumstance became observable, namely, this, that rural classes who are not yet pressed by want, who are able to sustain themselves, and to live without Government aid, will largely resort to relief work so long as those works are close at home, as the labour is easy and the wage worth having, and in the rural classes I include not only the menial servants in the villages, the beggars who subsist on village charity, the professional workpeople, the field labourer, the feudal serfs, but also the "pattadar" ryots (technically so termed), that is, the peasant proprietors, ryots having a beneficiary interest in the soil under the ryotwari settlement, and paying land revenue to Government. In some populous tract it came to this, that relief road ran through the middle of the villages, and the peasantry living on either side of the line within sight of it sauntered leisurely on to the works.

9. On or about the 1st of January there were some persons in all these classes who, even at that early date, really needed relief, and would have submitted to much trouble in order to obtain it. There were, however, many who would gladly take relief if they could get it without trouble, but who would prefer to dispense with it rather than submit to such trouble. There were thousands and thousands of powerful men, representing what would be termed a fine peasantry, whose physical condition would be called splendid, who thus got State wages for some few weeks, under the name of relief, though to them it really was gain. This has been indeed checked. But that this should be the view taken by so many of the peasant proprietary (as it was actually taken by tens of thousands of them) is a circumstance to arouse reflection.

10. It was natural enough, indeed, that such a view should be taken by the rural classes. A man and his family are not in actual want; they are not prepared to interrupt their domestic arrangements or to undergo severe toil; they are not willing to encamp out, perhaps to bivouac, to be on the work all day in inclement weather; still the times are hard, and may become harder, their ordinary work is slack; they have nothing in particular to do, they would be glad to make a little money, which would come in usefully, would replace dead cattle, would help to pay for deepening the well for irrigation, would reduce the debt to the village banker, and so on. And at that time (January) a man might have thus earned Rs. 3 $\frac{3}{4}$, his wife Rs. 2 $\frac{3}{4}$, and say his two elder children Rs. 3 $\frac{1}{2}$ more, in all Rs. 10 in a month; in four months (probable duration of distress) Rs. 40 would be obtained, which is really a consideration to a rustic family. If, then, the relief works suit this idea, they afford a temptation to tens, even to hundreds of thousands. Thus it is that resorting to relief works is *not* necessarily a test of distress: Thus it is that State charity becomes indiscriminate and superinduces a certain sort of demoralisation. That some demoralisation was beginning to creep into the rural community in these districts I distinctly apprehended, though we may now trust it has been checked. And the State, however much it may be bound to save life and to prevent extreme distress, is not bound to allow this; on the contrary, is bound to set its face against everything of the sort.

11. When, therefore, the numbers on the relief works became so much reduced during February, the main causes were the distribution of the works so as to render them more distant from the homes of the workpeople and the augmenting of the task. Instance after instance has occurred of gangs, some thousands strong, being told that the road on which they were engaged was sufficiently finished, and that they must march on to another road ten miles, even five miles off, and then melting away or never mustering again; or being told that they must do such and such a task, and rejoining that they did not like this, as it would involve so many hours a day, and then ceasing to appear. This is not, of course, the demeanour of persons who are in real need. And yet it has been exactly the demeanour of a large part of the million of relief labourers in these three districts during January.

12. When, therefore, it is sometimes asked how such large numbers were turned off during February, the answer is that for the most part they turned themselves off, and that they chose to be at rest on finding that they could not get relief on their own terms.

13. A certain number no doubt were picked out to be discharged, under the rule that those were to be rejected who seemed able to sustain themselves for a time, at least.

14. The reducing the wage, also, is calculated to keep people away from the works by diminishing the inducement, but it has not been long enough in operation to produce any marked effect.

15. As a remarkable example in a district adjoining these three districts, I may cite the case of the East Coast Canal, an excellent work under professional supervision. Labour is sorely needed for this work. The district all around it (Nellore) is much distressed, and might well send, say, 30,000 labourers to it (in addition to the few thousands already sent). But the rural poor of Nellore were at the outset comforted by convenient village works, and they refuse to leave these works to go to the canal; if pressed to go they strike work and decline relief altogether on such terms. Similar efforts were made, under stringent orders of the Madras Government, in Bellary, Kurnool, and Cuddapah, to induce relief labourers to go to the canal, but with very little success.

16. I distinctly apprehend that thousands and thousands of stalwart relief labourers in these several districts will leave the little village works and refuse relief altogether sooner than go to the canal or to any large public work under professional supervision, at any, even a moderate distance from their homes. I should even fear that they will undergo some distress and privation before they will yield, if indeed they ever do yield. It is indeed manifest enough that people who thus behave cannot be in severe want, nevertheless, the test of going away from home ought to be persistently applied to able-bodied applicants for relief. This can be done by concentrating operations as much as possible on larger works which have been or may yet be suggested. In my minute of the 14th February was said all that then occurred to me regarding these larger public works in the Madras Presidency.

17. I have never been insensible to the objection that these larger public works might cause extra expense in one particular way, namely this, that professional labourers might be engaged for them on account of their skill and efficiency, who might not be in absolute need, or who might have been able to obtain private employment; for experience shows that even in the distressed districts the practised and efficient labourers can generally find work for themselves; it is rather the inferior labourers, and they are legion, who suffer. But when a work of this description is opened, not primarily for the sake of material improvement, but for the purpose of relief, it is easy and necessary to order that no person shall be employed who is believed to be in any way able to sustain himself, for a time at least, or who lives so near that his attendance only shows that he is making a convenience of the work in order to earn a little money. And when this is ordered, then the only objection which exists to these works being undertaken for relief is removed.

18. On the other hand, the advantages of these professionally-controlled public works for purposes of relief are absolute. These works being at some distance from the homes of the people, involving some hardship and exposure, requiring people to camp out or to bivouac, exacting labour under engineering supervision, which cannot be cheated or evaded, restricting remuneration to work done according to "task" or "piece" and "measured up" professionally, supply a labour test, which assays the character of the relief-seeking classes, just as money is assayed at a mint. Those who are really in need must submit to all this. Those who are not in such need, but who would be glad enough to avail themselves of relief, that is, of State charity, if easily and conveniently obtained, will not submit. In the Madras Presidency the process of examining gangs of relief labourers, rejecting those who are well-to-do, and retaining those who are not, is described by an expressive phrase, "shroffing," in allusion to the manner by which a "shroff," or money-changer, tests the intrinsic value of the coins presented to him. The simple order to the able-bodied among the relief gang to proceed to one of the larger public works at a distance has immediately caused thousands of thousands to "shroff" themselves, that is, to take their discharge from the relief department altogether. And I apprehend that a similar order, if given even now, to many of the strongest gangs in Bellary, Kurnool, and Cuddapah would cause tens of thousands more to do the same. If indiscriminate charity by the State is to be avoided, if the charity is to be truly discriminating, relieving only those who are in want, and doing that effectually, then these larger public works afford a self-acting test.

19. The primary importance, therefore, of having large public works of this description ready beforehand for all districts where scarcity or famine is to be expected, becomes manifest. Even at this comparatively advanced season the plan may be still further worked with much effect in the Kurnool and Bellary districts especially.

20. It is to be remembered, of course, that there are many classes among the distressed poor who could not labour on these larger public works. For the employment of these people petty works must be provided close to their homes, and with but a very light task. But such works should be begun sparingly and as slowly and cautiously as possible, they should not be scattered all over distressed tracts until the famine has pronounced itself and the season of trouble has advanced, and none should be admitted

to them who could be reasonably expected to resort to the larger public works. The excess which occurred in Bellary, Kurnool, and Cuddapah, and which in the middle of January threatened, if not checked, to be overwhelming, arose because easy works close at home were opened all over these districts at the very commencement of the scarcity, and because there were hardly any large public works ready to which the able-bodied applicants for relief could be sent, under penalty of being discharged from relief if they should refuse to go.

21. Besides the petty relief works in the villages, there is the charitable relief to be administered by searching out every distressed person (even those who may fail to complain) by a house-to-house visitation throughout the country. But this important topic need not be pursued here.

22. Most or all of the considerations set forth in this minute are doubtless already known to the Government of India and to the Government of Madras. But the experience gained recently in the districts of Bellary, Kurnool, and Cuddapah affords such striking confirmation of the view, that I have deemed it my duty to record that experience while it is still fresh.

No. 178.

LXXVIII.—MINUTE by SIR RICHARD TEMPLE, recommending that immediate sanction be given to the Commencement of the Repairs to the Begum Talao in the Kaladgi district. No. 213.

Camp Wortee, Kaladgi district, 20th March 1877.

During my visit to the northern taluks of the Kaladgi district I had the advantage of visiting the large tank known as the Begum Talao, near the ruined city of Beejapur, in company with Mr. Molecey, the Executive Engineer, and Mr. Silcock, the Assistant Collector. This interesting reservoir was one of the sources of the prosperity of the city of Beejapur in the celebrated time of its Mahomedan sovereigns. If, as I learn to be the case, there is an intention of transferring the civil station of Kaladgi to Beejapur, which is centrally situated for the district, then the restoration of the great reservoir would be essential to such a plan.

Begum Talao Tank, near Beejapur, recommended for relief work.

2. I understand that a project has been prepared in the Irrigation Department, and approved by the Bombay Government, for putting this tank into order at a cost of about Rs. 50,000. The work to be done consists mainly of earthwork and of rough stone pitching. The Government have, however, directed that the work should not be begun as a relief work until there is absolute need for more relief employment in that part of the country.

3. Looking to the merits of the project itself, I find that this tank has an ample catchment area; that it can contain a very large supply of water; that its water used formerly to (and can again) irrigate a considerable area, and that it can supply drinking water to a great city; looking also to the fact that the embankment, more than one mile in length, is breached in two places only; that the silt, which has collected in great quantities at the bottom of the tank, can be easily excavated for the repair and heightening of the embankment; looking to all these considerations, I think that the repairing of this ancient reservoir is worthy of consideration.

4. From a relief point of view also, I should think that the work might well be undertaken. In that case its early commencement would appear to be very desirable. The situation of the work is salubrious. The numbers on relief works in the Kaladgi district have indeed fallen from 49,973 during the first week of February to 22,584 during the second week of March. But the local authorities anticipate that the numbers will again rise. Nearly all the road work that can in future years be maintained by the local funds has in this (the northern) part of the district been completed. And my inspections of about 6,800 relief labourers and of about 3,500 poor persons who are not in receipt of relief, satisfies me that, for the present at any rate, there is need for another large relief work in the Beejapur and in the south of the Indee taluk. On both grounds, therefore, the great usefulness of the undertaking and the ascertained necessity for more relief work, I would recommend to the Bombay Government that sanction be given to the immediate commencement of the repairs of the Begum Talao as a relief work.

Telegram, dated 21st March 1877.

From REVENUE ADDITIONAL SECRETARY, Calcutta, to REVENUE ADDITIONAL SECRETARY, Madras.

Grain re-
serve of Ma-
dras Govern-
ment, dis-
posal of.

Your telegram regarding grain reserve. Have you made the public notification requested in paragraphs 3 and 4 of our letter of the 9th instant, except that relating to the removal of Government grain to places 60 miles from railway. If not, please explain why? With regard to distribution of reserve grain, we request you to inform us as soon as possible what are the places less than 60 miles from the railway where reserve of Government grain are stored; what is the quantity so stored in each such place; and what your reasons for retaining it in a locality which, *prima facie*, ought to be easily reached by private trade. Telegraphic answer to these inquiries and early written reply to our letter of 9th instant are requested. The Government of India also request that all important announcements made, or decisions arrived at, by the Madras Government regarding the famine may be promptly telegraphed to Supreme Government. The public announcement, that the Government would hold the stock of grain at Madras in reserve, was not communicated to us at the time.

No. 181.

No. 313, dated 23rd March 1877.

From the ADDITIONAL SECRETARY TO THE GOVERNMENT OF INDIA to the SECRETARY TO THE GOVERNMENT OF MADRAS.

Grain reserve
of Madras
Government.

I have had the honour to receive your telegram of the 17th instant, in answer to my letter, No. 276, of the 9th instant.

2. In reply, I am directed to state that before coming to a final decision on the subject of the 2nd, 3rd, and 4th paragraphs of that letter, his Excellency the Governor-General in Council will await the result of the further reference which was made to the Government of Madras by telegraph yesterday.

3. The proposal in paragraph 5, that the reserve of grain now held by the Madras Government should be gradually sold off in small quantities at fixed intervals, was, I am to explain, intended to relieve the mercantile community from the standing menace which seemed to be involved in the existence of a stock of grain in the hands of the Government, liable to be despatched into the distressed districts, or to be thrown on the market at any time. From such inquiries as the Government of India have been able to make, it appears that at Calcutta there is considerable difference of opinion on the subject; although some of the leading merchants consider that the sales contemplated would tend to confirm the confidence of the mercantile community in our policy of non-interference with private trade, and that if conducted in the manner, and at the intervals proposed, they would not be of sufficient importance to have any serious effect upon prices. As, however, the general opinion of the trade at Madras appears to be adverse to the measure, and as his Excellency the Governor in Council has given a public pledge that the grain shall be retained in reserve to meet future emergencies, the Government of India will not press its suggestion further. I am, however, to add that the reserve should not be moved or utilised in any way without the permission of the Government of India, which, in case of necessity, may be applied for by telegraph, with a full explanation of the necessity of the case.

Not to be
utilised with-
out permis-
sion of Go-
vernment of
India.

From GOVERNMENT OF INDIA, Department of Revenue, Agriculture, and Commerce, to
the SECRETARY OF STATE FOR INDIA.

Calcutta, the 23rd March 1877.

We enclose, for your Lordship's information, copies of minutes and memoranda which we have received from Sir Richard Temple during the past week, referring to the following subjects :—

- | | |
|--|---|
| 1st. The utilisation of the Negapatam port and route for the supply of grain to Bangalore and the Mysore country. | Reviewing Sir Richard Temple's minutes. Nos. 132. 136. 149. |
| 2nd. The employment of weavers on some light work suitable to their physical condition. | No. 151. |
| 3rd. The expediency of making some concession to the caste-feelings of the people in the arrangements of the relief camps. | No. 152. |
| 4th. The present condition of the districts of Coimbatore and Salem. | Nos. 153-4. |
| 5th. The condition of persons on relief works and receiving gratuitous relief recently inspected by him. | No. 155. |
| 6th. The question of the sufficiency of the reduced rate of wages. | No. 165. |
| 7th. The relief operations in the taluks of Alur and Tádpatri, in the Bellary district. | No. 174. |
| 8th. The need for maintaining a steady and sufficient importation of northern grains into the famine districts of the Madras Presidency. | No. 158. |
| 9th. The causes which led to the enormous influx of persons to the works in the ceded districts during the earlier months of the present famine. | No. 177. |
| 10th. The expediency * of employing European and Native officers and privates of the Madras Army on the relief works. | No. 97. |
| 11th. The relief camps at the Red Hills and Palaveram. | No. 168. |
| 12th. The taluks and zemindaris in the Madras Presidency inspected by Sir Richard Temple between the 14th January and 14th March. | No. 169. |
2. We also submit a letter† from the Resident at Hyderabad, forwarding a report on the present condition of those districts in the Nizam's country which are more or less affected by scarcity, and the measures which have been taken for the relief of distress. † 162-3.
3. None of these papers call for lengthened remarks from us ; but in all of Sir Richard Temple's minutes suggestions are made, which appear to us to merit, and which we have no doubt are receiving the careful attention of the Government of Madras. The question which still causes us the greatest anxiety is that of the transport of grain by railway into the ceded districts both from the north-west and from Madras. Every effort is being made in the Railway Branch of our Public Works Department to overcome the difficulties which at present impede the transport with sufficient rapidity of the supplies which are considered to be necessary ; but at least six heavy goods engines are needed, in addition to those at present available in this country, to meet the requirements of the grain traffic. We have requested your Lordship by telegraph to arrange for this number of engines being sent to Bombay by way of the Suez Canal with as little delay as possible. Grain transport causing anxiety.
4. The facts stated and considerations urged by Sir Richard Temple in his minute of the 18th instant, regarding the causes which led to the enormous influx of persons to the relief works in the ceded districts and in Kurnool in the earlier months of the famine, indicate the urgent necessity of so arranging the works as to render them as little attractive as possible to those who are not in absolute need. Sir Richard Temple shows that whereas in December the number on the relief works in those districts amounted to 950,000, it has now been reduced to 493,000. The relief works were close to the homes of the people ; the work was light and easy ; the wages were more than sufficient to afford a bare subsistence ; all comers were admitted, without any question as to whether they were able to sustain themselves, and the consequence was that thousands and thousands of powerful men, representing what might be called a fine peasantry, whose physical condition was excellent, and who were really in no need of relief, received State wages as relief labourers. This was the state of things in January. The reduction in the numbers which has since taken place is mainly attributable to the relief works having been so re-arranged as to render them more distant from the homes of the workpeople and to augmenting the task. Sir Richard Temple states that "instance after instance

* The original of this minute appears to have miscarried in the post: The copy which reached us on the 22nd instant is a duplicate.

“ has occurred of gangs, some thousands strong, being told that the road on which they were engaged was sufficiently finished, and that they must march on to another road ten miles or even five miles off, and their melting away or never mustering again; or being told that they must do such and such a task, and rejoining that they did not like this, as it would involve so many hours a day, and then ceasing to appear.” Other causes which have contributed to the diminution of numbers are the reduction of the wage and the discharge of persons who seemed able to sustain themselves; but in Sir Richard Temple’s opinion, the main causes were the re-arrangement of the works and the enforcement of heavier tasks. Both these remedies, he considers, should be still further enforced in the three districts above mentioned, and if combined with petty relief works with light tasks for weakly persons, from which able-bodied labourers should be excluded, and by a searching house-to-house visitation systematically arranged, there need be no apprehension of the distress being inadequately dealt with.

* No. 175.
Grain reserve
of Madras
Government,
its disposal.

† No. 179.

‡ No. 180.

5. We enclose a copy of a telegram* which we received on the 18th instant from the Government of Madras with reference to the instructions conveyed and the suggestion offered in our letter of the 9th instant, regarding the stock of grain now in the hands of the Government in that Presidency, to which allusion was made in the 2nd and 3rd paragraphs of our Despatch of the same date. Copies of a telegram† which we have addressed to the Government of Madras, calling for further information on certain points, and of a letter‡ expressing our acquiescence, under the circumstances, in the decision arrived at by the Local Government, not to sell for the present the reserve of grain now in their hands at Madras, are also enclosed. Your Lordship will observe that in suggesting the sale to the highest bidders of the stock of Government grain now at Madras, in moderate specified quantities, at specified intervals, our object was to confirm the confidence of the mercantile community in our policy of non-interference with private trade, and to remove the standing menace to the trade which seemed to be involved in the existence of a stock of grain in the hands of the Government, liable to be despatched into the distressed districts or to be thrown into the market at any time, to the serious derangement of the calculations of private traders. From the inquiries which we have been able to make here, we find that at Calcutta there is considerable difference of opinion on the subject, although some of the leading merchants consider that the sales contemplated would tend to remove the uncertainty and distrust which have been felt regarding the action of the Government, and that if conducted in the manner and at the intervals proposed they would not be of sufficient importance to have any serious effect upon prices. At Madras, however, the preponderance of mercantile opinion appears to be adverse to the measure; and as it appears that his Grace the Governor in Council has given a public pledge that the grain shall be retained in reserve to meet future emergencies, and will not be utilised so long as private trade meets the requirements of the distressed districts, we have not deemed it advisable to press our suggestion further. We have desired, however, that the reserve should not be moved or utilised in any way without the permission of the Government of India, which, in case of necessity, may be applied for by telegraph, with a full explanation of the nature of the necessity.

6. We have much satisfaction in reporting that there has been a good fall of rain in several of the distressed districts, including Bellary, Kurnool, Cuddapah, Nellore, Trichinopoly, and Tinnevely. It has also extended to Mysore. The particulars have not yet reached us.

7. Sir Richard Temple telegraphs as follows on the 21st instant:—

“ I have during past week visited districts of Sholapur and Kaládgi in Bombay Presidency, and inspected in these districts 19,000 relief labourers, most of whom employed on task-work, professionally supervised and measured up. Physical condition generally satisfactory. Gangs under civil officers much diminished in numbers. Efforts to prevent waste or abuse very creditable to local authorities. System of relief strict. Some doubt whether village relief and house to house visitation sufficiently effective. General impression of Bombay management favourable. Comparison between Madras and Bombay Presidencies thus: Principles now the same in both; but in Madras the management more indulgent to people, relief more freely allowed, and expense more liberal. In Bombay the management is more rigid, the system more exact, the economy more complete. In neither Presidency is there enough visitation from village to village to search out individual cases of distress.”

8. There has been a slight decrease in the numbers on the relief works in Madras and an increase in Bombay. In Madras the number according to the latest return was 656,997 against 657,365, the number for the previous week. In Bombay the corresponding numbers were 226,841 and 223,865. The net increase in the two Presidencies was 2,608. There was, however, in Bombay a decrease of 11,947 children under seven

years of age and of women taking care of them, the number having been reduced from 44,150 to 32,203.

In the number of persons charitably relieved there was a large increase, amounting to 23,750 persons in Madras, the number having risen from 58,317 to 82,067. In Bombay the corresponding numbers were 6,135 and 5,566, showing a decrease of 569.

In Mysore the number on the relief works was 36,600, in addition to 30,794 employed by Public Works agency, and 37,361 charitably relieved, making a total of 104,755 against 99,699, the corresponding numbers for last week.

9. It will be seen from the Resident's letter, and from the papers appended to it, the opinion expressed in Sir Richard Temple's minute on the condition of Hyderabad, which was enclosed in our Despatch of the 9th ultimo, that the distress in that State was likely to be less than was at first apprehended, has so far been justified by the event. The condition of the rabi harvest, now in course of being gathered, is generally fairly favourable, and no further extension of the area in which distress has hitherto prevailed is apprehended. The maximum number of persons likely to be on the relief works is estimated at 43,000. The Resident bears testimony to the judgment with which Sir Salar Jung has dealt with the matter.

We have the honour to be, &c.

(Signed)

LYTTON.

No. 182.

MEMORANDUM by MR. BERNARD, Secretary to Sir Richard Temple, regarding RELIEF Nos. 186. OPERATIONS in the SHOLAPUR DISTRICT, as ascertained by Sir Richard Temple 213. during his visit of the 17th, 18th, and 22nd March 1877.

Camp, Poona District, 23rd March 1877.

Sir Richard Temple met at Sholapur the Revenue Commissioner, Mr. Robertson, the Collector, Mr. Percival, and the Executive Engineer, Major Mathew. In his minute of the 12th January were offered some general statistics regarding the distress in the Sholapur district, and it will suffice to note here that the district comprises an area of 4,496 square miles, with a population of 718,034 persons; that the failure of the crops has been general all over the district; and that the average out-turn of the food-crops was estimated at one anna out of 16 for the whole district.

Relief operations in Sholapur district.

2. In the month of January there were 93,000 persons on the relief works in the Sholapur district, now (20th March) there are only 48,855. Of these about 4,500 (or 600 in each taluk) are on the works under Civil agency, the remainder being employed under the officers of the Public Works Department, by whom task-work is exacted and efficient supervision is exercised. The Collector, Mr. Percival, assigns several causes for the decrease in numbers; thus, he attributes it in part to—

- (a.) The reduction in the rate of wages.
- (b.) The concentration of the people on works at a distance from their homes.
- (c.) The exaction of task-work.
- (d.) The ability of the people to do without relief to an extent not previously believed.
- (e.) The large charity still going on in all the towns and larger villages at the hands of Natives.

3. The rates of wage are 1 anna 10 pies for adult men on the Public Works, and 1 anna 3 pies for adult men on the Civil agency works. If persons or gangs on the Public Works do not perform the full tasks their wages are subject to deduction.

4. Regarding the condition of the people the Collector says that the gangs on the regular Public Works are in decidedly good condition; that the condition of the people on Civil agency is fair at present; but that he is apprehensive about these people, and recommends that the wage rate should be raised to $1\frac{1}{2}$ annas, or else that a Sunday wage should be given. The Commissioner, Mr. Robertson, does not admit that necessity has yet been shown for any increase in the rates. The Collector believes the condition of the people outside the works to be fairly good; he receives weekly diaries from relief officers, who get reports from relief inspectors and visit a great number of villages themselves. No single report of a starvation death has yet reached the Collector. He recently received a report from a single relief circle of 10 villages to the effect that

Relief opera-
tions in Sho-
lapur dis-
trict.

the condition of the people there was much depressed. The Assistant Collector has gone to visit this circle, and his report has not yet come to hand.

5. The charitable relief arrangements are on this wise: a relief house is established at every taluk head-quarters; each taluk is divided into eight or 10 circles of 10 villages each; over each of these circles is a relief inspector on Rs. 12 a month, whose duty is to visit every village in his circle twice a week; in every taluk there is a mamlatdar (Native subdivisional officer) whose full time is given to relief work; and over every taluk is a European or Native Assistant Collector, whose duty is to inspect villages and direct the subordinate agency. A register of paupers has been prepared and is periodically revised for every village; and every pauper who cannot support himself is expected to reside and be relieved at the taluk relief house, save in exceptional cases of infirm people who cannot travel and are relieved by the patels (village headmen) at the cost of the State. The relief houses are not popular with paupers, as they have to reside there. Only about 1,100 persons are now in receipt of charitable relief, besides some 6,000 young children whose parents are on the relief works. A very great deal of relief is being given by private charity; a Native charitable relief committee is doing good work in every considerable town in the district; in Sholapur town itself the committee spend Rs. 4,000 a month on distributing charitable relief to about 2,300 persons daily. The Collector has noticed with satisfaction the extent to which the helpless village poor are cared for by their own people, even in these hard times. Still he anticipates that larger numbers of these poor creatures must sooner or later come upon the Government for charitable relief.

6. Among other testimony given to Sir Richard Temple regarding the condition of the people in the Sholapur district may be mentioned:—

Lieutenant C. J. Dickson, District Superintendent of Police, who, in his last diary from tour, reports that he has visited many villages and found the state of the people to be good.

Lieutenant Christie, R.E., from the Midnapore district of Bengal, who has been employed for one month in the interior of the district. He has seen a great many of the workpeople. Last week he visited the Ashti tank, whereon 7,000 people were employed; and he was moving about among the people for two days. He found the workmen in "capital condition," and he considers them to be "as good coolies as one could see anywhere." Among 7,000 labourers there were of course some few weakly people; but the hospital was almost empty.

Lieutenant Affleck Graves, Assistant Engineer from Agra, has been employed for one month in the interior of the district, and has under him now 43 miles of road on which 3,000 labourers are employed. The wage rate for adult male is 1 anna 9 pies; and the people have throughout been in good condition, better indeed than the gangs recently working under him on the Agra district roads. The children especially seemed to be in good case.

7. Sir Richard Temple inspected a considerable number of relief labourers and of other poor in the Sholapur districts; thus:—

Moteebagh tank near Sholapur.—Four thousand labourers under Public Works agency, doing full task-work, on wages of 1 anna 10 pies a day for adult males; the condition of the gangs, men, women, and children was decidedly good; but it was said that, when this work was opened three weeks ago, many of the labourers were in a much reduced state. They had recovered their condition under the present reduced wages.

Kumbul tank, six miles from Sholapur.—Two hundred persons, all of the poorest classes, under Civil agency, on a wage of 1 anna 3 pie for adult males. These gangs were composed mainly of elderly persons, the able-bodied having been drafted on to the Public Works Department works. Their condition was fairly good, and Sir Richard Temple marked only one woman and one child as apparently suffering from want.

Another small tank, two miles further from Sholapur.—Three hundred labourers of both sexes on the Civil agency wage rate. These gangs, though composed of people from the very lowest classes, were generally in good physical condition, and did not appear to have suffered from the low rate of wages. Sir Richard Temple marked two men who ought to have been on charitable relief, and he marked four persons who were in a somewhat reduced condition of body.

The inhabitants of the village near the aforesaid tank.—All the people of this village (to the number of about 200) turned out for inspection. Sir Richard Temple found the condition of these people to be much the same as the condition of the people on the works, save that they wore better clothes. The only emaciated cripple was a man who, on inquiry, turned out to be a professional beggar whose trade paid better than State relief, for his family consisted of a sturdy, comfortable-looking wife and five well-

conditioned children, besides a sixth child who was said to be away begging in the streets of Sholapur.

Beejapur road near Wurrukbal, ten miles from Sholapur.—Two thousand five hundred labourers under Public Works agency and on a wage rate of 1 anna 10 pies for adults. The general condition of these gangs was very good; several hundreds of the men and women were remarkably fine specimens of the Deccan peasantry, well set up and well nourished. Only a very few cases (one per cent. in all) of persons in an apparently reduced condition were marked by Sir Richard Temple. The condition of the children in these gangs was specially good, save in the case of a very few infants. In some of the cases on this road it seemed doubtful whether the people were not being employed too near to their homes.

8. The Collector cannot say what the total amount of land revenue to be remitted may be. The total of remissions will probably fall short of the first estimate. He is now, with the assistance of the subordinate revenue officials, dividing his district land revenue demand into three categories, viz.,—

(a.) Revenue that should now be collected;

(b.) Revenue that should be suspended and collected in future years, if the harvests are good;

(c.) Revenue that must now be remitted.

9. The Collector fears that cattle must have died in large numbers. During the last two months 30,000 hides are said to have come into the Sholapur market alone. But things are not quite so bad as they were; cattle which were selling in December and January for Rs. 2 now fetch Rs. 8. The people, too, seem to have more hope than they had; they are bringing back some of their cattle, so as to be ready for agricultural work directly the April showers come. Crimes against property have decreased since January last, and there was no perceptible increase in crime after (or in consequence of) the reduction of numbers on the relief works.

No. 183.

MEMORANDUM by MR. BERNARD, Secretary to Sir Richard Temple, of the facts concerning RELIEF OPERATIONS in the KALÁDGI DISTRICT, ascertained by Sir Richard Temple on his visit of the 19th–21st March 1877.

Relief operations in Sholapur district.

Nos. 186. 213.

Camp, Poona District, 23rd March 1877.

On the 18th March Sir Richard Temple started from Sholapur for Beejapur, a central town of the Kaládgi district. He passed through the taluk of Sholapur in the Sholapur district, but on that day no workpeople were on the road. On the right bank of the Bheema he was met by the mamlutdar (Native sub-district officer) of Indee, the most northerly and most severely distressed taluk of Kaládgi. On the confines of the Beejapur taluk he was met by Mr. Molecey, the Executive Engineer, Mr. Silcock, the Assistant Collector, and Mr. Dunsterville, of the Survey Department, who is now employed upon relief work. Mr. Hogg, the Collector, had not received intimation of Sir Richard Temple's visit in time enough to enable him to attend.

Relief operations in Kaládgi district.

2. The general statistics of the Kaládgi district were given in Sir Richard Temple's minute of the 12th January, but it may be repeated here that the Kaládgi district contains 5,695 square miles and a population of 816,037 persons; that the rainfall over the whole district was short and the crops failed utterly in the north of the district; and that the failure was very great in the other taluks, so much so that the average out-turn of the season's crop is not estimated at above one anna out of 16. But Kaládgi is better off than the districts of Sholapur and Poona, in so far that its soil is better and its people are believed to possess greater resources. It is noteworthy that there was no increase of crime against property in the Kaládgi district when the numbers on relief works fell during February. There is now not more crime in Kaládgi than in ordinary years. In the months of November and December, on the other hand, crimes of violence and against property were very rife.

3. The number of people on relief works in the Kaládgi district was 54,000 during the first week of February, and it stands now (third week of March) at Rs. 27,000. Of this last total Rs. 22,500 are employed on works under the Public Works Department, and Rs. 4,500 are on works under the Civil officers. The great decrease in the number of people on relief works has been caused mainly by a strict adherence to the practice whereby gangs of labourers are shifted from one work to another and are employed at a distance from their homes. The enforcement of a moderate task-work has had some effect in keeping off the workpeople who could support themselves at home. The staff

Relief operations in Kaladgi district.

of engineering subordinates is quite sufficient to control and to enforce work from the comparatively reduced numbers now on the relief works. On the Civil agency works are taken infirm or weakly people, who could not do a good day's work; people on these works who grow strong are transferred to the regular engineering works.

4. The Executive Engineer, the Assistant Collector, and the mamlutdar were all agreed that, so far as their inspections and inquiries went, the people who had left the works were supporting themselves in one way or another at their homes. They did not believe that any people were dying of hunger away in the villages. The distressed taluks have not been parcelled off into circles, as has been done in Sholapur, but the mamlutdars are relieved of ordinary duties and are employed on relief work alone. They and the Assistant Collectors visit the villages and examine the lists, which every village headman (patel) has to keep, of persons requiring relief. These officers have therefore much though not such full means as in Sholapur of knowing the condition of the village people.

5. The wages paid on the Kaladgi public works are 2 annas per diem for an adult male; because the price of food (jowaree) keeps dearer than 9 seers per rupee. The Executive Engineer, Mr. Molecey, thinks that his wages suffice for the people who receive them. He regards the condition of his gangs to be various, though on the whole good. He thinks that the results of the shifting people to roads away from their homes must be carefully watched, as their reluctance to go far from home sometimes makes the people drift into danger. On the Civil agency works the maximum wage is $1\frac{1}{2}$ annas for an adult male. The Executive Engineer and Mr. Silcock consider that these wages are sufficient, as the people appear to keep in sufficiently good condition. But it was understood that the Collector (Mr. Hogg) and some other of the Civil officers regarded the Civil agency wage as too low. No wages are paid for, and no work is done on Sunday. On both classes of works a subsistence allowance of 3 pie per diem is made to those children of persons on the works who may be too young to do any labour for themselves.

6. Sir Richard Temple inspected at Beejapur 1,120 labourers on the Executive Engineer's works, besides about 800 new applicants for work who had presented themselves during the last three or four days. These people are employed on a road outside Beejapur, and they for the most part sleep in temporary huts, which they have provided for themselves close to the road. There was a certain small number of sturdy, well-to-do men and women among the Beejapur gangs, who could probably have done without State charity for a time at any rate. Out of the 1,120 labourers Sir Richard Temple marked 11 who were in a very reduced physical condition, and he noticed 12 such persons among the 800 applicants. The local officers made inquiries into each of these cases.

7. Out of the town of Beejapur and from the villages round 2,300 persons of the poorer classes were collected for inspection, in order that Sir Richard Temple might form an idea of the condition of the poorer classes that were in receipt of no relief at all. These people were called together suddenly; they were to all appearance poorly off, and they were probably fair representatives of the classes regarding whose condition anxiety might be felt. Out of the total number (2,300) Sir Richard Temple marked 48 persons whose physical condition was apparently much reduced by hunger; some of these cases would, in all probability, be soon in a dangerous condition. These people are now being looked after by the Civil officers. Sir Richard Temple at the same time inspected the people (about 120) in receipt of charitable relief at Beejapur; all these poor creatures were decidedly fit recipients for this kind of charity.

8. At Wortee, 20 miles outside Beejapur, Sir Richard Temple inspected, in company with the Executive Engineer, the Assistant Collector, and the mamlutdar, 4,800 labourers who are now at work on the road from Wortee to Indee, and also 250 persons of the poorest classes from Wortee and the surrounding villages, who were receiving no relief at all. The Wortee gangs were generally in poorer condition than those inspected at Beejapur; and Mr. Molecey explained that they were the very poorest gangs in his district. Out of these gangs Sir Richard Temple marked 133 persons whose condition was low. A very few infants were in an emaciated state, either from illness or from failure of their natural supply of food; but with these exceptions the children of the Wortee gangs were well nourished and comfortable. Still the labourers in these gangs were almost all of them suitable persons to be upon the relief works. The representative poor who came from Wortee and the adjacent villages for inspection were clearly in very poor circumstances, and among them Sir Richard Temple marked three cases which were in a very reduced physical condition, induced apparently by want of food.

9. On the whole it appeared to Sir Richard Temple that the relief works were well managed and were restricted to persons in real need of State aid. The test of shifting labourers and employing them far from their homes had been properly and successfully applied. It appeared, however, to Sir Richard Temple that the system of village visitation and village relief is not sufficiently carried out or adequately supervised. Among the representative bodies of villagers which Sir Richard Temple examined, from one to two per cent. appeared to be in a really reduced condition, and it seemed that this condition was due to hunger. Many of such people, if not searched out and relieved, must die during the next two months. If the same per-centage of bad cases exists in the villages all over the most distressed parts of Kaládgi, then no time should be lost in searching them out and relieving them. Raising the wage rate would not meet the necessities of the case; real and active village visitation under energetic supervision is required.

Relief operations in Kaládgi district.

10. The Assistant Collector and the Executive Engineer appear to think that one or more additional relief works would be required in the northern taluks of Kaládgi now that the road works, which could be usefully undertaken, were nearly completed. Regarding one of these works, the Begumtalo, Sir Richard Temple has recorded a separate minute. Mr. Silcock recommended strongly that four tanks in the Indee taluk, for which the Irrigation Department has plans and estimates ready, should be taken in hand and repaired. Mr. Burke, the Irrigation Engineer, informed Sir Richard Temple that he could begin these works at once; he considers them to be more useful than a continuance of road works, though the tanks are not such as in ordinary years would be considered remunerative irrigation works. Some colour was given to Mr. Silcock's opinion that one or more additional works were required for the Indee taluk, by a representation made to Sir Richard Temple by the patels, koolkarnees (village officers), and ryots of the villages of Dhoolkheif, Chanégaon, and Simnala, on the northern border of the Indee taluk. 450 persons of these and certain neighbouring villages were inspected by Sir Richard Temple; it was stated by the people, and affirmed by the village officials, that from 100 to 200 of these people had worked on the Sholapur road till work there was closed, and that they had afterwards gone to the Wortee road (distance 20 miles) for work, but they had for some reason or other been refused admission to the works. Among the people who said they had gone to find work at Wortee were four or five persons whose physical condition was low; but, on the whole, the 450 villagers inspected appeared to be in a fairly good physical condition.

11. Sir Richard Temple saw at Dhoolkheif 15 tons of Government grain (jowaree), which had been brought at the beginning of the scarcity when grain importations had hardly begun and supplies for the labourers seemed likely to run short. Other small parcels of Government grain are stored in different parts of the Kaládgi district. These stores have not yet been used, as the local markets sufficiently supply all wants. But as some of the grain is being destroyed by insects, and the supply in the local markets appears quite secure, the Bombay Government has ordered these stores to be sold by auction to the local merchants.

No. 184.

MEMORANDUM by MR. BERNARD, Secretary to Sir Richard Temple, regarding RELIEF OPERATIONS in the AHMEDNAGAR DISTRICT.

Nos. 186.
213.

Camp, Poona District, 23rd March 1877.

Sir Richard Temple was not able to visit the interior of the Ahmednagar district; but he met Mr. Jacomb, the Collector, in company with Mr. Robertson, the Commissioner, at Dhond, and he inspected a gang of 4,000 labourers on the Dhond and Munmar Railway relief work near the Bheema River, just within the confines of the Ahmednagar district. Mr. Izatt, C.E., who is in charge of the works, with Mr. Vacher, the Executive Engineer, was present.

Relief operations in Ahmednagar district.

2. The gangs of Ahmednagar labourers on the railway works were in very good condition. They are doing task-work on a wage rate of 1 anna 8 pie for adult men. At the outset they did not perform their full task; but now the engineers under Mr. Izatt get full work out of the people, who accordingly receive their full wage. Mr. Izatt reports that the disbursements on account of charitable relief (3 pie a head per diem) to young children amount to 10 per cent. of his whole expenditure for wages.

Mr. Jacomb's account of affairs in his district was briefly as follows:—

(a.) The north of the district in the Godavery valley has had fairly good crops. The bad parts are in the south, the Srigunda and Kurjut taluks, with parts of Nuggur and Parner. On the relief works there are now 11,800 labourers, as

Relief operations in Ahmednagar district.

against 26,000 in the beginning of February. Of this total only 900 are on the Civil agency works, where they receive a wage of 1 anna 1 pie for adult men. The Collector thinks this rate is too low, but he cannot say that he has found the people actually suffering in consequence of these low rates. Some of the poor of the district are wandering from their homes, but none are starving. No cases of starvation have ever been reported.

- (b.) In the worst taluks and in parts of others the villages are divided into circles, with an Inspector over each circle. These Inspectors furnish diaries of their work and of what they see. Over them are the mamlatdars (Native subdivisional officers) and the Assistant Collectors. The patels do really look up and relieve the village poor; save, perhaps, in the case of the Mhars (outcasts), regarding whom men of higher caste are very reluctant to exert themselves.
- (c.) The supply of food in the local markets is everywhere ample, and will continue to be so.
- (d.) In the Kurjut taluk only is there any real difficulty about water-supply. Wells are being deepened there, and also in other parts of the district.
- (e.) There has not as yet been any very great mortality among the cattle. The great majority of the animals in the worst taluks were driven away to distant pastures. Possibly one third of the emigrant cattle may die; but nothing certain is yet known.
- (f.) The Collector cannot say for certain, but he expects that out of the 12 lakhs of revenue demand from his district he may be able—
 - To collect 6 lakhs.
 - To suspend 4 lakhs.
 - To remit 2 lakhs.

In January last it had been estimated that 6 lakhs might have to be remitted.

No. 185.

Nos. 186.
213.

MEMORANDUM by Mr. BERNARD, Secretary to Sir Richard Temple, regarding RELIEF OPERATIONS in the POONA DISTRICT, as ascertained at Sir Richard Temple's visit of the 22nd–24th March 1877.

Camp, Poona District, 24th March 1877.

Relief operations in Poona districts.

Sir Richard Temple met in the western or more distressed tracts of the Poona district—

Mr. Norman, the Collector.

„ Keyser, the Assistant Collector.

„ Fletcher,

„ Holland,

„ Symonds,

} relief officers.

Major-General Kennedy, R.E., Secretary to the Bombay Government, in charge of the Famine Department, who was good enough to come to meet Sir Richard Temple.

Colonel Merriman, R.E., Chief Engineer of the Irrigation Department.

Mr. Clarke, Executive Engineer.

„ Joyner, Executive Engineer.

„ Toogood, Assistant Engineer.

The distressed area of the Poona district comprises the whole of the Bheemthari and Indapur taluks, with parts of the Haweyli (head-quarters) and Poorandhar taluks. These tracts contain a population of about 320,000 persons, and the failure there has been so great that the season's out-turn is estimated at only 1 anna out of a 16-annas (full) crop.

2. In the month of January there were 54,000 people on relief works in the Poona district; now (20th March) there are only 42,000, of whom about 38,000 are employed on works under Public Works officers, who exact full task-work and exercise very thorough supervision over the workpeople. The full wage of an adult man on the works under Engineering officers is 1 anna 10 pies per diem; but the workpeople incur deduction if they do not perform the full task. On all the great works which Sir Richard Temple visited in the Poona district, most of the labourers had forfeited from one fourth to one sixth of their wages during the earlier weeks that task-work was imposed. But now all the gangs, with but very few exceptions, do their full task and get their full wage. On the works under Civil agency the wage rate is 1 anna 3 pie.

3. The peculiar feature of the Poona district relief is that the relief labourers are concentrated on a very few large and useful works, mainly under the Irrigation Department,

viz., the Moota Canal, the Nira Canal, and the great reservoirs at Mahtoba and Sirsophul. Some gangs, gradually increasing in numbers, are employed on the southerly section of the Dhond and Munmar Railway. On every one of these works the labourers come, for the most part, from a distance, and they live in temporary huts provided by themselves close to the works. Various accounts are given of the condition of the thousands who have left the relief works since January. And the outcome of all these accounts is that some of the people have emigrated to the Nizam's country or to the hill pastures with their cattle; some have gone to Bombay to get work; and some few are in their villages preparing for the coming agricultural season. All the inspecting officers who visit the interior are, however, agreed that comparatively few of the ordinary residents are left in the villages of the Bheemthari and Indapur taluks.

Relief operations in Poona district.

4. Sir Richard Temple was able to inspect a considerable number of gangs of relief labourers and of other poor in the Poona district. He visited,—

The Dhond and Munmar Railway Works, whereon are 2,800 labourers of the Poona district. These gangs were among the poorest Sir Richard Temple has seen in the Bombay Presidency, and some proportion of the men were below par. Their wages were 1 anna 9 pies per diem for adult men who did full task. It was explained that the men were in poor condition when they came to the work; during the first 10 days no deduction was made for short work; then deductions began, and the men for about 10 days earned little more than half the full wage; during the last week they have been doing three quarters of full work; and the engineers have, at the Commissioner's request, decided that fines for light task shall not reduce the daily wage below the subsistence rate allowed on Civil agency works. The reduced people in these gangs, who are more numerous than in any other gangs inspected by Sir Richard Temple, are now being looked after by the officers in charge.

The Boreebayal Tank, on which were 60 labourers under Civil agency. Most of these people were old and infirm; all were very poor; still Sir Richard Temple marked only four persons who seemed reduced by want; 40 children were here in receipt of the 3 pie charitable allowance, and were all in excellent case. The able-bodied people had been drafted off to the Public Works Department works, and there was nothing in the condition of the labourers left to warrant an apprehension that the Civil works wage was insufficient to maintain the people's strength.

The Sirsophul Tank, whereon were 3,200 labourers, out of whom Sir Richard Temple marked 11 persons who seemed to be in a reduced physical condition. The remainder were in good case, the younger men and women looking stout and well. All were on the Public Works Department wage, and lived in temporary huts close to the work. Some few of the people looked as if they could have managed for themselves without State aid. There were 1,160 children and 33 infirm paupers belonging to the workpeople, who were all in receipt of charitable relief.

The Patas Tank, 1,300 labourers on Public Works Department rates, besides 51 employed under Civil agency. The condition of these gangs was on the whole good; and the people appeared to be well nourished. Fifty-three persons belonging to Patas town, who were on charitable relief, were inspected and were seen to be fit recipients for such charity.

Patas Town Poor who were not on Relief.—Two hundred and fifty of the poor of Patas, who were receiving no kind of relief, were inspected. The people all looked poor, but Sir Richard Temple marked only two persons who were reduced in physical condition, and ought to be taken on charitable relief. One of the two, a Mhar by caste, entirely declined to accept Government charity.

Moota Canal Works.—Ten thousand and two hundred people are now employed along about 22 miles of this canal, which was the first large work begun in this part of the Deccan. At one time as many as 19,000 people were employed on the canal. The exaction of task work which has been enforced rigorously since January caused the reduction in the numbers. From the beginning the workpeople have lived in temporary shelter close to the works, and have been shifted 8 or 10 miles down the canal as the work went on. On this canal Sir Richard Temple inspected 4,764 workpeople, besides 1,370 young children and 137 infirm old people, making 1,507 in all who were receiving charitable relief on the works. The condition of these people was decidedly good. Sir Richard Temple marked only six persons who were apparently in a reduced physical condition. The children were in particularly good case. The wage on these works for an adult man who does full work is 1 anna 9 pies. During February the deductions on account of short work came to 9 per cent. on the total wages; but during the month of March 90 per cent. of the

Relief opera-
tions in
Poona dis-
trict.

gangs have earned full wages. Mr. Joyner, the Executive Engineer in charge of this work, makes careful inquiry into the case of each gang that comes under deduction, so as to prevent the possibility of any gangs losing strength by reason of insufficient food. When task-work was first exacted to the full extent in January last, some of the gangs fell for a time below par; but remedies were applied, and all are now in excellent condition.

Mahtoba Tank, also an Irrigation Department work, on which Sir Richard Temple saw 5,400 workpeople, besides 1,600 children on charitable allowance. The physique of these gangs was not quite so good as that of the people on the Moota Canal, where relief works were opened early in the season. Still the condition of the Mahtoba gangs was good; the children were plump and happy; less than $\frac{1}{4}$ per cent. of the people were marked by Sir Richard Temple as in a reduced condition of body. The gangs were for the most part doing full task and getting full wage.

5. The supply of grain is ample in all markets of the Poona district. A village dealer whom Sir Richard Temple saw close to the Motee Canal was selling grain (jowaree) to the labourers at $10\frac{1}{2}$ seers (21 lbs.) per rupee. No one appears to have apprehensions respecting the sufficiency of the supply of grain, which private trade will maintain in all parts of the Poona district.

6. The numbers on charitable relief are :—

In villages -	-	-	-	-	-	-	3,042
On works, chiefly children -	-	-	-	-	-	-	12,649
Total							15,691

The Poona system of giving charitable relief differs from that practised elsewhere. No regular relief houses are established whence cooked food is distributed. But the patels (village headmen) are authorised to give paupers, who are entered on the village lists, an order on the village corn-dealer for half a seer (1 lb.) of grain per diem plus 3 pie in cash per week. The village dealer issues this relief and sends his bill to the nearest relief officer. The European Civil officers who inspect the villages, the engineers who are constantly among the people, and the Native officials from the mamlatdar (subdivisional magistrate) downwards are all agreed that the relief so given suffices for the needs of the village poor, and that no people are starving, or are likely to starve, at their homes in the villages. Sir Richard Temple's inspections quite bear out these assertions of the local officers. A good deal of private charity is being dispensed in Poona city and other towns in the interior. And wherever a municipality exists the municipal committee discreetly administer charitable relief within their borders. It is creditable to the patels and to the supervising officers, as well as to the people themselves, that the State charity administered through the village officers is not abused. It seems that the people are very loth to receive charitable relief if they can help it. And a case was related of a Poona villager in receipt of charitable relief, whose son on his return home at once and of his own motion repaid to Government the full amount spent on the relief of his mother during his absence.

7. The water-supply in some villages is short, but it is nowhere absolutely wanting. In or near the larger villages where deficiency occurs the relief officers are deepening the wells. This is specially needed for the outcast tribes (Mahas, &c.), who are not allowed to drink from the ordinary village well.

8. It seems to be generally admitted that a great number of cattle have died, and that the greater part of the residue have emigrated, some of which will die in distant pastures. The mamlatdar of Bhimthari, an officer of experience, who is much trusted by the district officers, reports that out of 72,000 head of cattle in his taluk, 44,000 have emigrated, 20,000 have died, and 7,000 are left alive. He says, however, that the cattle left and those which may return will suffice to distribute supplies of food into the interior of the districts, wherever it may be wanted.

9. The Collector of Poona has, as yet, granted no remissions of land revenue. He will continue collecting all he can; he has already collected in several taluks more than he had expected in January last; and he will suspend the demand instead of remitting in cases where eventual collection of revenue may be impossible. But in Indapur and Bhimthari much remission will have to be given; and perhaps in the end, if next season is good, the Poona remissions of land revenue may reach $3\frac{1}{2}$ lakhs as compared with 6 lakhs named in the January estimate of remissions.

Camp, Poona district, 24th March 1877.

In forwarding the accompanying memoranda of facts ascertained during my present visit to the districts of Sholapur, Kaládgi, and Poona, in the Bombay Presidency (which are the three most distressed districts), I have to record some general observations.

Sholapur,
Kaládgi, and
Poona dis-
tricts.

2. It will be in the recollection of the Government of India that on my first visit to the Deccan districts of the Bombay Presidency on the 10th and 11th of January last, I submitted several recommendations, the principal of which was to the effect that the petty village works close to the homes of the people, with easy or nominal work, on which the great majority of relief labourers were then employed, should be generally discouraged and closed wherever possible; and that the relief labourers should be concentrated as much as might be practicable on larger public works, generally at some distance from their homes, with rigid tasks under professional supervision. This principle was thought likely to prove acceptable to the Local Government, which had evinced a tendency to proceed in that direction. It has since been declared publicly to be in accordance with these views. It has certainly been acted up to during the two months and upwards which have elapsed since the above-mentioned dates with a rigour and decision which leave little to be desired, and with a result upon which, after allowance for any slight drawbacks that may be found, the Government of Bombay may be heartily congratulated.

3. On the 12th January I found 331,447 relief labourers in all, of whom 136,629 were on petty village works and 194,818 on professionally supervised public works. On the 20th March there are 209,000 relief labourers in all, of whom 34,000 only are on village works, while 175,000 are on the larger public works. In other words, whereas a moderate majority were on public works and a large proportion on village works, now the vast majority are on public works, and only an insignificant minority on village works. Again, on the 1st January, I found an universal expectation that the then large number would increase by 80 per cent. before the end of March. I find on the 20th March that the January number instead of increasing has actually decreased by 64 per cent.

4. Although the tendency of our measures has been to transfer large numbers to the public works, still even on these works there has actually been a decrease. This has arisen from the enforcement of the task-work previously ordered. Many persons came to work on task so long as they found it easy, but absented themselves when they found it becoming harder. On the Civil works the manner in which the reduction of numbers occurred was in this wise. The Public Works Department (including its general branch and its special irrigation branch) has been strongly organised with a staff of officers and of trained subordinates in the distressed districts. Professional preparations for public works on a sufficiently large scale, consisting partly of main roads, but chiefly of irrigation reservoirs (tanks) were got ready. To these all applicants (save and except those who appeared to be able to sustain themselves, for a time at least, without Government aid) were admitted. To these also all the labourers who had previously been on village works were drafted, except those who from age, infirmity, or other good cause were unable to go. The able-bodied were informed that they could no longer be employed on the village works, but that employment was available for them on the larger public works; to every person some such work at a reasonable distance was indicated; he was also informed, however, that in event of his refusing this offer he would not be otherwise employed. Very many did in fact refuse, and by so doing virtually discharged themselves from Government relief, thereby affording proof that they were not in real distress and could afford to stay away. Many, however, accepted the offer and are still serving on the public works, proving by their industry and discipline that they really need the support thus obtained.

5. The number who discharged themselves from Government relief in the manner above described were about 102,000.* They did, indeed, at first show signs of some method and system in their proceedings. They liked the village works with a lax system from which they had been discharged. They dis-

*i.e., difference between 136,000 on 12th January and 34,000 on 12th March as above stated.

liked the public works with a strict system to which it was proposed to transfer them. They imagined that by throwing themselves suddenly out of employ, they virtually offered a passive resistance to the orders of Government. Many of them endured more or less of inconvenience and privation in furtherance of a plan whereby they hoped ultimately to regain their position on the easy going village works. For so favourable an object they deemed that some suffering might be borne. They counted somewhat on

Sholapur,
Kaládgi, and
Poona dis-
tricts.

exciting the compassion of the authorities, and still more on arousing fears lest some accidents to human life should occur. They wandered about in bands and crowds seeking for sympathy. They probably did meet with sympathy, indirectly at least, in various quarters. They certainly had leaders both from among their own body and from among the employés, whose vocation had ceased from the contraction or cessation of the village works. Moreover, the village headmen (patels) are, as a class, much opposed to any system of relief works which takes the people away from their homes. This feeling may be natural on their part, but it cannot receive attention when it militates against so important a principle as the application of a definite test to a relief system in time of famine.

6. The Local Government, however, did not yield, though it did report the matter to the Government of India, apparently with a view to strengthening the position by eliciting further authoritative declarations. The Government of India, on two occasions, declared in effect that undue concessions must not be made to combinations of workpeople formed with sinister or self-interested objects; and that although Government was bound to do its utmost to save people from death by starvation, it could not always undertake to save them from death owing to their own obstinacy or misconduct. These views have doubtless helped to guide the thoughts of the people and to subdue any unreasonable hopes which may have been engendered.

7. Of those who thus deserted the relief works some returned to labour when they found resistance unavailing. But many after wandering about for a short time settled quietly in their own villages, where they still are (as I have myself seen them in several places) in a condition which, if not good, is yet not reduced. Of these it is thought that many must ere long be constrained to apply for relief.

8. On the other hand, while severity is deserved by those who try to resist the just efforts for reform and economy in the administration of relief, there are many poor ignorant persons misled by designing leaders. No exertion is spared to induce these misguided persons to accept the reasonable sort of relief which they are believed to need. To the village works only those are admitted who cannot be expected to perform the tasks set on the larger works. It was thought that these works would be more largely attended than they are. The authorities are ready to receive many more if they come, either on existing works, or upon other works which could be immediately opened. These works being of the simplest character can always be opened without any preparation. The gangs which I have inspected are exactly those whom we might expect to find, that is, they are people evidently needing assistance, strong enough to do light work near home, but not strong enough to perform the tasks of the public works.

9. For the larger works, as already stated, preparation is always needed. And this preparation has been made in case there should be any accession or influx of numbers as the season advances. After consulting the Public Works authorities I find that the works now open can accommodate 75,000 additional persons at the shortest notice. Here again, however, the rolls of the workmen do not fill as fast as was expected. Evidently the comparatively strictness of system is acting as a deterrent to keep away all save those who are truly in want.

10. Nothing can be more suitable than the character of the gangs on these works, whom I have carefully inspected in various places of these districts, numbering in all about 40,000 persons. By a suitable character I mean this, that the men and women belong to the labouring classes who are cast out of employ by dearth of employment, in consequence of the scarcity, and who really need assistance; they are able-bodied and fully equal to the hard task-work they perform; their physical condition is generally good, often it is very good, indicative of a fine peasantry which any Government may be proud to reckon among its subjects. There are some few exceptions indeed, but in almost every instance there is some satisfactory explanation as, for instance, a man is very thin, but then, though able to labour, he is suffering from some local disease, and he prefers for sake of keeping company with his relatives to be on this work rather than go to the easier village work, and so on.

11. Even to these larger works there are attached sets of weakly persons, and very young children, relatives of the able-bodied labourers, from whom they cannot well be separated. These sets receive special relief according to circumstances.

12. I have inspected many sets of persons receiving gratuitous relief from Government. These are truly miserable persons, and fit recipients of charity.

13. The same cannot always be said of the recipients of private charity in these districts, who are often persons hardly needing this form of relief. It were much to be desired that the charitable donors would consent that their charity should be administered on the same rules as Government charity.

14. The wage of 2* annas a day for an adult male (the wage of females being graduated accordingly) allowed on the public works is certainly sufficient; its sufficiency being attested by the fine physique of the majority of the labourers. Certainly, the task (slightly less than the rate for professional labourers in ordinary years) is not too much for these gangs. For some of the finest sets of these men, it is probably not quite hard enough. The wage allowed on the petty village works, equal to 1 lb. of grain a day plus $\frac{1}{2}$ anna for adult male (the wage of females being graduated accordingly, which is at least 25 per cent. less than the wage on the public works, is probably sufficient, as is shown by the fact that the labourers are looking much as they look in ordinary years. There are, I know, opinions to the contrary, but these are based on general considerations and not upon the one real ground, namely, the actual condition of the labourers. The children of all ages, even the tenderest, of the relief labourers are receiving some allowance.

Sholapur,
Kaládgi, and
Poona dis-
tricts.

15. On the whole I feel sure that in the Deccan districts of Bombay no abuse of State charity is allowed; no appreciable amount of Government money is wasted; no demoralisation of the rural classes is going on; on the contrary they are being taught the hard but salutary lesson of self-help in time of danger.

16. With this rigidity of system, and this careful restriction of relief, there must be some anxiety lest individual cases of unrelieved distress should occur and escape observation. So far as my inspection of the poorest classes not on relief has gone, it is to be inferred that they are generally in tolerable condition. Occasionally, though very rarely, I have found instances of persons whose appearance would ensure to them relief immediately on their asking for it. No doubt there is much scope for incessant vigilance. I drew attention to this on the 12th January. Subsequently when representing the same thing to the Madras Government, I sent a copy of that representation to the Government of Bombay, who in reply acknowledged the correctness of the principle and expressed a belief that it had been already carried out. And certainly I find that in the Bombay Deccan, so far as orders go, such vigilance ought to be secured. All village headmen have been warned of their duty in this matter; they frequently do give temporary relief on their own responsibility pending orders of relief officers. Lists have been made out in every village of persons likely to come within this category. European officers are posted in each one of the many subdivisions (talukas) of the distressed districts; and they, together with their Native subordinates, are constantly patrolling the villages and seeing whether the village headmen really do bring forward every deserving case or not. In every subdivision (taluka) of every distressed district there is a relief centre for the reception of these cases. The number on charitable relief is large indeed; but looking to the circumstances of the country, I should be glad to see it larger. It is, however, remarkable that many of the destitute poor are reluctant to resort to the poor-house from a feeling of self-respect which is creditable to them. Here and there, however, I have discovered persons who ought apparently to have come under the operations of these rules; and I think that the local officers cannot be too often reminded of these excellent orders.

17. I have not received any trustworthy evidence whatever that any death from starvation occurs or is in danger of occurring in these districts. But I have received much excellent evidence to the effect that nobody is dying or likely to die of this cause. Statements of an opposite description are sometimes made, but they are merely general in their terms, and are manifestly advanced in support of the view that easier terms of relief should be offered to the people. I am unable, however, to discover upon what foundation any statements that the people are starving can possibly rest. If any instance has happened within the last two months it must be very exceptional. If any instance happens now, it must be owing to some extraordinary conduct on the part of the person concerned, certainly not to any want of means of relief at hand.

18. The number of relief labourers having fallen and continued comparatively so low, the question whether it will greatly rise again is much canvassed locally. If it should rise, then the authorities are ready. I am more concerned to verify this than to debate a matter around which much uncertainty hangs, but which will, by the event, soon be placed beyond doubt. Doubtless the liberal scale, as it is now thought the too liberal scale, on which relief was at the outset administered had the effect of putting money into the pockets of the people on which they are now living. To some extent, but to a slight extent only, this may account for the decrease in numbers. The people are now

* NOTE.—This is the wage so long as grain¹ is not cheaper than 18 lbs. per rupee or dearer than 16 lbs. per rupee; when the price of food ranges beyond these limits, the wage is altered according to a sliding scale, so as to give the value of 1 lb. grain and one anna in cash to each adult male labourer who does full work.

Sholapur,
Kaládgi, and
Poona dis-
tricts.

seen to possess some self-sustaining power which is difficult to be gauged beforehand, but which proves to be greater than was at first supposed. The peasantry of these Deccan districts may be poor (as is sometimes affirmed), but they apparently can for the most part support themselves for one year notwithstanding the loss of their crops. They may have fallen into indebtedness, but still they have credit enough to obtain advances of grain from the village dealers, or others who hold stocks of grain. The grain markets continue to be very well supplied. And the price of food still ranges at 20 lbs. for the rupee, which is cheaper decidedly than a famine price.

19. As the case stands at this moment there are in the Bombay Presidency—

	Persons.
On works - - - - -	209,000
On charitable relief - - - - -	42,000
Total - - - - -	251,000

20. The fate of the cattle in all this drought is sadly uncertain. That numbers have died or will die is certain; these are probably the inferior animals. The best have been sent to the pasturage grounds of the Western Ghât mountains. We do not know exactly how they are faring there, not very well in all probability, as even those uplands have but meagre pasture in a year like this.

21. If the numbers of relief shall not materially increase beyond the present total, then there will be a considerable reduction, even below the reduced estimate of expenditure recently furnished for the Imperial budget.

22. During my first visit I drew attention to the importance of using all fair means to collect the land revenue of the current year in all the distressed districts, so far as the people could pay without undue pressure. The revenue authorities seem to have recently made and to be still making successful efforts in this direction. The loss of land revenue by reason of this famine is not thought likely to exceed 54 lakhs of rupees, and may even be less than that. It will be in the recollection of the Government of India that in the beginning of January, when the loss of land revenue was estimated at 50 lakhs, I strongly represented the expediency of not promising remission, so long as any hope of recovering the revenue should remain. Though nothing specifically was settled at the moment, the representation and the consequent agitation of the subject has evidently been of service fiscally. Another cause, no doubt, is the general improvement of the situation.

23. If these favourable anticipations shall be in any degree realised, then the famine of 1877 in the Bombay Presidency will not be so financially burdensome as was once feared. But they depend (it must always be remembered) upon an early and propitious rainfall during the coming summer. If that unhappily were to be withheld, then a fresh conjunction of adverse forces would arise.

No. 213.

LXXXV.—MINUTE by SIR RICHARD TEMPLE, dated Camp Poona District, the
24th March 1877.

Relief la-
bourers and
others in-
spected by
Sir Richard
Temple.

I desire to record a brief mention of the several gangs of relief labourers and other poor people whom I have inspected during my present tour in the Sholapur, Kaladgi, and Poona districts, and in one corner of the Ahmednagar district. I note at the same time the general impression I received of the physical condition of each set of persons whom I inspected.

2. The gangs were as follows :—

SHOLAPUR DISTRICT.

<i>Moti Bagh tank</i> - - - - -	4,000 labourers under Public Works Agency; condition of gangs, men, women, and children, decidedly good.
<i>Kambal tank</i> , 6 miles from Sholapur	200 labourers under Civil agency; condition of all fairly good.
<i>Second small tank</i> , 8 miles from } Sholapur - - - - - }	300 labourers under Civil agency; condition tolerably good.
<i>Poor of village near above-mentioned tank.</i>	200 persons; middling condition.
<i>Wurukbal road</i> , 10 miles from Sho- } lapur - - - - - }	2,500 labourers under Public Works agency; remarkably good condition.

KALADGI DISTRICT.

<i>Beejapore road</i>	-	-	1,120 labourers under Public Works agency ; good condition.
The paupers of Beejapore town and neighbouring villages	-	-	800 new applicants for work ; good condition. 2,300 persons not receiving any relief ; several of these people were much reduced, rest very poorly circumstanced.
<i>Inmates of Beejapore relief house</i>	-	-	120 persons ; infirm and old, but now fairly well nourished.
<i>Wortee road</i>	-	-	4,800 persons ; about 2 per cent. of them were in reduced condition, 15 per cent. were indifferent, rest were middling.
<i>Village poor of Wortee</i>	-	-	250 persons ; not reduced by want, condition middling.
<i>Village poor of Dholheir and other villages on the Bheema</i>	-	-	450 persons ; a very few in indifferent condition ; rest fairly good.

Relief labourers and others inspected by Sir Richard Temple.

AHMEDNAGAR DISTRICT.

<i>Dhond and Munmar Railway</i>	-	-	4,000 persons ; all of whom were in good condition.
---------------------------------	---	---	---

POONA DISTRICT.

<i>Dhond and Munmar Railway</i>	-	-	2,800 persons ; most only middling, and about one-fourth in indifferent condition.
<i>Boreebayal tank</i>	-	-	60 persons ; under Civil agency ; middling condition.
<i>Sirsophal tank</i>	-	-	3,200 labourers under Public Works Department agency ; good condition.
<i>Patas tank</i>	-	-	1,300 labourers under Public Works Department agency. 51 labourers under Civil agency ; all of them in good condition. 53 on charitable relief ; condition middling. 250 paupers of the town ; condition good and middling.
<i>Moota Canal work</i>	-	-	4,764 labourers under Public Works Department agency ; good condition.
<i>Mahtoba tank</i>	-	-	5,400 labourers under Public Works Department agency ; good condition.
<i>Khairgaon village poor</i>	-	-	200 persons ; fair condition ; only two marked as reduced by want.

Total	-	-	39,118
Add the children getting three pie a day charitable allowance on the works, all of whose condition is good, save a very few infants at the breast	-	-	5,600
Grand total	-	-	44,718

No. 188.

LXXXIV.—MEMORANDUM by DR. HARVEY, on Special Duty with Sir R. Temple, on the No. 213. PHYSICAL CONDITION of the PEOPLE in the DISTRESSED DISTRICTS of MADRAS and BOMBAY.

Keirgaon, March 25, 1877.

Having accompanied Sir Richard Temple thus far on his tour, and had the opportunity of seeing the greater part of the persons inspected by him, I beg to record at his request my professional opinion on their physical condition.

2. The persons seen have been—

- I. Those employed on relief works ;
- II. Those in receipt of gratuitous relief ;
- III. Portions of the general population not in receipt of relief.

R r 3

Physical condition of people in Madras and Bombay.

Physical condition of people.

3. 1. Those employed on relief works may be subdivided into—

(a.) Those employed under the supervision of the Public Works Department ;
and

(b.) Those employed under Civil supervision.

During the last few weeks this subdivision has to some extent meant that persons in class (a) under the Public Works Department are receiving the old rate of wages, while those in class (b) are on the reduced scale. For some time, however, most of the persons on Civil works were receiving the higher wage, and the number of persons seen who have been long enough on the lower rate for its effects to be manifest has been very small.

(a.) *Persons employed by the Public Works Department.*

4. The immense majority of persons in this class—men, women, and children, have appeared to me to be in as good physical condition and health as the average population of Upper India in ordinary times. Occasionally, no doubt, individuals have been met with, who from one cause or another, generally age, sickness, or the fact that they were sustaining others than themselves, were below par, and showed more or fewer signs of poverty or suffering ; but such cases have been quite exceptional. I should say of every gang in this class that so far as physique and condition are concerned, it was good ; and almost of every individual in every gang that he had not seriously suffered, and was in no danger of dying of starvation. It occasionally happens that young children, and especially children at the breast, are brought to the works by their parents in an emaciated condition ; but these have been comparatively few, and the condition of the children has on the whole been satisfactory.

(b.) *Persons on Work under Civil Agency.*

5. A very large proportion of the labourers in the Madras districts belongs to this class, and to a great extent the above remarks apply to them. The majority are in good condition, and in no danger of starvation ; and it is surprising to see so many apparently well-to-do people on the works. The gangs have, however, been much less level, and during the last few weeks a considerable number of the people have been receiving the reduced rate of wages. As yet, however, I have seen no signs of any general deterioration among the work-people in consequence of the reduction. The worst gangs seen were at Cuddapah on the 19th January, at a time when the full rate of wages were paid ; the best were at Goondakal on the 22nd February, just after the new rates had been introduced, but before they had had time to affect the people. The difference between these gangs was considerable. The Cuddapah people evidently belonged to a much lower class than those at Goondakal, and were inferior in physique and condition. Few or none appeared to be actually starving, but a good many were thin and pinched, and all or almost all seemed to be very poor and badly off. The majority of the Goondakal people on the other hand belonged to a class above the lowest, and were almost without exception in a very fine condition, looking as if they had undergone no suffering, nor even missed a meal.

6. The gangs seen elsewhere have been intermediate between these two, the Bellary and Kurnool gangs generally approximating to those of Goondakal, while the people on the works in North Arcot, Nellore, Salem, Coimbatore, though superior to the Cuddapah gangs in physical condition, seemed to belong to a lower grade in the social scale than many of those in the Bellary and Kurnool districts. In these districts, as elsewhere, very many persons did belong to the lowest classes, but the presence of a better class of people in large numbers gave a distinctive character to the gangs, and made their general level considerably better than those of other districts. It is probable that in every gang a certain number of persons could have been picked out who were below the average, and showed some signs of being in poor health and condition, but such anæmic persons are to be found at all times in every village throughout India, and I do not think they were much, if at all, more numerous than usual.

7. Within the last 10 days I have seen many thousand labourers in the Bombay districts of Sholapur, Kaladgi, Poona, and Ahmednagar. The great majority were employed under the Public Works Department, and consisted of able-bodied persons, presumably fit to accomplish a fair amount of task-work. They are paid on the sliding scale, and receive the value of a pound of grain plus one anna for a male adult. The general condition of these people I consider to be excellent, but some of the gangs in the Poona district at work on the Dhond and Munmar Railway were decidedly inferior in condition to those in Sholapur and to the Nagar gangs on the same work. The rate of task exacted was higher than in Sholapur, and many of the men were not earning the full

wage, which may explain why some of them were weak and thin, but they had been but a short time on the works, and it was expected that they would improve. Some 4,500 people employed on the Motee Bagh tank near Sholapur, who are now in admirable condition, are reported by the Engineer officers to have been in very poor case when taken on the works three weeks ago. They had been out of work for some time previously.

Physical condition of people.

8. The numbers on works under Civil agency in these Bombay districts are now very small, as all able-bodied persons are put on the regular works under the Public Works Department. All those seen by me were old or infirm persons not capable of doing hard work and all seemed to belong to the poorer classes. Many of them were old and feeble, some few were emaciated and seemed to have suffered from insufficient food before their admission to the works, but their general condition was satisfactory, and they did not seem to me to be worse off than such persons usually are.

9. II.—Those in receipt of gratuitous relief. People in this class are supposed to be unable to do any work; and the majority everywhere were the very old and feeble, the lame and the blind, lepers, and other sick persons. A considerable number were young children, and in most of the gangs there was a proportion of sturdy beggars and other persons quite able to work had they been so inclined. The general character of these gangs varied a good deal. In the majority there seemed to be little difference between the physical condition of the people and the usual condition of the same class of people in ordinary times. They were of course much below the relief labourers in physique and general health, but no special emaciation, or other sign of severe suffering was evident, save in exceptional cases. Many of the people at Vellore, however, and the great majority of them in the relief camps at Madras itself, were greatly emaciated and reduced, and had evidently endured great suffering. Many of the Madras people seen at my first visit were so far reduced that death was inevitable, but those seen at my last visit were not nearly so bad, and great improvement was evident in the general health and condition of those in the camps. Most of these poor people had not been employed on relief works, or been in receipt of relief until they arrived at the camps. They had left their homes without sufficient provision for the road, and had been wandering without proper food. Occasional isolated cases of a similar nature have been seen in almost every district.

10. III.—General population not on relief works. The poorer classes in various towns and villages have been paraded for Sir Richard's inspection. It has generally happened that a few persons have been found in poor condition and apparently distressed, who, for various reasons, have not applied for relief, but with these exceptions these people have seemed to be in much the same condition as those of their class on the relief works.

11. Speaking generally, and with reference to the distressed districts as a whole, I have been agreeably surprised and greatly pleased to find the people of all classes on the works, on gratuitous relief, and the poorer classes generally in much better physical condition than I expected, or than I imagined to be possible, considering the extent of the failure of crops, and the severity of the scarcity. I was at Bharatpur during the whole of the Rajputana famine of 1868-69, and although prices were very high, Bharatpur suffered so little compared to the rest of Rajputana, that it was considered to be outside of the famine limit. Yet even then the condition of the people was, I think, very decidedly worse than it now is in the distressed districts, except in the relief camps at Madras, and to a certain extent at Vellore. I have seen almost nothing to recall what were every day sights at Bharatpur in 1869. Isolated cases of severe distress have been seen, but I consider the general physical condition of the great bulk of the population throughout all the affected districts to be wonderfully good.

12. I have not seen enough of the operation of the reduced rate of wages to be able to give a positive opinion as to whether it is or is not enough to keep the people in health. I believe that it is so, provided always such person gets his own wages, and has not to share them with others. And I think the general satisfactory condition of the Bombay labourers, where the reduction is more stringently carried out than in Madras, and where more work is got out of the people, seems to show that it is so, and that no bad effects have followed its introduction.

No. 213.

No. 161, dated Adoni, the 26th March 1877.

From the SECRETARY TO SIR RICHARD TEMPLE to the ADDITIONAL SECRETARY TO THE
GOVERNMENT OF INDIA.

Land revenue
remissions.

*p. 43.

†No. 130.

‡No. 160.

§No. 173.

By direction of Sir Richard Temple, I have the honour to address you regarding paragraph 10* of the memorandum on relief affairs in Chingleput, where it was stated on the authority of the Collector that much of the arrear of land revenue of this season could be collected next year if the seasons were favourable.

2. Some time after the publication of that memorandum, I received a letter† from the Collector, stating that there must have been some misapprehension, as he had never proposed to suspend any of the land revenue, but had recommended the “absolute remission of all the revenue on dry lands” whereon there had been no crop. I then had the honour, by Sir Richard Temple’s direction, of writing‡ to Mr. Barlow, the Collector, stating what had been the impression left on Sir Richard Temple’s mind and my own by what passed when the question of land revenue remissions was discussed with Mr. Barlow, as it has been with every other Collector whom Sir Richard Temple has had the advantage of meeting. Mr. Barlow has now written§ to the effect that he was unaware it was even in contemplation to suspend the balances of land revenue; and that if he had expressed an opinion on the possibility of collecting arrears under any circumstances, his opinion must have been that such procedure was inadvisable and would ruin the already impoverished ryots.

3. In submitting these papers, I am directed to say that Sir Richard Temple has no doubt of the accuracy of the general impression left on his mind and my own by the conversation which passed with Mr. Barlow regarding the remission question. It was well known, and had been stated in previous memoranda, that it was contrary to the Madras revenue system and to the practice of Madras revenue officers to suspend instead of remitting balances of land revenue which could not be collected as part of the demand of the year. It was known that other Collectors, and it was supposed that Mr. Barlow would be adverse to changing the Madras system in this respect. But the question before Sir Richard Temple which (as it is believed) was put to Mr. Barlow, as well as to other Collectors, was this: If the seasons are good, could not much of the balance of this year be paid by the Chingleput ryots, whose assessment is on the whole very moderate? And to that question it was distinctly understood that Mr. Barlow gave an affirmative answer. Some such answer indeed must have been given, though it must have passed from Mr. Barlow’s recollection, perhaps being given in conversation it may have been made without particular deliberation. Nor did Sir Richard Temple lay any stress upon it. Mr. Barlow’s present letters make it clear that, when the answer was given as understood, Mr. Barlow would have wished to qualify it by a declaration of his opinion that the suggested procedure was inadvisable, or opposed to the Madras system.

4. As this question between the policy of remitting and the policy of suspending, in part at least, the land revenue in famine years, will have to be considered and decided for the guidance of officers concerned with future famines, it would be well that there should be no doubt about the deliberate opinion of any responsible officer, who has expressed himself on the matter. And therefore Sir Richard Temple would be glad if the same publication could be given to this letter and its enclosures, as to the previous memorandum on Chingleput.

5. It may not be out of place to add here that in Bombay, where the system of land tenure is the same as in Madras, and where the land revenue presses, at least as heavily (if not more heavily than) in Madras, the question put by Sir Richard Temple has been decided differently. Bombay Collectors in the famine country are now engaged, with much fiscal advantage to the State, in dividing off the land revenue of their districts into—

- (a.) Revenue that can be collected now;
- (b.) Revenue that should now be suspended, and may perhaps be collected in future good years;
- (c.) Revenue that must now be remitted at once.

No. 190.

Revenue, No. 27.

To his Excellency the Right Hon. the GOVERNOR-GENERAL OF INDIA IN COUNCIL.

India Office, London, March 29, 1877.

The Despatch of your Excellency in Council, dated 16th of February, No. 11 of 1877, No. 92. forwarding a summary of the principal matters which have engaged your attention in connection with the famine in Madras and Bombay since the 9th February, has been considered by me in Council.

2. Among the enclosures to the Despatch are minutes by Sir Richard Temple on the condition of Chingleput and North Arcot. In Chingleput the redeeming feature is that, in consequence of the presence of three railways in the district, the markets are well supplied with grain, but I regret to observe that the death-rate is very high in the relief camps, and that a heavy mortality among the cattle is expected, unless showers fall within the next six weeks. As this is the third bad season in the district, it cannot be regarded as matter for surprise that the Collector does not anticipate that more than half the land revenue will be realised.

3. In North Arcot, which Sir R. Temple has now visited for the second time, he found the condition of the district less favourable than he had hoped it would prove when making his first inquiries. I trust that the Government of Madras has disposed of the departmental difficulties which have delayed the commencement of certain relief works, by appointing a superior officer, as suggested by Sir R. Temple, for the general direction and control of all relief operations in the district.

4. I am glad to understand that Sir R. Temple considers the relief arrangements in Mysore to be "carefully and economically conducted," and that, in the Ceded Districts and Kurnool, "the condition of the people is fair and good, and the private trade in grain extraordinarily active."

5. I concur in the opinion expressed by your Excellency in Council and by the Government of Bombay, as to the mischief of yielding to a strike on relief works attributable to combination.

6. The question of granting remissions of land revenue in Madras has been very properly left to the discretion of the Government of that Presidency.

7. It is satisfactory that the returns again show a decrease in the number of persons on the relief works in Madras, the aggregate number being, for the week under report, 876,000, as against 908,410 in the previous week. The number of persons receiving gratuitous relief is also reduced by more than 7,000, the figures being for the present week 53,287, and for the previous week 60,402.

I have, &c.
(Signed) SALISBURY.

No. 191.

LXXXVI.—MINUTE by SIR RICHARD TEMPLE upon the Land Revenue Suspension No. 213. Question.

Gooty, March 29, 1877.

Since writing my minute, No. LIV. of the 6th March, in which I stated, among other things, that many Collectors in the Madras Presidency are in favour of the plan of suspending and not remitting the assessment on "dry" or unirrigated lands, I have seen that the Government of Madras observe in their Despatch of the 24th March that they have no knowledge of these opinions. This observation on the part of the Local Government has caused me to reconsider the statement made in my Minute above quoted, in case it should need any qualification or explanation; and I find that it does need to be further explained. If the statement were taken to mean (and it might be so read) that some Collectors appeared to me from their conversation to be in favour of suspending in the first instance the land revenue in distressed districts, leaving the question of remission for final decision when the coming season shall have declared itself—or to be in favour of making any substantial change of system—then it might need qualification. I did not exactly mean this, however, although the statement, made as it was in brief and general terms, might be so construed. I desire, however, to explain at greater length, and with more precision what I meant, and do still mean, which is this.

2. As regards what are technically called "wet" lands, that is, lands irrigated from tanks, canals, or water channels (but not wells) I never heard the Collectors express any opinion but one, namely, this, that in these cases there is a contract (which, if not expressed, is implied) between the State and the ryots to the effect that, the irrigation

remission
question.

Land revenue
remission
question.

work being under Government superintendence, there will be no revenue levied if the water be not supplied at all; if the water be supplied to a part of the lands, the revenue would be levied on that part only, and so on. But I understand that if, notwithstanding failure of the irrigation, some crop (perhaps an inferior crop) be raised on any portion of the lands in question, then such portion will be chargeable with dry or unirrigated rates.

3. As regards what are technically called "dry" or unirrigated lands (including, however, lands watered from wells), I understood and still understand that the Collectors regard the remission or suspension of the revenue in bad seasons to be a matter of grace, and not of contract at all, not even implied contract. Here, as elsewhere in India, there is a settlement of some sort; in some districts there has been a regular settlement after a professional field survey, in other districts the older settlements still run on, but in every district there is a settlement. The said settlement consists in this, that at the beginning of the agricultural year the ryot determines what fields he will give up or reap; upon those which he does keep he virtually engages to pay the settlement revenue rate. If upon the year the harvests turn out good, then the advantage is wholly his. If they turn out bad, then the disadvantage ought (in abstract justice) to be wholly his also; but practically, if the harvest is very bad, the disadvantage is partly borne by the State; in other words, is shared with him by the State. It is admitted, however, that he ought to bear as much of it as he reasonably can, inasmuch as he has enjoyed, and will enjoy, the entire advantage of good years without question or inquiry.

4. Now as regards the "dry" lands, the original estimates of remissions of revenue to be made in the official years 1876-77 and 1877-78, on account of the failure of harvests in the calendar year 1876, seemed to me to be very large, to have been framed at an early period of the distress, and to be susceptible of some alteration in favour of Government, as the out-turn of the season became more clear. And I perceived, or thought I perceived from the conversation of some Collectors, a hope that, when the actual out-turn of the whole of the crops came to be ascertained, and when the coming season (if happily it opened propitiously) should offer renewed prospects of plenty, the collection of the instalments of land revenue due on account of the winter and spring harvests of 1876 and 1877 might be considerably larger than the first anticipation, larger also than what was (as I supposed) the original estimate of the Board of Revenue. The remissions or suspensions would, in other words, be probably less than the first anticipations. Something considerable must, I knew, be remitted at the best; and this much of remission would be promised by an early date. But I gathered that some Collectors were disposed to hold in abeyance the remission of the remainder, refraining at present from collecting it and postponing decision as to its ultimate remission or collection until a future date.

5. It seemed to me to follow from this that there ought to be great caution exercised in promising extensive remissions at an early period, that is, until the summer of 1877. If a part of the revenue is not collected at present, and its ultimate collection is left undecided for some months (say till July or August next), then it is said to be suspended.

6. It was to all this that I meant to give brief expression in my minute above quoted. Whether, when conversing with the Collectors on a subject which is often obscured by technical or departmental phrases, I may have in any degree misapprehended local officers I know not. At all events, I submit that the view as above expressed was a reasonable one for revenue officers to hold. And if I supposed it to be held by the several Collectors, the supposition seemed to be consonant with the well-known rule of the Madras Presidency, which prescribes that in "dry" lands there shall be no remission save in very exceptional years, or in very exceptional cases. At present, indeed, there are many cases which come in this category. My apprehension was that (unless great circumspection be exercised) some cases might become included in this category which—in regard to the frequent occurrence of partial drought in Southern India—are not really so exceptional.

7. I quite understood that in a matter of this sort the several Collectors would look to the wishes of Government. If the Government thought that in justice to the general interests of the country and in reference to the circumstances of the ryot classes, reasonable efforts should be made to collect the revenue, notwithstanding the badness of the season, the Collectors would, I understood, be prepared to make such efforts. If the Government thought otherwise, then the Collectors would have no objection to spare the people accordingly. The case was not one for abstract opinion on the part of the revenue officers; it was rather one to be dealt with according to the view taken by superior authority of the fiscal obligation of the people and of their ability to discharge the same.

LXXXVII.—MINUTE by SIR RICHARD TEMPLE respecting the further Utilisation of the Department Public Works Agency in exacting Task-work from the Relief Labourers employed in the distressed Districts of the Madras Presidency. No. 213.

Gooty, March 29, 1877.

It has been known from the first that the difficulty in exacting task-work is one of the points to which attention has most to be directed in the Madras Presidency. Notwithstanding the many improvements which have been effected in the management of relief, the defects in the exaction of task-work continue to be very considerable. And even now there is time to make further improvements in this direction, inasmuch as two of the worst months of the scarcity remain (April and May), if the Madras Government shall be pleased to issue further orders on the subject.

Task-work
best exacted
by Public
Works De-
partment
agency.

2. The main cause of the failure to exact task-work lies in this, that the Public Works Department in each of the distressed districts is not sufficiently employed—indeed is sometimes hardly employed at all—in the tasking, an affair which is of all affairs the very one which it is most competent to manage, and which can be thoroughly managed by it alone. In Bellary and Kurnool especially (which are the two most important districts) and in other districts, the number of relief works under the Department Public Works is very small, while the vast majority of the relief works are under the Civil officers. Although these officers doubtless endeavour to the best of their ability to exact tasks, yet they cannot do so properly. Their tasking is at the best but light; and when the supervision is Native only, the tasks are too often nominal. So long as the relief works are under Civil officers only, the tasking will not be really effective. This is of course much to be regretted: it must tend to demoralisation with such large numbers as those who (despite all reductions of numbers) still remain on the relief rolls of the Madras Presidency. While the numbers remain so large, this defect may to some extent be inevitable; it may be said that the professional agency available does not suffice for the departmental supervision of hundred of thousands of relief labourers. Nevertheless that it is no reason why the Department Public Works should not be regularly employed at all in this business. It might be employed to some extent which *pro tanto* would be beneficial. It is this point then which I would bring to the notice of the Madras Government.

3. I know, indeed, that the Department Public Works staff do render some professional assistance to the Civil Officers. But such assistance is general only and not specific. In few and rare cases only is this staff really in charge of a relief work from beginning to end. As a rule they help in laying out the work and in appraising its worth after completion and the like, but they do not at all enforce task, and they are not at all answerable for the conduct of the operation or for its cost.

4. I have just visited the ceded districts once more for the examination of this particular point, as Bellary and Kurnool are the two most important of all the distressed districts of the Madras Presidency. In the Bellary district there are about 210,000 relief labourers, of whom very nearly all are under the Civil officers, and are often but inefficiently tasked, if tasked at all; but very few are under the Department Public Works, so few that practically we may say that there are none at all. Yet in that district there is an engineering establishment with officers and subordinates of various grades, who do not seem to be much occupied just now, and who are quite able, and doubtless would be most willing, to undertake the tasking of those relief labourers (within certain limits as to number) who may be made over to them. Surely, I submit, it is expedient to make use of this agency. The commencement of the earth-work on the railway from Bellary towards Dharwar is now under the Department Public Works, and the Civil officers are very properly selecting the strongest men and women from their relief gangs and making them over to Department Public Works for the railway work. These people then will be really well tasked.

5. But further I would suggest that in every taluk some particular work be selected and placed under the Department Public Works. For this work the Civil officers would pick out all the strongest men and men from the relief gangs, and these would at any rate be brought under real task. If the persons so picked out should refuse to go, they would of course be discharged. Those who were in real need would not refuse. The moral effect upon the relief labourers generally would be excellent. From local inquiry I am sure that such works could be immediately selected, and the plan could be

Task-work
best exacted
by Public
Works De-
partment
agency.

carried out within a day or two from the receipt of the orders. And after making this inquiry, I would suggest the following works :—

- (1.) The re-making of the road from Pennekonda to Gooty and Adoni, which would employ on task-work under Public Works Department officers 3,000 persons in each of the taluks of Hindupore, Pennekonda, Anantipore, Gooty, and Adoni - - - - - 15,000 persons.
- (2.) The road from Alúr to Goondacal, giving employment to 3,000 persons in the Alúr taluk - - - - - 3,000 "
- (3.) Certain tanks in Madaksirra for employing 3,000 persons - 3,000 "
- (4.) The Húbli Railway, on which, with a special establishment, up to 30,000 men can be employed from the Bellary and the four western taluks - - - - - 30,000 "

I believe that these works will be found to be the most suitable for this purpose, but if there be any doubt regarding any of them, some other ones might be substituted. Opposite each work I have entered the number of relief labourers who could probably be employed. The total amounts to 51,000 out of the total of 210,000 relief labourers in the whole district. In other words, about one-fourth of the whole could be thoroughly tasked and superintended by the professional and engineering staff: the remainder continuing under the Civil authorities.

6. Similar remarks apply, *mutatis mutandis*, to the district of Kurnool. In that district the Civil authorities indeed are beginning to make over a few out of the many relief works to the engineering staff, which will cause some very few thousands to be thoroughly tasked out of the total of 198,000 of relief labourers in the whole district. But this plan, excellent so far as it goes, needs, I would submit, to be further extended. And after local inquiry I believe that it might be so extended with the concurrence of the Engineer officers and their subordinates, and to the great convenience of the Civil officers. Over and above these advantages there is this cardinal advantage, that the strongest persons in the numerous relief gangs would be made over to be tasked by professional officers, whose profession includes the art and science of tasking. The moral effect of this will be salutary upon all the relief-seeking classes. After the local inquiry I believe that the following works might be thus treated, that is, made over absolutely to the Department Public Works. If there be doubt in any case, then some other work might be easily substituted. Opposite each work is entered the number of relief labourers who might be employed upon it; the total amounts to 52,000. In other words, more than one-fourth of the relief labourers of the district might be thoroughly subjected to task by a professional establishment :—

				Labourers.

				52,000

7. With this view, however, it would be necessary to concentrate some of the Department Public Works establishment which is somewhat scattered in this district. Individual Engineers are employed here and there in advising the local Civil officer and in helping generally towards the introduction of system in relief. They would, however, be more effectively employed, if they could be placed under the orders of their own department and upon particular works solely under their charge.

8. In my minute No. LXXV., dated 16th March, I discussed the very great advantages of professionally controlled relief works; and the object of the present minute is to show these advantages can, under present circumstances, be attained in the ceded districts. In representing this matter to the Government of Madras, I am not without precedent; for this very plan is in full force at this moment throughout the distressed districts of the Bombay Presidency; and although it may not be possible to introduce it to the same extent in Bellary and Kurnool, yet even in these districts it might be easily carried out to some extent, and to that extent it would prove most beneficial.

Task-work best exacted by Public Works Department agency.

No. 193.

XCI.—MEMORANDUM by CAPTAIN W. S. S. BISSET, on his visit to Bombay and the Nagpore District of the Great Indian Peninsula Railway.

Nos. 210.
221.

Bangalore, 31st March 1877.

According to the instructions conveyed in Sir Richard Temple's minute of the 13th March 1877, I visited Bombay on the 19th March, for the purpose of inquiring into the causes of the diminution of the supply of food grain from the north to the ceded districts, and I was present at a meeting held on the 20th March between the Consulting Engineer and the Agent and the General Traffic Manager of the Great Indian Peninsula Railway.

Grain traffic arrangements.

At this meeting a resolution* was recorded to the effect that the grain destined for the famine districts should have preference to all other consignments, and that waggons for its conveyance should be provided to the full extent indicated in Sir Richard

* A copy of this resolution has already been sent by Colonel Hancock for Sir Richard Temple's information.

Temple's minute.

2. I visited the Nagpore line of railway on the 21st, 22nd, and 23rd March and made inquiries into the accumulations of grain at each station, and also about the urgency of the demands for carriage. My notes† are appended in detail.

3. The accumulations of grain which existed in the month of January‡ had been cleared off by the middle of February; the fresh stocks§ now lying in the railway stations are much smaller than the previous ones, and they are to a larger extent than before destined for Bombay itself, probably for shipment|| to the ports on the western coast. The detention of grain at the stations is not so prolonged as formerly, but owing to the uniform demand for carriage from all parts of the Great Indian Peninsula Railway and to the large through traffic from Hindustan to Bombay, it has not been found possible to provide waggons or train-room to carry away the grain as fast as it is offered.

† On 19th January 1877 there			
were lying at Nagpore	-	-	8,500 tons grain.
At smaller stations	-	-	7,000 " "
Total	-	-	15,500 " "

§ On 21st March 1877 there			
were lying at Nagpore	-	-	1,500 tons grain.
At smaller stations	-	-	3,500 " "
Total	-	-	5,000 " "

|| The shipments from Bombay to the Southern Mahratta ports amounted to nearly 9,000 tons in the first 15 days of March. The despatches to the more southerly ports are not abstracted.

The reduced accumulations at the railway stations seem to indicate some reduction on the demand for carriage, but there have been changes in the mode of receiving goods which have tended to limit these deposits; and there seems no doubt that large quantities of grain are from various causes kept back in the bazaars and in the villages.

The brokers in attendance at the minor stations say they keep much of their grain back rather than take the risks of exposure to the weather and to the ravages of white ants during the unknown period of detention at the smaller railway stations. And for these reasons I believe that the reduction of the demand for carriage is not proportionate to the reduction in the weight of goods awaiting despatch.

4. The system of registration of goods actually deposited in the Nagpore station yard is most carefully carried out, and it appears to give the greatest satisfaction. The merchants understand it thoroughly, and they look after their own and their neighbours' allotments very sharply.

At the smaller stations some of the consignors think their claims are postponed for the advantage of senders from other stations, but they have no grounds for this belief

Grain traffic
arrange-
ments.

except their annoyance at having to wait. The only important requirement is that more goods shall be carried away, and with the present extraordinary pressure on the railway, this is the cry from all sides, and it is not perhaps much satisfaction to the merchants who have to wait to know that their goods are having, or that they are likely to have in their due turn, their proper place in the largest traffic that has ever been carried on this railway.

I have, however, ventured to suggest that instead of an undefined date for clearing off the accumulations at the roadside stations, there should be a periodical clearance, any one day of the week being fixed for each small station on which goods might be received, consigned, and despatched to such extent as is practicable. On the motion of Colonel Hancock, Consulting Engineer for Railways, this proposal has already been taken into consideration by Mr. Conder, and a decision may be expected shortly.

5. A few of the consignors at the smaller stations were loud in their appeals for waggons, not, however, to take away grain, but mainly to convey linseed to Bombay to meet contracts made for the end of March.

In the grain trade there is not at present the same prospect of large profits that there was in January, and, although there appears to be abundance of grain for despatch, there is less speculation and less anxiety for immediate transport. The anxiety is proportionate to the anticipation of profit, and the present prices in the famine districts of Sholapur and Madras give a sufficient but not a very large profit.

6. And there is a heavy demand for grain from Bombay itself, apparently of equal

The shipments from Bombay to the Southern Mahratta Ports amounted to nearly 9,000 tons in the first 15 days of March.

EXTRACT FROM NOTES.

In the week from the 15th to 21st March the despatches from Nagpore are shown below:—

	To Bombay.	To Poona and Sholapur.	To Raichore and Madras.
	Tons.	Tons.	Tons.
Linseed - - -	493	—	—
Wheat - - -	188	455	143
Jowari - - -	219		
Rice - - -	60		
Pulses - - -	65	—	—
Total tons -	1,025	455	143

On the 22nd March the consignments were—

	Tons.	Tons.	Tons.
Linseed - - -	80	—	—
Grains, &c. - -	180	176	66
Total tons -	260	176	66

urgency with the needs of the Deccan and Madras. This is evident from the figures in the margin, which show the despatches of linseed, grain, &c. from Nagpore during the seven days immediately preceding my visit. It may be necessary to explain that under the present arrangements for receiving and despatching grain at Nagpore station, these figures indicate very exactly the current demands of the several markets.

So that, although it is moderately certain that much more grain would have been despatched from Nagpore if there had been more waggons available, it is apparent that the merchants might have sent much more to the Poona and Sholapur Districts and to Madras if they had preferred doing so to sending linseed or grain to Bombay. And a very small rise in prices will again divert the flow of traffic to the south.

7. It is satisfactory to learn that although the deliveries of grain by railway have during the past fortnight been smaller than those which in the early part of the month excited some apprehension, the prices of grain have remained steady at Poona, Sholapur, and in the principal markets of the ceded districts of Madras. And it may be inferred that the requirements of grain have been estimated at too high a figure, and that the present importations are sufficient to meet the present wants.

8. The Great Indian Peninsula Railway has so much to do that it must sacrifice some of its Bombay traffic to carry more grain to Sholapur and Madras. The Government of India are arranging to augment the engine power of this railway, and in the meantime the Agent and Mr. Conder are prepared for the sacrifice, and they have arranged that the requisite number of waggons shall be provided as soon as the grain is presented.

The Madras Railway has, comparatively speaking, nothing but grain and salt to carry at present, and it is, I have good reason to believe, capable of carrying about half as much more grain as it has conveyed* during the month of March.

There is therefore every reason to hope that the railways will be equal to their share of the work, and from the evidence afforded by the recent reports there is little room to doubt the sufficiency of the means of carriage from the railways to the interior of the affected districts.

* Approximate total delivered by rail from all sources during March, 52,000 tons.

No. 194.

EXTRACT paragraph 7 from LETTER from GENERAL TRAFFIC MANAGER, to ACTING AGENT, Great Indian Peninsula Railway Company, No. 1,040, dated 2nd April 1877. Nos. 211. 256.

With regard to Jubbulpore there are 18,212 bags at the station. This is a much larger quantity than it would otherwise have been, owing to the East Indian Railway having booked grain from stations on their Jubbulpore line to Jubbulpore which was intended for Bombay. In some cases they have invoiced it through to destination, unloading it at Jubbulpore, to be reloaded into our trucks there, and in other cases, as I am informed, they have booked it as far as Jubbulpore only, both plans being contrary to the agreement and injurious to the trade; and also complicating our arrangements and causing delay. I am communicating with the East Indian Railway authorities on this matter, and, if necessary, will refer the question to you for further action. Grain accumulation at Jubbulpore.

No. 195.

LXXXIX.—MINUTE by SIR RICHARD TEMPLE regarding the Physical Condition of Relief Labourers with reference to the reduced Rate of Wages. Nos. 196. 221.

Bangalore, 3rd April 1877.

When questions arose as to the sufficiency of the revised scale of relief wages in both the Madras and the Bombay Presidency, the Government of India was pleased to depute, at my suggestion, Dr. Townsend, the Sanitary Commissioner, to visit the distressed districts and advise me whether the present rate of wages is sufficient to keep needy relief labourers in moderately good health. Dr. Townsend has now inspected more than 32,000 persons on relief works, of whom 29,000 were in the Madras Presidency; and he has drawn up a report stating his views and the grounds upon which he forms them. The reduced scale of wages.

2. I desire to lay this report of Dr. Townsend's before the Government of Madras. It will be seen that Dr. Townsend's experience and his knowledge leads him to lay little stress on the physiological argument that the reduced wage does not furnish the relief labourers with a sufficiency of certain elements of food. He prefers to decide the question, so far as decision is now possible, by investigating the physical condition of a large number of labourers of both sexes and all ages, who have been subsisting on the reduced wage for periods ranging from three to five weeks. His report and its annexure show that he found the relief gangs which he inspected to consist, in the main, of men, women, and children who were in good health and in moderately good condition. In nearly every large body of labourers he found some persons whose condition was below par. But in most of these cases he found that the sufferer's condition was referable to other causes than inadequacy of wages. Either the person had come very recently on to the works—in some cases he or she was supporting others from the subsistence wage intended for one person's support only—or the person had recently suffered from fever or guinea-worm. In some gangs a very few cases remained of persons whose reduced physical condition was not due to any other causes. But Dr. Townsend considers that the number of such exceptional cases was hardly greater than that which would be found among ordinary workpeople in ordinary years. Though Dr. Townsend has no special knowledge of the Southern India races, he has a very extensive knowledge of all classes of the people in other parts of India.

3. I am able to say that Dr. Townsend's views on this important matter coincide with mine, which have been formed after inspecting nearly 200,000 people under relief in Southern India. And my impression is that the majority of the Civil officers, the relief officers, and the engineering officers, employed in supervising relief operations in the Madras Presidency, hold the same views. Yet these officers are in no way wanting in thoughtful consideration for the people, or in energetic care in watching their condition. Of the senior Civil officers, Mr. Price, the Collector of Cuddapah, is the only one who has, to my knowledge, reported an opinion that the reduced relief wage is generally inadequate. But that view is not borne out by Dr. Townsend's inspection of some gangs at or near Cuddapah. And from my own knowledge of the relief gangs in that district, I should not be disposed to concur with the Collector.

4. Every relief officer must occasionally, as Dr. Townsend did, and as I have often done, come upon cases of relief labourers who are really reduced and who require special treatment. But I see no reason for thinking that such exceptional cases require or warrant a general enhancement of the wage rate.

5. The orders of the Madras Government, dated the 14th March, which were passed by them after conferring with me, and in which I fully concur, direct that relief officers

The reduced scale of wages

shall treat specially all cases of relief labourers who, from any cause, have fallen into a reduced condition of body. So far as my inquiries have gone, very few officers have found any cause to avail themselves of this discretion. But the humane instructions of the Government in this matter ought to be acted upon, wherever necessity arises; and if they are so acted upon, then I am confident that if the full wage* reaches punctually and not less than three times a week, then the present scale will suffice to keep in health relief labourers who do only a very moderate daily task.

6. I would therefore recommend the adoption of the opinion of the Sanitary Commissioner, Dr. Townsend, to the effect that there are not as yet any sufficient grounds whatever for any general raising of the relief wage rates in the Madras Presidency.

7. And I would again represent in the most earnest terms that, if unhappily some poor wanderers fall in a dangerously reduced condition and die, as has been the case in the relief camps near Madras, then such sad occurrences can be prevented and should be prevented, not by any general raising of relief wages, but by increased care and watchfulness in conducting house-to-house inspection, and in all the villages throughout the interior of the country, and in searching out all cases of poor creatures who wander away in search of charity and who never go upon the relief works at all.

Nos. 197.
221.

XC.—REPORT by SURGEON-MAJOR S. C. TOWNSEND, Officiating Sanitary Commissioner with the Government of India, on the Condition of the Famine Relief Labourers in the Madras Presidency.

Bangalore, 3rd April 1877.

Physical condition of labourers maintained on reduced scale of wages.

I was directed by the Government of India to proceed to Sholapur and put myself in communication with Sir Richard Temple under the following circumstances.

2. The Government of India in letter from the Additional Secretary in the Department of Revenue, Agriculture, and Commerce to Sir Richard Temple, No. 45, dated 16th January last, had laid down as the principle on which relief in the famine-affected districts of Bombay and Madras should be conducted, and while every effort should be made, so far as the resources of the State admit, for the preservation of deaths from famine, it is essential that the most severe economy should be practised, and moreover that, apart from financial considerations, it would not be just on the part of Government to attempt the task of preventing all suffering, and giving general relief to the poorer classes of the community, that indiscriminate charity on the part of Government would not only inevitably lead to the imposition of heavy and permanent burdens on the industry of the country, but would also tend to demoralise the people themselves.

3. In order to carry out the principle thus laid down, relief works were established of two kinds; one under the Department Public Works on which task-work could be exacted, and on which a full wage for a full task could be obtained by those who were able and willing to work; the other, works under the Civil administration established solely with the view of affording relief to persons who might be incapable of performing full task-work, or who in ordinary times would not undertake out-of-door labour. These Civil relief works have for the most part been established near the centres of population and conveniently near the homes of the people that would come on them. But while the Civil works form a very necessary part of the measures of famine relief, they are attended with the danger of creating difficulties in the labour market by withdrawing numbers of labourers from the usual occupation, and also of inducing a large influx of persons of both sexes who are not really in need of relief. In order to obviate this danger it was necessary to fix the rate of wage as low as possible, and to make it no more than is sufficient to maintain the applicants for relief in fair physical condition under the light amount of labour-exacted from them.

4. Up to the middle of January the rate of wage in the ceded districts of the Madras Presidency was 2 annas per diem for a male adult and proportionately less for women and children. This rate was fixed on the supposition that it would purchase $1\frac{1}{2}$ lb. of grain per diem, a quantity which was deemed essential for a man while at work. But it seemed to Sir Richard Temple that this rate of wage was too high, and that it had the effect of inducing numbers to come on the works who were not really in want, and withdrawing many from their usual occupations which were still open to them. He

* NOTE.—That is to say—

10½	annas for a man,
8½	” woman,
5½	” working child,
1½	” infant unable to work,

per week, when food is not dearer than 8 seers (16 lbs.) per rupee.

accordingly recommended in his minute of the 19th January that the rate of wage given on Civil relief works should be reduced from 2 annas to $1\frac{1}{2}$ for an adult, which at the prevailing prices would purchase a pound of grain, and leave a margin for condiments, vegetable, and the like. This recommendation was in effect adopted, and a reduced rate of wages ordered in the Madras Government order No. 329, dated 31st January 1877.

Physical condition of labourers maintained on reduced scale of wages.

5. The reduced rate was fixed so long as grain could be bought at 16 lbs. per rupee at $1\frac{1}{2}$ anna for adults, $1\frac{1}{4}$ anna for women, 9 pie or $\frac{3}{4}$ of an anna for children above seven years of age. This rate appears to have been brought into force generally on the relief works from the 15th to the 20th February. The practice is not uniform on all works with respect to payment for Sunday. On most of the works it is given; in some, as at Adoni and Cuddapah, it is not.

6. About the same time the allowance of 3 pie or $\frac{1}{4}$ of anna to children too young for labour was sanctioned, a measure which practically nullified the reduction in the case of married people with three or more children which they had been obliged to feed on the former rate of two annas.

7. In a letter to the Secretary to the Government of Madras, No. 115, dated the 13th February, Dr. Cornish, the Sanitary Commissioner for Madras, objected to the reduced scale of diet recommended by Sir Richard Temple, that it was not sufficient to maintain labouring persons in health, and that its adoption was fraught with great danger to the health of the people. Dr. Cornish's objection to the scale was founded chiefly on physiological grounds, that a pound of any of the grains used by the people did not contain the nitrogenous elements of food in sufficient quantity to supply the waste of the muscular and other tissues under labour. As Dr. Cornish's argument on this point seemed to Sir Richard Temple open to question, and as the conclusion arrived at, if acted upon, would involve a large increase of expenditure on famine relief, Sir Richard Temple deemed it advisable to ask for another opinion on the subject, and on the 16th of March I was directed to proceed to Sholapur and join Sir Richard Temple.

8. The point in question cannot in my opinion be decided on physiological grounds. It is true that some years ago the doctrine on the subject was, that muscular exertion entailed waste of muscular tissue, and that in order to compensate this waste, food containing nitrogenous principles must be supplied in proportion to the labour undergone, but later investigations have, I believe, tended greatly to modify this teaching, and certainly at the present time there is no theory on the subject so generally accepted or founded on data so incontrovertible that no economic question involving the expenditure of large sums of public money can be decided by it.

9. The question of the sufficiency or otherwise of any scale of diet can only be decided by observation of its effect on individuals and on masses of people, and observations of this kind in a time of scarcity like the present, if conducted impartially and without bias towards theories, cannot fail to contribute facts bearing on the question of the quantity of food of different kinds that is necessary to the support of the human system under certain conditions which would be of great value, from a scientific point of view, as well as for guidance in the conduct of measures of relief in future times. Observations of this kind, however, are beset with certain difficulties and sources of error, which have to be guarded against. Accurate information is wanting regarding the state of the people when they first came on the relief work, and again of their state when the rate of wages was reduced. Moreover, a knowledge of the aspect and condition of the poorer classes in ordinary times is requisite to enable one to form a just estimate of the effect that the prevailing scarcity may have had on them. I have no knowledge of the population of this Presidency, but considerable experience in other provinces leads me to believe that at all times signs of mal-nutrition are more or less visible among the poorer classes of the populations of India. A loose and shrivelled skin, a pale and anæmic aspect and emaciation will certainly follow privation and insufficient food, but the same appearances may arise from defective nutrition resulting from constitutional debility or disease. Again when famine presses hard on the population, diminutive and emaciated infants become numerous and form one of the most painful evidences of the prevailing distress; but in the best of times, if any large portion of the poorer classes were subjected to inspection, the number of these distressing objects would be considerable. Our statistics show that the rate of mortality of infants among the population of this country is as high or even higher than in the manufacturing districts of England, and it is more than probable that the number of women who are unable to nourish their infants is as numerous here as in other countries, while it is not the habit of the mothers to supplement their own defective supply by other food. In short, the scale of living among the population of this country is at all times low. Diseases resulting from mal-nutrition are common, and the rate of mortality compared with that of other countries is very high; therefore when inspecting masses of people

Physical condition of labourers maintained on reduced scale of wages.

collected from the poorer classes with the view of estimating the effects of abnormal scarcity among them, a very large allowance must be made for what may be called permanent poverty, and which it is beyond the power of Government to remove.

10. The want of accurate information as to the extent to which the people on the relief works possess sources of support, other than the daily wage given them, is another obstacle in the way of forming a correct estimate of the sufficiency or otherwise of that wage to maintain them in fair condition. Where the gangs are encamped on works away from their homes, and where the men are equal to or outnumber the women, it is probable that the majority are dependent solely on the wages they earn; but when the works are near the larger towns and the gangs are composed to a very large extent of women and children, it may be assumed that the men are earning wages in some form elsewhere, and that the earnings of the women and children are simply accessory to the ordinary means of support. On the other hand, inquiry will often elicit the fact that individuals on the works are supporting with their earnings a child or relation at home besides themselves.

11. But notwithstanding these difficulties it is possible by a careful scrutiny of large gangs of people in different localities, combined with information derived on the spot from the officers who have superintended the relief measures from the commencement and have watched the condition of the people, to arrive at a fair estimate of the extent to which the people have suffered and are suffering from the prevailing scarcity of labour and dearthness of food, and how far the measures adopted for their relief have proved successful.

12. The appended notes give the details concerning the several gangs that I have inspected in the course of my tour. I will here only direct attention to the points more particularly bearing on the question of the sufficiency of the reduced rate of wage. The first bodies of relief labourers that I inspected were at Sholapur in the Bombay Presidency. Here there were two bodies of labourers, a large body of upwards of 3,000 employed under the Department Public Works, and performing about half the task ordinarily exacted from able-bodied labourers. The men were receiving $1\frac{3}{4}$ annas, the women $1\frac{1}{4}$, and the children $\frac{3}{4}$ of an anna. Here there was no question as to the sufficiency of the food. Men, women, and children appeared in good condition, and there was no doubt on the part of the officers superintending the works that the wage was quite sufficient for the support of the labourers in health.

13. The other body of labourers was employed under the Civil authorities and numbered about 300. A large proportion of them was above middle age, and they had come on the works in January in an enfeebled state. Some of these people had improved since they came on the works, but as a body they were much lower in condition than the gangs under the Department Public Works. The wage given was in both instances the same, with the exception that the men employed on the Civil works received only $1\frac{1}{2}$ annas instead of $1\frac{3}{4}$; in neither case was payment given for Sundays, when no work was done. The lower condition of the Civil gangs was no doubt due chiefly to the circumstance that they had become more reduced before coming on the work. The average age of the adults was greater, and it is probable that at the best of times they were below the average in physique.

14. At Adoni I inspected nearly 13,000 relief labourers, the greater majority of whom had been on the reduced rate of wage for above a month. The task-work performed was very light, not more than one-tenth of the task exacted from a coolie in ordinary times. The largest gang employed on the Yemmogamir road was composed chiefly of inhabitants of the town of Adoni; the other gang contained chiefly people belonging to the agricultural population. As a rule, all these people were in fair condition, and in the opinion of the relief officer they had not deteriorated since the reduced rate of wage had been in force. There were of course exceptions, and weakly and feeble people were here and there picked out; but these exceptions consisted of persons who have never been in good health and condition, or it was found on inquiry that the individuals shared their wages with a child or other relative.

15. At Bellary I inspected upwards of 10,000 relief labourers. At the Hiliyal road, where a large body of 7,500 was employed, the men considerably outnumbered the women. Task-work was exacted, and if the task was not complete, less wage was given; and the great majority were receiving less than the reduced rate. There was, however, no sickness among them. The number whose appearance called for inquiry was very small, and the impoverished appearance of the individuals lighted on was usually accounted for in much the same way as at Adoni. The relief officer stated that these gangs had improved greatly in appearance since the works were established, and they had certainly not fallen off since the reduced rate of wage had come into force.

16. In Cuddapah I inspected two bodies of labourers; one numbering 950, employed close to the town and station, consisted chiefly of the inhabitants of the town, and the women greatly outnumbered the men; and several of these women were the wives of syces and other servants of Europeans. The daily task exacted was light and was commonly completed. In my opinion these people were in appearance little, if at all, below the standard of health common in the town populations of this country. Some were no doubt thin and anæmic, but the number was small, and in the majority of these cases the individuals had only lately come on the works or had been suffering from fever. The other gang, 800 strong, that I inspected in Cuddapah was composed chiefly of agricultural population belonging to the surrounding villages. Here also the women generally outnumbered the men, who were said to find work elsewhere. The general appearance of these people was very good. A very large number of the men and women were as stout and healthy-looking as they could be in the best of times; here and there thin and weakly persons were observed, but on inquiry it did not appear that their weak condition was attributable to want of food. The relief officer stated that when the people received the higher rate of wages they did not spend more in food than they do now, but saved the difference, and they have not deteriorated in condition since the wage was reduced.

Physical condition of people maintained on reduced wage.

17. At Vellore, North Arcot District, I inspected altogether about 3,000 people: 1,120 employed and 400 applicants for employment in the construction of an embankment on the Palaar River, may be considered as samples of the population who have not hitherto been on relief, for those employed had been collected some for about a fortnight, others for not more than a few days. The proportion of men employed here was small, being only 7 men to 28 women and children, and a very large proportion of the men were old or elderly. The task exacted here is 75 per cent. of the ordinary Department Public Works rates, and the people are paid at the following rates:—

Men	-	-	-	-	1 anna 11 pie.
Women	-	-	-	-	1 anna 5 pie.
Children	-	-	-	-	1 anna.

This is higher than the reduced rate given in other districts, and seven days' payment is given for six days' work. The elderly men were most of them of spare habit, but they were fairly muscular and their appearance healthy. The younger men were for the most part robust and in good condition. At the Sooriaghuta tank 1,600 people are employed, and here the proportion of men is very small, being only 3 to 35 women and children. This small proportion of men on the works is attributable to the circumstance that in this part of the country agricultural operations and other means of employment are not suspended to the same extent as in the ceded districts, and that the able-bodied men are for the most part employed in the occupations that engage them in ordinary seasons; but at the present prices of food their earnings do not suffice to maintain their families, and women, who in ordinary times would not undertake coolie labour, are on this account induced to come and earn additional means of subsistence on works which are conveniently near their homes. The gangs at the Sooria tank were first formed on the 24th November. From the 19th February to the 25th March they were on the reduced rate, but it has now been again raised to the same rate as on the Palaar Embankment, because the people did heavier tasks. As a body, these people were in fair condition, and so far as I was able to ascertain did not deteriorate or show signs of weakness during the five or six weeks that they were on the reduced rate of wages.

18. At the Vellore relief house 700 people who are incapable of work are fed. The proportion of men and women is about equal. Each adult male receives daily 1 lb. of dry rice cooked; 10 ozs. of this is given at 10 o'clock, and the remainder in the evening. To the evening meal is added half an ounce of dal mixed with vegetable and condiments in the form of curry. In many of these people the effects of famine are very evident, particularly among a number of people who have come in from the Kulhustri zemindari, but they are improving on the food now given them.

19. Taking the evidence that has come before me in the course of my tour, I can arrive at no other conclusion than that the rate to which the wage of the relief labourer was reduced on the recommendation of Sir Richard Temple is sufficient to support them in fair condition, provided that care is taken that the individual recipient is the only person who is supported on it. And I see no reason why the wage should be raised unless an equivalent amount of work is performed.

NOTES by DR. TOWNSEND, Officiating Sanitary Commissioner with the Government of India, deputed at the request of SIR RICHARD TEMPLE to investigate and ascertain whether the Scale of Wages now given to the People employed on the several Famine Relief Works is sufficient to support them in fair health.

Bangalore, April 3, 1877.

Reduced
scale of
wages.
Report by
Dr. Towns-
end after
inspection
of people.

Sholapur (Bombay), March 20th.—Inspected a large body of people, about 3,000, including women and children employed under the Department Public Works in excavating a large tank (Moti Bagh). The men are employed on task-work, the daily task being 54 cubic feet, or about half the ordinary task for an able-bodied coolie; for this he receives 1 anna and 9 pic. The women and children employed to remove the earth excavated receive $1\frac{1}{4}$ and $\frac{3}{4}$ of an anna respectively. No work is done and no pay given on Sundays.

Men, women, and children are in good condition. They exhibit no signs of being underfed, and there is no sickness among them attributable to insufficient food. I inspected the camps, and many of the people were preparing their evening meal; some had jowari, many wheat of a rather inferior quality, some Indian corn and jowari mixed; others bajra and toor. Salt, chillies, onions, were in common use. The young children were in very good case.

March 21st.—This morning rode out with Mr. Percival, the Collector, to visit a gang of labourers employed under the Civil authorities in excavating a tank about three miles from Sholapur. These were a much poorer lot than the gangs employed on the Moti Bagh tank. A very large portion of them were old and infirm, or in some way incapacitated for hard labour. Task-work is not exacted, and they accomplish very little in the day. The number employed here was about 300. The men receive $1\frac{1}{2}$ annas, the women $1\frac{1}{4}$ annas, and the children 7 to 9 pic. The bigger lads are reckoned as women. Children too young to work receive 3 pic each.

The greater number of these people had been on the work at the above rate of wages since the middle of January. Their condition varied considerably. Many were stout and in good condition; others were thin and weakly. The majority of the latter were old and infirm, but there were a few among the lads and young women who were undoubtedly suffering from the effects of insufficient nourishment. These cases, however, had come on the relief work very feeble and emaciated, and they had improved since. The young children were in very good condition and looked to be well cared for.

On the way back we inspected the charitable relief house, where about 200 people, old and infirm, or from other causes incapable of work of any kind are relieved. All were fit recipients of relief.

Adoni (Madras), March 26th.—Inspected with Mr. Oldham and Captain Hamilton.

1. Inefficient gang established 10 days and composed of persons who had previously been in receipt of charitable relief at the relief house, and of old and weakly persons drafted from other gangs. The number, including women and children, was 253. They were employed on light work, forming platforms for the sheds constructed near the railway station for storing grain.

Ration given—

To men	-	-	-	$1\frac{1}{2}$ annas.
„ women	-	-	-	$1\frac{1}{4}$ „
„ children on works	-	-	-	$0\frac{3}{4}$ „
„ young children	-	-	-	$0\frac{1}{4}$ „

Only the inefficient gangs receive pay or relief on Sundays.

Many old people were thin and shrivelled by reason of age. Only two old women looked weakly. There were no symptoms attributable to insufficient food. The children as a body were in very good case. Two infants, very thin and miserable-looking, had been suffering from fever.

2. A body of people numbering nearly 700 wanting work. These were mostly people who had been employed on relief works, but who had been discharged in consequence of their refusal to shift to works not more than 10 miles distant. The condition of the people was generally good, especially the women and children. The people who looked in worst condition were a few who had not been on any relief work at all.

3. A gang of 507 workpeople.—These people have been on works for some months altogether, and for one month on the reduced scale above given. As a body they appear to be in good condition. No sickness among them, with the exception of small-pox among the children. A few that we picked out as looking rather weakly had been only a few days on the works. One man had been feeding two children who were not in receipt of relief. Practically task-work is not exacted.

Five hundred cubic feet of earth-work is assigned to 50 men, which is half the ordinary task, but on measurement it is found that they execute only one-fifth of the task assigned.

4. Gangs from Sirgoopah Road, 1,208 in number, exclusive of very young children.—The condition of the women here was not so decidedly good as in the gangs close to Adoni. There was, however, nothing in their appearance to afford ground for fear that they were not now receiving sufficient nourishment. The condition of the men and the children on the other hand was very good. In some few cases men whom we lighted on as looking weakly, were found on inquiry to be sharing their ration with a wife or child at home.

5. A gang of applicants for labour, 139 in number, who had struck work on being selected for transfer to a short distance 20 days ago.—All in very fair condition. In a similar gang belonging to the Aloor taluk, 220 in number, a few persons exhibited signs of having been insufficiently fed.

6. Gang of Madaveram, 3,100, inclusive of 400 young children.—As a body, men, women, and children in good condition. Here and there where a weakly-looking individual was lighted on, it was found that he or she was suffering from fever, or sharing his ration with a relation not on the works.

7. Yemmigenoor Road.—Gang 7,000 strong, including women and children.—The greater number of these people are inhabitants of Adoni, and come out daily to the work, a distance of four or five miles. The total population of Adoni is stated to be 25,000. As a body, men, women, and children are in good condition. The young men and women with few exceptions were plump and well nourished. The exceptions consisted of persons who at no time are in good health and condition; one youth, for instance, consumptive; another had the scars of old ulcers in the thigh, and was lame from this cause; a third had a withered hand. Among the older people many exhibited that shrivelled condition of skin which is common among elderly natives of this climate at all times; but in other respects they were in good condition and looked healthy. In cases exhibiting weakness and want of nourishment the same explanation was given as in the gangs previously inspected. Either the individuals had been suffering from fever, or a child or other relation was sharing their means of subsistence with them. This was particularly the case with some of the women, for the allowance of 3 pie to each young child had not been distributed to the full extent intended by Government. The Adoni relief officers are now remedying this shortcoming.

Bellary, March 27th.—Gooty Road.—Gangs assembled on the fifth mile. The whole number employed from the fifth to the tenth mile amounts to upwards of 7,000, but the order to bring them together for inspection did not reach the relief officer sufficiently early, and not more than half were collected for inspection. The wages here given are the same as at Adoni. As a body, the people were in good condition, and a large number of the men who were stout and able-bodied were selected as fit for transfer to the Nellore irrigation works, others for the earth-work of the line of railway to be constructed from Bellary to Dharwar. Of those selected for transfer to Nellore about 50 per cent. consented to go.

Bellary, March 28th.—Hiriyal Road, sixth to eighth milestone from Bellary.—Gangs numbering altogether 7,500 * have been established three or four months. The employment consists in breaking and stacking metal and in excavating gravel. Task-work is exacted at the rate of six cubic yards from each gang, consisting of 25 men, 20 women, and 5 children; and for

* 3,750 men

3,000 women.

600 children above 7 years.

600 children under 7 years.

this task the payment is $1\frac{1}{2}$ annas men, $1\frac{1}{4}$ annas women, and 9 pie children; but very few gangs not amounting to 500 people altogether complete this task in a day and draw the full wage. The great bulk receive only $1\frac{1}{4}$ anna men, 1 anna women, and 7 pie children. The young children are allowed 3 pie each.

Rice is the food chiefly consumed by these people. Cholum is procurable in the shops where they purchase their food, but they buy rice in preference. The bazaar price of rice is 8 seers per rupee. Mr. Smith, the relief officer, showed great knowledge of the people under him and was able to give the history of a great number that we had reason to inquire about. As a body, these people are in very good condition. In walking down the long line the number whose appearance called for inquiry was very small, and in all or nearly all cases the impoverished appearance of the individual lighted on was accounted for:—

1st. A thin child through an oversight had not been registered in the list of those receiving the 3 pie allowance.

2nd. A very thin famished woman had only joined the work from a distant village two days previously.

end after
inspection
of people.

3rd. Another woman who gave the same explanation.

4th. Two brothers who had been on the work less than a week.

5th. An oldish man who had been on the work about a fortnight, and though thin had improved since he joined.

Mr. Smith, the relief officer, states that as a body these people have improved greatly in appearance since the works were established, and they have certainly not fallen off since the reduced rate of wage came into force. If on first arrival any of them are in a very bad state, they are first fed on cooked food for some days, but as soon as they are at all able they were allowed to wander on the works though without doing much, and they seemed to improve better on this plan than when kept altogether in the relief hospital. In some few cases the infants at the breast showed signs of being insufficiently nourished, but it was by no means the rule in their cases that the mother was in bad condition. At all times in a certain number of cases women will be unable to sufficiently nourish their infants.

Cuddapah, March 29th.—Inspected some gangs of labourers employed in excavation of a tank close to the town of Cuddapah. Dr. Cornish, Sanitary Commissioner for Madras, was kind enough to accompany me. They mustered 950 in all, arranged in gangs of 50, consisting of 20 men and 30 women and children. The number of children was small; the women greatly outnumbered the men, the people were chiefly the residents of the town and of villages within two miles, and the Civil Surgeon, Mr. Hyaswamy, stated that a very large number of the women were the wives of syces and other servants of Europeans. The wages given are:—

Men, 1 anna 5 pie.	Children above 7, $8\frac{1}{2}$ pie.
Women, 1 anna 2 pie.	Children under 7, 3 „

Payment is made on Sunday for six days. The daily task-work nominally exacted is 24 cubic yards of earth-work for a gang of 50. This task, which is very light, was commonly completed; but even if it were not, the wage above mentioned was generally given.

In my opinion these people were in appearance little, if at all, below the standard of health common in Native populations. Some were no doubt thin and anæmic, but the proportion in this condition was not great. In many instances individuals that struck us as being more enfeebled than others were found on inquiry to have been on the works a very short time. One of them had been on a fortnight, another came on only yesterday. A very thin weakly-looking woman had come on the works three days ago, another, a Brinjara, had been on only four days. A thin elderly man who looked weak was suffering from fever. One man, thin and anæmic, had been on the works from the commencement, but on either side of him there was a very stout strong man who had also been on the works for months.

I also inspected at Cuddapah a relief camp whereat persons coming in from the districts in a weak and enfeebled condition are supported until they become fit for work, when they are transferred to the works. The food here given is cholum and ragi mixed. Two meals are given daily at 10 and at 5, each meal consisting of 12 oz. of the above grain with condiments for an adult male. Women and children receive less. The greater number of these people were old and unequal to labour of any kind. It appeared that many of them were kept at the camp against their will; they would prefer being at large, picking up what they could by begging. No betel-nut being given was one reason why they disliked being detained in the camp.

Some of the people supported in idleness at the camp would, I think, have been more suitably provided for at the works. There was one woman, for instance, in very good condition with four children in equally good case; also a stout strong man with his family; the reason given for their being kept at the camp being that there was no one to look after the children while the parents were at work.

Cuddapah District, March 30th.—*Booja road*, three miles from Cuddapah.—Inspected with Mr. Macarthy 800 people divided into 16 gangs, each composed of 20 men, 25 women, and 5 children. The women generally outnumber the men, who find other work. The people all belong to the surrounding villages. They are employed in digging and stacking gravel. The daily task assigned is 18 cubic yards for each gang, a more severe task than is imposed upon the labourers at the tank inspected yesterday. It is, however, exacted without difficulty. The rate of wage is the same as the other gangs in the district. The labourers are paid once a week on Sunday for the six days. A considerable proportion of the people in these gangs, as well as in those inspected yesterday, belong to castes who eat meat. The Wudas kill and eat sheep and pigs but

not bullocks. The pariahs eat carrion or the flesh of bullocks and other animals that have died. The shepherds eat the flesh of sheep and goats that die.

The general appearance of the people composing these gangs was good. A very large number of the men and women were as stout and healthy looking as they could be in the best of times. Here and there thin persons in weakly condition were observable, but their history did not prove their condition to be attributable to want of food.

Reduced
scale of
wages.
Report by
Dr. Towns-
end after
inspection
of people.

Gang No. 1. Two thin men but not unhealthy looking.

„ „ 2. One spare weakly looking man states that he has been so for years.

„ „ 3. Two thin feeble men state that they have always been so; one sickly child has had fever.

„ „ 4. All in good condition.

„ „ 5. One feeble looking man states that he has always been so.

„ „ 6. The same.

„ Nos. 7, 8, 9. All in good condition.

„ No. 10. An emaciated boy has been on the works a fortnight and has improved since he joined.

„ „ 11. A thin weedy lad always so.

„ „ 12. All in good condition.

„ „ 13. A feeble man has a large spleen; is better now than he has been for a long time. Another sickly looking man has lately suffered from fever.

„ Nos. 14, 15, 16. All in good condition.

These gangs have been established from November last.

Mr. Quinlass, the relief officer, says that when the people received higher rate of wages they did not spend more in food than they do now, but saved the difference. They have not deteriorated in condition since the wage has been reduced. About 15 men who had been sent to Nellore returned again to these gangs. They said the place did not agree with them; that the water was bad and gave them dysentery. The task-work at Nellore appears to be harder and the maistries more severe upon people transferred from other works.

There were 26 applicants for work. Only one man among them, and he was a ryot, who had lost all his cattle, and having no other source of maintenance came on the works. He was a strong healthy man. The rest, all women and children, were in good condition.

Vellore, March 31st.

1. Relief gangs employed in constructing an embankment along the Palaar River, 1,120 people divided into 8 gangs of 32, in the proportion of 7 men, 16 women, and 12 children. Some of these gangs were formed on the 15th of March; others on the 21st to 23rd, and some as late as the 29th.

These people are employed on task-work, the task being 75 per cent. of the ordinary public works rates. And they are paid at the following rate:—

Men, 1 anna 11 pie.

Women, 1 anna 5 pie.

Children, 1 anna. No allowance is given to young children.

Payment is made once a week; seven days' pay is given for six days' work.

A very large proportion of the men employed were old or elderly, and many of them were of spare habit, as is very commonly the case with the Natives above the middle age, but they were fairly muscular and their appearance healthy. The younger men were for the most part robust and in good condition. The same may be said of the women. Many of the older women were thin and spare and some of them weakly looking, but the younger women were for the most part plump and in good condition. The children on the whole had the appearance of being well nourished.

There were present about 400 applicants for employment on these works, chiefly women and children belonging to the town. Of late too, a large proportion of Mussulman women have come on the works, and this is considered a sign that the distress is spreading to classes that have not been hitherto touched by it. The general appearance of the new applicants, however, did not indicate that they have been insufficiently fed.

2. Gangs of coolies, chiefly women, employed in fencing the relief camp. These gangs had been established about six weeks, and had been on the reduced rate of—

1 anna 5 pie for men,

1 anna for women,

9 pie for children.

Reduced
scale of
wages.

inspection
of people.

They appeared to me to be in very fair condition, and there was no sickness among them.

3. *Relief Camp.—Hospital.*—Forty-one patients, chiefly old people suffering from diarrhœa and dysentery, and it is probable that the per-centage of mortality among them will be high. There are about 700 people fed in the relief camps, the proportion of men, women, and children being about equal. In many of them the effects of famine are very evident, particularly among a number of people who had come from the Kalhustri zemindari, but they are now improving.

Each adult male receives daily 1 lb. of dry rice cooked; 10 oz. of this is given about 10 o'clock, and the remainder in the evening. To the evening meal is added half an ounce of dāl mixed with vegetable and condiments in the form of curry.

4. *Sooriaghunta tank.*—1,600 people employed in excavation work divided into gangs consisting of 3 men and 35 women and children. The gangs were first formed on the 24th November, and from the 19th February up to the 25th March were on the reduced rate of wages, viz., men 1 anna 5 pie; women 1 anna 2 pie; children 9 pie. No allowance was given for children too young for work.

No work is done on Sunday, but the people receive pay for that day.

As a body these people were in fair condition, and as far I was able to ascertain they did not deteriorate or show signs of weakness during the five or six weeks that they were on the reduced rate of wages.

The small proportion of men on these works is attributable to the circumstance that in this part of the country agricultural operations and other means of employment are not suspended to the same extent as in the ceded districts, and the able-bodied men are for the most part employed in their usual occupations; but at the present price of food their earnings are not sufficient to maintain their families, and women, who in ordinary times would not undertake coolie labour, are on this account induced to come on works which are conveniently near their homes and earn additional means of subsistence.

Telegram, dated April 4, 1877.

From SIR RICHARD TEMPLE, Bangalore, to REVENUE ADDITIONAL SECRETARY, Simla.

Telegraphic
summary.

Have again visited Ceded Districts and investigated matters there. Relief labourers in Madras Presidency not increasing, numbers on charitable relief slowly rising, task-work still imperfectly exacted, professional agency not sufficiently employed. I have made specific suggestion for utilising engineering staff for remedying this defect. Bellary railway work beginning, efforts to send relief labourers to East Coast Canal not yet successful. Dr. Townsend, Sanitary Commissioner, Government of India, has inspected 29,000 relief labourers on reduced wages in Madras districts, and finds their condition good on the whole. I agree in his view. Showers have fallen in parts of Madras Presidency. Impression increasing that people show more power of sustaining themselves, and that stocks and stores of grain are more adequate than was originally anticipated. Favourable rain nearly two inches has fallen all over Mysore province, doing great good for water-supply, fodder, and agriculture. Prices at Bangalore cheaper in consequence, and population inspired. Grain supply in Mysore abundant. Relief works appear adequate in Mysore, and village relief generally sufficient.

No. 199.

No. 19 of 1877.

From the GOVERNMENT OF INDIA, Department of Revenue, Agriculture, and Commerce,
to the SECRETARY OF STATE FOR INDIA.

Simla, April 5, 1877.

We replied briefly, by telegraph, on the 12th ultimo to your Lordship's telegram of the 6th idem, which requested us to obtain confidentially information as to facts alleged in a telegram, signed professedly by ryots of Sholapur and Poona, which had been received by your Lordship and others. A telegram in explanation of the facts was also sent to your Lordship on the 8th ultimo by the Government of Bombay.

Telegram from ryots of Sholapur and Poona. As to truth of facts alleged.

2. On reference to the Government of Bombay we learn that—

1st. Wages have not been reduced except on Civil agency works. Simultaneously with the reduction large works under Public Works Department were opened, on which old rates were maintained. These works are still available, and ready to take as many people as require relief and will work for their wages.

2nd. Wages on Public Works Department works 2 annas, will purchase 2 lbs. of grain while grain is dear, more when grain is cheap. Wages on Civil agency works will purchase $1\frac{1}{2}$ lbs. of grain, and so the Sabha's statement is incorrect.

3rd. Children under seven years of age whose parents are on relief works get 3 pies = 1 pice. This is an act of charity or grace on the part of Government, and is given even to infants. Children over seven years of age are employed on works, and draw regular wages according to the scale in force.

4th. Only one death is believed to have occurred from starvation.

5th. The Sarvajanic Sabha are interested in the question of remissions, as some of its members are the real owners of land in certain districts.

6th. They regret the transfer of Mr. Grant from Sholapur, as they have lost much influence by it and by the stricter system of relief which now prevails.

3. The Bombay Government report, on the subject of the authorship of the telegram, that "it was no doubt sent, as it purports to have been, by the Sarvajanic Sabha, a "political association or club, having its head-quarters in Poona and a branch at "Sholapur."

We have, &c.

(Signed) F. P. HAINES.
ALEX. J. ARBUTHNOT.

No. 200.

Revenue, No. 28.

From the SECRETARY OF STATE FOR INDIA IN COUNCIL to the GOVERNOR-GENERAL OF INDIA IN COUNCIL.

India Office, London, April 6, 1877.

Para. 1. I have considered in Council your letters of the 2nd and 9th February last, Nos. 7, 8, 9, and 10, Revenue, Famine.

Reply to Nos. 43. 44. 65. 66.

2. I have in other Despatches informed you that the Government highly approve of the measures which you have taken for the relief of distress in the Presidencies of Madras and Bombay, and have expressed their sense of the vigilance and sagacity which have marked your policy.

3. On the present occasion I propose to make some remarks upon the points in respect to which a difference of opinion has arisen between the Government of India and that of Bombay. The extent of this divergence appears to me to have been much overrated by the Government of Bombay, and in itself would hardly require any notice from me. But the emphasis which has been laid upon it by that Government makes some observations on my part necessary.

As to the difference of opinion between the Governments of India and Bombay.

4. The two points of presumed difference upon which the Bombay Government have laid stress are, the extent to which the obligation of giving relief should be accepted, and the mode in which relief labour can be most advantageously employed.

5. With respect to the first of these two points, I am unable to see the divergence to which the Bombay Government has called attention, and which, apparently, has embarrassed their decisions. I gather that these difficulties arise from seeking for an exactly defined rule, in a case where exact definition is impossible. Both your Government and that of Bombay concur in the wise and humane principle that human life shall not perish

As to the difference of opinion between the Governments of India and Bombay.

through want, when it is in the power of the State to preserve it. Both Governments are equally sensible of the necessity of guarding this rule from being wrested to the encouragement of indolence or of waste. It follows that the grievousness of destitution must be ascertained by labour tests, severe enough to deter from accepting relief all who can possibly obtain subsistence in any other way, yet not so hard as to repel those who are really starving. Special provision is requisite for the case of secluded women and of the infirm, and for the rarer cases where caste feeling makes gang labour inapplicable.

6. Any administrative rule may be damaged in argument by the suggestion of extreme cases for which it will not provide a solution. In the present instance, it is possible to ask, as the Bombay Government have done, what is to be done if you meet with a man whose love of life is so feeble, or whose dislike of exertion is so overpowering, that he had rather starve than work? Such a state of feeling cannot have been of long standing, as the subject of it must have long since died, at least if he belonged to the classes whom a few months of famine could reduce to a dependence on State aid. Of such singular exceptions, if they exist, it is only necessary to say, that they can be provided for by no rule, but must be left to the discretion of the officer who meets with them.

7. The other subject of discussion is of considerable importance, though the extent of the difference of view between your Government and that of Bombay has not in the end proved to be very large. The Government of Bombay were from an early period of opinion that the calamity should be treated as one of great magnitude, and that consequently relief works should be organised on a large scale. Proceeding on the assumption of a widespread famine, which events have unhappily justified, their policy was evidently sound. The most important argument in its favour is that effective supervision can be provided for one large work at far less cost than for many small works. The President in Council, however, upon the evidence before him, considered that the organisation of large relief works was premature, and was reluctant to sanction the commencement of undertakings which, except as famine works, the state of the finances would not justify the Government in completing. His objections were naturally fortified by the circumstance that the estimates furnished by the Government of Bombay for the works which they proposed were in some instances too imperfect to enable the Government of India to calculate the burden which their consent would throw upon the Treasury.

8. The Government of Bombay deserve great credit for the accuracy with which they foresaw the gravity of the calamity that was impending, and the energy of the measures which they took to meet it. At a greater distance from the localities where the distress was showing itself, the Government of India for some time were disposed to wait for more conclusive evidence, and in the meantime to be guided by the general principle that relief works ought to be proportionate to the distress they were intended to relieve, both in respect to duration and extent. When the evidence was more fully laid before them, the Government of India resolved to sanction a system of larger works, in view of the wider distress which it was necessary to relieve.

9. Large works admitting of the employment of a considerable number of men are more suitable for the relief of extensive calamities like the present, not only because they admit of a less costly supervision, but also because they furnish a more effective test of destitution than smaller local works. For a large work the greater number of those employed will have to move a considerable distance from their homes, and a necessity so unwelcome generally to the labouring classes in India offers a security that only those will submit to it who are forced to do so by the entire destitution of every other means of sustenance. A similar guarantee is not offered by the repair of village tanks, which are mostly accessible from the homes of those who are employed upon them.

10. In the selection of the larger works for the employment of the destitute population, it is undoubtedly desirable to prefer, where such a choice is possible, those which will be in some degree remunerative to the Treasury. I was therefore glad to learn that you had sanctioned the commencement of the earth-works of railways through the affected districts. The work, if completed as a railway, may not pay full interest upon the cost of its construction, but it will, from its first opening, contribute something towards that expenditure. A work, on the other hand, like a great road, though perhaps nearly or quite as advantageous to the inhabitants of the country through which it passes as the railway, will directly yield nothing towards defraying the yearly cost which its construction will entail upon the Exchequer. A very long period must elapse before its indirect effects will influence the revenue. Wherever, therefore, it is possible to do so, a directly remunerative work should be selected.

I have, &c.

(Signed) SALISBURY.

No. 201.

Revenue, No. 29.

From the SECRETARY OF STATE FOR INDIA IN COUNCIL to the GOVERNOR-GENERAL OF INDIA
IN COUNCIL.

India Office, London, 6th April 1877.

The Despatch of your Excellency in Council, dated 23rd February, No. 12 of 1877, forwarding further minutes and memoranda by Sir R. Temple relative to the famine in the Presidencies of Madras and Bombay has been considered by me in Council. Reply to No. 115.

2. The information contained in this Despatch and its enclosures has been, for the most part, anticipated by telegrams from your Excellency in Council. The minutes of Sir R. Temple are full of interest, and I have only to record that the intelligence to be gathered from the Despatch and its enclosures is, on the whole, more reassuring than could have been anticipated.

3. I fully concur in the praise bestowed by your Lordship in Council on the punctuality, care, and ability with which the tabular returns of the Bombay Presidency have been prepared, and I join with your Government in congratulating the Government of Bombay "on the manner in which the substantial safety of some five millions of people is being secured under circumstances of great danger."

I have the honour to be, &c.

(Signed) SALISBURY.

No. 202.

Telegram, dated 6th April 1877.

No. 213.

From SIR RICHARD TEMPLE, Bangalore, to REVENUE ADDITIONAL SECRETARY, Simla.

Doctor Townsend has inspected 34,000 relief labourers in distressed districts of Bombay and Madras; he has submitted a full minute. The final paragraph is as follows:— Taking the evidence that has come before me in the course of my tour, I can arrive at no other conclusion than that the rate to which the wage of the relief labourer was reduced on the recommendation of Sir Richard Temple is sufficient to support them in fair condition, provided that care is taken that the individual recipient is the only person who is supported on it, and I see no reason why the wage should be raised unless an equivalent amount of work is performed. I have laid Dr. Townsend's paper before Government, Madras, with expression of my full concurrence in Dr. Townsend's views. Copies have gone to you.

The reduced
scale of
wages.

No. 203.

XCII.—MINUTE by SIR RICHARD TEMPLE, explanatory of his reasons for recommending the Commencement of the Earth-work of the Conjeveram and Chingleput Railway Project. No. 221.

Bangalore, the 6th April 1877.

In memorandum No. XXVII., dated 30th January, were explained the reasons why I was then unable to recommend that the proposed railway from Chingleput to Conjeveram should be undertaken as a relief work. It was explained that the proportion of the cost that would be expended on relief wages was small, and that the financial prospects of the proposed line did not seem very good. The Conje-
veram and
Chingleput
Railway pro-
ject.

2. Since that memorandum was submitted the Government of India have been pleased to sanction my proposal that the earth-work of the Bellary and Hubli line should be begun as a relief work, without the Government being pledged to complete the line; which case establishes the principle that in a dearth of large projects for employment of relief labour the earth-work of any such project may be commenced, even though the Government may not be able at present to complete the scheme.

Further I have seen in the Madras Presidency that there is great need for large works, on which a large number of relief labourers can be concentrated under adequate professional supervision. My minutes dated the 18th and 29th March set forth the great advantages to be obtained by placing relief works under professional supervision. In Chingleput and North Arcot districts there was special need for professionally supervised works. So long, therefore, as the Government of India was not committed to the completion of the proposed line, I considered that it might be better to employ relief labourers

The Conje-
veram and
Chingleput
Railway pro-
ject.

under engineering control on a work that might hereafter be useful, than to leave them all on the scattered Civil works, whereon little real labour was exacted, and over which there was practically no adequate supervision.

3. Under these circumstances it seems to me that the conditions under which the Chingleput and Conjeveram Railway project presents itself have altered. I have now, therefore, recommended that, subject to the restriction above mentioned, the earth-work on the proposed Conjeveram and Chingleput Railway should be begun as a relief work, whether the line be subsequently completed or not. And that recommendation the Government of India has been pleased to approve.

No. 204.

Nos. 205.
221.

XCIII.—MINUTE by SIR RICHARD TEMPLE regarding the emigration of people from the Mysore Province to the relief institutions in Madras districts.

Bangalore, 6th April 1877.

Migration
from Mysore
to Madras
districts.

I have, while at Bangalore, investigated the facts regarding the emigration of people from the Mysore Province to the relief works and relief houses in British districts of the Madras Presidency. At one time there were some, perhaps many, thousands of Mysore people on the relief works in the Bellary and Cuddapah districts; and there were large bodies of Mysore labourers in the coffee districts of the Wynaad. Immigrant labourers from Mysore do indeed flock yearly to the coffee districts, and do much useful work there. This year, by reason of the scarcity, double the usual number emigrated to the Wynaad, and as the coffee crop was short there was less than the usual quantity of work to be done.

2. In my minute No. XXXVII., dated 16th February, I expressed my opinion that the distressed people of Mysore could be relieved by the Mysore Government which had made adequate provision to that end, and I advised that such people should, after receiving temporary relief, be sent back under proper arrangements to their homes.

3. If there were still at this time any considerable number of Mysore people receiving or needing relief in British districts, then I should advise that the Chief Commissioner's offer to depute an officer, who would take over such refugees, should at once be accepted. For there is no reason why the British Treasury should be burdened with the support of distressed persons from neighbouring States, which are both able and willing to relieve their own people.

4. But, as matters now stand, there seems no present need for action. The Wynaad coolie question is settling itself, for the Collector reports that the Mysore emigrants are returning to their homes. It is probable that while they were in the Wynaad they had earnings or other means of supporting themselves at least until they could recross the Mysore frontier.

5. In Bellary and Cuddapah the numbers of Mysoreans appears comparatively trifling. On the borders between provinces like Bellary and Mysore there will always be some interchange of population in times like this; and the Commissioner of the Nundidroog division recently learnt that several hundreds of British subjects from the Pennekonda division had come to the relief centres in Kolar and Bangalore, having fled from their home by reason of the cholera which was then raging.

6. Although there is no present need for action, yet, if hereafter there should be any large gathering of Mysore people on relief works, or at relief centres, I consider that early intimation should be given to the local officers in Mysore, so that the Mysore authorities might promptly take over and relieve their own people, as indeed they are very ready and able to do.

No. 205.

No. 221.

XCIV.—MEMORANDUM by MR. BERNARD, respecting Mysore people in the Madras distressed districts.

Bangalore, 2nd April 1877.

Migration
from Mysore
to Madras
districts.

The case now stands on this wise :—

Mysore declined to pay the charges which Madras might incur in relieving Mysore immigrants either by relief wages or otherwise. But Mysore offered to send and fetch back her people. Accordingly an Assistant Commissioner was sent from Kolar to Pennekonda to fetch back Mysore people who might be on the Bellary works. But

none were found in Pennekonda, and only 35 in the other taluks. So the Assistant Commissioner came back empty.

2. It was about Pennekonda that the question first arose. Subsequently Madras represented that Mysore people were surging over into Coimbatore; and specially that large numbers* of people, who had gone to the Wynaad for employment on the coffee estates, were now practically on the hands of the Madras Government, for there was no coffee labour to be had, and the people seemed disinclined to go back to Mysore. The

correspondence between the Collector and the planters shows that there is much want of roads in the Wynaad, and the present is considered a favourable opportunity of getting these roads made. The Madras Government inquired whether Mysore would contribute one-third the cost of these roads, on the ground that Mysore poor would be employed thereon and sustained thereby. Mysore declined the offer, because she too had plenty of good relief works waiting to be done, and on which in some places workpeople would not come. At the same time Mysore repeated the expression of her readiness to send and fetch her people home.

3. Madras has now replied asking that Mysore would at once send officers to fetch back her people from the Wynaad, Coimbatore, Bellary, and Cuddapah, and has begged that Mysore will take steps to prevent her people immigrating into Madras country for the future.

4. The Chief Commissioner of Mysore is now ready to send officers and will do so. The largest number of his tenants are said to be in the Wynaad; he has works close to the border to employ them, and he has relief houses along the road whereat the returning emigrants can be fed as they come along. But he anticipates that many of them will be quite unwilling to come back, if they can get easy, highly paid, work in the Wynaad. He foresees too that there will be difficulty, and there may be loss to the coffee interest if emigration from Mysore into the Wynaad is permanently checked or restricted. The Chief Commissioner has suggested that the Wynaad authorities should decide which Mysore people ought to be sent back home, and which should be kept.

Bangalore, 2nd April 1877.

Bangalore, 6th April 1877.

P.S.—After the foregoing paragraphs were written telegrams were sent by Sir Richard Temple's order to the Collectors of Malabar, Bellary, and Cuddapah, asking for an estimate of the number of Mysoreans needing relief in the Wynaad, in Bellary, and in Cuddapah. The Collector of Malabar replied that "no Mysore people in Wynaad now need relief. They are returning already to Mysore, and all say they intend returning, as crops and prospects have improved at home." The Collector of Bellary replied that he estimated "the Mysoreans on relief works and receiving gratuitous relief at not more than a few hundreds." The Collector of Cuddapah replied that he could "form no estimate," as he had "no data."

No. 206.

XCV.—MINUTE by SIR RICHARD TEMPLE on the present condition of relief affairs in Mysore.

Nos. 207.
221.

Bangalore, 6th April 1877.

I have again inquired into the state of relief affairs in the Mysore Province. I find that the total numbers on relief are now 116,000, equal to about 2 per cent. of the total population of Mysore, or about $3\frac{1}{4}$ per cent. of the population of its distressed tracts. An unusually large number of Mysore people had emigrated to the coffee districts, and though they are now coming back, yet for some months they obtained subsistence by working on the plantations. When the failure of season, which is now going on for the third year consecutively, is remembered, these numbers appear very moderate, and show, firstly, that the people must be in good condition and must have some self-sustaining power; and secondly, that the authorities are administering relief very carefully and economically.

2. The results of relief administration in Mysore still compare favourably with the neighbouring districts of the Madras Presidency, namely, the ceded districts and Kurnool, even after all the economy and reduction which have been introduced into those districts.

3. The labourers on the relief works are all employed on piece-work at rates somewhat cheaper than the piece-work rates of the Public Works Department in ordinary years.

U u 3

Migration from Mysore to Madras districts.

Condition of relief in Mysore favourable.

Condition of
relief in
Mysore.

They can earn in this way enough to support themselves, and they are in fairly good physical condition. Their earnings on piece-work are estimated to amount to 2 annas per diem for adult men. The people who receive gratuitous relief at the relief centres, also do a certain amount of light work. From the helpless poor, who are relieved at their villages through the agency of the patels (village headmen), no work of any kind is exacted.

4. I am still of the opinion expressed in my minute, dated the 14th February, that the Government of India and the Chief Commissioner may be satisfied with the progress of relief affairs in the Province of Mysore. Already favourable rain has (1st April) fallen over the whole province; prices have fallen, and the people are taking courage.

No. 207.

No. 221.

XCVI.—MEMORANDUM by MR. BERNARD on the present condition of relief affairs in Mysore.

Bangalore, 6th April 1877.

Since Sir Richard Temple was in Mysore last, the following changes have occurred in the relief operations and their results :—

- (1.) The distressed districts are much the same as before stated, except that severe distress has declared itself in the northern taluks of the Mysore district.
- (2.) The number of labourers on the relief works has increased somewhat, and so also have the numbers on charitable relief, thus :—

Name of District.	Total Number on Relief Works.		Number on charitable Relief.		Total on all Relief.	
	In January.	On 15th March.	January.	15th March.	January.	15th March.
Bangalore - - -	13,000	18,200	11,500	10,300	24,500	28,500
Municipality - - -	—	1,000	—	6,200	—	7,200
Kolar - - - - -	8,500	8,700	3,700	4,200	12,200	12,900
Tumkur - - - - -	8,900	10,600	2,100	18,200	11,000	28,800
Mysore - - - - -	5,500	9,800	3,700	1,900	9,200	11,700
Municipality - - -	—	200	—	1,600	—	1,800
Hassan - - - - -	9,700	7,100	4,200	1,400	13,900	8,500
Shimoga - - - - -	1,200	3,200	1,500	300	2,700	3,500
Kadoor - - - - -	6,300	3,000	1,400	800	7,700	3,800
Chittaldroog - - -	6,000	7,800	1,800	1,800	7,800	9,600
Total - - - - -	59,100	69,600	29,900	46,700	89,000	116,300

- (3.) Some of the increase is said to be due to the efficient village relief that is now being carried out. The Moonsiffs and Civil Court establishments are now employed on relief work, now that their ordinary business is so slack. For each distressed taluk a sufficient relief staff has been appointed; villages are really visited, and patels (village headmen) are kept up to their duty by responsible officers, whose weekly diaries show what is being done, and how useful the village relief is.

- (4.) Ample number of relief works are open and ready to be open in every district of the province.

- (5.) The importations of grain by railway into the Mysore Province has gone on increasing; they averaged 330 tons a day in January; they were 530 tons a day during the last week of March. Since the rain of Sunday (1st April) prices are cheaper, and importations have somewhat slackened. Of this total only about 30 tons a day as yet comes by the Negapatam route.

2. The Mysore Government issues every Monday a short progress report with tables showing the progress of relief operations during the week. These reports contain all necessary information as to the condition of the people and as to the relief operations.

3. I may note that Colonel Christie, Superintending Engineer of Irrigation, has recently been on tour in Chittaldroog. He tells me that he saw no emaciated people save in the relief kitchens, that the physical condition of the people on the relief works is good, and that in some cases his officers were unable to get labour for tank repairs which they wanted to carry out.

No. 208.

XCVII.—MINUTE by SIR RICHARD TEMPLE regarding the advisability of undertaking the earth-work of three short branch railways to Arcot, Vellore, and Salem as relief works. No. 221.

Bangalore, 6th April 1877.

The Government of India have asked my opinion on the suggestion that relief labour should be employed on the earth-work of three short branch railways, which have been projected to the towns of—

Arcot -	-	-	-	-	population 11,000
Vellore	-	-	-	-	„ 38,000
Salem -	-	-	-	-	„ 50,000

Arcot, Vellore, and Salem railways; commencement not recommended.

The Madras Railway line passes by each of these towns at a distance of from three to five miles. The Commission which reported on the traffic of the Madras Railway in 1875 recommended that these three branch lines should be undertaken in order to draw traffic to the railway. If the railway were now being aligned, there would be no doubt that it should be taken to Salem and Vellore, for Salem is the largest town south of Madras which this line serves; while Vellore is a great, if not the chief, trading mart between Madras and Trichinopoly. But the question now is whether it is advisable to undertake the earth-work of these branch lines as relief works.

2. I have not been able to see any detailed estimates for these lines. The Madras Government estimate the cost of the three at approximately 20 lakhs of rupees; and consider them not to be so well adapted for relief work as the Conjeveram and Chingleput line. I have traversed the lines which these three branch railways would probably take. On each of them the banks would, save perhaps at the Palar bridge approaches, be very light, and the great items of cost on the Vellore and Arcot branches would be the bridging of the Palar; for I understand that the existing narrow road bridge near Vellore would not suffice for a standard gauge railway.

3. I understand from Captain Bisset that, in default of detailed estimates, the earth-work and ballast on these branches could not be estimated at more than about Rs. 50,000 in all. This amounts to $2\frac{1}{2}$ per cent. on the total cost of the line; it is doubtful whether the work could (failing previous detailed surveys) be begun before the first week in May. And if good rains fall in May, it is most probable that relief labour would not suffice to finish even the banks and ballast. I fear that it would not be practicable to organise large gangs of skilled relief labourers (such as stone cutters of the Waddah caste) for employment on these lines, in time enough to do any considerable quantity of work before the rainy season begins.

4. Under these circumstances, however anxious I may be to find some public work on which relief labourers can be properly tasked, I hardly see how to recommend that these branch lines be undertaken as relief works. In regard to the general question whether the branch lines would pay, I attach weight to the view expressed in Mr. Elvin's dissent at page 18 of the Commission's report. And I think much inquiry should be made before the Government decide to add 200,000% to the guaranteed capital of a railway which does not pay, in order to construct branch lines which also may not pay. If any of these branch lines could be undertaken by private enterprise, as suggested by Mr. Elvin, then perhaps Government might see fit to grant some aid to the projectors of such branch railways.

No. 209.

From DR. CORNISH, the Sanitary Commissioner for Madras, to the CHIEF SECRETARY TO GOVERNMENT, Public Department, Fort St. George. Nos. 218. 245.

Madras, 6th April 1877.

I have the honour to acknowledge the receipt of two minutes dated respectively the 7th and 14th March 1877, by the Honourable Sir Richard Temple, Bt., K.C.S.I., in reference to my objections to the subsistence allowance of relief coolies being calculated on the basis of 1 lb. of grain a day, and to submit herewith for the consideration of the Madras Government a memorandum in further elucidation of the subject.

2. The Government of India, while giving every publicity to the "minutes" above referred to in the official Gazette of India has not thought proper to give a like publicity to my letter No. 115 of 13th February to overthrow the arguments of which these minutes were especially designed.

3. The subject involved is the sufficiency or otherwise of an arbitrary allowance of food to maintain the health and strength of the labouring poor. It is a practical question of the highest interest to men of science, political economists, and social reformers in

The reduced scale of wages. Dr. Cornish in reply to Sir Richard Temple.

The reduced scale of wages. Dr. Cornish in reply to Sir Richard Temple.

every part of the world, and in the interests of humanity generally I venture to express a hope that the fullest publicity be given to my own part in the discussion, as well as to Sir Richard Temple's, so that the public, and scientific men in particular, may have the subject of discussion before them.

A REPLY TO SIR RICHARD TEMPLE'S MINUTES of the 7th and 14th March as to the Sufficiency of a Pound of Grain as the basis of Famine Wages.

In a letter addressed to the Madras Government, dated 13th February 1877, No. 115, I felt it my duty to protest against a suggestion made by Sir R. Temple in his minute dated 10th January, that 16 ounces of cereal grain per diem would suffice for the maintenance of a labouring adult in health and strength.

Sir Richard Temple thought that the sufficiency or insufficiency of this grant of food was a matter of "opinion," and recommended that a scale of payment, based on the price of a pound of grain, should be tried "as an experiment" in the various relief operations throughout this Presidency, and the Madras Government had already acceded to the proposition, and issued orders for the enforcement of a reduced scale of wages, before I was aware that the subject had been before the Government. Under these circumstances there was a choice of courses before me. I might have beld my peace, and in the event of subsequent calamity have sheltered myself under the plea that the Madras Government had not done me the honour of seeking my advice before sanctioning the reduced scale of wages; or knowing from long and painful experience the risks to the population resulting from inadequate food and nourishment, and the general want of accurate knowledge of subjects by most people, I might have ventured unsolicited to sound a note of warning to the Government, and to state my opinion in terms admitting of no misunderstanding. I chose the latter course, and I am very glad that I did so, as my letter has drawn forth two elaborate minutes from Sir Richard Temple regarding the basis on which he calculated that a pound of grain a day would suffice for a labouring man, and the subject can now be discussed purely on its merits by scientific men and the public at large, quite irrespective of the official positions of the parties contributing to the solution of the problem of feeding a people with the least expenditure of life and money.

I have, of course, been an attentive reader of famine literature, to which Sir Richard Temple has been so large and valuable a contributor. His most masterly "Narrative on the Famine in Bengal and Behar in 1874" lays down with clearness and precision the data on which the importation of grain was then determined, and I need not say that I agree almost entirely with every word Sir Richard Temple then wrote in regard to the quantity and quality of the food supplies necessary for the maintenance of the health of the people of Bengal.

The only error I find, in fact, is one of an arithmetical, and not of a physiological character. Sir Richard Temple based his calculations on $1\frac{1}{2}$ lbs. of grain per head being required for a certain period for a certain proportion of the population, whereas $1\frac{1}{2}$ lbs. ought to have been taken for an adult, and half the quantity for each child under 10 years of age. The error was, of course, one on the right and humane side, but involved the provision of more than 100,000 tons of grain beyond what was necessary according to accepted physiological data.

Even so late as January 1877, in a minute written at Sholapur in Bombay, Sir Richard Temple accepted, without question, the fact that the relief wages in Bombay were calculated on the basis of $1\frac{1}{2}$ lbs. of grain per diem for an adult. It was only on his arrival in the Bellary district of the Madras Presidency that he appears to have undergone a conversion to the "pound a day" theory; but Sir Richard has not explained in the minute dated 13th January (to a portion of which I took exception) the grounds of his sudden change of opinion, and as his views in 1874 and 1877 appear to me to be irreconcilable, I can only quote them here in parallel columns, in the hope that some attempt may be made to explain them.

Sir R. Temple in 1874.

(Bengal Famine.)

"This rate ($\frac{3}{4}$ of a seer or about $1\frac{1}{2}$ lbs. per head for men, women, and children) at which grain should be provided was assumed after due consideration and discussion. The lowest diet provided in Bengal jails for non-labouring prisoners

Sir R. Temple in 1877.

(Madras Famine.)

"The present rate of wages is fixed at 2 annas per diem for an adult and proportionately lower for women and children. This rate is fixed upon the supposition that it will purchase $1\frac{1}{2}$ lbs. of grain per diem, a quantity which is deemed essential for a man while at

is equal to about 1 seer or 2 lbs. The ordinary diet of a labouring adult in Bengal is taken after statistical inquiry to be 1 seer of rice besides $\frac{1}{4}$ seer (about $\frac{1}{2}$ lb.) of fish, pulse, pepper, or other condiments. The diet prescribed for adult Bengalee emigrants on ship-board and for Bengalee sailors always exceeds 1 seer a day in total weight, and in some cases it reaches 2 seers a day. Many of the poor people for whom grain was to be provided would be labouring hard on relief works during inclement and exhausting weather. Nearly the whole of the Government provision of grain consisted of rice, which contains less strength-giving qualities than wheat and some other grains. It was known that each bag of the expected consignments of Burma rice would contain from 8 to 20 per cent. of innutritious husk. In view of all these considerations, I framed my estimates of total requirements on the basis that each person to be relieved would on the average require $\frac{3}{4}$ of a seer ($1\frac{1}{2}$ lbs. of grain) a day. In practice it was found that even to ordinary paupers, who did not do any work, local Committees had to give $\frac{2}{3}$ of a seer of rice daily besides one pie ($\frac{3}{8}$ of a penny) for the purchase of salt and condiments; to women in delicate health and to persons reduced by previous hunger a still larger daily dole had to be allowed.

Being responsible for the general character of these estimates, I feel bound to record my tribute to the utility of the census which had been carried out two years previously under Sir George Campbell—the first regular census which had ever been taken in Bengal. If the success of the prescribed plan of relief operations has in any degree depended on the framing of estimates, if these estimates have in any degree enabled the Government to make a proper forecast of the supplies, and the resources necessary to encounter the crisis, then it is to be remembered that these estimates could never have been framed had not that census existed."

work. There might indeed be a question whether life cannot be sustained with 1 lb. of grain per diem; and whether Government is bound to do more than sustain life. This is a matter of opinion, and I myself think that 1 lb. per diem might be sufficient to sustain life, and that the experiment ought to be tried. Possibly the gangs might not perceptibly fall off in condition. After a week or fortnight's experience it would be seen whether they so fall off, or not; if they were to seriously fall off, then the point could be considered."

The reduced scale of wages. Dr. Cornish in reply to Sir Richard Temple.

(11.) "The objection to the new scale, which Dr. Cornish states in detail is properly formulated by the phrase a full day's wages (that is, something more than the 1 lb. and the $\frac{1}{2}$ anna) for a fair day's work. But the phrase postulates that there is a fair day's work, which is just what the vast majority of the relief labourers do not render. Therefore they are not entitled to, and do not physically need, the full day's wage."

(14.) * * "The scale laid down appears to me to be on the whole sufficient to yield the people that subsistence which alone Government can afford. We would gladly give more if it were in our power, but we must content ourselves with saving life, and cannot pretend to prevent all forms of distress."

(16.) "Having carefully inspected during my tour in this Presidency thousands of relief labourers, I give it as my opinion that with very few exceptions, which are not, as a rule, traceable to insufficient relief wages, the general physical condition of the labourers is as good now as in ordinary years."

(17.) "In conclusion it is not possible, I submit, to determine, *à priori*, on scientific data, what amount of food is necessary to sustain the particular classes who come to our relief. The real point to be considered is whether in ordinary times they get more than 1 lb. a day for a male adult. This is an economic question which can be determined by calculating the rates of wages in the rural districts, not the wages of trained professional labourers employed by public bodies—not the wages of stalwart men of the professional class of workmen, but the men of lesser physique and lighter frame such as that of the village poor—but the wages received by the labouring poor in the villages of the interior; and then by taking the prices of common grains in ordinary years. Now from inquiries made in various districts of the Madras Presidency, I apprehend that the labouring poor in rural localities can hardly get more than 1 lb. a day for a male adult in ordinary times."

In his minute of the 7th March 1877, Sir Richard Temple declines to enter into the "purely professional arguments" advanced in my letter, further than to note "that

The reduced
scale of
wages.
Dr. Cornish
in reply to
Sir Richard
Temple.

" while no doubt abstract scientific theories of great value on the subject of public health
" are of modern growth, the Indian population with which we are now dealing have
" lived for centuries in disregard of them." I must confess that I am not quite clear as
to the meaning of the above extract. I did not put forward any "abstract scientific
theory," but merely stated a *fact*, that as the human frame, in every race and climate,
disposes of a certain amount of nitrogenous matter every 24 hours, a like amount must
be taken into the body in food to restore that waste, otherwise the tissues of the body
will gradually disappear, and that in my opinion 1 lb. of rice containing from 68 to 80
grains of nitrogen and a small money payment of six pice or three farthings, would not
suffice to enable a labourer to provide a sufficiency of nitrogenous food to restore his
daily expenditure of tissue. In reply I am told, in effect, that abstract scientific
theories are very pretty in their way, but that the Indian people who disregard them
manage to get on very well without them. But this manner of disposing of the subject
does not seem to have satisfied Sir Richard Temple, for in a subsequent "minute" dated
14th March, he endeavours to grapple with the scientific objections to his proposals.

I think, however, in dealing with this double reply, it will be more convenient if I
discuss the practical objections of the first minute here, leaving the scientific arguments
of the second minute for the conclusion.

Sir Richard Temple objects in the first place that my data refer to the case of
Europeans, and that owing to the greater size and weight of the white-skinned races, the
quantities of food necessary for Natives of India cannot be decided by European
experience. I am very sorry if I failed to make myself clear on this point, because in
paragraph 5 of my letter I expressly alluded to an important statistical inquiry under-
taken in *India* in the year 1863 regarding the nature and quality of the food of the
various classes of the people of *India*. I took an active part in this inquiry as regards
the Madras Presidency. I drew up the instructions for the medical officers who made
the investigations in the various districts, and I compiled the report in which the
observations were submitted to Government and the Secretary of State for India. I not
only did all this as regards the collection of facts from the Madras Presidency, but for
many months I made a collection of the various food grains, experimented with them
practically in my own person, as to the methods of preparing and cooking them, and
their digestibility, and I further learned by questioning all sorts and conditions of men
the average quantity of food they were in the habit of using. I did all this under a
conviction that the statistical inquiry ordered by the Secretary of State was one of vast
importance, and I took unusual trouble to attain accuracy based on actual investigation,
because I was convinced that the heavy mortality in our jails was in a great measure
due to bad and unscientific feeding, and that the only chance of improving the existing
jail diets lay in putting the evidence so clearly before Government that the deductions
would be irresistible.

But this investigation was not confined to the Madras Presidency. A similar inquiry
was made, so far as I can remember, by every Administration in India, and the results are
no doubt available for Sir Richard Temple's guidance, though in regard to many of the
provinces I never heard of the results having been published. I imagine that the
"statistical inquiry" alluded to by Sir Richard Temple in his "Narrative," and in
which the quantity of grain per adult is said to be from one to two seers per diem,
must be the one made in Bengal in 1863. I think it is much to be regretted that papers
of this kind were not at the time collected and published as a standard authority on food
supplies and Indian dietaries. There may perhaps be copies of my official reports in the
Government Offices, or in the India Office, but I do not myself possess a single copy. My
paper on "food and prison dietaries" published in Vol. VIII., pp. 1-73 of the "Madras
Medical Journal," embodies all the facts collected in reference to the nature and variety
of food supplies and the quantity of grain habitually used by the people of Southern
India.

It is not easy, therefore, to account for the mistake that my remarks had reference to
the dietaries of Europeans, when I was at special pains to point out that an independent
investigation conducted by some 20 or 30 medical officers in the Mofussil Civil stations,
and checked by my own independent inquiries and observations, showed that the mini-
mum grain allowance of a man in health and in work was not less than 24 ounces, and
that it was frequently double that quantity in favourable seasons.

Moreover, in regard to the proportion of nitrogenous to non-nitrogenous food, the
reference I made to Sir Robert Christison's labours was simply to show the standard to
which all successful dietaries should approach, and I expressly admitted that in the
food of an Indian people, the "proportions of one to three are but barely attained, and
" the tendency is always to a smaller proportion of nitrogenous food " (paragraph 4).

I referred moreover to the experience of Indian jails (paragraph 8) in which practical food experiments on many thousands of persons have been going on for a long series of years under very strict tests as to supervision and observation, with the view of showing that the food of a people was a more complex question than that of providing a certain quantity of grain.

The reduced scale of wages. Dr. Cornish in reply to Sir Richard Temple.

The whole experience I wished to bring forward on this question of food and health was Indian experience, and I am surprised that Sir Richard Temple, who knew so well in 1874 what the ordinary food of the people was, should write as if there had never existed any periodical medical literature in India, or that he should ignore the fact that every Indian medical authority who has written on the subject of food for prisoners is opposed to his recent opinions. One might think from Sir Richard Temple's minute that men like Leith, Chevers, Ewart, Bedford, Strong, Mouat, Fawcus, Irving, Forbes, Watson, Mayer, Lyons, myself, and many others, whose papers I have not immediately at hand to refer to, had never thought out the subject of feeding in its practical and scientific aspects, and that jail and other diets in India had been constructed without reference to the nutritious quality of the food-grains, or to the proportions of the various kinds of food. It must be abundantly clear to the Government that, if this new theory of Sir Richard Temple is correct, viz., that 1 lb. of grain and a small money payment equivalent to three farthings is enough to keep a man in health and strength while undergoing a fair daily task, then every Administration in India has been for years past inciting people to break the law by providing criminals with a dietary beyond their actual necessities, and all the carefully recorded experience of the last 30 years, as to the effects of food on health in Indian jails, must be discarded as worthless.

I shall have occasion to show, however, that the carefully built up experience of the past must be our guide in this matter, in preference to the mere "opinion" of a gentleman who apparently unconscious of the cruelty involved in his proposals, would desire to begin a huge "experiment" on the starving poor of this country, at a time and under conditions which would prevent the results of that "experiment" ever being tested and recorded.

What in fact was the proposition of Sir Richard Temple's to which I took exception? It was this: "There might indeed be a question whether life cannot be sustained with 1 lb. of grain per diem, and whether Government is bound to do more than sustain life. This is a matter of opinion, and I think that 1 lb. per diem might be sufficient to sustain life, and that the experiment ought to be tried. Perhaps the gangs might not perceptibly fall off in condition. After a week or fortnight of experience, it would be seen whether they so fall off or not."

If it were not so serious a matter as a blind experimentation on the limits of human endurance, it would be amusing to note the method by which Sir Richard Temple here proposes to test the results. "After a week or fortnight of experience" he says "it would be seen whether the gangs fall off perceptibly in condition." Now what are the conditions abroad in the country by which such an experiment could be subjected to those rigorous tests which would satisfy practical men, as well as scientific men? Our relief works are scattered over many thousands of square miles of country, they are but indifferently supervised, and in no instances are the Native supervisors qualified to test the results of any special system of feeding or payment as regards the health of the people. To record the results of such an experiment with the accuracy required, it would be essential to weigh every individual of a gang, to enter their names and weights in columns, and to repeat the weighing week by week for a period of several months, to note also the condition of each individual, week by week, as to anæmia, pulse, tongue, heart's action, muscular power, &c. An "experiment" of this nature might be carried out as regards a few persons under the constant observation of a medical man, aided by careful assistants, but it is obvious that the results on a large scale according to the tests proposed by Sir Richard Temple could never be ascertained. Sir Richard Temple does not seem to be aware of the fact that "a week or two" of low living, while doing much mischief, might still give no results measurable by the eye or by weighing.

There is nothing more remarkable in connexion with these famine relief works than the sudden changes and fluctuations in the "personal" of gangs. The people inspected one day may be away the next. The people falling ill and unable to work are replaced by others, and there is never any certainty that two inspecting officers going over the same ground, within a short interval of time are seeing the same people. Any comparison of their observations or reports therefore can scarcely be gone into profitably, while this uncertainty exists in regard to the identity of the individuals composing the gangs.

The reduced
scale of
wages.
Dr. Cornish
in reply to
Sir Richard
Temple.'

There is, however, a rough and coarse test of the results of the reduction of wages which may commend itself to the notice of Government. It is that while the numbers paid for, and supposed to be employed on, relief works in the first week of February were 907,316, they fell in the last week of March to 662,195, and that the numbers "too weak for work, requiring cooked food in relief houses," had increased from 38,163 in the first week of March to 99,113 in the last week of the same month. From my recent inspection in Maddanapully and Royachoti, I found these helpless and infirm people were increasing at the rate of more than 100 a day at each relief house, they continue so to increase, as I think it but too probable, the numbers to be fed in the Cuddapah district will probably reach 20,000 within the next two months, instead of 3,294 as in the last week of March. I leave it for others to determine whether the policy of substituting a bare subsistence wage on relief works has, or has not, contributed to the enormous increase of the sick and feeble, and of the gratuitous feeding throughout the distressed districts.

Sir Richard Temple is of opinion that the task-work required of coolies who are paid on the lower scale is very nearly equivalent to a condition of rest, and that the scale of food necessary for persons in a state of idleness will very well suit those who only execute light work.

The condition of the labouring gangs varies very much in the several localities. Some have very little distance to go to their labour, and in such cases the collection of half a cubic yard of road material may not involve any unusual exertion. But even in these cases I have seen work attempted when the ground was as hard as iron, and with tools much too heavy for the strength of those who had to wield them, and officials of the Public Works Department have told me that in their contract rates, no coolies would ever think of attempting work of this kind, except when the ground had been softened by rain. In such cases the bodily wear and tear of moving half a cubic yard of material, or executing 50 per cent. of a Department Public Works task, is considerable, and especially in the case of weakly gangs.

I have seen moreover very wretched and enfeebled creatures in the gangs who have come distances of four, six, and even eight miles to their work, some of them dragging their children to and fro with them, and I have no hesitation in stating that when these walking distances and carrying weights are taken into account with the day's work, that the expenditure of force is far ahead of its replenishment in the shape of food wages.

Sir Richard Temple states that his lowest scale of wages will permit in most instances of men buying $1\frac{1}{2}$ lbs. of grain in addition to condiments and some other nourishment, but, however, this may be the case in the Bellary district or in certain stations on the line of railway which I have not yet inspected, it is not so in the upland taluks of North Arcot and Cuddapah. At Goorumkonda the other day the bazaar price of rice was only 13 lbs. the rupee, and at Royachoti about 14 lbs., so that 1 anna would not purchase even a pound of grain.

The mode of calculating the wages of the coolies too in some districts has practically the effect of reducing the earnings of men from 1 anna 6 pie to 1 anna 5 pie or 1 anna 4 pie, and what with deductions for short work, and the "customary tribute" to the gangsmen, there is reason to fear that in a very large proportion of cases the labourers do not get anything like the whole of the reduced wage.

Sir Richard Temple has, however, made a most important concession to the famine labourers in consequence of my protest, and if no other good has resulted, I feel bound to thank him for the consideration given to the last paragraph of my letter, in which I pointed out that a man must *eat*, even if we give him no *work* on Sundays, and that a subsistence wage ought not to be shared with young children. Practically, there is now very little difference between Sir Richard Temple's wage rate and my own recommendations. I have contended, and given reasons for considering, that the basis of a pound of grain for a labouring man was unsafe, especially when that wage was paid only for six days in the week, and when helpless children had to share in the food. Sir Richard Temple admits the weakness of this portion of his scheme, and by conceding additional help to feed the young, has of point in fact yielded all that I felt justified in urging.

According to my observation, though the ordinary wage rate of 2 annas, 1-6 and 1 anna, for men, women, and children respectively, may in some districts be too little to procure a sufficiency of nourishing food to keep up health, yet in times like these the people are ready enough to work for wages cheerfully and with a good heart, getting payment for and doing work only on six days in the week. Whatever deficiencies in their food there may be, they supplement in their own fashion by using articles that, though not in general use, may help at a pinch to sustain life, such as the seeds of the

bamboo, tamarind, &c., the pith of the aloe plant, and certain jungle leaves like the *Sethia Indica*.

The actual wage receipts of a family of man, wife, and four children, on the old and amended new scale of wages is given below :—

Ordinary Scale.

			Rs.	A.	P.
Man -	-	- 6 days at 2 annas	0	12	2
Woman -	-	- „ 1½ „	0	9	0
Two children -	-	- „ 1 „	0	12	0
Two children under 7 years of age	-	-	—	—	—
Total per week			2	1	0

Sir Richard Temple's Amended Scale.

Man -	-	- 7 days at 1½ annas	0	10	6
Woman -	-	- „ 1¼ „	0	8	9
Two children -	-	- „ ¾ „	0	10	6
Two children below 7 years, relief grant	-	- „ ¼ „	0	3	6
Total per week			2	1	3

From this comparison it will be seen that in the case of a man with a family of four children, two of whom are workers and two non-workers, he is actually better off by 3 pie per week under Sir Richard Temple's modified reduced wage than he was when working six days in the week for ordinary wages. Mr. West, C.E., in charge of the Cheyar Embankment Works, informs me that to meet the views of the district authorities and to avoid the appearance of competition in the labour market, he has reduced his rates from the ordinary 2 annas to the modified scale of Sir Richard Temple's, and paid for the Sundays, and that practically his disbursements per head average just the same as before.

The great financial saving therefore of over so many lakhs of rupees is not likely to accrue from the introduction of the new scale of wage. It has given intense dissatisfaction to the labouring people, who could not, or would not, comprehend its terms; it has opened the door for abuses of various kinds, and it has not tended to economy in disbursements.

In some gangs near Cuddapah the other day I saw several women labourers encumbered by three or four children under age, who had been brought to secure the pittance granted under the recent modification of the rules. These children are of course much exposed all day, and distract the mother's attention from her work. The present system can be good neither for the mother nor the children, nor is it economical to the Government, according to the experience of Mr. West, who has tried both systems, and according to the typical case I have given.

Sir Richard Temple asks if I will admit that a pound of grain a day is sufficient to maintain an adult Native of India in a "state of rest." In reply, I have to state that I do not know of any cereal grain which would give a sufficiency of albuminous matter in a pound weight to replace the daily waste of nitrogen from the adult Native body, and consequently I am unable to admit any such proposition. The "evidence" adduced by Sir Richard Temple in regard to this matter is in reality no evidence at all. Sir Richard says that in the Vellore relief camp Dr. Fox and Captain Harris were agreed that men had so improved on 1 lb. of grain; but when I came to inquire into this matter I found that the "evidence" rested on general impressions, and not on periodical weighing and individual record of weight from time to time.

Even in the "weight test" some caution is necessary, for many of the people who come into camps appear to be filling out and fattening, when in reality they are getting dropsical and in a fair way to die. I can easily understand that the people in the Vellore camp did better on 1 lb. of grain per diem than they did on 12 ounces, which was the scale in use until a few weeks ago, when Dr. Fox urged an increase.

I have thought it safer and more prudent in this matter to fall back on our experience in dieting non-labouring prisoners, and to recommend 20 ounces or 1¼ lbs. of cereal grain besides dhall, vegetables, condiments, &c. for adults fed in relief camps, and this allowance is now sanctioned by Government, and should be, I think, a minimum allowance, considering how much tissue these poor creatures have to repair before they can be brought into a state to do a day's work.

The reduced scale of wages. Dr. Cornish in reply to Sir Richard Temple.

The reduced
scale of
wages.
Dr. Cornish
in reply to
Sir Richard
Temple.

In a paper recently brought to my notice by Surgeon-General G. Smith, I find that at Nellore, Surgeon-Major A. M. Ross has been weighing coolies on relief works, and that their average weight is below that of average "under trial" prisoners in jail. Thus—

<i>In Jail.</i>		
Men.	Women.	Children.
109·1 lbs.	92·3 lbs.	70 lbs.
<i>Relief Works.</i>		
94·3 lbs.	77·6 lbs.	46 lbs.

These weights appear to indicate much wasting, but the weighings will be continued and reported on from week to week.

In the last paragraph of his minute of the 7th March, Sir Richard Temple states his belief that the labouring poor in Madras in rural localities can hardly get more than 1 lb. of grain a day for a male adult in ordinary times. The inquiries on which this belief is founded were made, I apprehend, by Sir Richard Temple himself in the course of his rapid journeys through the country.

But I would submit to any impartial person whether inquiries made in this way to satisfy a foregone conclusion can be compared in value with the careful statistical inquiry undertaken calmly and deliberately in the years 1862 and 1863, and which inquiry furnished the basis for all our subsequent arrangements in the dieting of the people under circumstances where they cannot have any voice in the choice of their own food. Most people in India are acquainted with the sort of answers a high official personage will get in reply to leading questions, and if Sir Richard Temple thinks he has got at the truth in this matter, I can assure him, after a close practical study of the food of the people of Southern India for the last 15 years, that he is utterly and entirely mistaken, and that so far from the labouring adults living upon a pound a day, they eat on the average nearly double.

The following is what I wrote on this subject 15 years ago. With my great opportunities of inquiry in regard to the civil population, jails, hospitals, soldiers' rations, &c., during the past 15 years, I have nothing to add or alter.

"A free labourer, if he has the means, will use from 32 to 40 ounces of cereal grain (cholum, cumboo, ragi, or rice), about 2 or 3 ounces of dhal, a similar quantity of meat, or fish, and fruits or vegetables in addition.

"From numerous personal inquiries I should be inclined to reckon the average consumption of cereal grain per diem of an adult labouring man is rather under than above 30 ounces.

"The greater variety of food and its more liberal use by the free population depends very much upon the means of the individual, as well as upon the supply of food in the district. In times of famine and drought, after repeated failure of crops, the quantities of grain given as the probable daily consumption of a healthy man would be very much reduced, and in such seasons the jail diet would be superior to that of the greater number of the labouring poor. This is still too often the case. In years of scarcity grain robberies and petty thefts are very prevalent, and many of these offences are committed with the express object of securing the jail rations as a remedy against starvation. At such times the want of due nourishment is painfully evident in the attenuated bodies of the poor. Many die from the immediate effects of starvation, while the great bulk of those who live to struggle against famine have the vital powers so reduced that they are predisposed to suffer from the ravages of cholera and fever. The connexion between famine and pestilence, the following of the latter in the wake of the former, has received many a practical illustration in the 'records of Indian history within the present century.'—(*Cornish on Food and Prison Dietaries, Madras Medical Journal, Vol. VIII., page 83.*)

I now come to the consideration of Sir Richard Temple's second minute of the 14th March, in which he enters upon the scientific questions involved in my objections to his diet scale.

In this minute Sir Richard Temple observes, paragraph 6:—"The opinion that one pound a day of grain might suffice for a relief labourer, together with some allowance for condiments and the like, or some nutritious substance, was not indeed based on scientific theory. It was founded rather on probabilities practically deduced from the condition of the poorer classes in ordinary times, and on the results of general experience."

I think it would have been more to the point if Sir Richard Temple had given something a little more precise than the vague term "general experience." I may ask, in return, whose experience? Not Sir Richard Temple's, surely; for in 1874 he assures us that the people in Bengal habitually use from 1 to 2 seers of grain (2 to 4 lbs.) per adult, and that even the people in relief houses, doing no work, got $\frac{2}{3}$ of a seer ($1\frac{1}{2}$ lbs.). Sir Richard Temple records nothing of his travels in Bombay showing that the people on relief works there lived on a pound of grain a day. It was only on his arrival in the Bellary district that he evolved this strange doctrine, that a Madrassese could do what the people in no other part of India can,—thrive on 16 ozs. of cereal grain a day.

I know of no other "general experience" bearing on this question and favourable to Sir Richard Temple's view. Sir Richard Temple appears to consider Sir Robert Christison's opinion to be entitled to a respectful hearing, and I may therefore be allowed to make a further quotation from that venerable and accomplished author's remarks on the diet of the British soldier during the Crimean war.

"Experience has shown that the most successful dietaries for bodies of men, deduced from practical observation, contain carboniferous nitrogenous food in the proportion of about three of the former to one of the latter by weight. During 22 years that my attention has been turned to the present subject, not a single exception has occurred to me.

"Hence it is obvious that the least weight of food in the rough state will be required, first, when there is the least moisture and cellulose tissue in it, and, secondly, when the carboniferous and nitrogenous principles are nearest the proportion of three to one.

"Of the various nutritive principles belonging to each set, some may replace one another; some are better than others; some are probably essential.

"Two things, however, are certain, that nitrogenous may replace carboniferous food for supporting respiration, though at a great loss, but that carboniferous food (without nitrogen) *cannot replace nitrogenous food for repairing textural waste.*

"Dietaries are never to be estimated by the rough weight of their constituents, without distinct reference to the real nutriment in them as determined by physiological and chemical inquiry."

Keeping these principles in view, and with the help of a simple table it is not difficult to fix the dietary advisable for any body of men, according to their occupation. It is also, in general, easy to detect the source of error in unsuccessful dietaries. For example, any scientific person conversant with the present subject could have foretold as a certain consequence sooner or later of their dietary, that the British troops would have fallen into the calamitous state of health which befel them during their last winter in the Crimea.*

Remarks of this nature, from so eminent an authority as Sir R. Christison, ought to make unskilled constructors of dietaries in famine times somewhat modest in respect to their knowledge. It should make them especially cautious in the enunciation of new and strange doctrines, such as "that the amount of nitrogen required by Natives must be much less than that required by Europeans" (paragraph II. of minute).

This is really the crucial test of the whole question, and I am afraid it cannot be definitely settled on the *ipse dixit* of Sir Richard Temple. In the scientific world we are accustomed to ask that any one bringing forward a new theory shall state the facts on which his theory is based; and in this case it would be quite fair to ask Sir Richard Temple whether by himself, or with professional aid, he has endeavoured to test his theory by estimating and measuring the amount of nitrogen which Natives of ordinary size and weight eliminate from their bodies. The investigation is one of, by no means, a difficult character, and no one has any right to bring forward such a theory in proof of the sufficiency of a scale of food without first ascertaining, by repeated investigation and experiment, that the nitrogen excreted by Natives is proportionately less than in Europeans. The consequences of our accepting such a theory, without the clearest and plainest proof, might be most disastrous, and the *onus probandi* remains with the originator of the theory.

I almost wish, in regard to Sir Richard Temple's reputation as a gentleman of many and varied accomplishments, that he had spared me the difficulty of dealing with his "crucial tests" in paragraphs 11 and 12, as regards the alleged discrepancies in theory and practice as to the amount of nitrogen necessary to a successful dietary. It is not a pleasant thing for one in my position to point out errors of comprehension on Sir Richard Temple's part; but however painful the operation, it must be done. Sir Richard Temple quotes from the *Madras Manual of Hygiene*, a work of admitted excellence, by

The reduced scale of wages.
Dr. Cornish in reply to Sir Richard Temple.

* Observations on a report by Sir J. McNeill, relative to rations for soldiers.

The reduced
scale of
wages.
Dr. Cornish
in reply to
Sir Richard
Temple.

Surgeon-Major H. King, M.B., the composition of a scale of rations allowed to Native soldiers on foreign service. He points out very truly that these rations while yielding an abundance of carboniferous food (32 ounces of rice), are very defective in nitrogenous principles, the whole weight of food in fact yielding only 178 grains of nitrogen per diem. "According to this theory," observes Sir Richard Temple, "the Madras sepoy would be undergoing starvation at the hands of the Government. But, in fact, he is not so reduced physically, nor does he fail the Government when it calls upon him for exertion. This case, I submit, makes very strongly against Dr. Cornish's theory."

I have no excuse to make for this dietary of our Native soldiers on foreign service. I gave it up 15 years ago, and recorded my opinion of it in the following terms:—

"The deficiency of animal food in the diet, and the excess of carboniferous material, is undoubtedly a fertile source of the prevalence of sickness in Native troops on foreign service. The mortality of Madras troops on this diet in Burma is more than double what occurs in Indian stations, where they find their own food."*

The foreign service "ration" in fact is a "survival" from the time of the first Burmese war. It was framed in times long before sanitary commissioners or chemists learned in food composition existed; and at the present time it is no more to be regarded as a typical "diet" than are the buttons on the backs of our dress coats to be regarded as a device for supporting a sword-belt. The ration is simply an "aid" to the soldiers employed in a foreign country, and the men are put under no stoppages whatever on account of it, but draw the full pay of their rank, just as if they had to find every particle of food out of their pay. If the relief coolies in whose behalf I have protested had seven or nine rupees a month in addition to the pound of grain, I should have made no objections to the insufficiency of their rations.

The Government expect, in these settled times, with the Burmese markets well supplied with poultry, eggs, fish, and flesh, that the sepoy can buy his nitrogenous food for himself, and practically he does so to such an extent that of late years the troops stationed in Burma have been almost as healthy as when in Southern India.

But there are and have been exceptions. I need not go back to the very terrible mortality of Native troops from bowel complaints in the first and second Burmese wars. These things are matters of history, but no later than the year 1872 a detachment of Native troops was sent from Burma to occupy posts on the Arracan River in co-operation with the Lushai Expedition.

In this locality the men had no market at hand in which to buy animal food, and in attempting to live on their "rations," they sickened and died in large numbers. The proportions are given in the margin.

Strength	-	184	
Hospital admissions	-	901	
Deaths	-	27, 12 from "dropsy," 5 "debility."	
Ratios of Sick to Strength			
per Mille.			Deaths.
4896·7			146·7

In this case, and in all others demanding active service away from markets of supply, the Native soldier on foreign service *does*, in

fact, "fail to do what the Government want of him," and simply because his "rations" are unfitted of themselves to support his health and strength. The fact is acknowledged and admitted by every officer who has commanded in Burma, and I did not at all overstate the case 15 years ago when I reported to Government as follows:—

"I have not entered into the question as to the propriety of revising the ration list of sepoys on foreign service, or of effecting changes in civil hospital diets, or of the sufficiency of the food laid down by law for emigrants from British India to the Colonies, all of which dietaries are unscientific in composition, and there need be little hesitation in stating, unfitted to support life. The whole of these dietaries require revision."†

Then again the "rations" of the European soldier do not, as Sir Richard Temple supposes, constitute his whole food.

Every commanding officer knows that the British soldier habitually buys extra meat from the bazaar out of his ample pay, and there is no regiment in the country which has not a provision shop of its own in which anything, from a Yarmouth bloater to a truffled sausage, may be bought. The rations on the whole are very fairly adapted for the British soldier, although there is no doubt that he eats more meat than the quantity contained in the ration.

In the calculation of the component parts of this dietary in the Madras Manual of Hygiene, I see that the nutritive value of the 1 lb. of vegetables has been put down as if all the vegetables were of the cabbage or soft kind, "whereas potatoes form usually one half of the vegetable ration of the soldier."

* Madras Medical Journal, Volume VIII., page 30.

† Madras Medical Journal, Food and Prison Dietaries, Volume VIII., page 56.

No calculation, moreover, has been made of the nutritive value of the malt liquor or spirit he consumes.

The proportions of albuminous to carboniferous food in the official ration are about one to four.

Sir Richard Temple has made a mistake as to soldiers "in garrison" receiving a "reduced diet."

They do nothing of the kind, but European soldiers "in prison" do receive, when sentenced for short periods, a punitive diet which has no bearing whatever on the question of the insufficiency of albuminous food in a pound of grain to keep an adult Native in health.

I must confess that I was a little staggered by Sir Richard Temple's quotation of the scale of food allowed to "European soldiers on board ship." I was travelling at the time of receiving the minute, and away from all books of reference, so that I could not verify the composition of the diet, as given in the *Madras Manual of Hygiene*, but I knew that this diet had been framed under the advice of scientific men, and that it was not likely to err in the direction of giving too little nitrogenous food, and I was quite satisfied that some error had crept into the calculations, and that Sir Richard Temple had pitched upon this "crucial instance" without thought of the possible inaccuracy of the figures.

The explanation of the calculated quantity of nitrogen in this diet being only 155 grains per day is very simple. The diets which are valued in the appendix to the *Madras Manual of Hygiene* are all taken from the Madras Medical Code. The quantities of this particular diet will be found in the Code, page 133, Vol. II. The transcriber instead of entering 4 lbs. or 64 oz. "fresh bread" for a week's ration, has made the mistake of entering 4 oz., and, as a consequence, all the calculations of albuminous and carboniferous food are below the actual truth.

There is also another error. The calculator of the nutritive values has assumed that "salt meat" contains less albumen than fresh, and has put down a less proportion of nitrogen for the salt meat; but this is not really the case, though in salt meat the albuminous matter may be less easily digested. The effect of salting meat is to harden the albuminous tissues, and to cause the watery juices of the meat to enter the brine; consequently salt meat has more albumen in a given weight than fresh, or preserved, meat.

On the whole, I consider the ship-board dietary of the European soldier, containing as it does, according to my calculation, from 200 to 240 grains of nitrogen per diem, very well suited for a class of people who have nothing whatever to do.

Sir Richard Temple says the British soldier is not reduced by a diet containing 155 grains of nitrogen, and the answer to this statement is that the British soldier is never put on any such diet, and that the figures on which Sir Richard Temple rest his "crucial instance" are wholly wrong, partly from a clerical error of the transcriber and partly from the mistake in estimating the albuminous matter in the salt meat of the ship-board ration.

It follows, therefore, that all Sir Richard Temple's surmises on the hypothesis that 155 grains of nitrogen is enough for a British soldier fall to the ground, and this part of the question need scarcely be noticed further.

I feel bound, however, to protest against the line of argument advanced by Sir Richard Temple that, as the British soldier only needs so much nitrogenous food, the Native of India can do with two-thirds of that amount or less. We have no grounds whatever for admitting so dangerous a theory, and all our practical experience tells just the other way.

In the *Indian Annals of Medical Science*, Vol. III., 1855, Mr. Strong gives some very remarkable tables showing the influence of a change of diet in the Alipore jail. A Magistrate in charge *thought* that the prisoners were being too well treated, and so abandoned a scale of food, which had been sanctioned by the Medical Board, and which had kept the prisoners in health, for a dietary of his own devising. The change consisted chiefly in knocking off the meat, reducing the grain allowance, and obliging the prisoners to consume what they had in a single meal. The result of this amateur tampering with the food of the people was an increase in mortality from an average of 42.4 per thousand to 117.5 per thousand in the three years during which the "experiment" was in force. The constituents of this dietary gave about 19 parts of carboniferous food to 1½ of nitrogenous!

The late Mr. Bedford of the Bengal Medical Service records a similar increase of mortality dependent on a change of food in the Rajshaye jail in 1852-53. In this case several months elapsed before the bowel sickness began to appear, but the result was a trebling of the annual mortality.

The reduced scale of wages. Dr. Cornish in reply to Sir Richard Temple.

The reduced
scale of
wages.
Dr. Cornish
in reply to
Sir Richard
Temple.

The effect of improving the standard of diets in the Madras jails in 1867, so as to raise the amount of albuminous food equal to from 200 to 240 grains of nitrogen per diem, has been to diminish the mean annual death-rate from 107 to about 22 per thousand for the eight years in which the new dietaries have been in force.*

This ought to be fairly convincing testimony, but there is more behind. A few years ago, a jail superintendent, who had been admonished by Government for over much flogging, was requested to adopt some other mode of punishment, and the punishment book showed, in the course of a few months, some hundreds of entries to this effect: "Half rations until he completes his task." The result was great increase of sickness and mortality from the diseases such as now fill our famine camps, viz., sloughing ulcers, bowel complaints, dropsy, and impoverished blood. On discontinuing the food punishment the mortality began slowly to subside to its normal proportions. So close is the connexion in fact between a sufficiency of nitrogenous food and health of the prisoners, that I never now hear of an increase of bowel disorders and dropsies in a jail, without at once suspecting tampering with the food, or privation in the district furnishing prisoners. In talking the matter over with the Inspector-General of Prisons, I find that he has arrived at precisely the same conclusion. After the Bengal famine I see it noted that the rate of mortality in the Julpigori jail was 27 per cent. chiefly from "bowel complaints." In Rungpore 17.6 per cent. In Gya, Tirhoot, and Chumparun the mortality was 17, 10, and 15 per cent. respectively. "Dysentery was the most fatal disease." The precis-writer who compiles the sanitary statistics of the India Office does not appear to have had a notion of the connexion of the undue jail mortality with the famine, but notes that a "special report has been called for" to explain it.† Reading between the lines I can at once tell him that it was a mortality from starvation diseases.

With all these facts before me I think myself quite justified in having given early warning of the danger of reducing wages to the basis of 1 lb. of cereal grain a day, even admitting that my remonstrance was, as Sir Richard Temple states, "strongly worded." It saves time to state in plain terms one's actual meaning, and my meaning was quite evident when I showed that Sir Richard Temple's proposals were out of harmony with the experience of the Bengal famine, and with our actual knowledge of the effects of insufficient food.

There remains yet one more point to be noticed with reference to differences of opinion in regard to the present condition of the labouring poor. On this point Sir Richard Temple states:—"Having carefully inspected during my tour in this presidency thousands of relief labourers, I give it as my opinion that with very few exceptions, which are not as a rule traceable to insufficient wages, the general physical condition of the labourers is as good now as in ordinary years."

This is Sir Richard Temple's opinion, but not mine. I too have seen a considerable number of relief labourers, and have taken some pains to find out where the distress really is, and my experience is this, that if I want to see the darkest side of the famine picture, I must look for it elsewhere than amongst the ranks of those who have still strength enough left them to work. Consequently I make a point of examining, wherever I can, the condition of the people fed in relief houses, lungerkhanas, and by private charity. I try to ascertain the condition of the poor who frequent the public bazaars and markets; and I pay special attention to the condition of the old and the young, whom I find almost invariably to be the earliest victims to distress. It is in this respect probably that my estimate of the effects of the famine on the health of the lower classes differs so widely from Sir Richard Temple's. My view is briefly this, that the famine is pressing with peculiar severity upon certain sections of the labouring classes who average from 20 to 30 per cent. of the population of the several districts, that amongst these classes there has been already a very large mortality, primarily due to bad and insufficient feeding, and that the condition of the survivors is in many cases critical in the extreme, as shown by the rapidly increasing proportion of persons who are unfit to work, and who have to be fed entirely at Government expense to keep the feeble vitality they have from being altogether extinguished.

Immediately the condition of a people becomes so low that they cannot work, the question of saving life becomes enormously complicated, and in plain language the time has then passed by when Government relief can do more than attempt to rescue a few possessed of the strongest constitutions. What has been our experience in this respect in the Madras relief camps, and in the camps now being established throughout the

Sir Richard
Temple.

Even these figures, which we know to be under the truth, show an appalling mortality in the famine districts during December and January. I have no reason to suppose that the state of things here indicated has much improved in February and March. But in our municipal towns, or in some of them at least within the famine area, death registration is more efficiently managed, and the following figures will tend to show the gravity of famine, as exemplified in an abnormal death-rate. In Bellary I have long had reason to suppose that the registration was not properly done, and the returns of some of the Bellary municipalities are obviously imperfect. The first thing that attracted my attention in connexion with the famine, on returning to duty in the end of January, was the abnormal death-rate amongst certain classes and certain localities of the presidency town, and I lost no time in drawing the attention of Government to the condition of the people, and suggesting measures for combating the great destruction of life then going on. While the mortality of the presidency town was exaggerated by the influx of starving immigrants, the experience of other municipalities shows that throughout the famine tract the death rate has risen out of all proportion to its normal condition.

The famine so far has already fallen very heavily on the old, the weakly constituted, and young children. It is still “weeding out” from our labouring classes a large number of victims, and in consideration of the fact that diseased conditions dependent on sufficient food *follow many months after the cause has passed away*, I apprehend that a heavy and unusual mortality will continue even after the period of drought and dearth of food has ended.

The survivors of the famine will be the strongest and best fitted of their race to continue the species, and when plenty again blesses the land they will produce a vigorous race of descendants; but I think there can be no reasonable doubt that this food deficiency has fallen very heavily upon the ordinary agricultural labouring poor, and that many years must elapse before they will have made up the numbers who have fallen, and are still falling, victims to the combined famine and pestilence now in our midst. I have in former reports called attention to the fact that the children born of famine-stricken mothers are nothing but skin and bone. My recent experience goes to show that the birth-rate is seriously diminishing, and that pregnancy amongst the distressed women is becoming a rare condition.

It is on these grounds that I cannot subscribe to the pleasing and hopeful telegrams in which Sir Richard Temple summarises the weekly progress of events for the benefit of the Home Government and the English people. There are two sides to every picture. Sir Richard Temple, like a skilful general commanding in battle, naturally fixes his attention on the main points of attack and defence, and so long as these are safe, his main work is accomplished.

I on the other hand as a public health official, whose special duty it is to preserve life, am bound to listen to the cries of the wounded, and to note in what way the combatants suffer, and I should be wanting in my duty to myself, and to the Government I serve, if I failed to state the facts coming to my knowledge, and the deduction drawn from those facts.

No. 210.

No. 172, dated Bangalore, 7th April 1877.

No. 221.

From the SECRETARY TO SIR RICHARD TEMPLE to the ADDITIONAL SECRETARY TO THE
GOVERNMENT OF INDIA.

By direction of Sir Richard Temple, I have the honour to submit copy of the paper marginally noted, regarding the supply of grain from Central India to the northern districts of Madras.

Memorandum by Captain Bisset on his visit to Bombay and the Nagpore district of the Great Indian Peninsula Railway.

2. From Captain Bisset's narrative Sir Richard Temple learns that there is no reason to anticipate failure of the grain supplies from Nagpore and the Berars; that much of the grain from those quarters is at present despatched to Bombay, probably for shipment to the western ports; and that an increase in the despatches to the Deccan and to the ceded districts of Madras will occur as soon as a change in prices shows the need for a larger supply.

No. 193.
Grain supply
from Central
India to
Madras.

3. I am to express Sir Richard Temple's satisfaction with the promised provision of Great Indian Peninsula waggons to expedite the movement of grain to the south. He anticipates that, with the facilities thus given, the supplies to the chief grain markets of the ceded districts will be fully equal to the demands from the interior.

No. 211.

EXTRACT from a LETTER from the ACTING SECRETARY TO GREAT INDIAN PENINSULA RAILWAY COMPANY to the CONSULTING ENGINEER FOR RAILWAYS, No. 4,245, dated 7th April 1877.

Nos. 250.
256.

The following extract from the "Times of India" for the 7th March, giving extracts from the proceedings at a meeting of the Port Trustees, held in Bombay on the 1st March 1877, has reference to the statement that the dealers at Cawnpore were encouraged to send traffic to Howrah rather than to Bombay, viz. :—

Traffic
arrange-
ments of
East Indian
Railway
detrimental
to grain
traffic.

Submitted report by Traffic Manager, dated 6th February, on his visit to Delhi, Cawnpore, Lucknow, and other places, made in order to draw additional grain traffic to the Port Trust sidings. * * * The report having been circulated to the Trustees, it was further suggested by some of them that the Traffic Manager's statement that Calcutta merchants get waggons for their goods on the East Indian line more easily than Bombay merchants, should be communicated to the Chamber of Commerce.

I have no doubt that the East Indian have had many difficulties to contend with in dealing with the unusual and sudden increase of traffic on their line, but in the interest not only of the Great Indian Peninsula Railway, but also of the public, I have felt it only right to protest against the stoppage of through booking.

* * * * *

In continuation of the letter above quoted, Mr. Conder, under date 6th instant, writes to the Acting Agent as follows :—

"With reference to paragraph 7 of my letter, No. 1,047, of the 4th instant, I have since that letter was written received a letter of the same date from Mr. Lang, of Messrs. Finlay, Scott, and Company, in which the following statement is made, being an extract from a letter dated the 2nd April, written by Mr. Fernly, the agent of that firm at Jubbulpore, namely,—

"Both Mr. Batchelor and Mr. Carter gave me distinctly to understand that they would never put themselves out to furnish vehicles for Bombay from stations like Kutni, the distance, 56 miles, before reaching the Great Indian Peninsula, 56 miles being too small to benefit their line much."

"I have again to lay my plan before you of sending goods to Calcutta. From Sutna to Calcutta I could send 10,000 bags away in a month easily. At present I have considerable stock there. The gates are closed and likely to be for some time as far as Great Indian Peninsula traffic is concerned."

I think these statements show that the East Indian are encouraging traffic for Calcutta rather than dealing with all traffic in the strictly impartial way which is claimed for them, or at least mentioned as being maintained by them, in Lieutenant Scott's note to which the letter quoted above is a reply.

And they involve serious loss to this Company by diversion of traffic.

No. 212.

No. 221. XCVIII.—MINUTE by SIR RICHARD TEMPLE on the administration of relief works by Public Works Department officers in the Salem district, dated Salem, the 10th April 1877.

Administration of relief work in Salem district by Public Works Department.

In my minute dated the 29th March I invited the consideration of the Madras Government to the desirability of employing in the Bellary and Kurnool districts a certain proportion of the relief labourers on works supervised and directed by Public Works Department officers, who could exact from the labourers adequate tasks. And I indicated certain works on which this plan might at once be tried.

2. On revisiting the Salem district, I find that the procedure which I recommended for Bellary and Kurnool had already been adopted in Salem. Out of the 47,000 relief labourers in the district of Salem, about 25,000 are employed on 398 large and small works under the Public Works Department. Most of these works are irrigation tanks, which must be repaired sooner or later, and on which much excellent work will have been done this year. The labourers are employed on piece-works, at a rate of 2 annas per cubic yard, as compared with $1\frac{3}{4}$ annas which is paid in ordinary years. Mr. Norfor, Range officer, finds that on some of his works the people earned at these rates—

In the month of February.			In the month of March.		
0	2	2	for each adult man	-	0 1 10
0	1	4	for each woman	-	0 1 2
0	0	9	for each child	-	0 0 8

3. The Engineer officers do not seem to have succeeded in opening so many works in the more distressed taluk of Dharampooree as elsewhere. All labourers are admitted to the Public Works Department undertakings, who are willing to work at the present rates; and no inquiry is made as to the applicants being in absolute need. Relief labourers moreover are not, save in the case of about 6,000 labourers on works in December last, handed over by the Civil officers to the Engineering officers, as recommended should be done in Bellary and Kurnool. But there is apparently no reason to fear that relief is being given unnecessarily on the Engineers' works; for the officers in charge report that the condition of the labourers is generally poor when they come on the works. And there is no risk of the Civil and Engineering officers competing with each other for labour, as no Civil relief works are opened in the neighbourhoods served by the works under Engineering supervision.

4. I lay this account of Salem relief works before the Madras Government, because the system, which works well in Salem, would succeed in Bellary and Kurnool, where professionally supervised works are most urgently required.

No. 213.

No. 20 of 1877.

No. 264.

From the GOVERNMENT OF INDIA, Department of Revenue, Agriculture, and Commerce, to the SECRETARY OF STATE FOR INDIA.

Simla, the 12th April 1877.

Owing to the pressure of legislative business in the week before last, and the movement of the Government to this place during last week, we have been unable during the last fortnight to send to your Lordship the usual weekly Despatch regarding the famine in the Presidencies of Madras and Bombay. We have, however, kept you informed by telegraph of the principal facts which have come under our notice during the period in question.

2. We now enclose copies of minutes recorded by Sir Richard Temple on the following subjects :—

- No. 176. 1st. The present condition of relief operations in Kurnool.
- No. 178. 2nd. The expediency of repairing the Begum Talao, a tank near the ruined city of Beejapoor in the Kaládgi district of the Bombay Presidency.
- Nos. 182-6. 3rd. The recent course and present state of relief operations in the Bombay Presidency, as ascertained on the occasion of Sir Richard Temple's late visit to that Presidency.
- No. 187. 4th. The physical condition of the gangs inspected by Sir Richard Temple in the districts of Sholapur, Kaládgi, Poona, and Ahmednagar.

5th. The question of suspending, instead of wholly remitting, the demand for land No. 191.
revenue on unirrigated land in the distressed districts of the Madras
Presidency with reference to an observation contained in Sir Richard Temple's
minute of the 6th March on this subject.

6th. The expediency of further utilising the agency of the Department of Public No. 192.
Works in exacting task-work from the relief labourers employed in the dis-
tressed districts of the Madras Presidency.

3. Copies of the following papers are also enclosed :—

A letter from Mr. Bernard, Secretary to Sir Richard Temple, regarding a mis- Nos. 130.
apprehension which appears to have been entertained with reference to the views 160. 173.
of the Collector of the Chingleput district on the subject of remissions of land 189.
revenue.

A memorandum by Dr. Harvey, lately employed as medical officer on Sir Richard No. 188.
Temple's staff, on the physical condition of the people in the distressed districts
of the Madras and Bombay Presidencies.

Two telegrams from Sir Richard Temple, dated the 4th and 6th instant, already Nos. 198.
embodied in the weekly telegraphic summaries. 202.

4. The improvement which has taken place in the management of the relief operations
in the district of Kurnool is satisfactory, but that district still contrasts unfavourably,
both as to the number on the relief works, and as to the number of persons charitably
relieved by the State, with the somewhat similarly circumstanced district of Sholapur.

5. We desire to draw your Lordship's attention to the observations contained in Sir
Richard Temple's minute of the 24th ultimo, on the relief operations in the Bombay
Presidency, and to the results which have followed from the closing of large numbers
of village works and the enforcement of task-work on the larger public works under
professional supervision. Between the 12th January and the 20th March the number of
relief labourers had, owing to these measures, been reduced from 331,447 to 209,000.
The mode in which this reduction was effected is set forth in the following paragraphs
of the minute in question, which also contains an explanation of the circumstances
under which the strike occurred, which attracted a good deal of public attention some
weeks ago :—

Relief opera-
tions in
Bombay
Presidency.

"Although the tendency of our measures has been to transfer large numbers to the
public works, still even on these works there has actually been a decrease. This has
arisen from the enforcement of the task-work previously ordered. Many persons came
to work on task so long as they found it easy, but absented themselves when they found
it becoming harder. On the Civil works the manner in which the reduction of numbers
occurred was in this wise. The Public Works Department (including its general branch
and its special irrigation branch) has been strongly organised with a staff of officers and
of trained subordinates in the distressed districts. Professional preparations for public
works on a sufficiently large scale, consisting partly of main roads, but chiefly of irriga-
tion reservoirs (tanks), were got ready. To these all applicants (save and except those who
appeared to be able to sustain themselves, for a time at least, without Government aid)
were admitted. To these also all the labourers who had previously been on village
works were drafted, except those who from age, infirmity, or other good cause were
unable to go. The able-bodied were informed that they could no longer be employed
on the village works; but that employment was available for them on the larger public
works; to every person some such work at a reasonable distance was indicated; he was
also informed, however, that in event of his refusing this offer he would not be otherwise
employed. Very many did in fact refuse, and by so doing virtually discharged them-
selves from Government relief, thereby affording proof that they were not in real distress
and could afford to stay away. Many, however, accepted the offer and are still serving
on the public works, proving by their industry and discipline that they really need the
support thus obtained.

"The number who discharged themselves from Government relief in the manner
above described were about 102,000.* They did, indeed,
at first show signs of some method and system in their
proceedings. They liked the village works with a lax
system from which they had been discharged. They disliked the public works with a
strict system to which it was proposed to transfer them. They imagined that by throw-
ing themselves suddenly out of employ, they virtually offered a passive resistance to the
orders of Government. Many of them endured more or less of inconvenience and
privation in furtherance of a plan whereby they hoped ultimately to regain their position
on the easy-going village works. For so favourable an object they deemed that some
suffering might be borne. They counted somewhat on exciting the compassion of the

* i.e., difference between 136,000 on 12th
January and 34,000 on 12th March as
above stated.

Relief operations in
Bombay
Presidency.

authorities, and still more on arousing fears lest some accidents to human life should occur. They wandered about in bands and crowds seeking for sympathy. They probably did meet with sympathy, indirectly at least, in various quarters. They certainly had leaders both from among their own body and from among the employés, whose vocation had ceased from the contraction or cessation of the village works. Moreover, the village headmen (patels) are, as a class, much opposed to any system of relief works which takes the people away from their homes. This feeling may be natural on their part, but it cannot receive attention when it militates against so important a principle as the application of a definite test to a relief system in time of famine.

"The Local Government, however, did not yield, though it did report the matter to the Government of India, apparently with a view to strengthening the position by eliciting further authoritative declarations. The Government of India, on two occasions, declared in effect that undue concessions must not be made to combinations of workpeople formed with sinister or self-interested objects; and that, although Government was bound to do its utmost to save people from death by starvation, it could not always undertake to save them from death owing to their own obstinacy or misconduct. These views have doubtless helped to guide the thoughts of the people, and to subdue any unreasonable hopes which may have been engendered.

"Of those who thus deserted the relief works some returned to labour when they found resistance unavailing. But many, after wandering about for a short time, settled quietly in their own villages, where they still are (as I have myself seen them in several places) in a condition which, if not good, is yet not reduced. Of these it is thought that many must, ere long, be constrained to apply for relief.

"On the other hand, while severity is deserved by those who try to resist the just efforts for reform and economy in the administration of relief, there are many poor ignorant persons misled by designing leaders. No exertion is spared to induce these misguided persons to accept the reasonable sort of relief which they are believed to need. To the village works only those are admitted who cannot be expected to perform the tasks set on the larger works. It was thought that these works would be more largely attended than they are. The authorities are ready to receive many more if they come, either on existing works, or upon other works which could be immediately opened. These works being of the simplest character can always be opened without any preparation. The gangs which I have inspected are exactly those whom we might expect to find; that is, they are people evidently needing assistance, strong enough to do light work near home, but not strong enough to perform the tasks of the public works.

"For the larger works, as already stated, preparation is always needed. And this preparation has been made in case there should be any accession or influx of numbers as the season advances. After consulting the Public Works authorities, I find that the works now open can accommodate 75,000 additional persons at the shortest notice. Here again, however, the rolls of the workmen do not fill as fast as was expected. Evidently the comparatively strictness of system is acting as a deterrent to keep away all save those who are truly in want."

6. We consider the Government of Bombay to be entitled to great credit for the firmness and care with which they have dealt with this matter. It is evident that while a very material reduction of expenditure has been effected by the exclusion from the relief works of persons not really in need of relief, every precaution has been and is being taken to afford relief to those who require it. Sir Richard Temple considers that the poorest classes not on relief are generally in tolerable condition, and that while there is much scope for incessant vigilance, every effort has been made to secure it.

"All village headmen have been warned of their duty in this matter; they frequently do give temporary relief on their own responsibility pending orders of relief officers. Lists have been made out in every village of persons likely to come within this category. European officers are posted in each one of the many subdivisions (talukas) of the distressed districts; and they, together with their Native subordinates, are constantly patrolling the villages and seeing whether the village headmen really do bring forward every deserving case or not. In every subdivision (taluka) of every distressed district there is a relief centre for the reception of these cases. The number on charitable relief is large indeed; but looking to the circumstances of the country, I should be glad to see it larger. It is, however, remarkable that many of the destitute poor are reluctant to resort to the poor-house from a feeling of self-respect which is creditable to them.* Here and there, however, I have discovered persons who ought apparently to have come

* Mr. Bernard mentions the case of a woman in the Poona district in the receipt of charitable relief whose son, on his return home at once, and of his own motion, repaid to Government the full amount spent on the relief of his mother during his absence.

Credit due
to Bombay
Government.

under the operations of these rules, and I think that the local officers cannot be too often reminded of these excellent orders."

7. With reference to the allegations which have frequently been made of the occurrence of deaths from starvation, Sir Richard Temple writes as follows:—

"I have not received any trustworthy evidence whatever that any death from starvation occurs or is in danger of occurring in these districts. But I have received much excellent evidence to the effect that nobody is dying or likely to die of this cause. Statements of an opposite description are sometimes made, but they are merely general in their terms, and are manifestly advanced in support of the view that easier terms of relief should be offered to the people. I am unable, however, to discover upon what foundation any statements that the people are starving can possibly rest. If any instance has happened within the last two months, it must be very exceptional. If any instance happens now, it must be owing to some extraordinary conduct on the part of the person concerned, certainly not to any want of means of relief at hand."

8. As your Lordship is aware, there has been much discussion and difference of opinion as to the sufficiency of the rate of wages now allowed on the relief works. It will be seen from Sir Richard Temple's telegram of the 6th instant, the text of which was communicated in our last weekly telegram, that Dr. Townsend, the Sanitary Commissioner with the Government of India, who has recently inspected 34,000 relief labourers in the distressed districts of Bombay and Madras, considers that the reduced rate is sufficient to support the labourers in fair condition, provided that care is taken that the individual recipient is the only person supported on it. The opinion formed by Dr. Harvey, though expressed in less positive terms, is to the same effect. The reports made by Dr. Cornish, the Madras Sanitary Commissioner, on his inspection of the north-western portions of the district of North Arcot and of Madanapalli in the subdivision of the district of Cuddapah, to which reference is made in the Despatch addressed by the Madras Government to your Lordship under date the 31st ultimo, and which apparently contain a repetition of the adverse opinion already expressed by Dr. Cornish as to the sufficiency of the reduced rate of wage, have not yet reached us. On the evidence at present before us we are not satisfied that an increase is necessary, provided that due care be taken that the whole of the reduced rate is available for the support of the individual recipient, other arrangements being made for the relief of those members of his family who are unable to work.

The reduced
scale of
wages.

9. The following telegram, dated yesterday from Trichinopoly, has been received this day from Sir Richard Temple:—

"Have visited part of Salem district. Am now *en route* to Negapatam to inquire concerning grain traffic thence, which is still very slack. Proceed to North Madura. Good spring showers fallen in Mysore Province, Salem district, and parts of Trichinopoly, Coimbatore, and Tinnevely. The Cauvery and other rivers in flood. Ploughing in progress wherever rain has fallen, and numbers on relief decreasing in that neighbourhood. Condition of Madura uncertain. In districts above Ghâts number decreasing, Bellary and Cuddapah. This is to be expected as season advances. Import grain trade in that quarter diminishing, which indicates sufficiency of local stocks. Mortality from sickness still continues in some districts. Numbers on charitable relief increasing, and among these persons many are found wretched. If present prospect of showers is realised, there will be no increase of distress in Southern India. Mortality at relief camps near Madras and in the city still continues. General aspect of affairs in whole Presidency more favourable than anticipation for middle of April."

10. In the Madras Presidency there has been a further increase in the numbers on the relief works, namely, from 663,997 to 693,761. The numbers charitably relieved have also risen from 105,067 to 114,782. The rapid increase under charitable relief appears to be principally attributable to the grant of an allowance for children under seven years of age.

In Mysore also considerable increases have occurred, the number of persons on works being now 75,417, and of charitably relieved 52,471, which is 11,460 above the preceding week.

Regarding Bombay, we have no later statistics than those communicated to your Lordship in our telegram of the 7th instant.

We have the honour to be, &c.

Nos. 242.
262.

MINUTE by SIR RICHARD TEMPLE, dated Madura district, the 14th April 1877, being a General Report on his Mission to the Madras Presidency.

Sir Richard Temple's report on his mission to Madras.

By the resolution of the Government of India, dated 5th January 1877, I was deputed on a special mission to the presidencies of Madras and Bombay to inspect the distressed districts, to communicate personally with the two Governments regarding the measures which were being carried out, and which would have to be carried out, for the relief of distress, and to offer for their consideration such suggestions as might be deemed suitable.

By the Despatch of the Government of India, dated the 16th of the same month, general instructions were conveyed to me for conducting the work of the mission.

I have accordingly visited all the distressed districts of the Madras Presidency, and the principal of the distressed districts of the Bombay Presidency, and have forwarded from time to time to the several Local Governments full minutes of all suggestions that occurred to me; of all which minutes copies have been submitted regularly to the Government of India. Being now, with the permission of the Government of India, about to relinquish the work of the mission, I have to make a general report regarding the Madras Presidency. In respect to the proceedings of the mission in the Bombay Presidency, I would ask the Government of India to refer to my minute of the 23rd March, to which nothing need now be added under existing circumstances.

This report then will refer to the Madras Presidency alone. It will be divided into the following parts:—

- 1st. The extent of the drought, the failure of the harvests, and the effect of these disasters upon the fortunes and the physical condition of the people.
- 2nd. The measures adopted by Government to help the people in meeting or bearing up against these misfortunes.
- 3rd. The several points towards which the proceedings of the mission have been principally directed.
- 4th. The state of affairs at the present time of writing.
- 5th. The lessons to be deduced from all the circumstances which have yet occurred in connexion with these affairs.

In the following narrative and observations I shall have to deal with many matters on which controversy has been or may be raised respecting fact and inference, and with many questions regarding which there may be difference of opinion. I can only set forth the case as it presented itself to me after inquiry on the spot, and relate the impressions left on my mind by all that I have seen, heard, and read. It has not been any part of my duty to formally take or record evidence. Nor would space admit of my adducing proof of all the facts which may have to be stated.

PART I.

In regard to the extent of the droughts, the failure of the harvests, and the effect of these disasters upon the fortunes and the physical condition of the people, it is necessary to recall the fact that in 1876 throughout the greater part of the Madras Presidency the south-west monsoon or the summer rains were very deficient, and that the north-east monsoon or autumnal rains failed still more disastrously. In the northern portion only of the presidency, that is, in the littoral tract south of Orissa and in the deltas of the Godavery and the Kistna, was the rainfall ordinarily propitious. In the rest of the presidency comprising the peninsula of Southern India, the rainfall of the year ranged from 3 to 20 inches, in many large tracts of the worst districts it ranged from 6 to 10 inches. Whereas the average annual rainfall in this region may be taken to range from 20 to 40 inches. Even on the western or Malabar coast where, if anywhere, the rains are expected to be un failing, the rainfall was measured at only 87 inches, compared with an usual annual average of 126 inches.

The misfortune which, threatening first in July, and becoming more pronounced month by month, settled down upon the Madras Presidency during November, was aggravated by the similar misfortune which had befallen the Deccan districts of the Bombay Presidency, the greater part of the Mysore territory, and a portion of the Nizam's dominions.

The drought began in the north, a little below the River Taptee in Khandesh. In the Bombay Deccan it became severe in the districts of Ahmednagar, Poona, Sattara,

Sholapur, and Kaladgi. It was milder in the South Mahratta Country near Belgaum and Dharwar, and in the Nizam's territories around Goolburga and Raichore; but some parts of Dharwar suffered severely. Towards the Madras Presidency it reached the line of the Toongabhadra (or Toombadra) River which joins the Kistna below Kurnool, and followed the line of the Kistna to the eastern coast. In this latitude (16°) it stretched, with more or less intensity, almost from sea to sea.

Sir Richard Temple's report on his mission to Madras.

Within the Madras Presidency on the right or southern bank of the Toongabhadra the drought developed all its most destructive agencies, and showed its greatest force all along the frontier, covering the whole of the districts of Bellary and Kurnool and the greater part of Cuddapah, and comprising in desolation all the country above the Ghât mountains. Across the mountains it visited the greater part of the districts of Nellore, Chingleput (including the city of Madras), North Arcot, Salem, Coimbatore, and Trichinopoly. It caused the Kistna and its affluents to roll down in such a diminished volume that the canal from the Toongabhadra near Kurnool, and the great irrigation works of the Masulipatam delta were stinted in their supply. It made the freshes and floods of the Penair descend in such shrunken proportions that the reservoir and channels of Nellore were nearly deprived of water. It stopped the supply of the Cauverypauk lake near Arcot, and rendered the dam across the Palar inoperative. It rested for some time on the districts of South Arcot, Tanjore, and Trichinopoly, and threatened them with evil; they were, however, saved, South Arcot mainly by some later rains, and Tanjore and Trichinopoly partly by the same rains but chiefly by their canals. It extended itself with havoc throughout the southern peninsula, laying waste the districts of Madura and Tinnevely right down to the sea-shore near Cape Comorin; the tracts irrigated from the Tambrapoornee, near Tinnevely, alone escaping destruction. Though it failed to dry up the harvest of the rich tracts of Malabar and Travancore, or to prevent the Cauvery from filling the canals of the Tanjore delta, yet it rendered them powerless to send the succour that might otherwise have been expected.

Thus were injured, more or less seriously, ten large districts of the Madras Presidency, containing a total area of 74,000 square miles, and a population of 16,000,000 of souls. The whole of the area and of the population did not suffer in an equal degree. It may be stated approximately that 11,000,000 of people were distressed in a greater, and 5,000,000 in a lesser, degree.

In the devastated tracts there are two harvests in the year, one depending on the summer rains, the other upon the autumnal rains, the edible grains consisting of the rice and several kinds of millet. Of the whole cultivated area a small part (technically termed "wet") is watered from artificial tanks which often rise to the proportions of lakes; the remainder (technically termed "dry") is watered in some parts from wells, but for the most part from rainfall. The proportion of wet lands varies greatly in the several districts, being largest in Chingleput where it exceeds one-half of the whole cultivation, and smallest in Bellary where it is only one-twentieth.

The failure was worst in the "wet" lands. The tanks, having their catchment areas in undulating plains or low hills on which but little rain descended, were left almost dry. What are usually splendid sheets of water became scorched dusty plains, appearing as huge black patches with cracked and fissured soil. The sluices, the distributing channels, and all the apparatus of irrigation lay useless. Such an universal drying up of the tanks, for which the districts below the Ghât mountains are so celebrated, has hardly been witnessed within the memory of living men.

The "dry" lands fared somewhat better. Whatever rain fell, did cause something, however scanty, to spring up in them. But, even then, fertile expanses of champaign which ought to be clothed with crops looked bare and arid, being little better than a desert. The wells retained some of their supply; though even in them the water fell lower and lower, and sometimes disappeared altogether. Of the more valuable crops, the sugar-cane, the tobacco, the garden produce, were in part preserved. But the cotton crop of Bellary and Adoni yielded nothing. The factories are closed and the machinery is silent. Though the cultivators fell short of doing all they might have done, yet in countless instances they made a brave fight to save their crops. They excavated their failing wells, deeper and deeper in the rocky strata; they dug pits in their fields, searching for moisture; they sunk wells with wicker work. They delved for springs and under-currents of water in the sandy beds of the dry rivers, and there indeed their toil was often rewarded, miles and miles of well filled watercourses being led off to recuscitate the withering crops. These practices, which on this occasion stood the people in such

NOTE.—The Kistna district has been reckoned among the distressed districts; but I have not so regarded it, as only a small portion of it suffered.

Sir Richard Temple's report on his mission to Madras.

good stead, are known to them in ordinary times, but were resorted to very largely during this year. The Government wisely exhorted the cultivators to deepen the old wells and to excavate new wells; and offered them advances of money for these purposes, relaxing somewhat the rules and conditions under which such advances are ordinarily made. In many hundreds of instances they availed themselves of these advantages.

The failure was not uniform in degree throughout any of the distressed districts. It would be tedious here to give the particulars for the several subdivisions of each district. Suffice it to state that out of a full crop there were in the agricultural year 1876-77 only the fractions shown in the following statement, in a parallel column of which there is given the population of each district, so as to convey some idea of the gravity of the misfortune resulting from the loss of crops.

<i>Crop in 1876-77.</i>				Population.
Bellary	-	-	one-sixteenth of an average good crop	- 1,688,000
Kurnool	-	-	one-sixteenth " "	- 960,000
Cuddapah	-	-	three-sixteenths " "	- 1,351,000
Nellore	-	-	one-quarter " "	- 1,377,000
Chingleput (inclusive of Madras city)	-	-	three-sixteenths " "	- 1,336,000
North Arcot	-	-	one-quarter " "	- 2,015,000
Salem	-	-	one-third " "	- 1,967,000
Coimbatore	-	-	one-quarter " "	- 1,763,000
Madura	-	-	one-quarter " "	- 2,267,000
Tinnevelly	-	-	six-sixteenths " "	- 1,694,000

Experience has shown that the difficulty of dealing with famine is aggravated if the population is dense, and lessened if it is sparse. The following statement shows the average incidence of the population on the square mile in each district. As compared with some parts of India the most distressed districts are thinly peopled; and those tracts which are more thickly peopled are, fortunately, less distressed:—

Bellary has a population of	-	-	-	151	} persons to the square mile.
Kurnool	-	-	-	130	
Cuddapah	-	-	-	161	
Nellore	-	-	-	162	
Chingleput (exclusive of Madras city)	-	-	-	340	
North Arcot	-	-	-	282	
Salem	-	-	-	262	
Coimbatore	-	-	-	237	
Madura	-	-	-	238	
Tinnevelly	-	-	-	327	

The consequences of such a failure in 1876 are affected for better or for worse by the results of previous years. The year 1874 was generally good, and left a reserve of surplus grain. But 1875 was in many places unpropitious; and failure of crops in Mysore drained off supplies towards that province. In Bellary and in some parts of Kurnool, 1875 had been unfortunate in its seasons; and in Bellary 1874 had also been unfavourable. These circumstances caused the drought of 1876 to be felt with more intensity in Bellary than anywhere.

Inasmuch as the consequences of a scarcity in one region of India are mitigated or aggravated by the condition of other regions, it is to be remembered that from no part of the Madras Presidency could any surplus produce worth reckoning be drawn in aid of the distressed districts; that in the Mysore territories out of a population of 5,000,000 nearly 4,000,000 were also distressed; that in the Bombay Presidency some 5,000,000 of people were equally afflicted; that from the Nizam's dominions no considerable importation of grain could be anticipated, inasmuch as there also distress existed in some places. On the other hand—a fact of immense value—there was a good harvest in British Burma, in Guzerat, in the Central Provinces, in Malwa, in Northern India, and especially in Bengal, Behar, and Orissa.

This consideration leads us to the effect of these disasters upon the fortunes and the physical condition of the people. There was surplus grain enough and to spare within the limits of British India. But anxious minds immediately reflected whether the communications by sea and land would enable it to reach the distressed districts of the Madras Presidency. There was communication by sea from Calcutta to Madras, to Negapatam, to Tuticorin; and from Bombay to Beypore. From each of these ports

there was railway communication to every one of the distressed districts, save Nellore and Kurnool; even in the case of Kurnool the rail ran up to the western border of that district. But on these railways was laid the additional task of carrying grain to Bangalore, the entrepôt for the grain trade of the Mysore Province. The railway from the direction of Bombay pierced the Toongabhadra frontier, the very quarter where, as we have seen, the drought lay heaviest. The ships could bring, as was well known, much more grain to the ports than the railways could carry away. But the railways, with their combined power, could, it was calculated, carry 2,700 tons of food a day to the distressed districts. They who have seen what it is to contend with famine in Orissa, or North Bengal, or Behar, or Northern India, or Rajpootana—these know what priceless advantages are implied in the possession of transport by ships and by railways. What an amount of trouble, pain, and cost has been borne for want of complete communication during the famines in other parts of India, and has been saved by the possession of such communication during the famine in the Madras Presidency!

Sir Richard Temple's report on his mission to Madras.

While in the Madras Presidency prices rose to one rupee for six, seven, or eight seers (12, 14, or 16 lbs.) of common edible grains, tantamount to prices three times as dear as those of ordinary years—the prices in the Bengal Presidency were comparatively cheap; they ranged, for instance, at Calcutta, the most important place, at one rupee for 16 seers (32 lbs.). Thus there was a considerable difference between the prices at the places of demand and the places of supply, which afforded a fair margin of profit on importation into the distressed districts by trade, and encouraged the hope that private enterprise would surely seize the opportunity.

Though the area of the distressed districts is very extensive and thinly peopled, also much divided by hills and mountainous ranges, still the Madras Presidency is (for India) more than ordinarily well provided with good cart roads. The foresight of successive governors and administrators has caused the hills to be traversed in all directions by well aligned passes. Amidst the pasturage and the grazing grounds in these hilly regions there has been reared a race of hardy and long enduring draught-cattle. The carts are among the best constructed in all British India. The European merchants with characteristic vigour enter into the grain trade of the interior of the presidency. The Native grain dealers are resourceful and enterprising. If, then, the grain brought by rail from distant provinces should reach the several railway stations in time, there was little doubt of the power of the people to carry it on to their villages, at least during the earlier months of the scarcity. There was indeed much fear lest the draught-cattle should become stinted in their fodder and gradually exhausted as the season wore on and the heat raged fiercer.

There then arose that question which, however often it may be asked, can never be answered, as to whether the people had large or sufficient stocks of grain. There was a strong, though undefined, belief that they really had. For agricultural trouble of some sort, coming too in opposite forms—at one time drought and pestilence, at another time rainstorm and flood—has for some generations been so chronic in the Madras Presidency that probably the people, with an instinct of self-help against the evil day, habitually keep stores of grain. One season of propitious rain causes an immense productiveness in this comparatively inexhaustible soil, much beyond the current needs of the year for a population sparse upon the land. The people may thus be able to put by something for use in the years to ensue, which, as experience teaches them, are likely to be chequered by mishaps.

Even if the draught-cattle and some of the best animals in every village could be sustained through the troublous time—what, people would anxiously ask, will be the fate of the innumerable head of cattle used for ploughing and for other husbandry? They would be driven off in vast herds to the neighbouring mountains, the Eastern Ghâts, the Western Ghâts, the Central Ranges which form the backbone of the peninsula—where even in this year of scanty rainfall there is still some pasture. But then, with all the cattle upon a thousand hills, the scarce grass would be eaten up, perhaps, before the drought ends; and if so, then death must overtake them at last.

Lastly, there were some classes of the population regarding whom hope might be entertained and others for whom fear would be felt.

The Telugu and Tamil ryots* of the ryotwari settlements are the peasant proprietors of Southern India. They have a beneficiary interest in the lands they occupy. They pay a moderate and equitable land tax, assessed after a professional field survey in some districts, or settled after careful revision of the original assessment in other districts. They have had every motive to save something out of their yearly profits and to hoard

* There are Canarese ryots also in Southern India, but they are not numerous in the distressed districts.

Sir Richard Temple's report on his mission to Madras.

a little capital. They are formed into village communities headed by men holding hereditary offices; nowhere in India is the primitive village organisation better preserved than here. They are generally able to maintain themselves at least in any passing adversity. They are reputed to be poor; but poverty is a relative term. They are, indeed, a peasantry whom any Government might be proud to reckon among its subjects. They are prone to live beyond their humble income and to incur debt; notwithstanding this they have an unfailing credit with the village bankers who are also grain dealers. Under the ryots are the farm labourers, often holding some fields of their own, but adding to their livelihood by labouring in the fields of their neighbours. They form a large class having interests bound up with those of the superior ryots. They together with their wives and growing children are strong to labour. But now their vocation is gone for a time. There is no weeding or tending wanted for the withered crops. There is no harvesting to be done. The fields cannot be tilled for lack of moisture. The plough is unemployed. The oxen are straying in quest of fodder. Those men of this class, then, who possess any fields of their own may have some small stores of grain to live on. Those who are in the permanent employ of the village headmen or of the more substantial ryots, constitute a part of the capital of these little estates, and will be supported for a time by their employers. The rest must languish from the cessation of rural employment. These agricultural classes, both ryots and field labourers, have sturdy well-nourished frames. Among them may be seen large numbers with a stature and a stoutness hardly to be surpassed among the peasantry in any country.

Below these, in all the villages there are low-caste or caste-less people in a very varying condition—often in tolerably good case, often again living in squalor and degradation, continuing in scarceness at the best of times, and subsisting within the narrowest margin of existence in bad seasons. It was to be feared that from these outcasts of the social system charitable sympathy would be withheld by the better classes. There are also various gipsy clans habitually gathering the wild fruits of the forests, and eking out a precarious subsistence by disposing of jungle produce and doing chance work in the villages. On behalf of these poor untameable wanderers anxiety would be excited lest both the wild produce and the work should fail in a year like this.

Again, in some of the distressed districts there are many places, sacred to all Hindu nationalities, and frequented by pilgrims, by humble visitors, by religious mendicants, and by beggars of all sorts, from remote parts of India. If these people reached the holy spots they would doubtless be cared for by the religious establishments. But on the way they might find their travelling purse exhausted by the increased cost of food, and they might faint on the roadside or sink never to rise again.

It is remarkable that several of the most drought-stricken tracts belong to zemindars who, though possessing much rank and status, are not men of substance and capacity like the zemindars in some of the zemindari provinces elsewhere, but are either absent or involved in debt, or otherwise unfit to cope with the consequences of scarcity. These estates are sure to teem with instances of unmitigated misery.

In every town, almost in every large village, there are guilds of weavers, some making the finer, others the coarser fabrics. In many places there are shady groves of trees, serving as factories for this industry, and alive with the bustle of manufactures. But the demand for cloths has ceased for a time. The groves are no longer peopled, the spindles are hung up, and the looms idle. The weavers, thus thrown out of work, generally have means to last them for a time, but as they become gradually pinched and straitened they are unwilling to seek assistance from Government, which can be given only in return for labour unsuited to their sedentary habits.

Such then, in its character and in its effects upon the people, was the drought of 1876. Though some of the symptoms were extremely grave, there were many grounds on which to found the hope of a successful issue. Still the conjuncture was manifestly such as to call forth all the wisdom and firmness of the Government and all the devotion and ability of its officers.

PART II.

The second topic relates to the measures adopted by Government to help the people in meeting or bearing up against these misfortunes. It is necessary to insert a slight sketch of them—as they appeared to me—in order to explain the subsequent work of my own mission.

During the summer of 1876 small relief works were opened in Bellary, in Kurnool, and in other distressed districts. These operations increased as the months went on. It was hoped that they would be temporary only, and would cease if the north-east or

autumnal rains should be propitious. Up to the end of October, that is, to the close of the period during which hope of the autumnal rains remained, the number of persons thus admitted to relief was not large. The authorities who were then present on the spot must be supposed to have been able to judge of the necessity of affording relief. In the case of Bellary there was the consideration that the season of the preceding year 1875 had been unfavourable. The price of food, too, was dear throughout the greater part of the Presidency, having risen fast after the summer rains had begun to fail.

Sir Richard Temple's report on his mission to Madras.

Later in the autumn the state of the grain trade throughout the Presidency attracted the anxious attention of the Government. The failure of the autumn rains made it certain that a very large supply of food grain would have to be imported by some agency, commercial or other. Naturally the trade might be expected to bring in this supply. But if the trade should unfortunately be unable to do this, then it might in extreme resort become necessary for the Government to intervene in order to prevent the people perishing from want of food. The Madras Government seem to have doubted whether the trade would be able to meet such great requirements. In reality, however, during August, September, and October 5,637 tons of grain were imported into Madras from places beyond the Madras Presidency; further, 38,000 tons were imported into Madras port from various ports subordinate to the Madras Presidency; and 20,446 tons were carried by rail from Madras into the drought-stricken districts. Such facts occurring during these three months indicated considerable movements of trade and as much activity as could be expected at the outset of trouble; and the consideration set forth already in Part. I. of this minute regarding high prices in Madras compared with cheaper prices and abundant harvests in Bengal might have caused an anticipation of what actually happened afterwards, namely, large importation by sea during the winter months when Indian trade is always in full play. Still the Madras Government felt anxiety. Though there were no positive signs of the grain markets being anywhere empty, yet the grain trade was in many places sensitive and excitable. At some places there were grain riots. At Kurnool the trouble was so far serious that troops were sent there. In several districts grain robberies became daring and frequent, amounting to quite an outbreak of crime against property. In November and December numbers of famishing people came from the neighbouring districts into the city of Madras to beg for food. Public attention was painfully turned to these incidents, and inferences were probably drawn therefrom regarding the possible prevalence of famine in the interior of the country. Inquiry subsequently showed that no such widespread distress had broken out, or that, if it had anywhere broken out, it was being arrested by the action of the local authorities. Meanwhile a strong impression was made on the minds of many thoughtful persons at the Presidency.

Looking to all the circumstances of the time the Government of Madras determined on purchasing and did purchase, secretly and confidentially through a local firm, 30,000 tons of grain from places beyond the Presidency. This grain was to be held as a reserve, or to be sent to any place in the interior of the country where there might be any dangerous deficiency of grain. It was also decided that in the event of relief labour being employed to a great extent, the labourers should be paid in grain wherever this mode of payment might be deemed convenient. For this purpose additional quantities of grain were to be purchased within the Presidency. Thus were purchased about 13,000 tons, making up the total to 43,000 tons. The possibility of more purchases was contemplated, perhaps to a very large amount, according to the view which might be taken by Government of the requirements of the case, or according as events might unfold themselves.

The position of the markets in the more remote tracts situate near the Mysore frontier on the one side, and within the Eastern Ghât mountains on the other side, attracted attention. It was apprehended that Native traders would in some cases combine to keep prices abnormally dear, and would in other cases prove unequal to the task of supplying the local markets. By degrees the policy of the Government was developed further. Circumstances were foreseen under which it might be necessary for Government to throw grain into various places, not only to pay its own relief labourers, but also to influence the grain markets in favour of the people in the event of their being unable to purchase food, to frustrate combinations among the traders, and to prevent prices rising in any excessive degree. A transport agency on the part of Government was established for the distressed districts above the Ghât mountains with its head-quarters at Bellary. It was to ascertain from each local officer how much grain would be wanted either for paying relief labour or for other purposes. It was to engage carriage accordingly, that is, to make contracts for the supply of carts and bullocks to carry grain to such places as might be settled in concert with the local authorities under the direction of Government. It

Sir Richard Temple's report on his mission to Madras.

was to receive for transport all grain which might be received. It accordingly began to engage carriage, and by an early date carting contracts were made for 30,000 tons in all. It received quantities of grain which were despatched daily by rail and consigned to its care. Some consignments were sent to places close to the line of railway and some to places at a greater distance. The contracts were well and carefully made. The carriage thus engaged was efficient. And the executive arrangements were creditable to the officers concerned. The agency was capable of expanding into considerable dimensions until it should give to the Government an effective hold and check upon the grain trade in the districts above the Ghât mountains—Bellary, Kurnool, and Cuddapah—so that the State might either assist private enterprise in making the food supply reach the people, or prevent its being withheld from them, or import food by direct means according as the exigencies of the coming time might dictate.

It has been already seen that a system of relief on a small scale had been set on foot in the distressed districts before the end of October. When in November the failure of the autumn monsoon became certain, the prospect of widespread distress caused the Government and its officers to undertake the expansion of relief works. Some relief works of a larger kind were thought of. But in the main it was deemed necessary to open small relief works in every part of the distressed districts, in the heart of the drought-stricken area and among the villages, so as to be easily within reach of all who might need relief. These works were accordingly opened everywhere in numbers fully sufficient, according to this view of the necessity. The works were kept under the management of the Civil officers. The District Engineers and other establishments belonging to the Public Works Department were to advise and assist the Civil officers to align roads, to furnish designs, to help in professionally measuring up the work performed by the relief gangs. But they were not placed in actual command of any of the works or of the relief labour, nor was the tasking of the labour entrusted to them. All officers within the Presidency whose services could be obtained were despatched to the distressed districts. It was arranged to obtain the services of officers from other parts of India, especially Engineer officers and Civil Engineers. But little or no assistance of this kind had actually arrived up to the end of December.

The relief works were very largely resorted to. The progress of the number of relief labourers, men, women, and children, up to the first week in January, when the highest number was reached, may be thus seen:—

	Number of Persons.					
1st November	-	-	-	-	-	160,000
1st December	-	-	-	-	-	310,000
15th „	-	-	-	-	-	656,000
31st „	-	-	-	-	-	982,000
7th January	-	-	-	-	-	1,066,000
14th „	-	-	-	-	-	1,055,000

and the last-named number was increased to 1,165,000 persons by the addition of 110,000 persons on gratuitous relief.

The relief wages were at first fixed at $2\frac{1}{2}$ annas per diem for a man, the wages of women and children being proportionally less. In some places they exceeded this rate, and were as high as 3 annas. By the beginning of January they were reduced to 2 annas. Task-work was ordered, and the Civil officers did their best to enforce it. But to enforce it properly was, under the circumstances—that is, with fast coming crowds of labourers, and without any adequate professional agency—quite impossible. In only few places was it in any degree insisted upon. In most places it was quite easy. In many places it was nominal.

These operations certainly maintained the agricultural classes in unimpaired condition physically, and kept them in contentment and in immunity from trouble. And so far the famine was, at the outset, held thoroughly in check.

It was not deemed expedient to prescribe any test of admission, or to vest the Civil officers with any discretion to reject applicants for relief on any such ground as this, that they seemed able to support themselves, for a time, at least. It was thought that the wages offered were low in reference to the high prices, that persons who for the sake of such remuneration came on the works must be really in want, and that none save those in such need would come. There probably was, towards the close of 1876, much alarm in the minds of the agricultural classes towards the northern side of the Presidency, in the districts of Bellary and Kurnool especially, which feeling may be supposed to have naturally spread to the local authorities when they beheld the wide waste of lands once cultivated, and found a desert instead of rising crops.

It was up to that time, as I understood, the belief of the authorities that the Government should charge itself with the duty, not only of preventing mortality from starvation, but also of alleviating all suffering and relieving general distress during the period of the scarcity. How far this view could be sustained in reference to the intention and policy of the Government of India will be seen hereafter. But at the outset it considerably affected the character of the relief measures which were undertaken. Nothing could exceed the humane solicitude of the Madras Government and its officers on behalf of the people, as regards life and health and physical welfare. And the proceedings taken by them had a comprehensive scope, commensurate with the benevolence of the policy adopted.

Sir Richard Temple's report on his mission to Madras.

Consideration was given to the commencement of large public works on which relief labour might be concentrated under professional supervision. The projected railway from Bellary towards the South Mahratta Country was proposed for commencement, but on reference to the Government of India difficulties were found to exist. The vigorous prosecution of the excavation of the canal (already in progress) which is to be carried along the East Coast from the Pulicat Lake to the River Kistna, was ordered. Efforts were made, with a moderate degree of success, to obtain relief labourers from a distance for this work. Also the junction of this canal with the South Coast Canal below Madras was undertaken.

In the city of Madras and its neighbourhood the Government organised standing camps on a very large scale for the reception of the sufferers from famine. To this city there came thousands of wanderers, seekers for employment, and beggars of all sorts, who in Southern India are accustomed to roam from town to town, imagining that the larger and the more distant a place is, the more likely is it to afford a haven for the miserable. These poor people hoped to find work in the city of Madras, or to share in the private charities which, according to common rumour, were being bountifully dispensed by the rich Natives there. The famishing wayfarers were gathered from all the thoroughfares leading from the country to the capital. Excellent medical attendance was provided; but despite of it many died after being received into the camps. Similar camps were ordered to be formed near Arcot, near Vellore, and other towns in the interior.

The local authorities in the distant districts were instructed to establish centres of charitable relief, or to assist any effort which might be made by benevolent persons in this direction. Private charity was everywhere invoked and largely responded to the call. Many Native gentlemen honourably distinguished themselves in this good cause.

Up to this time, the end of December 1876, the Madras Government expended—

				£
On relief	-	-	-	372,500
On purchase of grain	-	-	-	302,400
				£674,900

There were other items, such as transport agency and local purchases of grain, which brought up the total to nearly three quarters of a million sterling.

The members of the Revenue Board were deputed to visit the most distressed districts, and to make reports to Government of all that they ascertained.

In every part of the distressed districts, the Civil officers of all grades exerted themselves with the utmost zeal, devotion, and humanity, and in a manner entirely worthy of the urgency and magnitude of the occasion.

PART III.

The third topic relates to the proceedings of the mission on which I have been engaged since the 14th January, the date on which I entered the Madras Presidency. At that time I was fully acquainted with the views of the Government of India, having had the advantage of learning them before starting on the mission. These views were immediately followed by me in anticipation of the official instructions which were expected to come very soon. The instructions dated the 16th January were received in the Madras Presidency on the 23rd.

The points to which attention was by these instructions authoritatively drawn may be summarised thus—

Every effort is to be made for the prevention of deaths by famine.

Sir Richard Temple's report on his mission to Madras.

Severe economy in relief should be practised. Indiscriminate charity on the part of individuals is admitted to be bad, but on the part of a Government is worse. A Government has no better right in a time of scarcity than at other times to attempt the task of preventing all suffering and of giving general relief to the poorer classes of the community.

The numbers on relief works are so great that there is reason to fear that many persons must be employed who without such relief could sustain themselves, for a time, at least.

The collection of such numbers should be restricted on works where labour is not exacted, where supervision is wanting, and where people can obtain, for the asking and in return for next to no work at all, wages in money or in grain.

No time should be lost in giving to the people, to the greatest extent practicable, the means of employment on large public works, which need not always be in the distressed districts or near the homes of the people.

The Government may be driven to set up petty relief works near the homes of the people, but not until distress becomes extreme, or a state of famine has been reached.

There is great advantage in paying relief labour in money (not in grain) wherever and so long as this mode of payment is practicable. But if money payment is not practicable, there is no more objection to Government purchasing grain for payment than there is to its making purchases through the commissariat for the troops.

There is to be no interference of any kind on the part of Government with the object of reducing the price of food.

Inquiry should be made as to how far private trade, if unfettered, can supply the wants of the country.

In certain localities remote from railways and large markets which private trade is unable to reach, it may become necessary for Government to intervene.

The transport of grain by the trade, by railways, by roads in the interior, and by the sea ports, should be carefully observed.

A question shortly arose as to what degree of distress was to be prevented by Government. I understood from the first that practically there would be two principal degrees of distress. Firstly, there might be distress which, however sore and lamentable, can yet be borne without physical health being impaired, or bodily power being disabled, or life being imperilled; and this the Government could not undertake to prevent or alleviate. Secondly, there might be distress which, increasing slowly, perhaps, but surely, must lead to extremity which would sooner or later end in death; and this the Government would, to the utmost of its means and ability, prevent. It was necessary, by the best diagnosis which could be made, to discriminate between the one kind of distress and the other; and if there should be a doubt whether any person or persons come within the first or the second category, then to give the people the benefit of that doubt. These principles were fully borne in mind in the discussions and conferences of the third week of January, in Bellary, Kurnool, and Cuddapah. Shortly afterwards similar principles were enunciated by the Government of India in reply to some references which had been made.

Such being the purport of my instructions, it became necessary to consider—what, indeed, I had been already considering from the moment of entering the Madras territory on the 14th January—the application of the principles as above laid down by the Government of India to the actual state of affairs in the Madras Presidency.

Among the most urgent of the many questions which presented themselves was the question relating to the purchasing, transporting, and storing of grain by Government. The proceedings of the Government of Madras in this important matter have been already described in this minute. Before starting on the mission, I had clearly understood that the purchasing of grain by Government from places beyond the Presidency was not approved by the Government of India; that doubt was felt as to the need of purchasing grain for Government within the Presidency; that the business of the transport agency should be reconsidered with a view to possible restriction. Proceeding from the north towards the Presidency I found quantities of grain being imported thither from the direction of Bombay and the countries beyond, and from the Nizam's dominions. Entering the Presidency I found the railway carrying grain to the utmost extent of its power. The local markets were everywhere seen to be well supplied. The traders—European and Native—seemed confident that the grain would be forthcoming from distant places, and that they could import it even to the remote parts of the interior of the country. The fears entertained by some regarding these remote parts did not appear to be shared by the trade. There was no sign of country carriage and draught cattle failing. Reports were received of the seaboard at Madras being piled up with

masses of grain brought by the ships. But I perceived, or thought I perceived, an apprehension in the minds of the trade lest the grain transactions of Government and its transport agency should have a dispiriting effect on private enterprise. There was no need whatever for Government to buy stores or transport grain for the payment of relief labour when the labourers if paid in cash could purchase food on the spot. All this was immediately represented to the Madras Government. The purchasing of grain for Government has subsequently ceased. The relief labourers are paid generally in cash. The transport agency has been restricted to the transporting of a limited quantity of grain (previously purchased by Government) to certain selected places, there to be held till further orders, and to certain limited engagements with contractors to supply carriage if required. The private grain trade has continued to be extraordinarily active.

Sir Richard Temple's report on his mission to Madras.

Having observed at various railway stations "blocks" or accumulations of grain destined for the distressed districts, and desiring to ascertain how far the several railways could be relied upon to carry the quantities necessary to supply these districts, I obtained from the Government of India the services of an Engineer officer belonging to the Railway Department. He was of great use in getting these accumulations cleared away, and in promoting efficiency in the joint working of the two railways. With his help I ascertained that the quantity then estimated to be required for the whole of the distressed districts and including the territory of Mysore, amounting to 2,700 tons a day, could with extreme exertions be carried by the two lines (that is, the Madras Railway and the Great Indian Peninsula Railway from Bombay). The railway from the Bombay side worked satisfactorily. But the working system of the Madras Railway, though cheap and sufficient for the light traffic of ordinary times, was hardly able to bear up against the pressure of the heavy traffic in a time like this. The Traffic Department of the Madras Railway, however, exerted itself most commendably under all these difficulties. The engine power on the Great Indian Peninsula Railway was found insufficient, and on the Madras Railway was quite unequal to such an occasion as this. In order to afford some remedy for this very serious want, additional engines were obtained from other parts of India. And in order to relieve the pressure, I recommended, with the full concurrence of the Madras Government, the doubling of the line as far as Arcot, which recommendation was accepted by the Government of India. Subsequently, in order to lessen the strain caused by the grain traffic to Mysore, the Madras Government desired that the Mysore traders should receive a part of their consignments through the port of Negapatam instead of through Madras, and reduced the rates on grain destined for Bangalore. When visiting Bangalore I pressed this matter on the consideration of the Native merchants there. And the Madras Government ordered additional measures to facilitate the landing of grain at Negapatam.

The question whether the three railways, namely, the Great Indian Peninsula Railway, bringing grain from the north-west to Bellary and Kurnool; the Madras Railway with its two branches, one towards Bellary and Kurnool, the other across the Peninsula to Beypore; the South of India Railway, leading from Negapatam to Trichinopoly and thence to Madura and Tuticorin opposite Ceylon,—could, or could not, at the worst season carry all the grain required for the distressed districts including Mysore, lay at the foundation of all our plans for a successful contest with the famine. Therefore, calculations bearing upon this point were repeatedly made and re-made. The results seemed to justify the expectation that the railways, in combination, would be able to perform this task. And, as yet, this expectation has been verified by the event. Such indeed have been the fluctuations in demand, that never yet have all these lines been simultaneously worked to the aggregate of their power.

An inspection of the country south of the right bank of the Toongabhadra (with its narrow fringe of unfailing cultivation watered by channels from the river) showed that the reality of the drought and its consequences equalled the worst reports. The Irrigation Company's canal, which can irrigate 250,000 acres of autumn crop lands, had given water to about 72,000 acres in the Kurnool and Cuddapah districts and so far proved to be a timely resource. But in some cases the ryots took the water too late to save their crops. The people have not as yet made use of the canal water in any adequate degree; for, in previous years only 9,000 acres have on the average been irrigated, whereas the canal has water enough for many times that area of autumn crop lands. It may be hoped that present experience will impart a stimulus to irrigation from this canal in future.

Among the questions which forced themselves on my mind at that time, 14th to 21st of January, in the most distressed districts, were these:—

Arc the measures of relief sufficient to meet the trouble?

Sir Richard Temple's report on his mission to Madras.

Are they more than sufficient in reference to the principle that the people should not be encouraged to resort unduly to State assistance and that all expenditure in excess of the actual necessities of the case should be prevented?

Are they in any degree open to the general objections set forth by the Government of India? If they are, then what steps by way of rectification ought to be recommended?

There could be no doubt that, on the whole, the grave consequences with which the people had been threatened by the drought were being successfully averted. In the interior of the Presidency, and especially in the most distressed districts above the Ghât mountains, there was no information of any mortality or even of any deaths of individuals from starvation. There was indeed information to the effect that nothing of the kind had occurred or was likely to occur. There was no sign of distress. Whatever distress had been threatened was being thoroughly relieved. Irrespectively then of cost, present or prospective, irrespectively also of any possible demoralising influences on the people, there was no doubt that the famine was being completely subdued.

It has been stated above that the consequences of the drought had on the whole been averted, because there was a defective point on which they had not been fully averted, namely this, that in some of the districts near Madras (as already mentioned) there was some unrelieved distress. This distress extended over nearly the whole of certain large

* Venkatagiri.
Kalastrī.
Karvetnagar.

zemindari estates,* which were not under the direct management of Government officers as the ordinary ryotwari districts are. It extended also over some of the lower castes in parts of the districts of Chingleput and

North Arcot, and it seriously affected many individuals in various classes. When the half-starved persons came forward at the centres of authority, or were picked up in public places, or were found lying about, they were fully cared for. But these occurrences might have been in some degree prevented had a proper system of village inspection and relief been ordered in the beginning. Even when events gave warning of the necessity of such a system, its introduction was too long delayed. But these defects, however grave, did not, when compared with the magnitude of the affairs in their totality, detract from the general result, which certainly amounted to this, that by the beginning of January the serious distress which threatened to rise in the Madras Presidency during December was effectually kept down.

But then there followed these several questions, namely:—

Whether the relief measures were more than sufficient?

Whether they encouraged the people to resort unduly to State assistance?

Whether they were involving an excessive expenditure beyond the actual necessities of the case?

Now, without at all disparaging the humane foresight, thoughtfulness, and anxiety of the Government, or the zeal, devotion, and benevolence of its officers, or the many difficulties and uncertainties with which this great and difficult affair was beset, I am constrained to answer these several questions in the affirmative.

But I would add in explanation, as already stated, that all those who were charged with the conduct of relief affairs, had up to this time thought themselves bound not only to save life but also to relieve to the utmost all suffering and general distress caused by the scarcity. And this understanding went somewhat beyond the intention of the Government of India as explained in the instructions just cited.

It has been already stated that on behalf of the Madras Government, one Member of the Board of Revenue after another had visited temporarily the most distressed districts, had consulted with the local officers, and had made reports to the Government, which had been very useful so far as they went. But these high officials did not always possess authority to give orders or instructions on the spot. Whatever authority they indirectly exercised was in its nature undefined, and was insufficient for conducting urgent and critical affairs. Each of them stayed but a short time and then returned to Madras. There was no superior authority resident in the scene of trouble, vested with power, and imbued with that sense of personal responsibility which conduces to forceful and thoughtful administration. Consequently there was no policy laid down in adaptation to local circumstances. The District Collectors had not enough of guidance under circumstances transcending their ordinary experience. And junior Civil officers in out-stations and in remote subdivisions were sometimes obliged to confront extraordinary difficulties, to incur large expense, and to commit the Government to important decisions, without having received any definite instructions.

Another difficulty consisted of the great size and area of the jurisdictions under each District Collector. The Collectorates of Bellary, Kurnool, and Cuddapah had extensive

and remote subdivisions, which had urgent affairs in progress, which were in the charge of officers full of zeal but comparatively young in experience, and which were removed by distance from the immediate cognizance of the Collectors.

Sir Richard Temple's report on his mission to Madras.

If, at the outset of the affair, some trusted official, who could have been empowered to issue orders on behalf of Government, and who would have been directly in communication with the Government, had been deputed to the most distressed districts, the Government of Madras would probably have succeeded earlier in systematising relief operations, and in securing economical administration.

As already seen, there were in the second week of January 1,165,000 persons on relief, of whom 1,008,000 belonged to the three districts of Bellary, Kurnool, and Cuddapah, and the remaining 157,000 persons belonged to the districts of Nellore, Chingleput, North Arcot, Salem, Coimbatore, and one or two others. In the last-named districts the numbers were not large enough to raise any important issue. But in Bellary, Kurnool, and Cuddapah, the numbers could not fail to arouse the gravest reflections.

The numbers on relief (relief works and gratuitous relief being taken together) in these three districts might be thus compared with the total population :—

—	Population.	Total Number on Relief.	Per-centage on Population.
Bellary - - -	1,688,000	460,000	27
Kurnool - - -	960,000	337,000	35
Cuddapah - - -	1,351,000	211,000	16

On examination of local details it was found that in several subdivisions of the districts of Bellary and Kurnool there were 50 to 60 per cent. of the population on relief works. It seemed possible that at the then rate of progression, the entire rural population in some parts of these districts would, with the exception of comparatively few individuals, be ultimately wishing to resort to State relief.

In Bellary there were, in addition, a large number of persons (upwards of 40,000) employed in the repairing of the roads and tanks and in the ordinary public works of the district, who were not reckoned as relief labourers at all, though they belonged to the labouring classes.

In the Deccan districts of the Bombay Presidency, which districts were afflicted by the same drought, the number stood thus for the same period :—

—	Population.	Total Number on Relief.	Per-centage of Population.
Sholapur - - -	718,000	93,000	13
Kaladgi - - -	816,000	27,000	3
Part of Poona - - -	318,000	47,000	11

The analogy of these equally afflicted districts pointed to the conclusion that there must be some excess in the relief administered in Bellary and Kurnool.

Again, these excessive numbers on relief in the districts of Bellary, Kurnool, and Cuddapah were found in the second week of January. According to the experience of all former famines in India, the numbers in January would be surpassed by the numbers of the succeeding months; indeed they would go on rising month by month till May, or till the south-west monsoon (expected in June) should arrive. If then these districts showed a million of recipients of relief in January, what it was anxiously asked would they be showing in March, or still more, what would be the enormous muster roll of April or May?

In January and February 1874, the worst districts of North Bengal and Behar hardly showed more than a few thousand recipients of relief. The numbers remained low till the middle of March. Then they rose rapidly, but did not reach their culminating point before the middle of April. No doubt there is a difference of at least one month in season between Behar or Bengal and the Madras Presidency, which might cause famine to declare itself a month earlier in the latter presidency. Still this would not account for the remarkable haste with which the famine seemed to be striding onwards

Sir Richard Temple's report on his mission to Madras.

in Bellary, Kurnool, and Cuddapah. And this consideration alone would have necessitated a review of the situation in these districts, to see whether there were not any artificial as well as natural causes working to precipitate a crisis.

The question then was whether any preventible causes existed to maintain the numbers on relief at such an excessively high rate in these districts? A sojourn of a few days in the districts of Bellary and Kurnool and a visit to Cuddapah, a careful inspection person by person of relief labourers, in gangs scattered over various parts of the country, an examination of some of the relief works, and much conversation with the local officers, European and Native, served to convince me that such causes actually existed. They were—

Offering of work close to the homes of the people;

Rendering the work light and easy;

Making the wages worth having irrespective of bare subsistence;

Admitting all comers without any question as to whether they could sustain themselves for a time;

Allowing all applications for employment without exception.

These several concessions offered considerable advantages in the eyes of a rural community. At that time a rustic family could earn on the relief works Rs. 10 a*

		Rs.	month; or Rs. 40 if the period of relief should last for
*Man -	-	3 $\frac{3}{4}$	four months. They will not perhaps seize the oppor-
Wife -	-	2 $\frac{3}{4}$	tunity if the work be hard and a long way off; but they
Two elder children -	-	3 $\frac{1}{2}$	will do so if it be easy and close at hand. Thus a

temptation is presented not only to the lower classes and to the field labourers, but even to the ryots and peasant proprietors who pay land tax to Government. A man and his family are not in actual want; they are not prepared to interrupt their domestic arrangements or to bivouac out or to work hard all day under the burning sun. But they find the times hard; their ordinary work is slack. They would be glad to make a little money. And this is exactly what the relief works enabled them to do, and what was actually done by tens of thousands of persons at that time. But manifestly this was not within the legitimate scope of relief operations. And undoubtedly some sort of demoralisation was beginning to creep over the rural community.

As already stated, the wages were, at the outset, supposed to be low relatively to the dear prices of food. But they were not really low, when every member of the family was able to earn them close at home. The monthly earnings of a poor family, at this time on the relief works, was equal to the salary in ordinary times of the lowest paid classes who can read and write.

These circumstances had not, however, lasted long; they were only in their inception; there was ample time within which they could be remedied. Under the best arrangements it is not always possible to avoid faults in such extraordinary affairs as these; it is more profitable to gird ourselves to set things right than to regret what may have gone wrong for a time, especially if that time has been but short.

In the first place, then, I addressed myself to the enforcement of task-work, and found from inquiry on the spot that at the outset there had been no sufficient progress made in this direction, but that subsequently the Madras Government had ordered task-work to be introduced. In most places these orders did some little good; in few places only were they acted up to. In fact, the numbers of relief labourers had swelled so rapidly that it would have been almost impossible to regulate properly the proceedings of undisciplined crowds, even if a strong regulating establishment had existed. But such an establishment did not exist. Those officers in Civil employ within the presidency who could be spared had, as already stated, been employed. It was held that officers from the Madras army could not be spared. Some officers from the Bengal army and from the Bengal Public Works Department had been sent for, but had not arrived. The European relief officers and the District Engineers, being few in number, did what they could, but were obliged to trust in the main to their Native subordinates. These latter consisted chiefly of Native Deputy Collectors, tehsildars, and Revenue Inspectors. Without any disparagement of the merits of these Native officials in the ordinary duties for which they had been trained, and with all acknowledgment of the good service rendered by some among them even on this trying occasion, I am obliged to state that they were generally deficient in aptitude for supervising relief work. They were appalled at the drought which had befallen the people and they shared in the most exaggerated fears as to its consequences. They admitted all comers, however well-to-do, without let, hindrance, or inquiry, and they permitted the people to freely indulge the hope that the State would feed everybody for the mere asking. There was nothing for it but to wait

the arrival of the additional officers expected to arrive, and meanwhile to press and urge the enforcement of such a degree of task-work as might be practicable.

At the same time I made careful inquiries in every direction regarding projects for large public works which could be undertaken with relief labour under professional supervision, and on which task-work could be exacted or piece-work established. The districts of Bellary, Kurnool, and Cuddapah were not fortunately situated in this respect. The project of a high level channel from the Toongabhadra was impracticable. The commencement of the railway from Bellary towards Dharwar had been negatived. The extension of the canal between Kurnool and Cuddapah was difficult in the state of the relations between the Government and the Irrigation Company. However, several main lines of road and several large tanks or lakes were proposed.

I duly remembered that in inviting projects for such public works in order to employ relief labour, there is the danger that proposals may be made for executing projects previously rejected on general grounds, to which projects labourers not absolutely in need might be attracted,—and that if this were to be allowed, the occasion of relief would be made use of in order to carry out unnecessary works, whereby extra and needless expense would be incurred. But this objection is obviated if those only are admitted who really need relief, who must be assisted on some work or other by reason of their distress, and if the strictest regard be paid to the selection of projects. Although the danger is real and has to be guarded against, it can with care be avoided. And this consideration does not at all counteract the advantages of insisting on relief labourers being drafted off to large public works wherever such can be found.

Although it seemed impossible at the time (though it afterwards became quite possible) to prevent the greater part of the works remaining under the care of officers whose tasking would probably be easy, still there were three things which could be done even by the unprofessional Civil establishments, firstly, moving the gangs to a little distance from their homes and concentrating them on works where some supervision might be managed; secondly, stopping the influx of new applicants who had been flocking in by tens of thousands week by week from some time past; thirdly, the eliminating from the ranks of the gangs those persons who were manifestly able to sustain themselves and whose presence constituted an abuse of the State charity. The numbers picked out to be discharged might not indeed be great enough to cause any appreciable saving of cost, but their discharge would have a gradual effect on the public mind, as showing that the Government would not suffer itself to be imposed upon.

I represented verbally without an hour's delay to the local authorities these various considerations, which I understood to be in the mind and intention of the Government of India. I avoided giving them any absolute instructions, for which indeed they were to look to the Madras Government. I conferred with them, and explained to them, for their consideration, the principles of relief policy and the results of experience. In most cases they seemed from their own experience to be prepared for these views, and often proceeded to give effect thereto, under the responsibility vested in them by their own Government. The general effect was an instant cessation of increase in the rolls of relief labourers, and the commencement of decrease almost day by day. The flow of the tide was arrested and the ebb set in.

I understood that the Madras Government, being satisfied that the approach of the famine had been withstood and repelled, was quite prepared to adopt further measures for systematising relief operations. On the 21st of January I laid before them, in addition to the enforcement of task-work already ordered, proposals for—

Stopping all fresh admissions to relief works in Bellary, Kurnool, and Cuddapah, save under an order from some responsible official;

Examining every gang person by person with the view of discharging for the present every one not in absolute need of State relief;

Reducing the relief wage for men from 2 annas to $1\frac{1}{2}$ annas per diem; the wage for women and children to be adjusted accordingly.

It was shown that at the price of common grain then prevailing and likely to prevail (namely, one rupee for eight seers or 16 lbs.) during the time of distress, the $1\frac{1}{2}$ annas rate would enable a man to buy 1 lb. of grain per diem, and to have a margin for buying vegetables and condiments. Besides the financial saving, which would be considerable, the foregoing narrative will have shown the importance of lowering the relief wage to the standard of subsistence, of sustaining life in ordinary health, and nothing more.

These views were generally accepted by the Madras Government on the 31st January, and orders were issued by them accordingly to all the distressed districts. Instead of the wage of $1\frac{1}{2}$ annas per diem as proposed by me, the Madras Government ordered that

Sir Richard Temple's report on his mission to Madras.

Sir Richard Temple's report on his mission to Madras.

the wage should be fixed for all relief labourers, not under professional supervision, at an amount representing the price of 1 lb. a day of grain plus $\frac{1}{2}$ anna for vegetables and condiments. This rate was as economical as mine, but it had this disadvantage, that doubts would arise in different districts as to what kind of grain was meant, that time would be lost in discussion, and that, in the midst of doubts, the reduction of wage would in some localities fail to take effect. All this actually happened. The reduction did not take effect till nearly the end of February, and in many places it settled itself into the $1\frac{1}{2}$ annas rate, the very rate first recommended.

For those relief labourers who were employed by the Public Works Department under the departmental rules of work, or who, though supervised by other agency, might be working up to the departmental standard, a rate of 2 annas per diem was allowed.

While in Madras at this time, I named, at the request of the Madras Government, a number of covenanted Civil servants of the Bengal Presidency who had experience in the famine of 1874. The Government of India was pleased to despatch these officers for service in the distressed districts of the Madras Presidency. They arrived at their posts in the interior of the country with the least possible delay.

Subsequently I recommended that European officers of the Madras Army should, if they could possibly be spared, be employed in the relief operations. I also invited consideration to the advantage of employing the Native officers of all grades in the army, and also selected sepoys in the supervision of relief gangs and in the exaction of task-work; this plan having been tried with signal advantage in the famine of 1874, when numbers of Native officers and soldiers of the Bengal Army served throughout the famine relief, in a manner worthy of the great profession to which they belonged. By these means a trustworthy and comparatively inexpensive agency is obtained at a time of emergent demand for establishments of this description.

On or about the 24th of January the instructions of the Government of India, already described, were published throughout the Madras Presidency. Their appearance, of course, imparted authoritative weight and solidity to all the proceedings which had been taken to reduce the relief operations to system, and to prevent the waste of money, and strengthened all the representations which might be made with these objects to the Local Government and to its officers.

At the same time it was most important to provide for the inspection of the poorer classes in the distressed districts from village to village, from house to house, in the highways and byeways, in every place where men either congregate or wander. The orders of the Madras Government were that relief camps for the reception of destitute persons should be formed at all the principal places, and that the residuum of such persons should be relieved by the village headmen under the supervision of the district authorities. These orders were doubtless excellent so far as they went. But being general in their terms they needed to be followed up with more specific directions. On the 16th January I caused a detailed memorandum to be drawn up of the manner in which the Kurnool district might be divided into circles and sub-circles for the inspection of every house in every village, for the purpose of searching out cases of destitution, which memorandum was immediately transmitted to the Madras Government. On the 19th January I drew attention to the importance of impressing upon the headmen of every village their responsibility for bringing before the nearest authority every case of dangerous distress. On the 8th February I formally represented to the Madras Government the general importance of the subject, observing that, however comprehensive the relief measures might be, still experience showed that individuals or families might be suffering in silence, and might compose themselves for death without complaining. For this there was one, and only one, remedy, namely, inspecting the villages house to house, and bringing forward for relief every destitute or famishing person who could be found. I pointed out the remarkable advantages which the ryotwari system—with its staff of officials, tehsildars, and Revenue Inspectors in each of the many subdivisions into which every district was divided, and with the hereditary headmen and accountants in every village—offered for carrying out such a plan; concluding with a recommendation that, although the local authorities had a general understanding of the subject, they should be more specifically instructed in its details.

My next care was to visit rapidly the distressed districts below the Ghât mountains. As already seen, some parts of those districts were much distressed. And if the ideas which had for a time prevailed in the districts above the Ghât mountains (Bellary, Kurnool, Cuddapah) should take possession of the people below them, the crowding of large numbers on relief works might become very embarrassing. I therefore passed through parts of Chingleput, North Arcot, Salem, Coimbatore, Trichinopoly, Madura, and Tinnevely. This visit was decidedly re-assuring. The failure of the autumn and

winter harvests had been less ; the promise of the spring harvest was better ; the resources of the people were in several respects greater. Nothing like indiscriminate relief had prevailed ; the local officers had been cautious and thrifty ; the people had been taught the lesson of self-control under threatening circumstances. The recipients of relief were comparatively few, and their number did not seem likely to increase largely.

Sir Richard Temple's report on his mission to Madras.

At this time, the end of January, it became necessary for me to estimate the cost of the famine in the Madras Presidency. In December 1876 the Revenue Board had made an approximate estimate, which showed an expenditure of nearly $3\frac{1}{2}$ millions sterling, 3,410,000*l.*, exclusive of losses of revenue. But the Government did not accept this, as it was formed on very rough data only. But now, 5th February, it seemed proper for me to submit to the Government of India a preliminary estimate of the possible cost of the famine in the Madras Presidency. This was accordingly done. The main factor in the estimate was the probable number of relief labourers. This was ascertained from the Collector of each district, allowance being made for the restrictive measures which had been discussed, as already described in this minute. The numbers still seemed very high, and I was hopeful of seeing them reduced. But it was not thought prudent to deviate from the authoritative opinions of the several Collectors until further facts should be developed. And as these numbers were high, it seemed advisable to prepare the Government of India for all financial eventualities. On the data then furnished by local authority, the number assumed for February was 1,228,000 persons, for March 1,480,000, for April 1,840,000, for May 1,530,000. After that month it was calculated that the numbers would fall to 795,000 in June and 310,000 in July. Besides these numbers on relief works, it was thought advisable to provide for large numbers of persons coming on gratuitous relief, which numbers might gradually rise to 700,000 in the month of June. The result was a total estimated cost of 2,920,000*l.*, being 490,000*l.* or half a million less than the first rough estimate. The cost might under certain contingencies come out greater. But there was hope that if economy could be successfully introduced the expense might be kept much within this estimate, in which case a revision of the estimate would have to be made.

As measures of additional control came to be adopted, it was apprehended that local questions would arise which could not be promptly settled without some officer being present on the spot with plenary power. Further, with measures of relief spread over so large an area and affecting so many classes, it would be difficult to secure that uniformity of system which is necessary to be maintained, even after allowing for all local peculiarities, unless there be some authority at hand to whom all officers must defer. I therefore recommended that some officer be appointed to reside in the most distressed districts and be vested with power, subject immediately to the Government of Madras, to direct and control all the relief operations. No particular action was taken upon this recommendation.

I visited the Mysore Province for a few days at this time. The proceedings taken there, which were useful for comparing the standard of relief adopted in this neighbouring province with that prevailing in the Madras Presidency, need not be described now.

It then became desirable for me to return to the districts above the Ghât mountains, Bellary, Kurnool, and Cuddapah, to see whether the Madras Government orders regarding the systematisation of relief were being fully carried out. This second visit lasted from the beginning of February to the end of that month. During this time I visited many localities in the interior of the country, examined the various relief works, inspected numerous relief gangs, myself examining upwards of one hundred thousand relief labourers in all of both sexes and all ages, conferred with most of the relief officers, European and Native, and saw as much as possible of the middle and humbler classes who were not upon relief. Once more I impressed upon all concerned the principles set forth in the instructions of the Government of India, superadding this time, however, exhortation founded on the orders of the Government of Madras issued, as already explained, on the 31st January. By this time too the European officers, military and other, from distant parts of India, and especially the Civil servants experienced in the famine of 1874 (who have been already alluded to), were beginning to arrive. Their presence greatly strengthened the supervision and control. The local officers, despite much difficulty, exerted themselves most loyally to restrict relief to those who absolutely needed it ; to reject those who were making a convenience of the State bounty ; while they extended discriminating charity to all cases of real misery. Many persons were discharged as being manifestly without claim to support from Government. This doubtless discouraged applicants who knew themselves unworthy. To such persons the reduction of the relief wage served as a further discouragement. This tended to keep

Sir Richard Temple's report on his mission to Madras.

the numbers down. As might be expected, the increased supervision brought to light the various sorts of frauds, malpractices, and false returns, which are sure to be found on these occasions everywhere. The returning of persons who never existed is expressively termed in these districts the "counting of crows in the air and entering them in a roll." Sometimes outbreaks of small-pox or cholera or other sickness, sometimes also holidays and festivals, would cause gangs to break up, and not to re-assemble. Again, the relief works were systematically re-arranged in order to take the relief labourers to some reasonable distance from their homes, and to make the tasks in some degree irksome, so as to apply some test and trial of the reality of their need. The manner in which the gangs thinned their ranks, when required to move away, to perform a day's march, to render a fixed tale of work, to bivouac or encamp in the open fields, was quite remarkable. Then it was that tens of thousands proved by their own behaviour that they had been taking State wages for gain or convenience, and not for the support of life. More than this, many gangs, on receiving orders which would have been obeyed unhesitatingly by persons really in need, struck work, hoping to make terms with the authorities. Finding themselves unable to dictate their own terms, some would come back after remaining for a while on strike, but many stayed away altogether. Instance after instance occurred of gangs, some thousands strong, disappearing from muster on being told that the road running through the middle of their villages to which they had sauntered leisurely day by day for weeks past was now finished, and that they would be assembled at another road, one day or two days' march off. Other gangs equally large, on being set to do an augmented task, would cease working and run off, shouting that this new burden was unjust, and that Government, having let them become accustomed to easy work, should allow them to continue in ease to the end. The effect of all this was to bring down the numbers week by week. In Bellary, Kurnool, and Cuddapah the highest total in January of persons on relief works amounted to 950,000. It fell to 540,000 by the end of February and to 490,000 by the middle of March. And the decrease is the more remarkable, inasmuch as the season was advancing during which the distress was expected. In this part of the country the process of rejecting from the gangs those who are well-to-do and retaining those who are poor is described by an expressive phrase "shroffing," in allusion to the manner by which a "shroff" or money-changer tests the intrinsic value of the coins presented to him. Thus the majority of the people who left the works had "shroffed" themselves. In this part of the country there was no symptom of distress among these people after their departure. In some instances the prices of common things, grass, firewood, and the like, fell after their departure from the works, proving that they had reverted to regular occupations, and that their presence on the works had for a time actually interrupted rural business.

Inquiry was made as to what the relief labourers were doing with their wages. In many places it was understood that they were not devoting these earnings entirely to the purchase of food grain. The sales of grain at the shops or bazaars established near the gangs on the works appeared often to be less than the cash disbursements in relief wages. It was thence inferred that the labourers were hoarding a part of their wages. There was some information to the effect that they were exchanging the small copper coins for small silver coins.

Again, in some gangs there were large numbers of women whose husbands or relatives were not on the works, but were at home following some pursuits of their own. In such cases it was to be inferred that, while the husbands were following their ordinary professions, the wives were labouring on the relief works in order to eke out the little income of the family.

These and other indications seemed to show that, even after all the reductions in numbers, there must still be many who attended the relief works for gain and convenience rather than from necessity. Still the great majority of those now on the works, though maintained in good condition, would have rapidly deteriorated without State assistance. Thus the relief measures when duly restricted, were really necessary to prevent a section of the population from perishing or being disabled.

It was satisfactory to find that the robberies and thefts which had been so rife from November to January had to a great extent ceased, and that the state of crime against property was not much above its ordinary level. To this remark some places such as the frontier of Kurnool, near the Kistna, certain parts of Salem, and perhaps other localities formed exceptions.

During this visit I inquired most carefully as to whether the prescribed system of village inspection and relief was being carried out. It was found that much was being done in this direction; that the village headmen had received strict injunctions to inspect, report, or relieve; that they had in many cases received small advances of funds, so that they

would be without excuse for failing to afford relief in emergency; that circles had been formed each containing a few villages only, there being a special relief centre in the midst of each circle; that there was a larger relief centre at the head-quarters of each subdivision comprising a cluster of circles. But still here and there among the villages, and sometimes among the gangs of sturdy and vigorous relief labourers, I found weakly or wretched individuals. And sometimes inquiry into these miserable cases showed that the poor people were sharing their wages with infirm people at home. Such infirm persons ought, of course, to have been sought out and brought forward for succour under the system of village inspection and relief. These and other circumstances induced me again to address the Madras Government, reiterating the recommendation made on the 8th February, and suggesting the issue of more definite and detailed orders, compelling all village headmen to pay thorough attention to this part of their duties, and ensuring an effective watch over the headmen on the part of relief officers and officials of all grades.

Sir Richard Temple's report on his mission to Madras.

Wherever I went sickness and mortality, either just past or actually present, were found showing their sad effects. Everywhere cholera and small-pox met our view, and were mainly to be accounted for by unwholesome drinking water and insanitary habits. In some cases the sickness began with dysentery arising from bad food, and ended in cholera. But at that time, and in that part of the country, those who succumbed under insufficient nourishment, perished—if any really thus perished—through their own default, for everywhere was relief proffered, and was close at hand.

Having regard to the urgent need of large public works on which relief labourers could be professionally tasked, I recommended (with the entire approval of the Madras Government) that the earth-work on the projected railway from Bellary towards Dharwar, and on the branch connecting Chingleput near Madras with Conjeveram, should be taken in hand for employing relief labourers, on the understanding that the Government should not be thereby pledged in respect to the time and manner of completing the lines. To this recommendation the Government of India were pleased to accede.

I next proceeded (on the 27th February) to the Nellore district, and was much struck by the general excellence of the East Coast Canal, and its special suitability for the extensive employment of relief labour under professional supervision and with complete sanitary control. But, whereas the canal could employ 90,000 labourers, only 30,000 were then employed, and 60,000 were wanted. The orders of the Madras Government for sending to this canal relief labour from a distance had received attention, and some labourers had arrived, but their number was not very considerable. Notwithstanding this, in the very district of Nellore and at short distances from the canal, there were 55,000 persons employed on petty works under the Civil officers. These people were, as a rule, quite unwilling to exchange their comfortable work for labour on the canal. This is an instance of the sort of demoralisation which must arise when people are admitted to easy work at home while they might be drafted to larger public works. I urged the Collector to consider this. He arranged to draft 20,000 selected persons from his village works to the canal. I then represented to the Madras Government the expediency of drafting 40,000 persons from the relief gangs in Bellary and Kurnool, and orders to that effect were issued.

I also asked the consideration of the Madras Government to the suitability of the "Sungum" irrigation project in this district for employment of relief labour, for which project professional plans and estimates were ready.

Apart from the defect above noticed, the administration of relief in this district seemed to have been more careful and economical than in the districts above the Ghât mountains; but there were reasons to fear that the village inspection and relief was not sufficiently carried out.

Returning from Nellore, I again visited the North Arcot district, that being the quarter where—notwithstanding all the precautions which had been taken by the local authorities—individual cases of severe distress were most likely to be found scattered about the country. I found that, although the relief measures were sufficient in most parts of the district, still in some of the large zemindari estates (mentioned in a previous part of this minute) much unrelieved distress still existed, for the remedying of which full suggestions were offered by me to the district officers.

After this, on the 4th March, I was required by the Government of India to submit a revised estimate of the cost of the famine in the Madras Presidency. It has been already seen that the numbers of persons on relief had been steadily falling, especially in the most distressed districts, since the middle of January. It was therefore necessary to reduce the amount of the preliminary estimate submitted during the first week of

Sir Richard Temple's report on his mission to Madras.

February. Instead of the total of 1,200,000 relief labourers for February which I had then taken on the authority of the local officers, the latest returns for that month showed only 713,000. Instead of 100,000 which had been estimated as the number of persons on gratuitous relief during February, the actual number was 50,000. The result was that the revised estimate showed a total expenditure of 2,176,000*l.* instead of 2,920,000*l.* the total of the preliminary estimate. But it was explained that the revised estimate assumed the strict maintenance of all the economical checks which had been introduced, the coming of the ordinary showers in April, and the propitiousness of the coming summer monsoon. It was stated that if there should be failure in any of these respects, the estimate would be disturbed.

As favourable reports had been received regarding the districts of Madura and Tinnevely, it did not seem necessary for me to revisit them. But as events had fully developed themselves in the districts of Salem and Coimbatore, it was desirable to examine the relief operations there, and to see whether system and order had been fully observed. On visiting these districts I found that carefulness and economy, consistently with a due regard to the condition of the people, had been practised there from the first, and had been steadily maintained.

I examined the large relief camps in this part of the country, as well as in the neighbourhood of Madras. Their internal economy was excellent. But though largely attended, they somehow were unpopular with the poorest classes, and were sometimes avoided by even destitute persons. One cause seemed to be the insufficient provision for the separation of the better castes from the caste-less people, and for other social customs which even the humblest hold dear. This was immediately represented to the Madras Government. Some improvement has been already effected.

It was found that while some of the weavers habituated to make the coarser fabrics could labour on the relief works, those weavers who wove the finer stuffs with delicate handiwork could not handle the implements of rough labour. I therefore suggested that for the weavers of finer fabrics, who were often suffering severe privations, some light and suitable relief work should be provided. The Madras Government approved and acted upon this view.

I had to report to the Madras Government the information gathered regarding unrelieved distress in the three large zemindaris already mentioned in this minute, and regarding the failure on the part of the zemindars to do that which is elsewhere acknowledged to be the duty of landlords towards their tenantry and dependants. Suitable admonitions to those concerned have been issued by Government.

In some places I found private charity on a large scale being dispensed by benevolent Native gentlemen to all comers without discrimination as to whether they were deserving or undeserving objects. I therefore suggested to the local authorities the expediency of representing to the charitable donors that it would be preferable for them to contribute to some public institution of which the organisation is such as to admit of due discrimination being conveniently exercised.

I then proceeded to Madras to confer with the Government regarding the sufficiency or otherwise of the reduced relief wage. The Sanitary Commissioner of Madras had raised objections to the reduced scale of wages for relief labour, based on theoretical and scientific grounds, and supported by his previous experience of the people in Southern India. It was thought by him and by some others that the wage ought to be raised to the rate at which it had stood in the beginning of January. I, however, represented to the Government of Madras that the reduced wage had not received any proper trial, and that it ought, in justice to the public interest, to be fully tried. This view was accepted. It was at the same time ordered that any person in the relief gangs who might be found in a condition below par should be specially treated, either by extra allowance or by diminution of task.

It was arranged that, when relief labourers brought to the work children of tender ages unfit for labour, such children should receive a special allowance. This concession, on which the Madras Government laid great stress, obviated a risk which might otherwise have been run, when the relief wage was reduced.

Besides the advantage of economy, which is considerable, there are obvious reasons for keeping the wage down to the lowest rate compatible with the health of the relief labourers. The people are less tempted to resort to relief except under necessity, as they are known to be much influenced by the rise or fall of the relief wage. The margin for illicit practices on the part of ministerial officials is narrowed. If the wage is liberal, a part of it is sure to be absorbed by these officials; if it be just enough and no more, then the labourers cannot afford to give anything to the officials. The question whether the wage representing 1 lb. of grain a day, and $\frac{1}{2}$ anna for extras, is sufficient, can be

decided by experience. There is reason to infer from the rates of wages in ordinary times—not of trained labourers or of persons employed in central places or on special work—but of the labouring poor among the villages, and from the ordinary prices of food grains, that a man of this class can hardly get more than 1 lb. a day besides extras. If that be so, it becomes important to establish a relief wage on this basis. It may be that somewhat more liberal terms have been allowed on former occasions. But that is no reason why these more economical terms should not be now introduced if experience proves them to be feasible. And although some instances to the contrary were adduced, still at that time, the middle of March, large gangs of labourers in Bellary and Kurnool were known to have been working for some little time on the reduced wage without physical detriment. Opinion at Madras was apparently affected by the wretched condition of the wanderers who strayed into the capital or its suburbs, in quest of food, and who doubtless may need generous sustenance for a time. But these were cases of special distress and were quite apart from the mass of relief labourers in the interior of the country, who had been employed before they could lapse into wretchedness, and had since been maintained in good case.

Sir Richard Temple's report on his mission to Madras.

It was necessary next to proceed on the 15th March to the Bombay Presidency to carry on the work of my mission there.

I returned to the Madras Presidency on the 25th March, entering the district of Bellary. I found both in that district and in Kurnool that the engineering and professional establishments were still far from being adequately employed in the supervision of relief works and on the exaction of task-work. As herein there seemed to be a waste of power, and consequent detriment of the relief operations, I submitted to the Madras Government a detailed scheme, prepared on the spot in concert with the local authorities whereby certain selected works might in each of these districts be taken up by the Engineer officers—to which works the Civil officers might draft off all the strongest labourers of both sexes from the ordinary relief works. The persons thus drafted off would be really subjected to task. A precise statement was submitted of the works to which this scheme would apply; they were chiefly trunk roads running through these districts. I also tried to assist in expediting the selection of able-bodied men to be drafted from the relief works in these districts to the East Coast Canal and to the railway from Bellary towards Dharwar. The relief labourers, however, evinced much unwillingness to be transferred from the easy village works to these larger public works.

I also again examined the progress made with village inspection and relief. Much improvement in this respect was perceptible. Those destitute persons who could move were resorting to relief centres, established amidst the circles of inspection into which the villages had been grouped. Those who could not move were being specially treated in their villages by the village headmen. I was unable to hear of any death occurring or being likely to occur from starvation.

On this occasion I was accompanied by Dr. S. Townsend, the Sanitary Commissioner to the Government of India, whose assistance had been asked for to enable me to judge of the physical condition of the relief labourers, and to estimate under professional advice the objections raised by the Sanitary Commissioner of Madras. After inspecting nearly 40,000 of these people in different parts of the country, Dr. Townsend stated his deliberate opinion that their physical condition was fairly good, and that there were no grounds perceptible for raising the wages. This opinion I duly reported to the Government of Madras.

The Sanitary Commissioner of Madras has, however, admitted that, with the special allowance given to the little children of relief labourers, perhaps also with the allowance of wages on Sundays, the reduced wage is about equal to that which he himself recommended.

Still in some quarters it seems to be supposed that there is some connexion between the mortality among the recipients of gratuitous relief and the reduced relief wages; if persons die at the gratuitous relief camps, or are picked up in a famishing state on the roads or elsewhere, that is imagined by some to be a proof that the relief wages must be too low. But evidently there is no connexion whatever between the two cases. Those who are found starving (with exceptions so rare as to prove the rule) are not, and have never been relief labourers at all, and have not been earning any wages. Most of them are not accustomed or are not able to work; and this is mainly the reason why they have been admitted to gratuitous relief. How, therefore, can the rate of relief wages possibly affect them? Any inference drawn from these conditions would be wholly irrelevant if applied to relief labourers. These poor people have sunk into danger, either because they themselves failed to apply for charitable aid, or because those who ought to have brought them forward for gratuitous relief failed to do so. But that is a matter quite

Sir Richard Temple's report on his mission to Madras.

separate from the question of relief wages, which refers to a totally different class of persons.

Even though the reduced wage may, as now stated by the Sanitary Commissioner of Madras, be much the same as that which he recommends, and may so far have the support of his authority, still its effect ought to be carefully watched; and if any signs of real deterioration in the physique of the relief labourers should hereafter appear, there need not be any difficulty in raising it.

I then returned for a time to the Mysore Province, and again compared the relief system there with that in the Madras Presidency.

Thence I re-visited the Salem district, in parts of which severe distress existed following two successive years of drought, and where the village inspection and relief required further examination. Then travelling by Trichinopoly I proceeded to Negapatam, where the activity of the grain trade is producing much result, and to the Madura district, which is passing through a critical period of the drought. In these districts there have been showers, some heavy, some light, falling here and there on limited areas, and causing husbandry to revive wherever they fall. In the southern peninsula relief is afforded by the temporary emigration of abnormally large numbers to the coffee plantations and the labour markets of Ceylon; where they are still able to find remunerative employment.

I am now proceeding towards Madras, and I hope to visit South Arcot, in parts of which some distress is apprehended, and to pass through the Bellary and Kurnool districts once more, before leaving the presidency.

The mission has lasted from the third week in January (1877) to the fourth week of April. Within the Madras Presidency 10 districts, 46 "taluks" or local divisions of districts, and five large zemindaris, have been visited. 132,500 relief labourers of both sexes have been passed in review person by person, of whom 65,000 were found to be good in physical condition, 47,000 middling, 16,700 indifferent, and 3,800 bad. 5,300 miles have been travelled over, of which 4,420 were by rail and 880 by other means of travelling. These proceedings are irrespective of my tours in the Bombay Presidency and in the Mysore Province within the above-mentioned time.

Before concluding this part, it may be well to mention another question into which I inquired, namely, how far it might be absolutely necessary to remit the land revenue due from ryots whose crops had wholly or partially failed. In the Bengal Presidency the theory of the land revenue settlement is that the landholder bears any loss in bad years, for he enjoys all the profits of good harvests or high prices. In years of grievous failure of harvest it is customary to suspend collection of a part of the land revenue until the next good season comes. And in temporarily settled tracts some remission is often granted where all the crops have been lost. The theory of the Madras revenue system is somewhat different. In the districts under regular settlement the rule is that, if the water supply to any "wet" lands (that is, lands irrigated from tanks or rivers) wholly fails, then the land revenue on such lands is remitted in full, but not otherwise. For either it is a part of the implied understanding between Government and the ryot, or else it has been the practice, that water shall be provided to irrigate "wet" lands. On "dry" lands (that is, lands not irrigated at all, or irrigated only from wells) a reduction of 20 per cent. is made on the Government demand to meet vicissitudes of season; and on these lands no remission is granted save under very exceptional circumstances. In the districts not under regular settlement, remission of land revenue is granted on account of partial failure on "wet" lands, and it is also allowed more freely for loss of crop on "dry" lands.

The present season of scarcity deepening into famine is indeed very exceptional; and the Madras revenue authorities considered that very large remissions of revenue would be required; while they regarded it as inexpedient to hold in suspense over the ryots any part of the land revenue that could not with fairness be collected this year.

It seemed to me that the policy of Government in this matter might properly be reconsidered. The plan of spending very large sums of public money on saving life from famine had crystallised into a broad and important policy. But the cost of famine relief would be indefinitely augmented if the public treasury were to be consumed, as it were, at both ends, by great expenditure on relief and by large remissions of land revenue. The Madras land revenue has been moderately assessed, and falls comparatively light on "dry" lands; and an ordinary ryot might well afford to pay the arrear land revenue of a bad year out of his profits, if the succeeding two years shall be good. The circumstance that lands irrigated from wells are taxed at "dry" or unirrigated rates of land revenue, greatly strengthens the position of ryots on "dry" lands; for crops irrigated by wells yield an out-turn on which the assessment falls with very light

incidence. On the other hand, a considerable portion of the whole land is held by very petty ryots, whose standard of living is low, and who might be unable to pay up the arrears of their land tax in full. I estimated, however, that perhaps two-thirds of the land revenue, which could not fairly be collected this year, might be paid by the ryots during the two succeeding years, if the seasons should be propitious. And I recommended that the arrear land revenue of the present year should be kept in suspense, and that no remission should at present be promised on "dry" lands, in order that the public treasury might have a chance of recovering part of the arrears, if the future seasons shall be favourable. If the people should be found hereafter unable to pay the revenue for this year, which by settlement or other arrangement they had engaged to pay, neither I nor any one else would recommend their being unduly pressed. There will doubtless be under any circumstances a disposition to show to the ryot all the consideration which could be claimed under a just and lenient view of the obligations between him and the State. Also in the administration of such a branch of the revenue as the land revenue, due regard must always be paid to old-established practice, so that whatever proceedings are taken may be such as would naturally connect themselves with the existing system. But if fortunately the ryots should hereafter prove able to pay, then they ought to pay whatever may be due from them under settlement or other engagements; and there seems to be no reason why, by any premature remission, we should preclude ourselves from the chances of making such recoveries. If this principle be deemed novel in the Madras Presidency (it is not novel in other parts of India), there is on the other hand, the consideration that the public expenditure now going on, which is mainly for the sustenance of the lower agricultural classes, is without precedent in Southern India.

Sir Richard Temple's report on his mission to Madras.

The Government of Madras held that this view could not be accepted, and that the practice of Northern India is not applicable to the different circumstances of Madras. In Bombay, where, as in Madras, the land is held on ryotwari (petty proprietary) tenure, the Government after consideration accepted this view, so far that the arrears of the present year in the famine tracts of Bombay are in part "remitted," and in part "suspended" for collection in future years if seasons permit. The Government of India decided that the question of remitting or suspending the land revenue should be left to the discretion of the Local Governments. And the latest estimate of the Madras Board of Revenue is that 143 lakhs of rupees (1,430,000*l.*) of land revenue must be remitted on account of the recent failure of harvests. I see reason to hope that the total remissions, which will not be precisely known till August next, will fall below this estimate; for the board has inculcated and enforced on Collectors carefulness and regard for the public treasury, within the broad lines laid down for the settlement of the affair. The decision of the Government of Madras is taking effect, so far as the present trouble is concerned. But the question has so important a bearing on the Imperial finance of future famines, that I may have to submit to the Government of India a further account of the matter in a separate paper.

PART IV.

The state of affairs at the present time of writing may be summarised thus. The numbers on relief were according to the returns for the third week in March—

	Persons.	
On relief works	-	664,000
On gratuitous relief	-	97,000
Total	-	761,000

By 1st April these numbers rose to—

On relief works	-	695,000
On gratuitous relief	-	115,000
Total	-	810,000

The total is moderate as compared with the total which was shown upon the data given me by the local authorities in the beginning of February, after they had made many abatements in the direction of restrictive economy.

Sir Richard
Temple's
report on
his mission
to Madras.

But with the advance of the season the numbers may be expected to rise.

In respect to those upon the works, the great majority do really need and deserve this relief. There doubtless are still among them many thousands of persons who are not absolutely in want and who would certainly leave the works, if only severe task-work could be enforced, or if they could be drafted to large public works under professional control. I still think that something more might be done towards this very salutary end.

The exaction of task-work is probably as good as can be expected in works under Civil officers and unprofessional establishments. In some of the districts below the Ghât mountains it has been enforced with a strictness most creditable to the local authorities.

It must be admitted that the plan of employing relief labourers on large public works has in a considerable degree failed in the Madras Presidency. More might have been, and might still be done in this respect. The engineering and professional establishments of the Public Works Department have not, I think, been directly utilised enough for conducting the relief operations. This defect ought, apparently, to be remediable. Again, the impression produced on the minds of the people by the liberal manner in which petty works among the villages were opened in the beginning, intensified the distaste of the relief labourers for large public works. This also overwhelmed the authorities with unmanageable crowds of persons demanding instant attention, and distracting the thoughts of all the officers from the business of systematisation and organisation.

But even if the Public Works establishments had been perfectly brought into play, if the fullest restrictiveness and abstinence had been practised in respect to petty Civil works, if the officers had been able to concentrate their energies on systematisation, still it must be allowed that the distressed districts and the presidency generally were unfortunate in having so few large practicable projects suited for the employment of relief labour. It is but just to remember this, when the poverty of result in this respect is reviewed; though, perhaps, the utmost may not always have been made of the few works which did exist.

The total of those on gratuitous relief amounts now to 115,000 persons. It is in some degree swollen by little children whose parents are on the relief works. Excluding these children, I am sure that the total is not larger than it ought to be. Indeed I fear that it is not large enough. Despite the persistent efforts which have been made, the system of village relief and house-to-house inspection is far from perfect. Disappointment may reasonably be felt at the shortcomings in this matter under a ryotwari system which offers such advantages in this behalf. Much was to be expected from the hereditary headmen and the hereditary accountants in the villages, who represent ancient institutions which have been studiously fostered by the Madras Government for generations. These men may yet do well, and are doing better than they did, but at first they were backward in their duty.

The following statement shows the per-centage of the total number on relief (relief works and charitable relief together) on the population of each district :—

Distressed Districts.	Total Numbers on Relief Works and on gratuitous Relief during the First Week of April.	Per-centage of Persons receiving Relief of both kinds on the Total Population of the District.
Bellary - - -	269,000	17 per cent.
Kurnool - - -	236,000	24½ "
Cuddapah - - -	80,000	6 "
Nellore - - -	69,000	5 "
Chingleput (inclusive of Madras city).	29,000	2 "
North Arcot - - -	32,000	1½ "
Salem - - -	53,000	3 "
Coimbatore - - -	27,000	12½ "
Madura - - -	12,000	½ "
Tinnevely - - -	3,000	⅓ "

I have again drawn attention, with suitable suggestions, to the unduly high per-centage which, after all the reductions which have been made, still prevails in Kurnool.

A corresponding statement for the distressed districts of the Bombay Presidency, which have been already adverted to in this minute, stands thus :—

—			Total Numbers on Relief Works and on gratuitous Relief during the Third Week of March.	Per-centage of Persons receiving Relief of both kinds on the Total Population of the District.
Sholapur	-	-	49,955	7 per cent.
Kaladgi	-	-	27,120	3½ "
Part of Poona	-	-	57,691	6⅓ "

The physical condition of the people in the distressed districts of the Madras Presidency is fairly good; better decidedly than it was expected to be. An impression (which I quite share) seems to be gaining acceptance that the agricultural classes have more self-sustaining power, more life-supporting resources than was originally anticipated. There is reason to think that the relief wages earned by so many thousands have not been entirely spent in buying food, but have in part been hoarded. This circumstance may be expected to facilitate the discharge of these people as soon as the season shall improve. There is still some lamentable mortality in or about Madras itself, and in some other central places below the Ghât mountains, which, though immediately caused by disease, is in part traceable to insufficient nourishment. The death-rate among the people received into the relief camps in and about the city of Madras continues extraordinarily high. These occurrences, happening at or near the capital, naturally make a painful impression on the public mind. Elsewhere the physical condition of the peasantry is in the main satisfactory, although to a broad and important statement of this kind there are, and must be, some exceptions. On the whole the consequences of the drought are being well subdued.

However successful the physical results may be in saving life and in preserving the bodily strength of the people from deteriorating, the moral effect of the relief operations cannot be overlooked. These operations must bind the people to the Government by ties of gratitude and respect. But there remains the question whether anything like demoralisation, or disposition to rely unduly on the State, or indisposition to practise self-help among the people has grown out of these affairs. While admitting the efforts made by the cultivators generally to save their crops, I have received an impression that in many cases they have failed or omitted to do all that they might have done to retrieve their misfortunes, or to extemporise the means of raising some crops despite the destruction of the ordinary harvests. The almost constant recurrence of scarcity in some part or other in the Madras Presidency, and the quickening of the sense of responsibility on the part of Government during recent years, may have taught and are teaching the people to regard the State as a beneficent power on which they may, in the last resort, rely for sustenance, whether they do their best for themselves or not. If there be any such feeling in their minds, it must have been evoked by the liberal manner in which relief operations were commenced in Bellary, Kurnool, and Cuddapah towards the end of 1876. Some demoralisation did, I think, begin to creep not only into the labouring classes but into the peasant proprietary, and threatened to spread. It was but narrowly avoided, if, indeed, it was avoided altogether. However, the measures subsequently taken have kept the proprietary classes comparatively free from such depressing influences. But there is fear lest the sense of the duty of being independently industrious should become lowered among the labouring classes.

The spring harvest in all the distressed districts, save Bellary and Kurnool, has been tolerably good. With a larger yield probably than was expected, it has tended to keep down prices, and to bring out stocks to market. It has added something most opportunely to the food-supply of the year. Its productiveness is mainly due to the wells. While most of the tanks or lakes, which ordinarily fertilise the best lands, have remained empty during this drought, the wells have been the means of drawing water from those subterranean reservoirs which the granitic formations and the various rocky strata retain, preserving the moisture of previous times. It is noteworthy in most parts of the Madras Presidency that wells, if deepened, will still produce springs of water, despite a drought, certainly of one year, and probably of two years. One of the best prophylactics against famine, then, is to encourage the excavation of wells more and more. The experience of 1876 and 1877 has, as already mentioned, imparted much impetus to the sinking of wells throughout the country. It is to be hoped that the Government will be able to maintain this impetus in years to come. And the circumstances of 1877 vindicate the policy whereby the Madras revenue system imposes no additional land tax on fields watered by wells which the ryots themselves have dug.

It is of course to be regretted that the elaborate system of tanks or lakes, on which so

Sir Richard
Temple's
report on
his mission
to Madras.

much of skilled labour and capital has been expended for so many generations, should be almost entirely exhausted by one year of drought, that most of these noble reservoirs should not hold more than one year's supply of water, and that so few of them are efficiently protected against the disastrous floods which periodically recur. Whether many of them could be made to hold (as some few probably are holding) a quantity of water that would outlast a drought of one or two years' duration, is an engineering question of some difficulty. In the Madras Presidency, hydraulic engineering has been pursued with such signal success that all practicable expedients may be presumed to have already been tried. Still this particular point is proved by the experience of 1877 to be so important that a notice of it cannot be out of place or inopportune.

There was in the beginning some fear lest the drinking water should prove very deficient in some parts of the country. As yet, however, there has not been any such deficiency, though often the drinking water has deteriorated during the drought; and wherever this has happened, the people have suffered.

The activity of the grain trade has been most healthy, from the seaports to the central marts, from the railways to the roads, from the markets and depôts to the village booths. This activity was more vigorously exhibited during the early months of 1877, and to it must be attributed the steadiness of prices and their tendency to fall rather than to rise as the season of trouble has advanced. But during the last half of March and the first half of April the importation of grain by sea to Madras, and by rail to the northern frontier, has somewhat declined. The accumulated bags of grain, housed in barns near the Madras beach seemed so unmanageable in quantity, that men wondered whether the railway would be able to carry away such an amount within the allotted time. But there is little fear of its not all being soon cleared away, now that the hitherto constant influx has subsided. The quantity of grain required from without for the distressed districts could never, of course, be estimated beforehand with any certainty. But various calculations on different series of data concurred in pointing to 2,700 tons a day as the quantity for which carrying power should be provided. And every effort was put forth to secure provision accordingly, with a fair prospect of sufficient success. But now the average quantity carried daily is under 2,000 tons. Notwithstanding this, the markets—great and small—the entrepôts and depôts, in the interior of the country continue well supplied with grain. Nor is any apprehension expressed by the traders. The inference necessarily is that the stocks of grain within the Madras Presidency, and the internal resources of the country, must be greater than the original anticipation.

From the beginning of the present trouble down to the end of March 1877, the quantities of food grain brought into the distressed districts of the Madras Presidency amounted to about 535,000 tons. This great supply was drawn from several sources, thus,—

By sea into Madras, Tuticorin, and other East Coast ports from	
Bengal, Burma, Orissa, and Ganjam	356,000 tons.
By sea into Beypore and other West Coast ports	118,000 „
By the Great Indian Peninsula Railway from Northern and Central	
India into the Madras Presidency	61,000 „

The pressure of the scarcity was felt in the interior of the country before imported grain began to arrive from distant provinces. And the earliest movement of the grain trade was the transport of grain by rail from old stocks on the coast into the interior. Considerable importations from without began in November, and the imports went on increasing till they culminated in January with a total of 101,000 tons. The imports slackened somewhat in February, when the total was 80,000 tons; and they were still less during the month of March.

Only 30,000 tons of all this quantity were imported on Government account; the rest, 505,000 tons in all, were brought into the country by private trade. The imported grain was distributed by the Madras railways into the interior of the country, thus,—

Bellary, Cuddapah, and Kurnool received	147,000 tons.
The Mysore province received	81,000 „
The districts of North Arcot, Salem, Coimbatore received	73,000 „
The districts of Chingleput and Malabar received	10,000 „
	311,000 „

Of this total, some was sent into the Nizam's territory, and the remainder has either been distributed by the South India Railway, by cart or by canal boat through the coast districts, or is still awaiting means of railway carriage into the interior. There were some considerable grain imports by cart from the southern ports of the Bombay

Presidency, and much grain was carted from Raichore and other places in the Nizam's territory into Kurnool.

If the period from August to October 1876 be included, the total imports into the Madras Presidency will be seen to be as follows :—

Sir Richard Temple's report on his mission to Madras.

IMPORT OF FOOD GRAINS into the PRESIDENCY of MADRAS.

Madras received in	From Ports beyond the Presidency or non-subordinate Ports.	From subordinate Ports.	Total.
	Tons.	Tons.	Tons.
August 1876	1,769	38,000	43,637
September „	875		
October „	2,993		
November „	26,792	30,000	85,466
December „	28,674		
January 1877	72,985	36,000	201,852
February „	57,421		
March „	35,446		
Total	226,955	104,000	330,955
Other East Coast ports received from all sources			25,000
Grand total Madras and East Coast			355,955
Bey pore and Calicut received from all sources			63,000
Other West Coast ports ditto ditto			55,000
Grand total of West Coast ports			118,000
The Northern districts received by rail from Great Indian Peninsula Railway			61,000
The above figures abstracted show the total imports as follows :—			
By sea from Bengal, Burma, Orissa, and Ganjam to Madras, Tuticorin, &c.			356,000
By sea into Bey pore and other West Coast ports			118,000
By Great Indian Peninsula Railway from Northern and Central India into the Madras Presidency.			61,000
Grand total -			535,000

If, as is probably the case, imported grain did not come generally into consumption before the month of November, then the grain which was carried by rail into the interior of the country before the end of March will suffice to feed $3\frac{3}{4}$ millions of people for six months, that is to say, it will support 25 per cent. of the population of the more distressed tracts of Madras and Mysore from the 1st November down to the end of April. These grain importations, distributed as they have been by railway and by cart over the length and breadth of the country, have sufficiently supplied all requirements. And the price of common food grain at the larger marts has since the 1st January last usually been cheaper than 8 seers (16 lbs.) per rupee; while even at the lesser marts of the interior prices have rarely been so dear as 7 seers (14 lbs.) per rupee.

Passing from the present to the thought of the future, we cannot but reflect whether the uncertainty of season which often proves so disastrous in Southern India is not becoming worse and worse, whether there may not be some physical causes at work to render the rainfall precarious, and whether such causes can be ascertained or obviated. It is hard to conceive a question more practically important than this. The discussion of it would be beyond the scope of this minute.

But, connected with it, there is one particular matter which may be mentioned forcibly though briefly. The southern peninsula of India has been or is being denuded, not only of its forests but also of its jungles, its brushwood, its groves, its trees. The denudation has been, as I understand, going on near the sources and the upper courses of the many rivers which water the country. This perhaps is being in some degree checked. But with the progress of coffee planting, and with the assertion of communal rights on behalf of the people, the utmost vigilance will be needed to keep it within bounds. If it were to proceed unchecked, there would be imminent danger of the rivers running dry by reason of the catchment basins and the drainage areas near their sources being rainless. And as these rivers supply the great canal systems, this danger has only to be mentioned in order to be felt. The same argument applies in a lesser degree to the tanks or lakes which are second only to the canals in usefulness for irrigation. It has

Sir Richard
Temple's
report on
his mission
to Madras.

already been seen how precarious is the position of these reservoirs even with one year's drought. The progress of the country causes the price of timber and of firewood to rise. The introduction of railways has, in the absence of any local coal mines, greatly augmented the demand for fuel. Strong temptations are thus inevitably offered to the people at large to fell, cut, and lop recklessly, to bring every log, stump, and stick to market, to dig out the very roots of the jungle, so stopping any chance of reproduction, without thought for the future. There are stories to be heard everywhere of groves and hedgerows and scattered trees being cut for sale. In the midst of cultivated tracts there are to be seen bare sterile hillsides, said to have been forest-clad within living memory. In such localities the climate is supposed to have changed for the worse. Beyond the Ghât mountains, in Bellary and Kurnool, the treeless, shrubless aspect of the country is as wonderful as it is melancholy. These are the very districts where famine has been occasionally epidemic, and where scarcity is almost endemic. Any thoughtful spectator must perceive that according to all meteorological experience, and to the almost certain teaching of proved facts, these fine districts were not destined by nature to be the prey and sport of famine or scarcity, but have been rendered subject to these calamities by the thoughtless action of man. Even the numerous groves planted in the last generation by the great Collector, Mr. Robertson, whose name is still a household word, were made over many years ago to the villagers, and have been mostly cut down. Trees, jungle, and forests must, indeed, be thinned and cut for the use of man; but they need never be exhausted, and something might always be left for re-production. There is, of course, a department of forest conservancy in the Presidency, and much good is done thereby. Whether its functions and proceedings are fully sufficient for the wants of the country is a question not to be discussed here. At all events there is reason to hope that the waste lands in hill and dale, which are in this Presidency so extensive, might be kept much more thickly wooded than they are, and that large areas now quite naked and devoid of vegetation would, if reserved and guarded, become again covered with trees or brushwood as they were in former ages. And the successful efforts of individual officers in the past prove what may yet be effected in the way of planting. If the necessity be duly recognised, then there is no doubt of the possibility of devising remedies.

Before this part of the minute is concluded it is necessary to advert to the estimate of the cost of the famine. It has been already shown that the first approximate estimate by the Revenue Board showed a total of 3,410,000*l.* But the estimate of relief expenditure made by me in the beginning of February on data obtained from the local officers during January showed 2,920,000*l.* In that estimate it was necessary to follow the local estimates of the numbers to come upon relief works, the total of which came to 1,800,000 persons in the worst season between the middle of April and the middle of May, there being actually 1,066,000 in the beginning of January. But finding that system and economy had brought down the actual number to 713,000 by the end of February, I presented a revised estimate of 2,176,000*l.* on the 6th March, in which the highest number on relief works at the worst season was assumed at less than 1,200,000. There was great hope, however, that even this reduced number might prove to be in excess of the reality, if the system which had proved so successful in February could be kept up through March, and due effort was to be made to keep it up. The result for March has been even better than that for February—when the difference of season is remembered—and has been better still, relatively, for the first half of April. If system and economy be maintained, and if no new adversity of season shall happen, it is thought that the highest number will not exceed 800,000 persons on relief works, and may be even less than that. My latest estimate now shows 2,050,000*l.* of expenditure.

This estimate, as my former estimates, is exclusive of losses of revenue.

PART V.

There are yet to be considered the lessons to be deduced from all the circumstances which have yet occurred in connexion with these affairs. It seems to me that from these events we forcibly and positively learn—

To determine beforehand, as soon as any forecast of the coming distress can be made, the large public works upon which relief labour can be employed, and upon which task-work can be exacted, or piece-work established, under professional supervision;

To notify generally and to intimate to all concerned, especially to the Civil officers, the particular public works to which the relief labourers in each distressed district are to be drafted;

- To organise an engineering staff in readiness for undertaking vigorously these particular public works when the time for active operations shall arrive, and to prepare for devoting to this purpose all the professional establishments which can be obtained ;
- To prohibit absolutely, in the beginning of the distress, the opening of petty works under Civil officers or non-professional establishments among the villages close to the homes of the people ;
- To refuse relief to strong able-bodied persons of both sexes in any form, save employment on the large public works ;
- To allow petty village works to be opened only when severe and widespread distress has declared itself at a comparatively advanced stage in any district or part of a district, and even then to reject all, save those who cannot reasonably be expected to proceed to the large public works,—in short to reserve these petty works for the weakly, the sickly, the advanced in life, and for those who have any just claim for indulgence ;
- To insist upon a systematic inspection by responsible Civil officers of all relief gangs, person by person, and from time to time, in order to see whether they are all in need of or deserving of State assistance, and to note whether their physical condition improves or deteriorates, and whether their wages are too much or too little ;
- To reject every applicant for, or recipient of relief, whether on a public work or on other works, who can be shown to be able to support himself for a time without State assistance ;
- To take care that such establishments in various grades are provided beforehand as may be able to exact tasks on the petty works near the villages ;
- To keep the wages on relief works at the lowest rate compatible with the health of the labourers, this being necessary, not only in the interests of economy, but also to prevent demoralisation of the people ;
- To insist on inspection being instituted from village to village in the distressed districts for the discovery and treatment of the casual cases of dangerous distress which are likely to occur, this inspection of villages, house to house, to be made stricter and stricter as the season of distress advances, full use being made of existing rural institutions (hereditary headmen, accountants, and the like), or, if these do not exist, such arrangements being improvised as may prove adequate ;
- To organise relief camps on a sufficient scale near large towns, at central spots where high roads converge and the like, for the reception of destitute persons who should be compelled to live there temporarily as a proof of the sincerity of their appeal for help ; and to adapt the internal arrangements of these camps as much as possible to the caste feelings and other social habits of the people ;
- To encourage private charity to the utmost, but to explain to benevolent persons that they can best serve the public by making their contribution to some public organised institutions, where relief can be restricted to the deserving, rather than by dispensing charity to all comers, among whom there are sure to be many undeserving ;
- To allow and encourage smaller relief centres in the interior of the districts as the season of distress advances, to which all recipients of gratuitous relief must resort who can move ;
- To provide for those who are destitute and unable to move being cared for in the villages ;
- To arrange relief charges territorially in compact and manageable areas, so that no jurisdiction shall be too large or too remote for the supervision either of the District Collector, or of an officer of the experience and status of a Collector ;
- To depute, either to the whole distressed territory, or to the most distressed districts, some officer, with full instructions as to the policy to be pursued in relief, and with power to direct and control on the spot the relief operations, subject to the direct orders of the Government itself ;
- To postpone relief operations as long as may be safely possible, while maintaining full preparedness against any emergency that may arise, and, by annexing to all forms of relief such conditions as the people can reasonably bear, to teach them that State support is not a matter of course for the alleviation of general distress, but is only permissible to prevent extreme distress and to save life ;
- To make forecasts of the State expenditure required for relief, but to revise them at short intervals from time to time, being mindful that the questions relating to the effect of scarcity upon the condition of the people are recondite ; that the event may be worse than the anticipation, and more often perhaps may be better ;

Sir Richard Temple's report on his mission to Madras.

To watch carefully the rising of prices in the beginning of scarcity to rates even three times as dear as ordinary rates, to withstand the alarms which are likely to be excited among the people by such symptoms, in the confidence that, so long as prices are cheaper elsewhere, the dearness constitutes a remedy provided by the economy of nature, for attracting supplies through private trade ;

To contemplate purchases by Government of grain in distant markets only under absolute necessity when there is no prospect of supply on the spot, but to be ready, if need arises, to buy grain from local or other dealers who will deliver it at the places where it may be required to pay relief labourers or to feed destitute paupers ;

To reject all proposals for placing Government grain in any positions within easy reach of railways or other main lines of communication ;

To pay relief labour in cash so long as the labourers can buy food with their wages, and to postpone paying in grain as long as possible, because any purchases of grain by Government, however unobjectionable otherwise, tend to disconcert private trade if it exists in the locality, and to raise undefined apprehensions ;

To contemplate the possibility of being obliged to organise Government transport establishments in the event of emergency arising, but to avoid as long as possible calling them into action or placing them in the field, lest misapprehension should be caused in the trade ;

To publish from week to week, while the scarcity lasts, information regarding the current prices, the importation of grain from without, the varying state of the distressed districts, the carrying power of the railways, or other transport agencies ;

To maintain on the great railway lines a moderate, though adequate reserve of engine power, so as to enable the railways to meet emergent requirements such as must arise in a year of famine :

To consider the possibility (so far as engineering considerations may permit) of ensuring in the irrigation tanks enough water for at least two years ;

To stimulate the ryots to sink wells more and more, and to assist the people with advances of money for this purpose so far as funds may allow ;

To diligently inquire whether the failure of seasons, so chronic in Southern India, can be traced in any degree to preventible causes ;

To conserve existing forests and woods, however small or scattered, to study the reproduction of extinct jungle, to preserve the groves, to make plantations, to encourage the spontaneous growth not only of timber trees but also of brushwood wherever possible ;

To jealously watch and guard the forests near the sources and the incipient streams of all the rivers.

Doubtless all the points which have been mentioned above are well known to the Government, and most of them have received practical consideration. But as their importance has been brought home to us by the experience of the Madras famine, it has seemed proper to specify them here, as they may be useful for reference on future occasions.

In conclusion, it is not required of me to express any general opinion regarding the treatment of the famine in the Madras Presidency, which famine, indeed, is not yet over. But I must declare my cordial thanks to the Madras Government and its principal officers for all the kindness and consideration received from them during my mission. And though the Government is doubtless well aware of the merits and services of its officers throughout this trying time, yet I must state my sense of, and add my testimony to, the excellent conduct of the local officers, the Collectors, Sub-Collectors, Assistants, and other Civil and Military officers employed on relief. Having travelled, worked, and lived among them for three months of strenuous exertion, I have unsurpassed means of knowing how unremittingly they have toiled, how thoughtfully they have planned, and how anxiously they have striven in the service of the Government and for the good of the people.

My thankful acknowledgments are due to the members of my staff—Mr. C. E. Buckland, C.S., Captain S. Rivett-Carnac, and Dr. R. Harvey—for their zealous and useful assistance in the work of the mission ; also to Captain W. S. S. Bisset, R.E., for his vigilant attention to all affairs connected with the grain traffic on the railways.

From my Secretary, Mr. C. E. Bernard, C.S.I., I have received valuable aid and counsel in every branch of the work, and I would represent his good service and his administrative ability for the favourable consideration of the Government of India.

No. 215.

C.—MEMORANDUM by MR. BERNARD on RELIEF AFFAIRS in the worst part of the SALEM DISTRICT, during the middle of April 1877, dated Morapore, 16th April 1877. Nos. 216. 237.

The total population of the district is in round numbers two millions. On the 9th April the district had—

Relief in Salem district.

On relief works—	No.
Under Civil officers	24,527
„ Public Works Department officers	26,861
Total	51,388

On gratuitous relief 17,249

During the last fortnight there have been partial showers, nowhere exceeding $1\frac{1}{4}$ inches, and in most places much less. The people have ploughed a good deal of land where the rain has exceeded half an inch. As yet the rain has not sufficed to raise fodder for the cattle.

2. The relief labourers are for the most part paid by piece-work; and the rates are from 50 to 100 per cent. dearer (that is, more favourable to the workman) than in ordinary years. Some weeks ago the rates were harder, but they were lightened by the Collector, who considered that the people were becoming reduced in condition. An adult male labourer earns at piece-work from $2\frac{1}{2}$ to 2 annas a day; women and children make proportionate earnings. Some few light labour gangs in every taluk are on a daily wage of $1\frac{1}{2}$ annas a day for men, and $1\frac{1}{4}$ annas for women. Infants who cannot work get 3 pie a day, whether their parents belong to piece-work or light labour gangs.

3. Though the whole district is distressed, yet some parts are much worse than others. The Dhurumpooree taluk (population 186,000) is the worst of all; next comes the Ootengiri taluk (population 170,000); and there is some severe distress in and around the town of Salem, and in the taluk of Trichurgode.

4. It is ascertained from Mr. Dawes, Deputy Collector, that in his two taluks, Ootengiri and Tripettore, there were—

8,100 on relief works under Public Works Department officers.
2,800 on relief works under Civil officers.
1,000 on gratuitous relief in three relief camps and at villages.

The village relief system established by the Collector in January, but stopped by the Board's orders after a few weeks' trial, is now being revived. Under this system a list of the helpless poor in every village is made out and checked, and then a cash allowance, 12 to 15 pie a day, is made to each one of these destitute people through the village headman; children get only 10 pie. The success of this system depends entirely on the supervising staff; and the Collector has 8 to 14 circles in each taluk with a sufficiently paid inspector over each. These inspectors acting under the tahsildar and relief officer, see that the gratuitous allowance really reaches the needy people.

5. Nearly all the relief labourers in these two taluks are employed on piece-work at rates which are double (that is, twice as dear as) the rates of ordinary years. All the work done is useful work, and most of it is on tanks. No public works undertakings are going on, or ever have gone on in the Salem district, side by side with and in competition with the relief works. Both Mr. Dawes and the Tahsildar of Ootengiri were confident that deaths do not now occur in these two taluks from starvation, unless in the case of some of the wanderers whom it is so difficult to control. Cholera keeps constantly appearing here and there among the villages. Cattle are dying in great numbers; to this fact the enormous number of hides constantly brought to market testifies. People have driven their cattle down off the Shevaroy and other hills because of the want of water there. In the low lands there is no absolute dearth of water either for man or beast.

6. At Dhurumpooree 2,300 labourers were inspected, of whom about 200 were on daily wages at the $1\frac{1}{2}$ anna rate; and the rest were on piece-work, earning about two annas for each male adult. Most of these people had been employed for three or four months. About two-fifths of them belonged to Pariah, and three-fifths to other castes. Among them were some 400 men and women who were remarkably stout and strong; these sturdy gangs have to do 20 per cent. more work for the rupee than the other gangs, and they are going to be drafted on to tank work elsewhere. The rest of these workpeople were in fair (but not first-rate) physical condition; some few were below par. There was only one really emaciated person, and he had been at work for three months; but

Relief in
Salem dis-
trict.

he had been supporting two sick relations at home out of his wage. The children were, as a rule, in very fair condition. The tahsildar and a pensioned Rajpoot Subadar, who lives in Dhurumpooree, considered that the people in these gangs were decidedly below the physical condition of such people in ordinary years, but if we could, by our relief operations, keep the suffering poor up to the standard of these gangs till the end of the famine, we should be very successful.

7. Some 400 applicants for work were inspected. Most of these people have till very lately been on other relief works, and their condition was on the whole fair.

8. On inquiry into the causes of the depressed condition of the labourers as reported by the Relief Officer and Collector several weeks ago, it appeared that the relief wage had been kept at 1 anna 6 pie for adults, even when food was selling at 11 and 12 lbs. per rupee. Under the Madras Government orders of the 30th January, the man's wage ought to have been about 1 anna 10 pie or 1 anna 11 pie when the price of food was so dear. Prices in Dhurumpooree are now much cheaper, ranging at 16 or 17 lbs. per rupee for rice in the Dhurumpooree bar, and 15 or 15½ lbs. in the outlying villages.

9. The aspect of the relief camp made it clear that we have not succeeded in keeping the condition of all the suffering poor of this taluk nearly up to the standard of the labour gangs of the Dhurumpooree Fort. There were 930 inmates, and among the children there were many, nearly 10 per cent., very emaciated little creatures. Most of these little things had been two or three months in the relief camp, and they had not picked up at all. Side by side with them were fat, happy little creatures, who got no larger allowance than the thin ones. The explanation given by the Relief Officer and the Native doctor is that some of the children came into the camp in very bad condition, and that they cannot assimilate the rice and rice broth. The Native doctor said that these poor little things passed their food in an undigested state, they had been tried with ragi, with rice and with cholum, and some of them had been treated in hospital with sago, but nothing would bring them round. Among the adults, too, were some people who had been in the camp for months, and yet were still very emaciated. The death-rate was for weeks six per diem in this camp.

10. The ration of rice in the camp has recently been raised from 16 ounces to 20 ounces per diem for adults, and the results of this change remain to be seen. But when the greater number of inmates; adults and children, flourish on the ration, the circumstance that a per-centage fail to recover condition does not by itself prove the ration to be insufficient. Probably the only way of getting these poor creatures into good condition will be to send them back gradually to their homes, with sufficient care for their maintenance on the road, and then to bring them upon the village relief now organised by the Collector. The change home, with assured hope of food while the trouble lasts, would give these poor people a chance of recovering. There seems to be something in the air or circumstances of the camp that prevents some of the people from picking up strength. Not that the camp is badly organised,—much otherwise,—the sheds are well ventilated and clean; and the camp is locally more popular than any other of the relief camps yet visited in the interior of the presidency.

11. It may not be possible to send some of the famine babies and their mothers home just yet; and for them the Relief Officer is, under the Collector's instructions, arranging some kind of nursery apart from the camp for the children which do not recover under present circumstances.

12. On some of the roads round Dhurumpooree and in the town were to be seen a certain number of emaciated people, women and young men, whose physical condition showed them to be in real need of relief. The village relief now being organised will, it is to be hoped, suffice to save such people from the risk in which they are now. In and round Dhurumpooree indeed are now to be seen more pronounced signs of famine than have been noticed anywhere outside the Madras camps.

No. 216.

No. 237. XCIX.—MINUTE by SIR RICHARD TEMPLE, regarding RELIEF OPERATIONS in the most distressed parts of the SALEM DISTRICT, dated Raneepet, the 17th April 1877.

Relief in
Salem dis-
trict.

In forwarding the accompanying memorandum regarding the most distressed parts of the Salem district, I have a few remarks to record.

2. The taluks above the Ghât range adjoining the Mysore plateau are among the most distressed tracts in the whole of the Madras Presidency. Some parts of these taluks have not had crops for two years. The endurance of the inhabitants and the relieving zeal of the officers are being tasked to the utmost.

3. On further examination the system of relief works in this district is found to merit all the praise bestowed upon it in my minute of the 12th March. As regards strict tasking by the Civil officers, utilising of the Public Works establishments, discharging relief labourers wherever showers enable the people to plough, preserving the relief labourers in sufficiently good condition without offering any undue temptation, selecting useful and beneficial works for the employment of relief labour, there is little left to be desired. And the management of the whole affair by the Collector, Mr. Longley, is entirely worthy of confidence.

Relief in
Salem dis-
trict.

4. The relief camp at Dhurumpooree, in the midst of the scene of the greatest distress, is comparatively popular. The camp at Salem is not unpopular, or at least is fairly well attended. There is some light suitable work afforded, or about to be afforded, to the weavers of the finer fabrics in that city.

5. The system of village relief and visitation is being carried out all over the district and nowhere is it more needed than here. In some of the worst tracts it was probably not commenced soon enough in full force. I trust that it is now going on rightly. At first there was some difference of opinion between the Collector and the Board of Revenue. The Board seem to have rightly deemed the Collector's proposals too large for the commencement, as indeed they were. But although the Collector could not carry out his own proposals in their integrity, he could fall back upon the general orders of Government to collect in large camps all those destitute persons who could be collected, and to sustain in the villages those who could not be so collected; and he doubtless did so. This plan is being carried out fully, as I understand, in the worst tracts.

6. There is one tract however where the system was not being carried out at the time of my visit, the 7th and 8th April, and where it is much wanted, namely, the low hills and valleys and jungly places in and about the Shevaroy hills inhabited by various Malayali tribes. Many wretched persons were met with going up to Yercand (the settlement on the Shevaroy hills), and some equally miserable were on a relief work at Yercand. Information reached me to the effect that others, in equally bad case, might be lingering in the huts and hamlets among these hills. I was glad to see that the subject was attracting the attention of the authorities on the spot. It certainly seemed to me that some special official ought to be deputed to examine immediately all the inhabitants of that group of hills. And I have been glad to hear that the Collector has since taken steps to effect such examination.

No. 217.

CL.—MINUTE by SIR RICHARD TEMPLE, regarding the Need for Improved Relief Arrangements in the Kalustri Zemindari.

No. 245.

Raneepet, 17th April 1877.

I have again inspected the relief camp at Arcot (Raneepet), and have inquired further into the circumstances of the inmates. The number is now just about 800. Fresh admissions are constantly being made; or rather fresh persons are daily being sent in, having been picked up or found on the roads or in the villages of the interior. But then there are desertions going on just as constantly, and so the numbers are not progressive. Indeed they are rather retrogressive, for recently there were, I understand, 1,200 inmates. If this be so, it would seem to follow that some hundreds of persons sent in by the local authorities in consequence of destitution must have deserted the camp and reverted to a most precarious existence. This necessarily causes grave apprehension, and suggests the necessity of re-doubled precautions for village inspection and relief. It might have been expected that many of the most wretched of them come from the zemindaris of Kalustri and Kárvetnagar, and this has led me to inquire further into the system of village inspection specially recommended for these tracts in my minute of the 5th March. It is the more necessary to pursue the subject, inasmuch as the distress is becoming more and more severe as the season advances.

Kalustri
Zemindari
need for
improved
relief.

2. The local authorities appear to have given the requisite orders in these very distressed tracts, that is to say, Government officials are sent round to inspect the villages, to cause those who cannot move to be relieved in their homes and those who can move to be sent to the relief centres, and some relief centres are in working order, though my impression is that the number of these centres might be increased with advantage. Taking the cases which I have just seen together with what I hear, I am under the impression that, however excellent the local arrangements may be in these two zemindaris, especially in Kalustri, they require to be further strengthened by European supervision of a superior kind. There ought to be the means of knowing whether the Native officials are really and faithfully performing that which must be a toilsome and irksome duty, on the due performance of which very many human lives may depend.

Otherwise I fear that many deaths from starvation may occur in Kalustri before the season of distress is over. I bear in mind that many destitute persons from the Madhoo Pauk portion of Kalustri resort to the camps at or near Madras, which are nearer than Kalustri, the head-quarters of the zemindari. Still I should apprehend that even this part needs more of trained and competent inspection than it now receives. And this remark is still more applicable to the more distant parts of the zemindari. I know that the Collector has not at his disposal any European officer for the work of such inspection. But the Government might be able to send an officer for this purpose.

3. I would therefore most earnestly and urgently recommend for the consideration of the Madras Government that a selected European officer of smartness and ability be deputed to Kalustri to reside there, and under the direction of the Collector to see that the village inspection and relief is thoroughly carried out, for the general carrying out of which he would feel himself responsible. He would understand that no destitute person is to be permitted to perish of hunger; that every destitute person who can move must be sent to a relief centre, where relief can be dispensed without compulsory residence in camp, and that every destitute person who cannot move (of whom there may be one or more in every village) must be fed at home. He might reside at Kalustri where there is good accommodation. And Kárvetnagar might be included in his jurisdiction.

No. 218.

No. 245.

CII.—MINUTE by SIR RICHARD TEMPLE, respecting passages in the Report of the Sanitary Commissioner of Madras.

Cuddalore, the 18th April 1877.

The reduced scale of wages. Sir Richard Temple in reply to Dr. Cornish.

It is necessary for me to make a few brief remarks upon the minute of the 6th April by the Sanitary Commissioner of Madras regarding the reduced wage for the relief labourers of Madras, inasmuch as this minute refers to some of my own previous minutes on the subject. Having regard to the importance of the subject, I refrain from making the objections which might ordinarily be made to the tone of some parts of the Sanitary Commissioner's minute as an official paper.

2. In order to show the uncertainty of medico-chemical dicta regarding such a matter as relief wages, I pointed out certain discrepancies between the Sanitary Commissioner's opinion and the Madras Manual of Hygiene on a particular point. The Sanitary Commissioner now says that the Manual of Hygiene is wrong on this point. Very possibly it is.

3. It is not necessary, however, to pursue this point, or any such like points, because I understand that the medico-chemical theories upon which the Sanitary Commissioner seems still to rely are not implicitly accepted by the highest sanitary authorities in India, and do not entirely coincide with the newest development of scientific thought regarding the carbonaceous and nitrogenous elements necessary for the nutrition of the human frame. Nor is it practically necessary to discuss further the Sanitary Commissioner's opinion regarding the sufficiency or otherwise of the reduced wages, because in his present minute he admits that, as now applied, it is sufficient. His previous objections appear to have been diminished by the granting of the wage on Sundays as well as weekdays, and by the granting of a small allowance for the support of the young children of persons employed on the works.

4. I had myself always contemplated that the reduced wage should be allowed on Sundays. As regards the very young children, their case did not at first suggest itself for consideration, as all children of seven years and upwards were admitted to relief. But as soon as the case of the children under seven years of age was brought to my notice, I recommended that they also should receive a small allowance. I found, however, that this had been already ordered by the Madras Government.

5. Though I do not undertake to pronounce any opinion upon a medico-chemical point, yet I do undertake to say whether thousands of relief labourers inspected by me are physically in fair working condition or not. And I adhere to the opinion previously expressed that the many gangs which I inspected working on the reduced wage were in such condition, regard being had to the condition of such persons in ordinary times. In this opinion I was confirmed by the experienced medical officer on my staff, who had seen the realities of famine in other parts of India. But in order that no doubt might remain upon the point, I asked for and obtained the opinion of the Sanitary Commissioner with the Government of India. And after inspecting in different parts of the country some 35,000 relief labourers, he pronounced them to be, with some individual exceptions, in fair physical condition. This then is the true test of the sufficiency or otherwise of the reduced wage to which I have always appealed and still appeal. According to this test the wage appears to be sufficient at present. If at any time any

marked deterioration of the physical condition were to indicate that the reduced wage is insufficient, then I shall be the first to make a revised recommendation.

The reduced scale of wages. Sir Richard Temple in reply to Dr. Cornish.

6. But I must advert for a moment to certain parts of the argument of the Sanitary Commissioner of Madras which seem to amount to this, that because there is mortality among the recipients of gratuitous relief, who are admitted to particular relief camps, therefore the wages of relief labourers must be insufficient. Whether the Sanitary Commissioner intends to convey this idea I know not, but something of the sort would, I apprehend, be gathered by ordinary readers of that which he has written. Therefore I have to explain that there is no connexion whatever between recipients of gratuitous relief on the one hand and the recipients of relief wages on the other. The gratuitous rations allowed to the inmates of relief camps have nothing whatever to do with the wages paid on relief works. The inmates of these camps who are admitted there as being unable to work are a class totally different from those who are admitted to the relief works as being able to work. Inferences deduced from the condition of the recipients of gratuitous relief are wholly irrelevant if attempted to be applied to the condition of relief labourers. If unhappily there be mortality among the inmates of relief camps, it by no means follows that there is any mortality among relief labourers. In point of fact there is no mortality among relief labourers except from cholera, small-pox, or other diseases, and when sometimes cholera has stricken and dispersed large gangs of relief labourers, there has never been any reason to suppose that the scourge arose from want of food. Again, if notwithstanding scientifically arranged diet, the condition of the inmates of relief camps continues bad, no amelioration whatever could be afforded by raising the wage of relief labourers who are a totally different class. These poor inmates have never gone to relief works at all. Indeed the very reason of their admission to the relief camps is this, that they are incapable of going to relief works. They are diseased or infirm, or being indisposed to work have wandered about, or passing by means of relief close at home have wandered to a distance.

7. Being thus helpless for one reason or another they are picked up and taken care of, but when picked up they are often beyond the reach of human aid. No analogy therefore drawn from these persons can possibly be applicable to relief labourers; and to mention the two cases with any sort of parallelism and in any kind of connexion would be to produce confusion of ideas and other misapprehension.

8. If indeed persons who were pale on being admitted to relief works were to become thinner and thinner and weaker and weaker till at last they had to be drafted off to gratuitous relief camps as unfit to work, then that would be a reason for reconsidering the wage, but this is just what has not occurred, and is not occurring. If I saw or knew any signs of it occurring, then I should be the first to move. Many relief labourers indeed have left the works of their own accord, not so much however because the wage was reduced, but rather because task-work was enforced, or because the scene of labour was removed to a distance from their homes.

9. How it happens that so many of the destitute poor sank so low before being taken up for gratuitous relief is a question which need not be discussed in this minute. I may reiterate however that the proper remedy lies in the institution of house-to-house visitation throughout the distressed districts, and from the time of entering the Madras Presidency I have never ceased to urge upon the Government and the local authorities the necessity of such a visitation. And indeed this visitation has generally been instituted. But that it has not always been perfectly carried out is proved by the mortality which has occurred, or still occurs, in some of the relief camps.

No. 219.

CIII.—MINUTE by SIR RICHARD TEMPLE, dated 18th April 1877, regarding the present condition of Relief Affairs in the District of Madura. No. 245.

I have paid a second visit (13th to 16th April) to the Madura district to see the Collector, Mr. MacQuhae, and some of his officers, because, as already stated in the memorandum of the 24th January, the month of April is likely to be a critical season in determining whether there is to be distress or not in that season. By the 15th of April some of the ordinary spring showers had fallen, causing some partial revival of agriculture, but except in one place (Periakolum, at foot of the Pulnee Hills), there had not been enough rain to place the district or any part of the district beyond the reach of distress in May.

Madura district,

2. The grain markets continue to be well stocked; the main source of supply is the port of Negapatam, though supplies come also from Tuticorin. In fact, it is the strong

demand in Madura that attracts the grain which might otherwise have gone from Negapatam to Mysore. At present the grain goes in the Mysore direction as far as Trichinopoly, and is thence diverted to the Madura district.

3. Meanwhile, the proprietary ryots seem to be bearing up well against the consequences of the long-continued drought. Either they have material resources of their own, or they possess credit whereby they can obtain such resources. Field labourers, notwithstanding the want of labour in the fields, appear to receive some support from their employers; but doubtless one great means of support for this class is emigration to Ceylon, which appears to have attained during this year nearly double its ordinary proportions. I could not learn that the excess number who had gone to Ceylon are faring badly, though perhaps they are not receiving so much remuneration as would have been given had the numbers been less. There is, of course, the usual proportion of the poorest classes, but it is understood that they are receiving some support from private charity.

4. The relief labourers are as yet but few in number. Care has been exercised by the Collector to prevent the number increasing unnecessarily, and the task-work is being strictly exacted. It would have been better, perhaps, if the works had been placed altogether under the Public Works Department. The assistance of that Department, however, is used for measuring up the task-work. Arrangements are made for giving all the gratuitous relief that is really needed, though happily the amount needed is as yet but little. Relief centres in sufficient number have been established. On the whole, I should think that the consequences of the drought are being prudently and firmly dealt with by the Collector, and at present I have nothing further to suggest.

No. 220.

No. 245.

CIV.—MINUTE by SIR RICHARD TEMPLE, dated Cuddalore, 18th April 1877, suggesting the Use of Coal on the Madras Railways as some check against the Destruction of Forests of the Madras Presidency.

Rainfall affected by destruction of forests.

There is a point connected with the supply of fuel to the several railways of the Madras Presidency which has a bearing upon the rainfall and the prospects of future harvests, and which I desire to represent to the Madras Government as follows:—

2. The failure of the periodical rains, and the consequent loss of crops, seem to be becoming more frequent in Southern India. This circumstance is attributed by many, with much show of probability, to the gradual denudation of the forests with which the country used to abound. The effects are felt throughout the Presidency generally, but more particularly in those tracts which adjoin the sources or upper courses of some of the rivers, upon which irrigation works, great or small, depend. One potential cause of this denudation has been, and still is, the demand of fuel for the consumption of the locomotives on the several railways.

3. As an instance out of a great many, I would mention that at this moment there is understood to be a contract between the Madras Railway Company and a Native contractor for the supply of a very large quantity of wood fuel—a quantity large enough to cause a heavy drain, if not an utter exhaustion, of the particular forests from which the supplies are drawn. It unfortunately happens that these forests lie, as I understand, near the upper course of the Palar River. Their destruction doubtless tends to aggravate the uncertainty which hangs more and more over the water-supply of this river. And such uncertainty is peculiarly unfortunate, inasmuch as from this river are drawn the channels which fill an extensive series of tanks for irrigation in the districts of North Arcot and Chingleput. Seldom does this river descend in seasonable and propitious floods. One year it will come down with violent inundation demolishing its dams, tearing up its channels, breaching its tanks; another year it will leave them all high and dry. I merely adduce this as a type of what is going on too often and in too many parts of the country, and which is in part at least attributable to denudation of forests.

4. Of course there are difficulties arising out of private rights with reference to the preservation of forests. There are also many means of overcoming those difficulties. I am now addressing myself to one measure only for mitigating the evil, viz., the diminution of the demand which is at present so greatly stimulated by the railway requirements for wood fuel.

5. The question immediately arises, why should not the Madras railways burn coal in the same way as do the East Indian Railway, the Eastern Bengal Railway, the Great Indian Peninsula Railway, the Oudh and Rohilkhund Railway, and various of the State railways? The Madras Railway, it is true, does not pass through the heart of a rich

coal basin as the East Indian Railway does, nor does it touch a coal-field at any of its extremities, as the Great Indian Peninsula Railway does; but compared with any other of the railways mentioned it is favourably situated. It touches the sea-coast at Madras and Beypore, and at either of these ports it can land English and Australian coal at the same rate per ton as the Great Indian Peninsula Railway Company does at Bombay, or as both the southern lines do at Madras and Negapatam or Tuticorin. And although from a commercial company trading at its own risk, grave objections might be offered to

* NOTE.—And I cite the Madras Railway Company as a sample.

a course which will undoubtedly at first increase its expenditure on fuel, I have to repeat that this is a case* where present economy may, and in the opinion of most thoughtful men undoubtedly will, aggravate the calamity of famine in future.

6. The increased cost, as far as the Madras Railway Company is concerned, is likely, for many years to come, to fall upon the Government, and it may be possible to form an approximate estimate of its amount.

7. The cost of working 2,400,000 train miles per annum would, I am informed by Captain Bisset, be approximately Rs. 8,00,000 at the present cost of fuel to the Madras Railway Company. Considering the advantages of the two ports, it may fairly be estimated that the cost of working the same number of train miles with coal fuel only will not much exceed Rs. 9,00,000. And when local enterprise enters into the business of carrying coal from the fields of Bengal to the coast ports of Madras, it is not unreasonable to expect that the cost of Indian coal delivered at these ports (which is at the present time quoted at Rs. 22 per ton, or from Rs. 2 to Rs. 4 higher than English coal of rather higher cash value at the pit's mouth) will be so far reduced as to make coal fuel even less expensive to the Madras Railway than wood fuel is at the present time.

8. There are some minor advantages in the use of coal fuel which are too well known to require mention in this minute, although they are of some importance to economical working. And I conclude by reiterating my opinion that the interests of the Madras districts require a more careful guarding of the forests, especially the hill forests, from destruction, and that one practical way of checking this destruction would be to burn coal instead of wood on all the Madras Railway lines, and so stop entirely a heavy and constant drain on the forests and undergrowth of the hill-sides of the Madras country.

No. 221.

No. 21 of 1877.

No. 263

From the GOVERNMENT OF INDIA, Department of Revenue, Agriculture, and Commerce,
to the SECRETARY OF STATE FOR INDIA.

Simla, the 19th April 1877.

Our latest information from the famine districts is contained in the following telegram from Sir Richard Temple, despatched from Arcot on the 17th instant, but referring exclusively to the Presidency of Madras.

"After telegraphing to Government India account of Negapatam trade, I visited Madura district. Situation of Southern Peninsula, including Madura and Tinnevely, is as follows:—Rain has begun falling in most parts, especially under Ghât mountains. Emigration to Ceylon affords relief. Agricultural classes possess resources. No general distress yet, but some slight scattered distress relieved with discrimination. Markets filled with grain from ports of Negapatam and Tuticorin. Neighbouring parts of Tanjore and Trichinopoly almost free from distress, but rain has recently ceased, and until it falls sufficiently, situation somewhat critical. In Salem and North Arcot considerable scattered distress relieved by village visitation. Central relief camps still unpopular, this aggravates necessity for village relief. In districts near Madras wanderers and stray beggars still going about in bad condition. Whenever found they are relieved, but despite medical treatment they often die, and these cases affect public mind. Agriculture partly reviving after recent showers. In Bellary rain has fallen, but situation not likely to improve in that quarter at present. Relief labourers generally keep well. Better success beginning in despatch of relief labourers to Nellore Canal and Railway from Bellary towards Dharwar. Failure to utilise Public Works Department in relief works generally continues, and is to be regretted."

2. We enclose several papers received from Sir Richard Temple during the present week, of which the most important is the report made by Dr. Townsend,* Officiating Sanitary Commissioner with the Government of India, regarding the physical condition of the labourers employed on the relief works, with reference to the alleged insufficiency of the reduced rate of wages. In our Despatch of the 12th instant, we stated the

* No. 196.
Question of
the suffi-
ciency of the
reduced scale
of wages.

As to sufficiency of reduced scale of wages.

conclusion at which Dr. Townsend had arrived, as communicated to us by telegraph, viz., that the reduced rate is sufficient to support the labourers in fair condition, provided that care is taken that the individual recipient is the only person supported on it. The grounds of this conclusion are fully stated in Dr. Townsend's report. It is based on an inspection of gangs containing some 32,000 persons (34,000 was the number erroneously given in our last Despatch, owing to some error in the telegram) in the districts of Sholapur, Bellary, Cuddapah, and North Arcot.

At Sholapur the labourers employed under the Public Works Department were in good condition, men, women, and children, and there was no doubt on the part of the officers superintending the works that the wage was quite sufficient for the support of the labourers in health. The labourers on the Civil works were in a less satisfactory condition; but a large proportion of them were above middle age, and they had come on the works in January in an enfeebled state. Dr. Townsend thinks it probable that at the best of times they were below the average physique.

At Adoni, in the Bellary district, the labourers, as a rule, were in fair condition, and, in the opinion of the relief officers, they had not deteriorated since the reduced rate of wage had been in force. There were here and there weakly and feeble people; but these exceptions consisted of persons who had never been in good health or condition, or it was found on inquiry that they shared their wages with a child or other relative.

At Bellary, where task-work was exacted, the great majority were receiving less than the reduced rate; but there was no sickness among them, and the relief officers stated that these gangs had improved greatly in appearance since the works were established, and they certainly had not fallen off since the reduced rate of wage had come into force.

At Cuddapah, where Dr. Townsend inspected two bodies of labourers, one close to the town, which he visited in company with Dr. Cornish, the Madras Sanitary Commissioner, and on which the women greatly outnumbered the men, the people were in appearance little, if at all, below the standard of health common in the town populations of this country. In the other gang, composed chiefly of the agricultural population of the surrounding villages, the appearance of the people "was very good." A very large number of the men and women were as stout and healthy looking as they could be in the best of times. Here and there thin and weakly persons were observed; but on inquiry it did not appear that their weakly condition was attributable to want of food. The relief officer stated that when the people received the higher rate of wages, they did not spend more on food than they do now, but saved the difference, and they have not deteriorated in condition since the wage was reduced.

At Vellore, in a relief gang consisting of 1,600 people, who had been for a time on the reduced rate of wages, which apparently had been recently raised, the people were in fair condition, and, as far as Dr. Townsend had been able to ascertain, "they did not deteriorate or show signs of weakness during the five or six weeks that they were on the reduced rate of wages."

3. The facts stated in the foregoing extracts from Dr. Townsend's report appear to us to justify the conclusion at which he has arrived, that there are not yet any sufficient grounds for any general raising of the relief wage rates in the Madras Presidency. The Madras Government have very properly directed, as Sir Richard Temple points out in the 5th paragraph of his minute, that relief officers shall treat specially all cases of relief labourers who from any cause have fallen into a reduced condition of body. They have also directed that the relief wages shall be paid daily. If these instructions be duly enforced, and if care be taken to carry out a systematic house-to-house visitation in the villages, and to search out wanderers on the high roads, as has been frequently suggested by Sir Richard Temple, and ordered by the Government of Madras, we see no reason to doubt that the objects which the Government have in view, viz., the saving of life and the prevention of severe suffering, may be accomplished without any general raising of relief wages. At the same time we do not overlook the fact that the recent reports of the Madras Sanitary Commissioner contain very lamentable descriptions of the condition of the people at some of the places visited by him. We have requested the Madras Government to communicate to us the result of the inquiry directed in their orders* on Dr. Cornish's report, with reference to the unsatisfactory physical condition of many of the relief labourers at Maddanapalli, where the reduced rate of wages had not been introduced.

4. With reference to the remarks made in the 7th paragraph of the Despatch addressed by the Madras Government to your Lordship, under date the 7th instant, to the effect that no communication had been made to them regarding Dr. Townsend's

* Reported to Secretary of State in Madras Despatch of 7th April, No. 25.

deputation, we have explained to that Government that Dr. Townsend not having been sent on an independent mission, but merely having been placed under the orders of Sir Richard Temple to aid him in conducting certain inquiries which he desired to institute in the two Presidencies, it was not deemed necessary to make any communication to either Government on the subject of Dr. Townsend's deputation.

5. The prospect of the supply of grain to the ceded districts from the north, as explained in Captain Bisset's memorandum of the 31st ultimo, appears to be satisfactory.

6. Reference has more than once been made, in the correspondence regarding the famine in Madras, to the difficulty which appeared to be experienced in that Presidency in devising large works on which the relief labourers could be employed. The only works of magnitude which have been proposed are the East Coal Canal, the railway from Bellary towards Hubli, and the extension of the railway from Conjeveram to Chingleput. To these may perhaps be added the doubling of the railway line from Madras to Arconum. Recently, on a suggestion from our Public Works Department, we asked Sir Richard Temple for his opinion as to the expediency of employing relief labour on the earth-work of three short branch railways which were proposed some years ago for connecting the Madras Railway with the towns of Arcot, Vellore, and Salem. His reply, which is contained in his minute of the 6th instant (No. XCVII.), is adverse to the proposition. He does not consider these lines to be adapted as relief works. The amount of earth-work and ballast is not considerable. It is doubtful whether the work could be begun before the first week in May, and if good rain falls in that month, it is probable that relief labour would not suffice to finish even the banks and ballast; nor does Sir Richard Temple consider that it would be practicable to organise large gangs of skilled relief labourers (such as stone-cutters of the Waddah caste) for employment on these lines in time enough to do any considerable quantity of work before the rainy season begins. These objections appear to us to be conclusive against the adoption of the works in question as relief works, at all events, at the present. Should the famine unhappily last longer than we at present anticipate, the question may have to be reconsidered.

Difficulty in devising large works in Madras.

7. Sir Richard Temple in his short minute on the present condition of Mysore (No. XCV.)* repeats the favourable opinion expressed by him on the 14th February last, regarding the progress of relief administration in that province. The labourers on relief works are all employed on piece-work at rates somewhat cheaper than the piece-work rates of the Public Works Department in ordinary years. They can earn in this way enough to support themselves, and are in fairly good physical condition. Villages are really visited, and patels (village headmen) are kept up to their duty by responsible officers, whose weekly diaries show what is being done, and how useful the village relief is.

Mysore relief administration.

*No. 206.

8. In connexion with Mysore, we enclose a correspondence which has passed between the Chief Commissioner and the Government of Madras, regarding the incidence of certain charges incurred in affording relief to inhabitants of Mysore who had migrated into the adjoining Madras districts, together with a minute recorded on the subject by Sir Richard Temple. We have not received any communication on the subject from the Government of Madras, and at present no orders appear to be required.

No. 161.

9. The following extract from our telegram of the 14th instant gives the numbers of persons on the relief works, and on the receipt of charitable relief according to the latest returns:—

"In Madras Presidency relief labourers increased to 693,000, and charitably relieved to 114,000; latter increase chiefly young children. In Mysore 75,000 on works, and 52,000 charitably relieved. In Bombay further increase to 256,000 on works; 62,000 charitably relieved."

We have the honour to be, &c.

(Signed)

F. P. HAINES.

ALEX. J. ARBUTHNOT.

No. 222.

Revenue, No. 32.

From the SECRETARY OF STATE to the GOVERNOR-GENERAL OF INDIA IN COUNCIL.

India Office, London, 19th April 1877.

Para. 1. The Despatch of your Excellency in Council, dated 2nd March, No. 13, of 1877, giving a summary of the matters which had engaged the attention of your Government in connexion with the famine in Southern and Western India during the week ending 27th February, has been considered by me in Council.

No. 133.

2. I approve of your resolution to sanction the earth-work of the railway from Bellary to Hubli as a relief work, on the understanding that your Government is not pledged to carry on the line to Karwar.

3. The equalisation of the through rate for grain from the port of Negapatam, in Tanjore, to Bangalore, and the suspension of port dues at Negapatam in the case of vessels importing grain equal to a quarter of their whole cargo, will, I trust, greatly diminish the difficulties now experienced in carrying grain into the interior. Such also will be the effect of doubling the line from Ambatur to Arconum. It is also to be hoped that some of the grain now sent from Calcutta, Burma, and elsewhere to Madras may be shipped to Negapatam, and thus find its way to the distressed districts in the south of the Madras Presidency.

4. The intelligence received from Sir R. Temple relative to Nellore, Bellary, and Tinnevely, and also to the spring crops in Cuddapah and North Arcot, is, on the whole, satisfactory.

5. I have already, in my Despatches of the 15th March and 6th April, Nos. 24 and 28 of 1877, expressed my opinion that, while the utmost efforts are made to preserve life, Government relief should be accompanied by such conditions as to prevent it being accepted by any but the really destitute. I concur, therefore, with the principles which have guided you in your instructions upon this subject to the Government of Bombay.

I have the honour to be, &c.

(Signed) SALISBURY.

From the ADDITIONAL SECRETARY TO THE GOVERNMENT OF INDIA to the ADDITIONAL SECRETARY TO THE GOVERNMENT OF MADRAS, Revenue Department.

The deputation of Dr. Townsend.

With reference to the remarks made in paragraph 7 of the Despatch addressed by the Madras Government to the Secretary of State under date the 7th instant, No. 25 (Miscellaneous), to the effect that no communication had been made to them regarding Dr. Townsend's deputation, I am directed to explain that Dr. Townsend not having been sent on an independent mission, but having merely been placed under the orders of Sir R. Temple to aid him in conducting certain inquiries which he desired to institute in the two presidencies, it was not deemed necessary to make any communication to either Government on the subject.

No. 224.

Nos. 225.
245.

MEMORANDUM by MR. C. BERNARD respecting the CONDITION of AFFAIRS in the SOUTH ARCOT DISTRICT and CUDDALORE, 19th April.

South Arcot and Cuddalore.

Sir Richard Temple met in the South Arcot district the Collector Mr. Hughesdon, the Sub-Collector Mr. Wallace, the Head Assistant Mr. Thomson, as well as the Collectorate Sheristadar and other Native officials.

2. Sir Richard Temple also visited Pondicherry, and learnt that severe drought had afflicted the French territory, and that gratuitous relief was being distributed to a considerable number of persons. He did not understand that relief works had been opened.

3. The taluks of South Arcot, in parts of which there is risk of severe distress being felt, are—

Trinomalai,
Tindevenum,
Kallukoorchy,
Tricaloor,
Vridachellum,

where the rainfall last year failed, where there is comparatively little "wet" cultivation, and where the crops were extremely short. As yet there has been no severe distress, but if the rain holds off till the end of May trouble must arise. Relief works were opened in parts of Tindevenum, Trinomalai, and Vellapoorum about the end of January, but people would not come readily to work, so very little was done, and during the last two weeks there has been small demand for relief employment. One relief centre was opened for distributing gratuitous relief in Trinomalai. Some little relief was also given

about a month ago in Villapoorum by private charity. But this has since stopped as the demand slackened; now that the late rice, the ragi, and ground-nut is being harvested. A good deal of work is being given by the South Indian Railway to people in the Vellapoorum, Cuddalore, and Chellumbrum taluks; a very little is being given in Tindevnum. All this helps to support the labouring poor.

4. The Public Works Department has projects, namely, repairs of tank, dams, and irrigation channels on hand to do. The grant for the whole year for the district is about one lakh of rupees. Of this perhaps Rs. 15,000 would, under ordinary circumstances, be spent during May. The work is done by contract; but the village headmen are usually the people to whom contracts of this kind are let. The Public Works Department could undertake and supervise works costing much more than this sum of Rs. 15,000, provided only that certain restrictions were foregone, which compel the range officer to inspect and pay for every work himself.

5. There is plenty of food in the district, and the dealers have stores of imported rice. Prices are high. But there has not hitherto been any starvation or any famine anywhere. The jumabundi (annual verification of cultivated holdings) is now going on everywhere; Revenue Inspectors and higher Revenue Officers are seeing a great deal of the people at their villages; and the district officers are satisfied that there is not at present anything worse than distress in any part of the district. So far as they can judge, the best way of preventing increase of distress would be for the Public Works Department to push on at once its works in the worst taluks, and to keep sufficient works going until the rain sets in. If the grants made to the District Engineer from ordinary sources should be nearly exhausted, then more grants might be given, debitable to famine. Under this system, if adopted, relief labour would be utilised to the utmost on necessary district works. The work would be done by petty contract, but the people needing relief would get the work, and at present the people are strong enough to do such work at ordinary contract rates.

6. Major Mead, District Engineer, considers that he could, without additional engineering establishment, do all that may at present be needed. If further grants were made, he could spend them most usefully on much needed irrigation repairs. But he would require discretion to relax the present rules as to completion certificate for works costing less than Rs. 1,000 a piece. And also he would want to have temporarily in abeyance the order which forbids the District Engineer and Collector to sanction any petty irrigation repairs for which the estimate exceeds the average annual revenue from the work. The District Engineer would of course be careful in acting upon the additional discretion allowed him. But unless it be granted, there is risk that, if much relief employment is suddenly wanted, we may have to drift, in South Arcot as elsewhere, into the practice of leaving the relief works to be managed by professionally unskilled and (at time of jumabundi) hard-worked Civil officials.

No. 225.

CV.—MINUTE by SIR RICHARD TEMPLE, respecting the condition of Affairs in the South Arcot District. No. 245.

20th April 1877.

In forwarding the accompanying memorandum regarding my recent visit to the district of South Arcot, I have to record some few brief remarks. South Arcot district.

2. Though the south-west monsoon of 1876 failed here as elsewhere, still there was a good fall of rain at the end of the north-east monsoon in the south-east part of the district, and saved especially the taluks of Cuddalore, Vellapoorum, and Chellumbrum. The south-western and the central parts of the district received but little rain on this occasion. Being near to the coast taluks which received rain and to the Coleroon and Cauvery basin where the crops have been good, these parts have not yet suffered distress. And hope was entertained that if the April showers should prove propitious, distress might be staved off until the next monsoon. As yet however (20th April) these showers (which have fallen favourably to the westwards) have held off in this district, one taluk only (Kallukoorchy in the south-west) having received any rain during the spring season. They may yet come; of course if they do, trouble will be averted. But if they do not come by the middle of May, and if the south-west monsoon should be late, and it is usually late in this quarter, not arriving till July, then some severe distress can hardly be avoided in certain parts of this district.

3. As yet the district authorities have prudently refrained from giving any encouragement to the agricultural classes to resort to relief. In some taluks satisfactory reports

are heard of the efforts made by the people themselves to save their crops by digging wells. That they had the means of sustaining themselves during the winter months is proved by the fact that, when some small relief works were opened tentatively, they did not avail themselves of the opportunity.

4. If relief works have to be opened at all, I would earnestly recommend that this be not done through the Civil officers who have so much else to attend to, but should be entrusted to the regular Public Works Department, which in this district is strongly represented by the Irrigation Engineers. There is much work for them to do by way of repairing and improving the tanks, and if they undertake this they will be able to afford all the relief that is needed for the able-bodied, who will be thus employed on works not scattered but concentrated and under professional supervision.

5. To the Civil officers would then be left what may be described as their legitimate work, that is, visiting the villages in search of destitute and helpless persons, affording gratuitous relief to some, and assigning light work to others, who though weakly can yet do something.

6. We need not yet, however, abandon the hope that seasonable showers may yet ward off the threatened distress.

No. 226.

No. 245. CVI.—MINUTE by SIR RICHARD TEMPLE, respecting the Management of Relief Works in the North Arcot District through the Public Works Department Agency.

Madras, 20th April 1877.

North Arcot relief works. In continuation of my minutes of the 29th March regarding Bellary and Kurnool, and of the 10th April regarding Salem, the purport of which was to represent the expediency of placing relief works as much as possible under the regular Public Works Department, I desire to submit a similar representation regarding the district of North Arcot, which I have passed through once more, visiting the anicut over the Palar and the Cauvery Pauk Lake.

2. In reference to the apprehensions which arose during February or March regarding distress breaking out here and there in this district, relief works have been opened (not under professional officers, but such Civil officials as can be obtained for the occasion) in many and various places, and doubtless have done good so far as they have gone. But while appreciating the reasons which induced the local authorities to take these proceedings, I must yet represent that these numerous petty and scattered works are very much open to all the objections which have been elsewhere urged against relief works of this description, except that the wage having been reduced the temptation is so far lessened. But even now there are, I fear, hundreds, perhaps thousands, of instances of persons who avail themselves of these works, not exactly to keep off distress, but slightly to enlarge their narrow income,—for instance, men who still have some employment of their own at home, send their wives and elder children to the relief works close at hand, in order to make just a little money for the family. Besides this, the season is advancing, the spring harvest has been partly reaped, the demand for relief employment is slightly increasing. On the other hand there is still some spring harvest to be reaped. The spring showers have caused ploughing to be commenced in most parts of the district. And the spring harvest itself, which owing to the wells in which the district abounds is proving to be fairly good, will afford a considerable augmentation of the food supply. Notwithstanding all this, the numbers on relief works about 40,000, according to the latest information, have been mounting up and may mount higher still; thus the aggregate is becoming sufficiently large and serious to necessitate the consideration of the introduction of some further checks.

3. The obvious check is, of course, the placing of the relief works under the regular Public Works Department.

4. Already the Madras Government have ordered that petty relief works, within easy reach of the operations for the doubling of the railway line to Arcot, should be closed. This order will doubtless have the beneficial effect of compelling many able-bodied persons seeking relief to place themselves under the professional supervision of the railway engineers.

5. Similarly, I believe that the Government intend to order the closing of any petty relief works which exist near the railway line from Chingleput to Conjeveram, of which the earth-work is about to be commenced. Although this work pertains to the Chingleput district, possibly some able-bodied persons might be sent to this work from North Arcot district.

Should be under control of Public Works Department.

6. But in North Arcot the main point is this :—The Government, as I understand, have signified a wish that the irrigation works, repairs and improvement of tanks, and the like, should be pressed on as much as possible, and that the available funds appropriated to irrigation for the year should be made use of, as soon as possible, for purposes of relief, under the engineering establishments. There can be no doubt of the excellence of this policy. The only precaution necessary would be to provide that none should be thus employed save those able-bodied persons who are in need of relief. The Engineers might be directed to fill their rolls in the first instances with able-bodied persons selected from the Civil relief works. In that case it would be very desirable to instruct the Collector to draft off to the irrigation works under the Engineers all able-bodied persons who are now on the petty relief works. If any such persons, on being ordered, refuse to go, they might be discharged altogether, as evidently being not in need of relief. The effect of this would be excellent. And then the petty relief works would have but those who are weakly and who have from any reason a claim to indulgence, and the apprehension which now arises from the recent augmentation of numbers on these works would be mitigated. I believe the Collector understands this already, and he may be perhaps acting on this principle. Still it might be well to order this explicitly.

No. 227.

No. 200, dated Tadputree, 21st April 1877.

From C. BERNARD, Esq., C.S.I., Secretary to Sir Richard Temple, to the ADDITIONAL SECRETARY TO THE GOVERNMENT OF INDIA.

Nos. 253.
256.

At paragraph 9 of the Madras Government Despatch (No. 28 of the 14th April) to Her Majesty's Secretary of State for India, allusion is made to Dr. Townsend, the Sanitary Commissioner's visit to the Madras Presidency. And Sir Richard Temple directs me to lay before the Government of India certain explanations relating thereto.

Deputation
of Dr.
Townsend.

2. Dr. Townsend was deputed by the Government of India to advise Sir Richard Temple concerning the sufficiency of the reduced relief wage and its effect on the condition of the people. Dr. Townsend joined the mission when Sir Richard Temple was in the Bombay Presidency; and he inspected gangs of labourers at and near Sholapore. The long railway journey from Calcutta to Sholapore in the heat had, however, brought on an attack of dysentery, and Dr. Townsend was unable to do as much as he wished.

3. On the day Dr. Townsend entered the Madras Presidency, Sir Richard Temple wrote and informed his Grace the Governor of Dr. Townsend's coming and of the work he was to do in connexion with the mission. On the same day I informed Mr. Garstin, the Secretary to the Madras Government, of Dr. Townsend's arrival and of the inspections he hoped to make.

4. Dr. Townsend inspected some 30,000 labourers, and then drew up a report of what he had seen, and of the impressions he had received. A copy of that report with a minute recorded by Sir Richard Temple was immediately forwarded to the Government of Madras. And Sir Richard Temple arranged with his Grace the Governor that Dr. Townsend, whose early return to ordinary duty with the Government of India was much desired, should visit Madras and wait upon his Grace.

5. Meanwhile, Dr. Townsend had gone southwards to inspect certain Coimbatore gangs, regarding the physical condition of which there had been doubt. He was to have visited Madras according to the appointment already made on his way back from Coimbatore. But at that place he was again attacked by the same complaint which had afflicted him previously. And as the complaint did not at first yield to treatment, he decided not to go into Madras, but to return to Bombay at once. He at once intimated to his Grace the Governor's Private Secretary the reasons which had, to his regret, compelled him to leave the Madras Presidency without waiting upon his Excellency. And afterwards I explained more at length to Mr. Garstin, the Famine Secretary, the circumstances of Dr. Townsend's departure. Sir Richard Temple also explained to his Excellency the Governor the sickness which prevented Dr. Townsend from presenting himself at Madras.

6. Sir Richard Temple regrets much that Dr. Townsend should thus have been unavoidably prevented from waiting on his Grace the Governor of Madras, and laying before his Excellency the impressions he had received from his inspections of relief labourers in the Bombay and Madras Presidencies.

7. Dr. Townsend had, however, the advantage of meeting at Cuddapah, by special appointment and arrangement, the Sanitary Commissioner of Madras.

EXTRACT, paragraph 9, from the MADRAS GOVERNMENT DESPATCH No. 28 of 14th April 1877, to the SECRETARY OF STATE FOR INDIA.

Para. 9.—We have not been favoured with any intimation from the Supreme Government of the outline of the instructions given to Dr. Townsend, the Sanitary Commissioner with the Government of India, who left the presidency without having reported to us his arrival in it, or made any other communication with us. He did not visit the city of Madras or the camps in its neighbourhood.

No. 228.

Nos. 230.
245.

CIX.—MEMORANDUM by Mr. C BERNARD, regarding the PRESENT STATE OF RELIEF AFFAIRS in the CUDDAPAH DISTRICT, dated Tadputri, 21st April 1877.

State of
relief in
Cuddapah.

Mr. Benson, one of the relief officers of the Cuddapah district, met Sir Richard Temple at Tadputri on the railway line; he brought with him the Serishtadar who was acquainted with the relief statistics of the whole district.

2. There was good rain (averaging about one inch) over the whole district in the middle of last month (March), and there have been partial light showers since. One result has been that a certain small quantity of fodder has come up, and the cattle are not dying at the same rate as before, but many of the weakly animals have previously been carried off.

3. The numbers on relief for the second week of April are—

On relief works	-	-	-	-	80,000
On gratuitous relief	-	-	-	-	30,000

About 5,000 labourers in all have gone off to the Nellore Canal. Twelve annas a head (8 annas to the labourer and 4 annas to the recruiter) is paid under Government orders for every adult man who reaches the canal work; and he gets rations for himself and his

* NOTE.—This includes the labourers on the Chevair embankment under Mr. West, the railway engineer.

family on the road. In the Palampett taluk one half of the labourers are working under the Public Works Department,* and effort is being made to hand still more labourers over to professional officers. In Sidhout all the labourers are supervised by a Public Works Department overseer, who is now serving directly under Mr. Benson. Payments to these labourers are, however, made by the revenue officials on certificates furnished by the Public Works Department officers. On the Civil works some task is exacted; but the majority of people do their full task, the deductions for short work, amounting to barely two per cent. of the total wage. No figures are here available to show the proportion of labourers under Public Works Department's supervision in other taluks.

4. Regarding the condition of his labourers, Mr. Benson says that the men and women on the works seem to him to be generally in fair condition. But among the small children (on 3 pie per diem) he finds, especially at Kodoor, a considerable number of emaciated little creatures. Many of these were found on inquiry to have come on the 3 pie allowance within the last few days only. Perhaps they will come round on the 3 pie; meanwhile those who were very reduced have been handed over to the village headmen (reddies) to be fed at home. On the Chevair embankment the labourers were till recently on the 2 annas scale, but they were reduced to the 1½ annas rate about 20 days ago. Since the reduction took place, Mr. Benson has visited them twice, and he did not observe any sensible reduction in their condition. But then though the wages are reduced, these labourers now get the Sunday's wage, and also get the 3 pie allowance for children, whereas previously they enjoyed neither of these advantages.

5. Out of the number on gratuitous relief (30,000), nearly one-half are the 3-pie children on the works. For the rest there is a relief camp (in the Madanpally division, one of several centres for outdoor relief) at the head-quarters of each taluk. Additional relief camps are being erected in Mr. Benson's taluks. There is a first class relief camp at Cuddapah itself, where over 330 inmates are fed. The smaller camps are to hold 250 a piece; but as yet none of Mr. Benson's camps have more than 80 inmates, as they have only just been completed. A certain number of people, who cannot be brought into the relief camps, are being relieved through the village headmen in their villages.

6. The village relief is supervised by inspectors, of whom there are two to four to each taluk. But Mr. Benson fears that it is only very recently that the village headmen are fulfilling their duties. They are and always were prompt enough to relieve ryots and people of the middle class. But it is very difficult to make them look after and relieve the pariahs, although they are fully repaid for all their expenses, and though each reddy has an advance of Government money to meet such charges. The duty of the reddy is

to relieve on the spot the helpless, to relieve and send into the nearest camp such paupers as can be moved, and to send in weekly accounts of their expenditure. The inspectors, with their peons, go round and enforce these duties on the reddies. Each inspector has from 30,000 to 50,000 people in his circle. Mr. Benson has been on tour for ten weeks and has inspected many villages. He found in many places, especially in the larger villages, a small number of people of pariah caste who were much reduced by want. Such cases are, he hopes, being gradually picked up and relieved. But the most emaciated cases he has seen anywhere were the 3-pie children newly brought upon the works, to which reference has been made at paragraph 4.

State of
relief in
Cuddapah.

No. 229.

CVII.—MINUTE by SIR RICHARD TEMPLE, regarding the discharge of Paupers from the Relief Camps.

Gooty, 22nd April 1877.

No. 245.

There is one suggestion which I wish to lay before the Government of Madras, respecting the treatment and retention of paupers in the large relief camps. At the beginning of the distress it was no doubt quite necessary to confine wandering paupers and other non-labouring poor in relief camps, because the restrictions accompanying indoor relief are irksome, and prevent persons who are not absolutely in need from seeking (and even from accepting) admission to the camps. Moreover, the village relief system, which is still in many places incomplete, was not begun; and so there was little hope of the indigent poor being relieved anywhere except on relief works or at relief camps. And, as we know, there were in January, and are still, many thousands who seem to prefer the chances of wandering and begging to the moderate certainty of the relief wage.

The very
helpless
should be
removed
from the
relief camps
to their own
homes.

2. In most of the relief camps which I have visited, and notably in the relief camps round Madras, all that humane care and medical skill could, within reasonable limits, desire, has been done to improve the condition of the inmates of relief camps. In many cases there is marked improvement in the physical condition of the older inmates of these camps. But still the fact remains that the death-rate among the inmates of camps is terribly high; that such diseases as are engendered among gatherings of poor people often appear and reappear, and that the air and surroundings of these camps are very depressing. For the little children especially the life must be very depressing indeed. Some of these troubles will, I fear, be aggravated when rain and cold come on, and make relief camp life even less endurable than it now is.

3. When I thus point out the evils of relief camp life, I would not be understood to find any fault whatever with the humane and diligent officers who manage these camps. The experience of relief camps in Orissa during 1866 was the same. And I should anticipate that some of the very best of the relief camp officers feel how difficult it is for the poor creatures under their care to recover health and strength under the conditions of the relief camps.

4. The question then arises what remedy can be suggested. It seems to me that a remedy may be applied on this wise. Able-bodied people are drafted on to the works, and regarding them nothing further need be said. But the old, the cripples, the women burdened with children, and the children, cannot be drafted to the works. I would recommend that such people, when they are able to move, should be sent under proper arrangements to their homes, to be brought upon the village relief lists there.

5. At the homes of some of the inmates of the Madras relief camps, such as those who live in the Kalustri or Karvetnagar zemindaris, full reliance cannot yet be placed on the village relief arrangements which have been or are being organised; and people from these tracts cannot yet be sent home. But in the Chingleput district, in most parts of Nellore and Cuddapah, and in many parts of North Arcot such reliance may be placed on the organisation of relief circles, and on relief inspectors who enforce their duties on the village headmen (reddies or moonsiffs). And people belonging to these tracts might safely be sent home from the relief camps near Madras, and in the same way people might gradually be sent home from other relief camps, such as the Vellore, the Dhurmpuri, the Salem, and the Cuddapah relief camps.

6. The poor people could not be sent away suddenly or in large numbers. But the plan might be begun gradually; the inmates of the camps might be sent away a few at a time under care of a camp servant; and they could be made over to the relief inspector* of this circle, whose duty it would be to see that the poor people were brought upon the village relief lists.

* NOTE.—In all the worst districts the taluks are divided into circles containing 15,000 to 20,000 inhabitants each. And the inspector of each of these circles has more or less close relations with the village headman of his circle.

7. The District Collector and his officials would work in unison with the relief camp officer. And in this way the inmates of the camps would gradually be conveyed to their homes and would be cared for there. Eventually the survivors of the camps must be so sent back, and provided the village relief system is efficient, the sooner they go the better it will be for them. And it will also be to the advantage of the public treasury; for inmates of relief camps probably cost, all told, from 3 annas a head at the relief camps of Madras to $1\frac{1}{2}$ annas a head at the cheaper relief camps in the interior; whereas the village relief allowance proposed by the Board for Salem is only 1 anna per diem, while in no district it is more than $1\frac{1}{4}$ or $1\frac{1}{2}$ annas a day for adult men.

8. I recommend, therefore, that an attempt be made, on some such plan as is here suggested, to gradually draft, not only the able-bodied but the infirm and helpless poor from the relief camps to their homes. In regard to orphan children difficulty may arise; but this difficulty will have to be met under any circumstances; and the longer the parents are kept in relief camps, the larger the number of orphans is likely to become.

No. 230.

No. 245.

CVIII.—MINUTE by SIR RICHARD TEMPLE, dated Gooty, 22nd April 1877.

Passing through the Cuddapah district, I had the advantage of once more considering the returns of relief labourers and recipients of gratuitous relief, as presented by Mr. Benson, the Head Assistant Collector, and by the Collectorate Serishtadar.

2. The present number of relief labourers is 80,000, the lowest number was 67,000, the highest number in January was 204,000. In no district since January last has stricter care been exercised in preventing relief being given to those who do not need it, or in confining relief to those who really are in need. The vigilance and discrimination exercised in this respect seem to me to be very creditable to the Collector (Mr. Price). Considering, however, the comparatively good spring harvest which has been and is still being reaped in this district, and the fall of rain, timely though moderate, which has fallen in this quarter, I should think that much caution ought to be exercised in permitting the number of relief labourers to rise materially, unless indeed from the rain holding off, or from other cause, matters should take a turn for the worse.

3. On the other hand, my impression is that the numbers on gratuitous relief in the interior of the district (some 30,000 persons*) is probably not large enough, and that the system of village inspection and relief is still incomplete. I fail to gather favourable accounts of the conduct of the village headmen in this respect. As the staff of European officers is now so strong, there ought to be no difficulty in seeing that the village headmen do their duty. This seems to me more necessary in the Maddanpally subdivision of the district than anywhere, from which quarter accounts of distressed individuals scattered here and there are received.

4. An examination of the return of relief work makes me apprehend that they are too numerous in some parts of the district, especially in the north-western taluks; if they could in such places be more concentrated that would facilitate check and control.

5. Some of the relief works are really under the control of Public Works officers, but most of the works are not so. In the latter works, which constitute the great majority, the Public Works Department merely helps and advises, but does not take actual charge of the works. This is, as it seems to me, to be regretted, especially as there are three ranges or executive divisions in the district in each of which there is a professional establishment. I would recommend that this establishment be utilised by being ordered to take charge of as many of the relief works as possible.

No. 231.

No. 245.

CX.—MINUTE by SIR RICHARD TEMPLE after Inspection of certain Relief Gangs at Gooty and Goondakal.

Bellary District, 24th April 1877.

Relief gangs of Gooty and Goondakal. Having again paid a brief visit to a part of the Bellary district, I have to submit the following remarks:—

2. One gang (500 strong) of relief labourers employed on the railway at Gooty under professional supervision, on reduced wage and good tasks, were found by me to be in very fair condition. Another large gang (1,000 strong) inspected by me at Goondakal consisted of 800 women and children in fair condition (with some few exceptions), and

of 200 men of whom one-third were in indifferent condition, some even in bad condition, most of these latter being new arrivals. From information received from Bellary and Adoni, I learn that in several gangs there are found some persons in weakly condition. These points will doubtless cause some to think that the relief wage ought to be raised. Looking, however, to Dr. Townsend's recent evidence as to the good condition of the able-bodied labourers on the reduced wage, which is again confirmed by my own recent observation, and to the importance of not holding out any temptation to able-bodied men to come on relief who might be otherwise able to sustain themselves, I would still strongly deprecate raising of the wage to the able-bodied.

3. In some places the Sunday wage is not allowed, as no work is done on that day. It is in these cases supposed that the men have some other slight means of support besides their relief wage. If, however, there be any doubt on this point, then the Sunday wage might be allowed on the ground that the subsistence afforded by the wage is as much needed on Sundays as on week-days. But as it is inconvenient to pay the wage on Sundays ($1\frac{1}{2}$ annas), then in commutation $\frac{1}{4}$ of anna might be paid on each week-day, raising the wage to $1\frac{3}{4}$ annas.

4. If any person now in the gangs fall into bad health, or come on to the works in a low state, the existing orders amply provide for their being specially treated either by extra special allowance or by nominal work.

5. But it is very important at this season to avoid offering more than $1\frac{1}{2}$ annas a day to the able-bodied people outside, who are possibly considering in their own minds as the season advances whether they will or will not come on to the works.

6. The number of persons who are unable to work and who are seeking for food is increasing fast. I believe that the system of relief centres and village relief is being fairly well worked in this district. But the subject is so important that I must be excused for making reiterated mention of it.

No. 232.

CXI.—MINUTE by SIR RICHARD TEMPLE, bringing to Notice the State of Affairs on the Bellary-Dharwar Railway. No. 245.

Bellary District, 24th April 1877.

Having had a share in recommending the commencement of the earth-work of the railway from Bellary towards Dharwar, and having inquired much during my visit to Bellary (on the 26th March) as to the possibility of making a speedy commencement, I deem it my duty to report to the Madras Government that, from what I learn while passing through the district, the commencement is apparently not being made with the expected rapidity by the local Engineers. I am under the impression that the Civil officers have got, or could immediately get, from 10,000 to 12,000 relief labourers ready for this work, and the expectation was that at least this number would be employed. Whereas not more than 3,000 persons are actually being employed. This is excellent so far as it goes; but as much more is needed, it would seem to follow either that some further instructions from Government to the local Engineers, or else that, if such instructions have been given to these officers, they have not yet been sufficiently followed. As so much stress was laid by the Madras Government on the undertaking of this work as a means of employing and tasking relief labour under professional officers, I trust I shall be excused in bringing this subject again to notice.

Bellary-Dharwar Railway.

2. It is the more necessary to press the point, as this is the only large work in the district where relief labour can be professionally tasked, no action having apparently been taken on my minute of the 10th April recommending that relief labourers be drafted on to certain selected public works,—a suggestion which I would still commend to the consideration of the Government of Madras.

No. 233.

CXII.—MINUTE by SIR RICHARD TEMPLE, suggesting the deputation of an experienced European Officer to the Western Taluks of the Bellary District. No. 245.

Bellary District, 24th April 1877.

My last visit to the Bellary district brought to recollection a point which I have often heard discussed namely, the need of some European officer being deputed to inspect the relief operations in the western taluks of that district, namely, Harpanhally, Havind-Hudgully, and Kudlegi. These operations are no doubt under able Native officers, and

European officer required for western taluks.

the distress is not very bad apparently in that quarter. Still the work would be all the better for a visit from an experienced European officer vested in the principles and practice of relief. It is probable that such an officer would effect good as regards the discharge of persons not fit objects of relief, the tasking of the relief labourers, and the prevention of waste or fraud. All the other parts of the district have the advantage of European supervision save these western taluks. I would represent to the Madras Government the expediency of despatching thither such an officer if he could be spared, as someone might probably be spared for a time at least. I understand that the Collector, who has been for some time past in camp, intended to visit the taluks, but he has not (I believe) done so yet.

No. 234.

No. 245.

CXIII.—MINUTE by SIR RICHARD TEMPLE, comparing the per-centage of relief recipients in Kurnool with those in the Bombay Deccan, and suggesting the concentration of relief works under Public Works officers.

Goondakal (Bellary District), the 24th April 1877.

Large number receiving relief in Kurnool district.

Having again paid a brief visit to a part of the Kurnool district, I find the numbers of persons on relief wages and gratuitous relief together to be so high, that I must invite the consideration of the Madras Government to the points set forth in my minutes of the 17th March and of the 29th March. These points are doubtless well known to the Madras Government, and they certainly have been brought to the notice of the local authorities. But as there is no change in those respects perceptible, I must again represent the case.

2. The per-centage of recipients of relief of both kinds in the Kurnool district may be compared thus with the per-centages in other districts of the Madras and the Bombay Presidencies :—

Distressed Districts.				Total Numbers on Relief Works and on gratuitous Relief during the First Week of April.	Per-centage of Persons receiving Relief of both kinds on the Total Population of the District.
Madras Presidency	Kurnool	-	-	236,000	24½ per cent.
	Bellary	-	-	269,000	17 "
	Cuddapah	-	-	80,000	6 "
	Nellore	-	-	69,000	5 "
	Chingleput (inclusive of Madras city)	-	-	29,000	2 "
	North Arcot	-	-	32,000	1½ "
	Salem	-	-	58,000	3 "
	Coimbatore	-	-	27,000	1⅔ "
	Madura	-	-	12,000	½ "
Bombay Presidency	Tinnevely	-	-	3,000	⅓ "
	Sholapur	-	-	49,955	7 "
	Kaladgi	-	-	27,120	3½ "
	Part of Poona	-	-	57,691	6⅛ "

3. Many of the Madras districts have been so economically managed from the first that it is difficult to make a comparison. But Kurnool may be fairly compared with Bellary, in which the failure of harvests has been worse, and in which there was quite as much liberality of relief at the outset as in Kurnool. There cannot be any good reason why the per-centage should be 24 in Kurnool, while it is only 17 per cent. in Bellary. Indeed, if the per-centage (17) in Bellary be deemed reasonable, the per-centage in Kurnool ought to be under 15.

4. The contrast with the Bombay Deccan is still more striking. It is, I believe, impossible to account for the difference in the extent of relief save by assuming that there is a difference in system. And what is that systematic difference? Why! just this, that in the Bombay Deccan the relief labourers are systematically tasked by engineering establishments and under professional supervision, while in Kurnool they are not so tasked. I have been unable to ascertain the precise value of the work done by the Kurnool relief gangs, but I understand that it costs many times as much as it would in ordinary times under the Department of Public Works, and that the tasks are very light.

In the Bombay Deccan the Department of Public Works has real control over the relief labourers, while in Kurnool it has not. This matter was represented to the Madras Government by my minute of the 29th March. I do not know exactly how far the recommendations therein submitted have been approved.

Largenum-
ber receiving
relief in
Kurnool
district.

5. The per-centage of relief recipients to the whole population in the Kurnool district may be better seen from the details of the "taluks" or divisions into which the district is divided:—

Taluks.	Population according to Census of 1871.	Number of Persons		Total.	Per-centage of Relief Recipients to Population.
		On Relief Works.	On gratuitous Relief.		
Ramalkota - - -	146,195	40,391	16,060	56,451	38 $\frac{1}{5}$
Nandikotkur - - -	101,866	12,330	2,205	14,535	14 $\frac{1}{4}$
Nandial - - -	107,320	31,103	5,750	36,853	34 $\frac{1}{3}$
Sirwell - - -	71,066	16,449	2,776	19,225	27
Koilkuntla - - -	98,844	32,679	5,409	38,088	38 $\frac{3}{5}$
Pattikonda - - -	173,434	26,289	10,652	36,941	27 $\frac{1}{4}$
Cumbum - - -	123,042	46,346	3,172	49,518	40 $\frac{1}{5}$
Markapur - - -	92,665	11,178	817	11,995	12 $\frac{5}{6}$
	914,432	216,765	46,841	263,606	28 $\frac{3}{4}$

6. The numbers on gratuitous relief are probably not too high; the excess must be in the numbers on relief works, which is specially apparent in the "taluks" of Cumbum, Koilkuntla, and of Nandial. Perhaps in Ramalkota the apparent excess may be accounted for by the Kurnool city being situate therein; otherwise there also the per-centage is very high.

7. The measure primarily to be suggested is the concentration of the gangs on public works (specified in the minutes of the 17th and 29th March) under Public Works officers. Then they will be sent to some longer distance from their homes than at present, and will be better tasked that at present. The effect of this on the numbers of the labourers would, I am sanguine, be soon apparent.

8. In submitting these remarks I am far from being forgetful of the efforts made by the Collector and his officers to enforce system and economy; but it is impossible to overlook the statistical facts which show that some further efforts are still necessary.

No. 235.

CXIV.—MINUTE by SIR RICHARD TEMPLE, comparing the system of tasking relief labourers in the Madras and Bombay Presidencies, and suggesting the utilisation of the Public Works officers in Madras on relief works in certain districts.

Bellary District, the 24th April 1877.

Before quitting the Madras Presidency, I would beg to represent to the Madras Government one remarkable difference between the system heretofore pursued in that presidency and the system followed from the first in the Bombay Presidency, and which is being followed there more and more. Though the point has previously been brought by me to the notice of the Madras Government, it is so important that I may be excused representing it once more.

Public
Works offi-
cers should
superintend
relief works
in Madras.

2. There will doubtless be no question as to the superiority of the plan whereby relief labourers are tasked under a settled departmental system by professional establishments specially trained for the business, over the plan by which they are tasked by Civil officers not trained to the business. In the former case the tasking will be strict and hard and will be endured only by those who are in need; in the latter case it will often (though not always) be either light or nominal, and will be undergone by many who are not in need.

3. In the Bombay Presidency the plan has been so advanced that now almost all the relief labourers are under the Public Works Department. Out of 287,760 persons in all, 259,057 are under that department, and only 28,703 are under Civil officers.

4. In the Madras Presidency, out of 716,507 in all, there are not more than 83,000*			
*East Coast Canal	-	-	40,000
Arconum doubling	-	-	15,000
Bellary-Dharwar Railway	-	-	3,000
Salem district	-	-	25,000
Total	-	-	83,000

Some may be very shortly expected on the Chingleput Railway, and some also on the irrigation works of North Arcot.

It is especially remarkable that in the two districts showing the largest numbers, Bellary and Kurnool, having both together 422,784 persons, the whole are under Civil officers, and lightly tasked, with the exception of the 3,000 on the railway from Bellary towards Dharwar.

5. I am sure that this difference in system is the main cause of the difference in the proportion of relief labourers to the whole population between these two districts on the one hand, and the Bombay Deccan on the other hand. The per-centage of relief labourers on the whole population is in Bellary $12\frac{3}{4}$ per cent. and in Kurnool $21\frac{1}{4}$; while (Bombay Presidency) in Sholapur it is only 6.69, in Kaladgi 4.8, and in the distressed part of Poona 10.5.

6. There is no want of engineering and professional establishments in the districts of Bellary, Kurnool, and Cuddapah; on the contrary each District is under a district Engineer, whose executive charge is divided into so many "ranges," in each of which there is an Engineer officer. But, as shown by me in former minutes, these excellent and competent establishments only help in a general way, and have no actual charge of any relief work. They might be utilised fully for this important purpose at any moment the Madras Government may see fit.

7. The same remarks apply equally to North Arcot, and would similarly apply to South Arcot if any relief works shall have to be opened there. They apply too in a considerable degree to Nellore.

MEMORANDUM by CAPTAIN W. S. S. BISSET, R.E., on Special Duty, dated Dhond, the 25th April 1877.

Movements
of food
grains in
Madras.

The three accompanying statements abstracted from returns furnished, at Sir Richard Temple's request, by the officers of the Madras Railway Company, contain statistics of considerable interest to the mercantile world.

The first exhibits the movements of food grains on the Madras Railway for March 1877, the second shows month by month the quantity of food grain delivered by rail into each district, and the third exhibits the total quantities received in each district from the 1st August to the 31st March, as well as the source from which the supplies have been drawn. In Statement No. II. the last column professes to show the total delivery of each month by the Madras Railway, but it is necessary to explain that a considerable portion of the grain invoiced from Northern India in December 1876 and January 1877 was not actually delivered in the Madras Presidency till the month of February.

The best month's work out of Madras has been that of March, when nearly 35,000 tons of grain were despatched; the best month's work from Beypore that of January, when over 10,000 tons of grain were carried; and the best month's work from the northern end that of February, when the actual quantity of grain sent southwards from Raichore was approximately 18,000 tons.

Up to the end of March there was no effective increase to the engine power, for although the additional engines were in the hands of the Madras Railway Company, the drivers for these engines had not reached their posts till the first week of April.

With the increased demand which is just beginning to be felt in the ceded districts of Madras, and which, in my humble opinion, is likely to grow daily till the rains fall, the additional engine power will be fully engaged; and it may be worthy of notice that, while the despatches of grain from Madras cannot be largely increased without suspension of the ordinary traffic, there is even now train room for many more grain waggons from the north.

Bad report
from Madras.

We enclose a minute by Sir Richard Temple regarding the condition of the upland taluks in the district of Salem, which he describes as being among the most distressed tracts in the whole of the Madras Presidency. Some parts of these taluks have not had crops for two years. One of them, Utangiri, was one of the taluks which suffered most severely in the scarcity of 1866. The relief operations appear to be conducted with care and judgment.

2. Yesterday we received the following telegram from Sir Richard Temple :—

“Since last weekly telegram I have visited South Arcot, revisited districts North Arcot, Cuddapah, Kurnool, Bellary. In Southern India situation changed slightly for worse contrary to expectation, because showers ceased middle April; any moment rain might alter whole case, otherwise distress must gradually increase. Near Madras, on East Coast, no rain at all; country there quite parched. Northwards, above Ghâts, in Bellary and Kurnool, situation worse, according to previous expectation. Season of trouble approaching. Agricultural and able-bodied classes still sustain themselves; but famine beginning to seize lower classes. Numbers on gratuitous relief rising. Many come to relief works in reduced state. Village inspection and relief being better developed but still not complete everywhere; I have again urged its full development. Those who cannot work becoming badly distressed; in relief gangs able-bodied still healthy, but weaker ones sometimes fall into low condition. A sort of scurvy appearing; many think reduced wage should be raised. I deprecate raising wages for able-bodied, fearing influx of persons to work who could otherwise support themselves; but I have recommended special allowance for all who are found reduced, also concession Sunday wage. Efforts with some success to send labourers to Nellore Canal; but earth-work slowly and feebly begun on railway from Bellary towards Dharwar. Active markets supplied. Draught cattle sustained. Inferior animals languishing or perishing in large numbers. Imports to Madras steady, but from Bombay direction increasing. No actual want of drinking water. I have just quitted Madras Presidency.”

From the facts stated in this telegram it is evident that, unless rain falls within the next week or so, there will be a very great increase in the numbers of persons needing relief, and also in the loss of cattle, already, it is to be feared, very grievous. Your Lordship will have learnt from our telegram of the 21st instant that the number in receipt of relief in the Madras Presidency had then reached very nearly a million, which, however, is still considerably below the estimate for April submitted by the Madras Board of Revenue in December last, according to which the numbers likely to require relief in April were put down at 1,405,000. The greatest increase is perceptible in the number in receipt of gratuitous relief, which amounted to 241,000 persons; and from Sir Richard Temple's allusion in his present telegram to the insufficient development of the system of village inspection, we may look for a still further increase in the numbers requiring State relief in this form.

3. The situation is serious and critical; but the trade in grain is active, and there is, we trust, no reason for apprehending any deficiency in the supply in any of the districts. Sir Richard Temple, who is now on his way to Bombay to assume the Government of that Presidency, is about to furnish us with a comprehensive report on his mission, which will doubtless embody his latest impressions on the present aspect of the famine, and which we shall lose no time in forwarding to your Lordship.

4. The following is an extract from our telegram of the 21st instant regarding the numbers on the relief works and in the receipt of charitable relief according to the latest returns :—

“In Madras 726,000 on relief works, and 241,000 charitably relieved. In Bombay 270,000 on works, and 66,000 charitably relieved. In Mysore 64,000 on works, and 59,000 charitably relieved.”

5. Since the above was written we have received the following supplementary telegram from Sir Richard Temple, despatched yesterday from Dhond in the Poona district, the point from which the railway starts which is to connect the Northern and Southern

sections of the Great Indian Peninsula Railway, and which has been commenced as a relief work :—

“ I have seen some local officers, districts Sholapur, Poona, and Ahmednagar, have inspected 3,500 relief labourers, person by person, on Dhond and Munmar Railway, found them doing well on new wage. General situation of Bombay Deccan appears thus : Pressure becoming harder everywhere, numbers on relief works slightly increasing, system steady. Vast majority of relief labourers under professional officers, task-works well enforced, numbers on gratuitous relief increasing fast, village inspection developed. Prices slightly rising. Trade active. Markets well supplied. Draught cattle sustained, but numbers of other cattle perishing. Fate of animals sent to Ghát mountains for grazing uncertain. Many dying there. Anxiety about bullocks for future ploughing. Showers have fallen, but do not effect material good. I found water in rivers Tungabadra and Krishna increased in volume since last visit. Drinking water scarce occasionally, but failure averted by excavating wells.

We have the honour to be, &c.

WHITLEY STOKES.

No. 238.

Revenue No. 33.

From the SECRETARY OF STATE to the GOVERNOR-GENERAL OF INDIA IN COUNCIL.

India Office, London, 26th April 1877.

Para. 1. The Despatch of your Excellency in Council, dated 9th March, No. 14 of No. 147. 1877, relative to the famine in the Presidencies of Madras and Bombay, has been considered by me in Council.

2. The insufficiency of the means at present available for the transport of grain from Madras to the interior, and especially to the ceded districts and Kurnool, must reasonably have caused much anxiety. The efforts hitherto made to increase the carrying power of the railway have been met by unforeseen difficulties, but as the subject is now engaging the earnest attention of your Excellency's Government and that of Madras, I trust that means will be devised for overcoming the present obstacles.

3. Your instructions to the Government of Madras relative to the necessity of removing the misapprehensions which exist in the public mind as to the relations between the Government and the firm of Arbuthnot and Co. have my approval. If, after consultation with the Madras Government, your suggestion for the sale of the Government reserve stock be acted upon, I trust that the periods of sale and quantities sold may be so arranged as not to disturb the ordinary operations of trade.

4. I trust that the local authorities in Nellore, the ceded districts, and Kurnool, will succeed in carrying into execution the plan suggested by Sir R. Temple of drafting labourers from the relief works in those districts to the great work of the East coast Navigation Canal. The end to be attained is so important, that I trust no exertions will be spared to make use of the present opportunity for the completion of this useful work.

5. I shall await the result of your deliberations on the subject to which the Sanitary Commissioner of the Madras Government has drawn attention, of the alleged insufficiency of the reduced rate of wages lately prescribed for the relief works in that Presidency.

6. I fully concur in the views expressed in the Resolution of your Excellency's Government on the returns received from the Chief Commissioner of Mysore relative to the scarcity in that province. The Chief Commissioner and the officers of the Administration appear to have well deserved the praise bestowed on them by your Excellency in

Council for the zeal, judgment, and humanity which have characterised their arrangements and exertions to meet the great calamity which has fallen on the province.

7. I concur with your Excellency in the emphatic recognition which you record of the value of Sir R. Temple's labours.

I have the honour to be, &c.

(Signed) SALISBURY.

No. 239.

Revenue, No. 36.

From the SECRETARY OF STATE to the GOVERNOR-GENERAL OF INDIA IN COUNCIL.

India Office, London, 26th April 1877.

No. 170.

Para. 1. The Despatch of your Excellency in Council, dated 16th March, No. 15 of 1877, relative to the famine in the Presidencies of Bombay and Madras, has been considered by me in Council.

2. I will await the result of the deliberations of your Excellency in Council, after full communication with the Government of Madras, on the Sangam project. As a reproductive work, it is well worthy of consideration at such a crisis as that which now engages your attention.

3. I am glad to learn that the conclusions at which Sir R. Temple arrived, after his repeated visits to North Arcot, are, on the whole, favourable, and that he considers everything has been done which ought to have been done in respect to measures of relief by the local authorities.

4. Sir Richard Temple has discussed with ability the views stated by Dr. Cornish, the Sanitary Commissioner at Madras, as to the scale of rations for labourers on relief works. The question at issue is, without doubt, one of great difficulty, and one on which it would be unwise to lay down an inflexible rule. I am confident that the humane principles already laid down by your Excellency will be scrupulously carried out by the officers of the Government, and that no scale of rations will be maintained which is not adequate to the sustenance of the labourer.

5. It is very satisfactory that progress has been made towards enabling the Madras Railway Company to carry 1,400 tons a day, twice the amount which it has hitherto been able to carry.

6. The statement that the number of persons on the relief works in the two presidencies has, during the week under review, been reduced by 49,266, is satisfactory.

7. I feel it my duty to record my approbation of the discrimination and judgment with which the calamity before you has been met by your Excellency in Council, by Sir Richard Temple, by the Governments of Madras and Bombay, and by the local authorities in those presidencies.

I have the honour to be, &c.

MEMORANDUM by CAPTAIN W. S. S. BISSET, R.E., on Special Duty, dated Bombay, the 28th April 1877.

Imports of
food grains.

The following notes are based upon returns which have just been obtained from Madras. The very extensive importation into Madras of grain from the subordinate ports during the months of August, September, and October 1876 had escaped my notice, and I have to express my thanks to Captain Coaker, R.E., Deputy Consulting Engineer, and to Mr. H. E. Church, Traffic Manager of the Madras Railway, for having called attention to the matter and for having assisted me in obtaining the additional statistics now presented.

For the months of August, September, and October 1876, the published statements of the Madras Board of Revenue show the import of food grains into the port of Madras at a total of 5,637 tons. During the same period the Madras Railway alone carried out of Madras 20,446 tons of grain, and the question arose where this supply came from.

The figures thus published are found to be the imports from non-subordinate ports only, the imports of food grains from the ports subordinate to the Madras Presidency

during these months having actually amounted to 38,000 tons in addition to the 5,637 tons above mentioned. Imports of food grains into Madras.

During November and December 1876, 55,466 tons were delivered in Madras from beyond the presidency, and 30,000 tons from the subordinate ports, while during the first three months of 1877 the imports of food grains into the port of Madras amounted to 165,852 tons from ports beyond, and 36,000 tons from other ports within the jurisdiction of the Local Government. The imports into the port of Madras commencing in August with a total of 15,000 tons steadily rose up to January 1877, when the total imports from all sources into Madras alone exceeded 80,000 tons.

The total food supply made available in Madras from August 1876 to the end of March was therefore—

	Tons.
From subordinate ports - - - -	104,000
From non-subordinate ports - - - -	227,000
Total - - - -	<u>331,000</u>

Of this vast supply, the Madras Railway forwarded from Madras over 146,000 tons, its maximum despatches having amounted to 35,000 tons during the month of March.

Up to the end of March the minor East Coast ports of Negapatam, Tuticorin, and others imported 25,000 tons of grain, and this supply enabled Southern India to send to the more distressed districts served by the Madras Railway over 15,000 tons of food grain; Mysore taking over 8,000 tons of this amount.

During the same period, Beypore and Calicut received approximately 63,000 tons of food grains. Of this, over 35,000 tons was sent up by rail, nearly all to Coimbatore, Salem, and Mysore. The Malabar district probably received much of this by land, for it sent away by rail 5,000 tons of grain more than it received.

The other ports on the West Coast are said to have received 52,750* tons up to the end of February, and this large supply has all been distributed by cart.

If the period from August to October 1876 be included, the total imports into the Madras Presidency will be seen to be as follows:—

IMPORT OF FOOD GRAINS into the PRESIDENCY of MADRAS.

Madras received in	From Ports beyond the Presidency or Non-Subordinate Ports.	From Subordinate Ports.	Total.
	tons.	tons.	tons.
August 1876	1,769	38,000	43,637
September "	875		
October "	2,993		
November "	26,792	30,000	85,466
December "	28,674		
January 1877	72,985		
February "	57,421	36,000	201,852
March "	35,446		
Total - - -	226,955	104,000	330,955
Other East Coast ports received from all sources - - -	-	-	25,000
Grand total Madras and East Coast - - -	-	-	355,955
Beypore and Calicut received from all sources - - -	-	-	63,000
Other West Coast ports " " - - -	-	-	55,000
Grand total of West Coast ports - - -	-	-	118,000

The Northern districts received by rail from Great Indian Peninsula
Railway - - - - - 61,000

Imports of
food grains
into Madras.

The above figures abstracted show the total imports as follows:—

	Tons.
By sea from Bengal, Burma, Orissa, and Ganjam to Madras, Tuticorin, &c.	356,000
By sea into Beypore and other West Coast ports	118,000
By Great Indian Peninsula Railway from Northern and Central India into the Madras Presidency	61,000
Grand total	535,000

No. 241.

No. 256.

CXV.—MINUTE by SIR RICHARD TEMPLE, on the subject of the Imports of Grain into the Presidency of Madras and its Transport by the Madras Railway.

Bombay, the 28th April 1877.

Later information makes it desirable to state finally the statistics of the imports of food grains into the Presidency of Madras since the commencement of the scarcity of 1876-77. Copies of certain notes and memoranda by Captain Bisset are forwarded.

2. It was assumed originally on the published data of the Madras Board of Revenue that the imports before the month of November were altogether inconsiderable. The despatches of grain by rail from Madras were, however, during the months of August, September, and October so much in excess of the total imports thus shown that it was doubted whether the Board's statements were complete. And on further inquiry it was ascertained that the 5,637 tons shown as imported during August, September, and October from beyond the presidency were supplemented by an import amounting to 38,000 tons from ports known by the Madras Board of Revenue as "subordinate ports."

3. Thus before November, the month previously recognised by me as the beginning of heavy imports, there were delivered into Madras a total of 44,000 tons of food grains. Some corrections have been made in the returns for the period from November onwards, the estimated imports for March having been very much exceeded by the actuals both at Madras and at the minor ports on the East and West Coasts, and the whole supply taken by the Presidency has to be stated at 535,000 tons.

4. The following is the abstract of importations in the Presidency of Madras:—

	Tons.
By sea from Bengal, Burma, Orissa, and Ganjam to Madras and other East Coast ports	356,000
To Beypore	118,000
By the Great Indian Peninsula Railway	61,000
Grand total	535,000

5. The following is an abstract of the quantities of grain which were carried away by rail from Madras into the interior:—

	Tons.
To Chingleput district	514
„ North Arcot	22,316
„ Mysore territory	45,542
„ Salem district	5,486
„ Coimbatore and Malabar	1,878
„ Cuddapah district	33,045
„ Bellary and Kurnool	37,335
Total	146,454

6. The despatches of grain from Madras from 3,000 tons in August rose to over 10,000 tons in October, and to more than 13,000 tons in November, from which time the despatches have been limited only by the carrying powers of the Madras Railway.

7. Hence it is apparent that there was a very great activity in the grain trade of Madras during the autumn, a fact very material to the estimate which was formed of the conjuncture arising at that period.

No. 242.

No. 214, dated Bombay, the 28th April 1877.

From the PRIVATE SECRETARY TO SIR RICHARD TEMPLE to the ADDITIONAL SECRETARY No. 262.
TO THE GOVERNMENT OF INDIA.

I am directed by Sir Richard Temple to submit a printed copy of his minute, dated 14th April, being a general report on his late mission to the distressed districts of the Madras Presidency. This report being submitted for the information or consideration of the Government of India, no copy has as yet been sent by Sir Richard Temple to the Government of Madras, as he deemed that perhaps the Government of India would prefer communicating the report to the Local Government.

Forwarding
Sir Richard
Temple's re-
port on his
mission.
No. .

2. The report will, it is hoped, be found to be drawn up in sufficient detail to speak for itself. But it had, by reason of Sir Richard Temple's approaching departure from the Presidency, to be completed and sent to press on the 14th April, which date represents a critical point in the season, when a change for the better or for the worse was to be expected. Therefore Sir Richard Temple desires to add that during the ten days subsequent to the 14th April, say up to the 25th April, when he left the Madras Presidency, the season declared itself adversely. The expected change came indeed, but it was for the worse. Consequently the position of affairs on the 25th April was somewhat more unfavourable than that described in Part IV. of the Report, which applied to the period ending on 14th April. The cause is the cessation of the usual spring showers of Southern India, which fell propitiously until the middle of April, and then ceased. To this, however, the country on the east coast around Madras itself formed an exception, having received no rain at all, great drought therefore prevailed in the Chingleput district up to the 25th April. The mortality in the relief camps near Madras was as bad as, if not worse than, ever; and the need was becoming apparent of sending to their homes, to be relieved there, all those inmates of the camps who could possibly be moved. Distress was certainly becoming worse in Madura, perhaps was arising in Tinnevely, and was to be shortly expected in South Arcot. Affairs were somewhat better in Coimbatore, Salem, North Arcot, and Nellore; but if rain should be withheld for a few days longer in those districts, then some aggravation of trouble was to be feared. In Cuddapah and Kurnool matters were going on according to expectation, save that in one subdivision of Cuddapah (Mudanapulli) there seemed to be some degree of administrative failure. In Bellary the famine seemed to be making some strides onwards. The applications for gratuitous relief were fast increasing. And in the relief labourer gangs working upon the reduced wage the proportion of persons needing special concessions was rising.

Subsequent
change for
the worse.

3. Even now a timely fall of rain (which is ordinarily to be expected at this season in Southern India) would change the whole face of affairs. But if there be no more showers until the coming of the south-west monsoon, then the unfavourable features indicated in this letter will become aggravated gradually, week by week, almost day by day.

4. I am to add that the grain trade continued active as ever, and the carrying power of the several railways was still sufficient for the conveyance of the grain supplies. But if, as is possible, there should be a rapid influx of grain during the month of May, then Sir Richard Temple apprehends that additional engines will be much wanted.

Activity of
grain trade.

No. 243.

NOTIFICATION by the GOVERNMENT OF INDIA.

No. 245.

Simla, April 30, 1877.

The Hon. Sir Richard Temple, Bart., K.C.S.I., being about to assume the office of Governor of Bombay, to which he has been appointed by Her Majesty, and being in consequence under the necessity of closing the special mission on which he has been employed since the beginning of January in the Presidencies of Madras and Bombay, and in the territories of his Highness the Maharaja of Mysore, his Excellency the Viceroy and Governor-General in Council desires to give public expression to the high sense which the Government of India entertain of Sir Richard Temple's services on this occasion.

Acknow-
ledgement of
Sir Richard
Temple's
services.

When in January last it was deemed expedient that a high officer fully acquainted with the views of the Government of India should visit the Presidencies of Madras and Bombay for the purpose of inspecting the districts afflicted with scarcity, and communicating personally with the two Governments regarding the measures which were being carried out for the relief of distress, the choice of the Government of India at once fell upon Sir Richard Temple as the officer whose experience, ability, and energy pointed him out to be specially qualified for the duty. At a considerable sacrifice of personal comfort and convenience, Sir Richard Temple promptly responded to the call made upon him, and has conducted his arduous and delicate mission with signal ability and success.

The energy and devotion which have enabled him to undergo an amount of physical exertion which few could have accomplished are not more remarkable than the thoroughness of his inquiries and the judgment and tact which have characterised his communications with the Local Governments and their officers. To the Government of India Sir Richard Temple has rendered invaluable assistance at this trying juncture, in enabling it by his clear and lucid reports to appreciate the actual facts of the situation; and his Excellency in Council is persuaded that the Government to which he was accredited must recognise the advantage of his practical suggestions for the relief of distress and for promoting a judicious economy in the heavy expenditure which is being necessarily incurred.

The Governor-General in Council has no doubt that if life and health be spared to him in the high office which he is about to assume, Sir Richard Temple will add fresh and important services to those which he has already rendered to the State during his long and distinguished career. In entering upon his new duties he carries with him the best wishes of the Government of India.

No. 244.

Revenue, No. 39.

From the SECRETARY OF STATE to the GOVERNOR-GENERAL OF INDIA IN COUNCIL.

India Office, London, 3rd May 1877.

No. 181.

Para. 1. The Despatch of your Excellency in Council, dated 23rd March, No. 16 of 1877, relative to the famine in the Presidencies of Madras and Bombay, has been considered by me in Council.

2. With your Despatch you have transmitted 12 minutes and memoranda by Sir Richard Temple on various questions connected with the famine. The views therein expressed will doubtless receive every attention from the Government of Madras, but they do not at the present time demand remarks from me.

3. Your judgment in determining that relief operations should be so conducted as not to interfere with private trade was sound, and has been fully justified by the event. All doubt as to the manner in which the grain in the hands of the Madras Government will be employed has been set at rest by the public declaration of that Government that the grain shall be retained in reserve to meet future emergencies, and will not be utilised so long as private trade meets the requirements of the distressed districts. Under these circumstances, and with this reservation, I am of opinion that the movement and utilisation of the reserve may be left to the discretion of the Madras Government.

4. The intelligence that there has been a good fall of rain in Bellary, Cuddapah, Kurnool, Nellore, Trichinopoly, Tinnevely, and other of the afflicted districts, is very satisfactory.

5. The small increase of 2,608 persons on the relief works in the two presidencies may also be deemed satisfactory, when the period of the year is taken into consideration.

I have, &c.
(Signed) SALISBURY.

No. 245.

No. 23 of 1877.

No. 265.

GOVERNMENT OF INDIA, Department of Revenue, Agriculture, and Commerce, to the
SECRETARY OF STATE FOR INDIA.

Simla, the 3rd May 1877.

We enclose several minutes written by Sir Richard Temple during the last fortnight of his stay in the Madras Presidency, referring to various questions connected with the administration of famine relief.

2. The most important questions discussed in these papers are—

1st. The expediency of utilising the officers of the Public Works Department in the superintendence of the relief works. No. 235.]

2nd. The sufficiency of the rate of relief wages. No. 218.

3rd. The expediency of gradually reducing and eventually abolishing the relief camps, by drafting able-bodied persons to the works, and sending the infirm and helpless poor to their homes, as the system of village relief becomes sufficiently organised. No. 229.

4th. The substitution of coal fuel for wood on the Madras Railway lines, with the object of preventing the destruction of the forests, and especially the hill forests, the gradual denudation of which has a prejudicial effect on the regularity of the rainfall. No. 220.

The last of these "proposals will require to be carefully examined; and while we fully recognise its importance, we are not at present in a position to offer any definite opinion as to its feasibility.

3. The question of more effectively utilising the large public works establishments in the Madras Presidency, on the duty of superintending the relief works, has been repeatedly pressed by Sir Richard Temple upon the attention of the Madras Government, not only in the minutes now sent, but in other minutes which have been already laid before your Lordship. In his minute of the 29th March* (No. LXXXVII.), adverting to the defects in the exaction of task-work, which characterised many of the relief works in Madras, Sir Richard Temple remarked that the main cause of the failure consisted in this, "that the Public Works Department in each of the distressed districts "is not sufficiently employed (indeed is sometimes hardly employed at all) in the "tasking,—an affair which is of all affairs the very one which it is most competent to "manage, and which can be thoroughly managed by it alone." In most of the districts, and especially in Bellary and Kurnool, the number of the relief works under the department of public works is very small, while the majority of the relief works are under civil officers. The result is that the tasking is at the best but light, and when the supervision is Native only, the tasking is too often nominal. The subject is referred to in several of the minutes enclosed in this Despatch, and more particularly in that of the 24th ultimo, written on the eve of Sir Richard Temple's departure from the Madras Presidency, wherein he points out that, while in the Bombay Presidency the plan of tasking the relief labourers under a settled departmental system by professional establishments, specially trained for the business, has been so advanced, that out of 287,760 persons on the relief works in that presidency, 259,057 are worked under the Public Works Department, and only 28,703 are under civil officers; in the Madras Presidency, out of 716,507 in all, there are not more than 83,000 under the Public Works Department, the remainder, 633,507, being under civil officers—

"Out of this latter number it may be admitted that 24,140 in Coimbatore, 28,000 in Salem, 13,626 in Madura, in all 65,766, are well and fully tasked. The remainder, 568,741, are (with the exception of a certain number in Cuddapah which I cannot state precisely) under the civil officers, and are for the most part lightly tasked. It is especially remarkable that in the two districts showing the largest numbers, Bellary and Kurnool, having both together 422,784 persons, the whole are under civil officers, and lightly tasked, with the exception of the 3,000 on the railway from Bellary towards Dharwar."

This difference in system, in Sir Richard Temple's opinion, is the main cause of the difference in the proportion of relief labourers to the whole population between these two districts, on the one hand, and the Bombay Deccan, on the other hand. The percentage of relief labourers on the whole population is in Bellary 12·75 per cent., and in Kurnool 21·25; while in Sholapur, in the Bombay Presidency, it is only 6·69, in Kaladgi 4·8, and in the distressed part of Poona 3·7. Making every allowance for

On question of relief works being placed under control of Public Works Department. *No. 192.

the greater intensity of the famine in the Madras Presidency, these facts appear to us to afford strong presumptive evidence of the superiority of the Bombay system, and of the expediency of adopting it in Madras. Another consideration which is adverted to in Sir Richard Temple's minute of the 20th ultimo, regarding the South Arcot district, is that, if this plan were adopted, the civil officers would then have more leisure for effectively superintending the system of village relief. We are about to address the Madras Government on this subject, with reference to the remarks contained in the 8th paragraph of their despatch to your Lordship, under date the 7th ultimo, No. 25, and also regarding the proposal contained in Sir Richard Temple's minute of the 22nd ultimo, for the gradual abolition of the relief camps.

The question of the sufficiency of the reduced scale of wages.

* No. 218.

4. The remarks recorded in Sir Richard Temple's minute of the 18th ultimo* appear to us fully to dispose of the objections advanced by the Sanitary Commissioner of Madras to the reduced rate of wage. We would draw your Lordship's particular attention to the following passages in the minute:—

"I must advert for a moment to certain parts of the argument of the Sanitary Commissioner of Madras, which seem to amount to this, that because there is mortality among the recipients of gratuitous relief, who are admitted to particular relief camps, therefore the wages of relief labourers must be insufficient. Whether the Sanitary Commissioner intends to convey this idea I know not, but something of the sort would, I apprehend, be gathered by ordinary readers of that which he has written. Therefore, I have to explain that there is no connexion whatever between recipients of gratuitous relief on the one hand, and the recipients of relief wages on the other. The gratuitous rations allowed to the inmates of relief camps have nothing whatever to do with the wages paid on relief works. The inmates of these camps who are admitted there as being unable to work are a class totally different from those who are admitted to the relief works as being able to work. Inferences deduced from the condition of the recipients of gratuitous relief are wholly irrelevant if attempted to be applied to the condition of relief labourers. If unhappily there be mortality among the inmates of relief camps, it by no means follows that there is any mortality among relief labourers. In point of fact, there is no mortality among relief labourers except from cholera, small-pox, or other diseases, and when sometimes cholera has stricken and dispersed large gangs of relief labourers, there has never been any reason to suppose that the scourge arose from want of food. Again, if, notwithstanding scientifically arranged diet, the condition of the inmates of relief camps continues bad, no amelioration whatever could be afforded by raising the wage of relief labourers; who are a totally different class. These poor inmates have never gone to relief works at all. Indeed, the very reason of their admission to the relief camps is this, that they are incapable of going to relief works. They are diseased or infirm, or being indisposed to work have wandered about, or passing by means of relief close at home have wandered to a distance.

"Being thus helpless for one reason or another they are picked up and taken care of, but when picked up they are often beyond the reach of human aid. No analogy, therefore, drawn from these persons can possibly be applicable to relief labourers, and to mention the two cases with any sort of parallelism and in any kind of connexion, would be to produce confusion of ideas and other misapprehension.

"If, indeed, persons who were pale on being admitted to relief works were to become thinner and thinner and weaker and weaker till at last they had to be drafted off to gratuitous relief camps as unfit to work, then that would be a reason for reconsidering the wage, but this is just what has not occurred, and is not occurring. If I saw or knew any signs of its occurring, then I should be the first to move. Many relief labourers indeed have left the works of their own accord, not so much, however, because the wage was reduced, but rather because task-work was enforced, or because the scene of labour was removed to a distance from their homes.

"How it happens that so many of the destitute poor sank so low before being taken up for gratuitous relief is a question which need not be discussed in this minute. I may reiterate, however, that the proper remedy lies in the institution of house-to-house visitation throughout the distressed districts, and from the time of entering the Madras Presidency I have never ceased to urge upon the Government and the local authorities the necessity of such a visitation. And, indeed, this visitation has generally been instituted. But that it has not always been perfectly carried out is proved by the mortality which has occurred, or still occurs, in some of the relief camps."

5. Regarding the condition of the Bombay Presidency, Sir Richard Temple telegraphed as follows on the 1st instant:—

"Situation of Bombay Deccan same as described in my telegram of 25th. Recent showers in Konkan and South Mahratta country have encouraged people, improved

water supply, and benefited cattle. Poona and Sholapur plough cattle suffering severely, but draught cattle sustained, and trade active. Great Indian Peninsula Railway continues doing well. Emigrants who left Deccan districts beginning to return home to resume agriculture. Movement discouraged as premature. Number on relief works slightly reduced, and on gratuitous relief increased. This was expected. General condition of the people fairly good. Special concessions allowed to return emigrants in South Mahratta Country. Similar allowance authorised in individual cases of need everywhere; but relief labourers on reduced wages are sustained in fair health. One pound grain per diem still thought sufficient if work light. Endeavours made to render village relief efficient as pressure on poorest classes increases. In Bombay city much sickness, and death-rate high, due to fever attacking all classes alike. Causes not connected at all with famine. Those who come from interior find employment in city."

6. According to the latest returns which have reached us, the numbers in the receipt of relief were as follows:—

In Madras	-	-	{ 702,923 on relief works.
			{ 299,325 charitably relieved.
In Bombay	-	-	{ 311,000 on relief works.
			{ 77,700 charitably relieved.
In Mysore	-	-	{ 59,701 on relief works.
			{ 68,641 charitably relieved.

7. Last week's season reports showed that there had been a good fall of rain in parts of Bellary, Madura, and Tinnevely, and showers in Kurnool, Tanjore, Coimbatore, and Salem, and in most of the Bombay districts, as well as in the western districts of Mysore.

8. We enclose copy of a notification* which we issued on the 1st instant, giving public expression to the high sense which we entertain of Sir Richard Temple's services in the difficult and delicate mission on which he has been employed since January last. We shall advert to this subject more fully in our review of Sir Richard Temple's final report, which we expect to receive in the course of a few days.

We have, &c.
(Signed) LYTTON.

No. 246.

EXTRACT from the Proceedings of the Government of India, in the Department of Revenue, Agriculture, and Commerce, dated Simla, the 5th May 1877. No. 256.

RESOLUTION.

In the month of January 1876, some remarks in the weekly "season and crops" telegram from the Government of Madras, referring to the unsatisfactory prospects of certain districts in that presidency, attracted the attention of the Government of India, and the Local Government were requested to give further information on the subject. From some papers then submitted, and subsequently from a more comprehensive report received in the month of July, it appeared that, in consequence of the deficiency of the north-east monsoon, failure of crops had taken place in parts of four districts. In Bellary and Cuddapah there had been a considerable decrease of cultivation, and some remissions would be required, but prices were steady, and the condition of the labouring classes did not appear to call for the interference of the State. In North and South Arcot the loss of crops had been rather more severe, larger remissions were needed, and a general want of drinking water and pasturage was complained of. At the same time, slight falls of rain had taken place in all the districts, and while nothing could be safely predicted as to the coming south-west monsoon, the Government of Madras reported that they had taken every precaution for guarding against the serious effects of famine which its failure would occasion, and had sanctioned relief works for execution in the event of the provision of labour for the poorer classes becoming indispensable. In the month of August 1876 the Madras Government applied for a grant of Rs. 41,000 from Imperial revenues for relief purposes, but it was not until the receipt of telegrams, dated October the 24th and 27th, that the Government of India became aware that the condition of Bellary, Kurnool, and Cuddapah was very serious, and that if the north-east

Review of
Madras re-
turns.

monsoon should not set in favourably within fifteen days, the gravest results were to be apprehended in those districts.

2. In accordance with the experience of the past, as summarised in paragraphs 9 and 11 of the Resolution of the Government of India on the Bengal famine of 1873-74, dated February 13th, 1875, the Madras Government were on October the 25th requested by telegraph to supply detailed information on various important points with reference to the distressed districts. The replies to this call being incomplete in essential particulars, such as the extent of failure of crops and of relief works organised, it was followed on the 2nd December by a request for a complete review and forecast of all distressed districts, like that which had been required from the Government of Bombay on the 30th of November, to be submitted to the Government of India by the 15th of January. The Chief Commissioner of Mysore also was, on the same date, directed to submit similar information.

3. The reports of the Bombay local officers were sent in to their immediate superiors, in a generally complete state, about the close of the year, and, together with the views of the Government of Bombay, were received by the Government of India in time to be considered and summarised, with orders thereon, in the "Gazette of India" of the 23rd February last. The reports from Mysore, though not quite so complete or trustworthy as those from Bombay, were similarly dealt with by the 10th of March. His Excellency the Governor-General in Council regrets to observe that the reports of the local officers in the distressed districts of the Madras Presidency have not, with some notable exceptions, been characterised by the same punctuality, accuracy, or completeness. Their various deficiencies in important particulars have been sufficiently commented on by the Madras Board of Revenue, and have been to a great extent supplemented by the series of elaborate and able reviews of the several districts by the Board itself which have accompanied them. His Excellency in Council is willing to make the most ample allowance for the irksomeness and difficulty which must have been felt in submitting detailed statistics by officers who were labouring under the practical difficulties of organising relief for clamorous and starving multitudes, but is constrained to observe that had they more generally grasped the imperative need of temperate and thorough diagnosis of the condition of affairs around them at a very early stage of famine, the exaggerated impressions which were in many instances received, and the excessive and uncalled for relief which was consequently given, might have been alike avoided, and the general policy of Government might have been, in important particulars, different from what it was. While thus commenting on a general tendency which has had a not unimportant influence upon the conduct of affairs, his Excellency the Governor-General in Council cannot withhold a tribute of admiration to the energy, ability, and self-devotion which the local officers of the Madras Presidency, of all grades, have uniformly displayed, to the humanity by which their measures, even if at times in excess of the occasion, have been prompted, and the loyalty with which they have accepted and endeavoured to carry out the famine policy of the Government of India, as set forth in the instructions of the 16th of January last, and personally explained by Sir Richard Temple in the course of his mission.

4. The delay which has taken place in submitting the review and forecast which was due on the 15th of January last has necessarily altered its character and diminished its use. The detailed information supplied is in some cases, and not in others, brought down to much later periods than that originally intended, and it is no longer possible by its aid to view, from a fixed standpoint, either the facts of the past or the prospects of the future. Fortunately, there is no longer the same necessity for doing so, as the progress of events, together with the mission of Sir Richard Temple, has solved many problems which, before the close of the year, presented themselves for earnest consideration. At the same time, his Excellency in Council is of opinion that the information which has now been collected, although in some instances incomplete in matters of calculation, and in others incongruous in point of time, may not prove to be devoid of value as a record of the earlier stage of a great famine, and of the attempt to deal with it on a basis of actual facts.

5. The area of the Madras Presidency, exclusive of Native States and of the city of Madras, is 138,291 square miles, and the total population 30,883,625. This tract is divided into 20 districts, of which Ganjam, Vizagapatam and Godavery on the extreme north, South Arcot and Tanjore towards the east centre, and South Canara, Malabar, and Nilgiris, on the west, have escaped any approach to actual famine, though the distress in parts of some of them, owing to high prices induced by partial failure of crops or extensive exportation, has not been inconsiderable. The remaining 12 districts have been subjected throughout to varied, but still severe pressure, which in parts of

many of them has reached the extremities of famine. The 12 districts comprise 121 separate taluks or subdivisions (of which 13 are zemindars' estates), and for each of these separate information has now been submitted by the local officers, and reviewed by the Madras Board of Revenue. The total area and population of the

Review of
Madras re-
turns.

	Total.	Affected.
Area in square miles -	81,852	63,910
Population -	18,592,534	13,713,307

12 districts, and the area and population actually affected by famine, on the basis of considering as affected all taluks in which the crop saved amounts to less than one-half, are shown in the margin. If, however, taluks in which the crop saved amounts to one-half be included, the affected area and population will be raised to 71,849 and 15,432,393 respectively. Considering that the quantity of land not cultivated at all has in many instances been omitted by the Madras local officers from their calculations of failure, these latter figures probably afford, in the case of Madras, a juster estimate than the former. The extent of the famine in Madras is contrasted in the subjoined table with that in the Presidency of Bombay and the Province of Mysore :—

	BOMBAY.			MYSORE.			MADRAS.		
	Total.	AFFECTED.		Total.	AFFECTED.		Total.	AFFECTED.	
		Including half crops.	Excluding half crops.		Including half crops.	Excluding half crops.		Including half crops.	Excluding half crops.
Area in square miles	54,355	41,254	33,873	27,077	16,160	14,479	81,892	71,849	63,910
Population - -	7,963,927	6,180,209	4,981,616	5,055,412	3,141,747	2,849,329	18,592,534	15,432,393	13,713,307

6. Proceeding on the more favourable course of excluding taluks with half crops saved, it will be found that in Bombay the affected area and population are 62 per cent. of the total area of the districts concerned, in Mysore they are 53 and 56 per cent. only, while in Madras they reach 78 and 74 per cent. respectively. If taluks with half crops saved be included, the results are almost the same: Bombay appears somewhat less favourably, Mysore more so, but Madras still considerably exceeds the others. These facts, together with the large excess of the affected area and population in Madras over that of Bombay and Mysore combined, are sufficient evidence both of the magnitude of the calamity which has overtaken that presidency, and the difficulties with which the Local Government and its subordinates of all grades are called upon to contend.

7. The total rainfall during the past season, as reported up to the close of the year,

Proportion.	Number of Taluks.
Full or nearly so -	9
Three-fourths -	12
Two-thirds -	23
One-half -	31
One-third -	24
One-quarter -	7
One-fifth -	1
One-sixth -	3
One-eighth and under -	2
	112

or to dates since which no appreciable increase has occurred, is shown in the margin for 112 taluks. For the other nine, which are zemindari, no returns are available. The results, as thus shown, are less favourable, though not greatly so, than those ascertained regarding Bombay, which, again, held a lower place than those for Mysore. In order, however, fully to appreciate the severity of the failure of rain which has fallen upon the Madras Presidency, the fact must be remembered that the latter is dependent upon two monsoons instead of one, in proportions which vary greatly but rarely exceed two-thirds of one to one-third of the other. A fair supply during one monsoon, though it helps

materially to raise the general proportion, is therefore no compensation for extensive failure during the other. This will be more fully understood from the accompanying statement :—

DISTRICTS.	APRIL TO SEPTEMBER.		OCTOBER TO DECEMBER.		DISTRICTS.	APRIL TO SEPTEMBER.		OCTOBER TO DECEMBER.	
	Average.	1876-77.	Average.	1876-77.		Average.	1876-77.	Average.	1876-77.
Kistna -	20.4	16.1	11.8	0.8	Chingleput -	20.8	19.8	15.2	4.8
Nellore -	14.4	9.3	20.2	2.1	Salem -	20.5	15.8	9.9	2.0
Bellary -	16.7	7.7	8.3	0.3	Coimbatore -	12.5	14.0	10.2	3.1
Cuddapah -	21.9	7.1	10.5	0.5	Madura -	12.1	10.7	15.0	6.2
Kurnool -	25.7	7.5	7.4	0.4	Trichinopoly -	14.8	17.8	16.1	5.2
North Arcot -	25.6	16.0	11.3	2.5	Tinnevely -	6.3	4.3	11.6	6.3

The later rains were, in all cases, of great importance, but in some their failure alone produced the severity of famine.

8. The obscurity involving the estimates of the proportion of crops saved, in consequence of omission to take into account

DISTRICTS.	NUMBER OF TALUKS IN WHICH THE CROP WAS

land left uncultivated, failure of later crops, or other particulars, has been in several instances pointed out by the Board of Revenue. The marginal table gives such a summary as can be made, but it probably shows matters somewhat better than they really are. It does not, moreover, show fully the actual relative pressure of famine, as some districts which have lost more are, from previous good seasons or other circumstances, better off than others which have saved a larger proportion of their crops. Contrasting this table with the similar ones relating to Bombay and Mysore which have already been made public, the following results are obtained:—The

failure has been total, or nearly so, in 21 taluks of Bombay, 18 of Mysore, and 35 of Madras, or $22\frac{1}{2}$, $26\frac{1}{2}$, and 29 per cent. respectively; the taluks which have lost from one-sixth to one-half, both inclusive, are 48, 25, and 68, or $51\frac{1}{2}$, $36\frac{1}{2}$, and 56 per cent. in the three cases; while, finally, those which lost less than one-half are 24, 25, and 18, or 26, 37, and 15 per cent. The Madras losses, even on the figures now obtainable, which have been described above as probably unduly favourable, are consequently heavier in every instance than those experienced by either Bombay or Mysore.

9. The estimates of probable remissions submitted by the local officers amount to Rs. 1,24,33,758, or about one crore and a quarter of rupees. The Board of Revenue, in their reviews, make reductions in the case of Coimbatore, Kistna, Kurnool, Madura, and Nellore, which reduce this amount to about one crore, and express their belief that further large reductions are practicable in Cuddapah, Salem, and Tinnevely. The question of remissions of land revenue has been the subject of a special correspondence with the Governor of Madras, in consequence of suggestions submitted to them by Sir Richard Temple for suspension of portion of the demand with a view to its recovery in future years. His Excellency the Governor-General in Council decided to leave the matter in the hands of the Government of Madras, on the understanding that the local officers would be warned against too free remissions, and authorised to hold balances in suspense in cases in which it appeared likely that the landholder would be able, without undue pressure, to pay up next season. It is satisfactory to find that the remissions now stand at a lower figure than the previous estimate, and that the Board of Revenue consider further considerable reductions to be practicable.

10. The condition of the cattle and agricultural stock has occupied in all districts that attention which its importance deserves. According to the Administration Report of 1874-5, the numbers of cattle and sheep in the 12 affected districts were as shown in the margin. The fact that these numbers, compared with the population, betoken a wealth in this respect inferior to that of the affected districts of Bombay, enhances both the severity of losses and the urgency of reducing them to a minimum. According to the local reports, the condition of the cattle appears to be good in 46 taluks, indifferent in 38, and bad in 37. In some districts the mortality has already been extremely heavy. In Bellary the Madras Board of Revenue consider it unlikely that more than 25 per cent. of non-agricultural cattle, and from 60 to 70 per cent. of the agricultural cattle, will survive; Cuddapah and Kurnool have likewise suffered severely, while the heavy losses which have befallen the well-known breed in Nellore will be felt, for years to come, far beyond the limits of the district itself. Such relief as was practicable, by means of throwing open reserves and digging wells, has already been resorted to, and it may be hoped that the showers which have begun to fall may tend to freshen the pastures, and to diminish the further mortality which is so generally apprehended.

11. The means of water-supply do not appear to have been so extensively impaired as might have been expected, and as has been the case in Mysore. The condition of 45 taluks is considered to be good, of 48 indifferent, and of 28 bad, but though the inconvenience caused by scarcity will be in many instances extreme, no actual calamity is anywhere anticipated. Already the rains, partial though they have been, have brought relief, and difficulties in this particular are not now likely to be prolonged.

Cattle -	5,323,000
Sheep -	5,894,000
Total -	11,217,000

12. Regarding the course of prices, the only remarks which may be made are that the rise appears mostly to have commenced at a very early date, so that the rates at the beginning of October were abnormally high; that the increase appears to have been continuous, though in some cases more sudden than in others, until the close of the year; and that staple grains were at that period generally dearer than in the Bombay Presidency.

Review of
Madras re-
turns.

13. The extent of the local stocks is a point at all times most difficult to ascertain, and the practice of hoarding until the nature of the coming season is assured tends to defeat any attempt at exact calculation. In districts such as Cuddapah, Kurnool, Madura, and Nellore, which had suffered from previous bad seasons, the supplies in hand were undoubtedly low, and in others, where they were originally fair, they were drawn forth for exportation by the high prices obtainable elsewhere. The Madras Presidency enjoys, however, in its system of railways, penetrating almost every one of the distressed districts, and conveying supplies both from Northern India and the Coast, as also in its extensive seaboard, lying open to the trade of Bengal and Burma, exceptional advantages for supplementing deficiencies in its food supply. The experience of the past four months has amply demonstrated that it has at its command, both within and beyond its limits, a body of merchants both competent and ready to utilise these advantages to the utmost, in accordance with the ordinary laws of supply and demand, and that any attempts to supplement their operations are entirely unnecessary, and cannot but prove prejudicial.

14. The condition of the mass of the people in the distressed districts, with the exception, perhaps, of Tinnevely, is poor. There are, however, in certain districts, large zemindari estates of a nature nowhere to be found in Bombay and Mysore, the owners of which ought to be in a position to assist their tenants, but exhibit, with a few noteworthy exceptions, no disposition to do so. The proportion of agriculturists generally exceeds considerably that of other classes, and there can be no doubt that the population as a whole, after exhausting what little accumulated means individuals may possess, are dependent, on an emergency like the present, upon such aid as the State can afford.

15. The emigration reported amounts to only 174,925, or 1·3 per cent. of the total affected population, but some persons, whose numbers are unascertained, have probably left other taluks. The principal known emigration has occurred in the districts named

Tinnevely -	- 49,511	in the margin. From Bellary, Kurnool, and Cuddapah persons have resorted to the adjacent territories of the Nizam and
Salem -	- 38,831	to Mysore, as well as to British districts, but their movement is
Bellary -	- 21,316	altogether abnormal, and they have probably already returned in
Cuddapah -	- 19,000	large numbers. In the southern districts it is difficult to distinguish the emigration to Ceylon and the coffee plantations of
Madura -	- 17,171	
Kurnool -	- 15,746	

the western range of Ghâts which has been caused by famine, as the population annually use to a great extent these outlets for their labour. Practically, the difficulties of the famine have, in the Madras Presidency, been but little affected by the movement of the people. It may be added, in connection with this subject, that the Government of India have recently approved of proposals submitted by the Chief Commissioner of British Burma for encouraging, by means of advances, the emigration of 20,000 labourers to that province.

16. Relief works on an extensive scale had been started before the close of the year in Bellary, Kurnool, and Cuddapah, and to a less, though still considerable, extent in Nellore. In Kistna, Coimbatore, North Arcot, Chingleput, and Salem a commencement had been made, while in Madura, Trichinopoly, and Tinnevely the necessity for relief had barely made itself felt, and local funds were mostly supplying what little could be said to be necessary. In the two last-named districts, indeed, actual distress has continued to be so limited that even up to April 14th only Rs. 18,857 had been expended. The works undertaken were, and have on the whole continued to be, what may be termed small and local, with the exception of the East Coast Canal, the Junction Canal, the Penair Embankment, and one or two minor undertakings. The construction and repair of roads, repair of tanks, and their supply channels, digging or deepening wells, and village improvements of a petty nature have been generally resorted to. This material difference between the nature of the Madras works and those undertaken in Bombay is attributed by Sir Richard Temple, in his minute of the 10th of February, to the alleged fact that the facilities in the Madras Presidency for large projects are remarkably few. The Madras works also differ from those of Bombay in another important particular—that they have been, and are, conducted mainly by Civil officers, without taking, to a greater extent than about 11½ per cent., advantage of the more strict and disciplined organisation of the Public Works Department.

Review of
Madras re-
turns.

17. The numbers in receipt of gratuitous relief at the end of the year were 56,042, of whom 36,342 were in Bellary, and 10,512 in Nellore, other districts contributing the remainder in figures mostly quite insignificant. The system was mostly that of giving cooked food at central points to the aged or infirm, and authorising the village officers to relieve destitute travellers or other special cases of distress. The organisation of house-to-house visitation, and the admission of the children of labourers on the works to a charitable allowance of three pies per diem, are measures of recent origin, and not yet universally in force, but their effect has been apparent in the increase of the number gratuitously relieved, which on April 24th had reached 295,256. The operations of the Government in this respect have been materially aided by conspicuous efforts of private charity.

18. In the case of Madras, as in that of Bombay, three estimates, which are shown

Months.	Board of Revenue, December 19th.	District Reports, Christmas.	Sir Richard Temple, February 5th.	Actual Monthly Average.
December	577,000	—	—	—
January	820,000	—	1,039,000	1,025,025
February	1,035,000	—	1,228,000	821,357
March	1,220,000	1,646,139	1,480,000	640,117
April	1,405,000	—	1,840,000	702,076
May	1,355,000	1,857,245	1,530,000	—
June	1,140,000	—	795,000	—

September	100,000	—	—	—
	8,967,000	—	8,222,000	—

in the margin, have been framed of the numbers likely to be on relief works at various periods. The first was submitted by the Board of Revenue to the Government of Madras on the 19th of December 1876; the second is for the 1st of March, May, and July only, and is the total of the estimates of local officers contained in the reports now under review; the last is that contained in Sir Richard Temple's minute of February 5th, 1877, and based, as shown by the remarks on its reverse, on information obtained, in almost all cases,

from the local officers, at a time when, on the one hand famine had assumed, in some districts, a severer aspect than before, while, on the other, the policy to be followed in dealing with it had been defined and generally made known.

For the numbers on charitable relief no separate estimate is offered by the Board of

Months.	District Reports, Christmas.	Sir Richard Temple, February 5th	Annual Monthly Average.
January	—	50,000	81,219
February	—	100,000	44,850
March	176,064	250,000	62,282
April	—	500,000	209,860
May	213,471	600,000	—
June	—	700,000	—
July	225,782	500,000	—
August	—	160,000	—
	—	2,860,000	—

Revenue in their letter above referred to, but the local reports, and Sir Richard Temple's minute based on later local information, afford the results shown in the margin. The measures adopted for more thorough relief of this description, which have been already alluded to, will, no doubt, cause a large access to the numbers in receipt of it in the months of pressure which are yet to come.

The actual numbers relieved according to the latest accounts, both by the works and charitably, have been placed in juxtaposition with the estimates, and his Excellency the Governor-General in Council is glad to observe that, severe as is the

amount of suffering which they disclose, it has fallen far short of the most careful estimates which circumstances permitted to be made.

19. In conclusion, his Excellency the Governor-General in Council, while recording his deep concern at the calamity which has befallen so large a portion of British India as the Presidency of Madras, would add the expression of his warm sympathy with the extraordinary exertions which are being put forth by the officers of Government in all departments for the mitigation of the suffering by which they are surrounded, and his confidence that their judgment and caution will be alike successful in the preservation of life and the watchful husbandry of the resources of the State.

ORDER.—Ordered, that copies of this Resolution be communicated to the Secretary of State for India, the Governments of Madras and Bombay, Sir Richard Temple, and the Chief Commissioner of Mysore, and that it be published in the "Gazette of India."

EXTRACT from the PROCEEDINGS of the MADRAS GOVERNMENT, PUBLIC WORKS DEPARTMENT, No. 14 I., dated 7th May 1877.

ORDER by the GOVERNMENT of MADRAS.

The Sungum
project.

To enable Government to address the Government of India further on the subject of the Sungum project, His Grace the Governor in Council considers it desirable that the question of returns should be further considered in the Revenue Department, particularly

as regards the probable growth of revenue, and the time within which it may be expected that the ultimate revenue will be reached.

2. To furnish the information asked for by the Government of India as to the nature of the repairs and improvements which will require to be carried out to existing tanks and channels, should the Sangam project be abandoned, and as to the cost of such work, a special investigation would be required which would occupy a considerable time, and cost a good deal of money, but the district engineer, Nellore, will furnish such information as may be available as to the probable outlay which will be required to render the existing works fairly efficient. He will also, with reference to paragraph 4 of the letter from the Government of India, state whether any and what drainage works consequent on the completion of the Sangam project are likely to be required, and in support of any opinion which he may express on this point, he should show generally what the present drainage arrangements, natural or artificial, of this tract of country are.

MEMORANDUM by Surgeon-Major I. B. LYON, F.C.S., Chemical Analyser to Government.

Bombay, 7th May 1877.

During the year 1876, 534 Native prisoners (all on hard labour) were discharged from the Bombay House of Correction. Their average weight on admission was 105 lbs. = 7 stone 7 lbs. On discharge they were found to have gained in weight on an average 1 lb. 10 $\frac{1}{4}$ oz. each. Their daily diet, while in jail, is shown at (a.) Table I., its value in nitrogen and carbon, calculated by the factors given in Table II., is, as shown (Table III. a.), nitrogen 201.6 grains, carbon 4,011 grains daily.

Sufficiency
of the re-
duced scale
of wages.

These quantities of nitrogen and carbon are very much less than the quantities laid down by authorities as requisite for a European of average weight in moderate work. Thus many authorities estimate the quantities required by a European, of average weight in moderate work, at about nitrogen 300 grains, carbon 4,850 grains daily (*see* Table IV., 1 and 2). Letheby, taking a mean calculated from the researches of various physiologists, estimates the quantities required by a European male adult of average weight on ordinary labour as nitrogen 307 grains, carbon 5,688 grains (Table IV., 3). The hard labour diet of English convicts contains nitrogen 281 grains, carbon 5,140 grains per diem (*see* Table IV., 10).

The experience of the Bombay House of Correction that Native prisoners at hard labour gain weight on a diet containing less nitrogen and carbon than the quantities laid down by authorities as requisite for European adults of average weight in moderate work, is confirmed by the experience of the jails of the Hyderabad Assigned Districts. The hard labour diet of these jails is shown in Table I. (b'), and its value, nitrogen 230.5 grains, carbon 4,600 at Table III. (b'). On this diet, the lowest, except the Bombay House of Correction diet, of the hard labour diets of the Indian jails, the prisoners are found to be "very healthy." Again, the new scale for all Indian jails proposed by the Jail Conference recently assembled at Calcutta (Table I. (c.)), values (*see* Table III. (c.)) nitrogen 213.2 grains, carbon 4,454 grains.

Considering together the experience of the Bombay House of Correction and the experience of the Hyderabad Assigned District jails, and considering also this proposal of the Jail Conference which, it may be presumed, is founded on the experience of officers well qualified to judge of the requirements of native prisoners, there seems to be no doubt but that hard labour prisoners in Indian jails require a diet containing less carbon and nitrogen than the amounts laid down by authorities as required by Europeans of average weight in moderate work. There thus appears to be a difference between Indian experience and European authorities.

If, however, the weight of Natives of India as compared with Europeans is taken into account, this apparent difference practically disappears, for taking the Bombay House of Correction diet, shown by experience to suffice for labouring prisoners averaging 105 lbs. in weight and raising its value in the proportion of 105 to 150, the quantities become nitrogen 288 grains, carbon 5,730 grains, quantities not greatly different from—1, Letheby's estimate for ordinary labour (Table IV., 3), viz., nitrogen 307 grains, carbon 5,688 grains, and 2, the value of the hard labour diet of English convicts (Table IV., 10), viz., nitrogen 281 grains, carbon 5,140 grains. The proportion 105 to 150 is employed, because, while the average weight of the prisoners discharged from the Bombay House of Correction in 1876 was on admission 105 lbs., the average weight of a European male adult is given by most authorities as 150 lbs.

On the sufficiency of the reduced scale of wages.

There certainly appears to be no theoretical objection to the proposition that the quantity of food required by adults is proportionate to their weight; provided, of course, always that the quantity of work expected from them is likewise proportioned to their weight. In order, however, to place the three diet scales I now propose (*see* Tables V. to IX.) as much as possible on the basis of experiences, I take as the foundation of the scales the experience of the Bombay House of Correction, viz., that Native prisoners averaging 105 lbs. in weight did well at jail labour on a daily diet, containing nitrogen 201·6 grains, carbon 4,011 grains. From this I derive the three proposed scales as follows:—

1. *Scale No. 1.*—The labour scale is simply the Bombay House of Correction scale, raised and lowered proportionally to the weight of the individuals to be fed.
2. *Scale No. 2.*—The light labour scale is scale No. 1, reduced in the same proportion that the light labour diet of English convicts (Table IV., 12) is lower than English convict hard labour diet (Table IV., 10).
3. *Scale No. 3.*—The bare sustenance scale is scale No. 1, reduced in the same proportion that a mean between Edwin Smith's and Letheby's estimates for bare sustenance (Table IV., 16 and 17) is lower than English convict hard labour diet (Table IV., 10).

On these three scales the quantities of nitrogen and carbon required daily by men averaging 105 lbs. in weight is in grains (Table V.):—

	Nitrogen.	Carbon.
On Scale No. 1, Labour	201·6	4,011
On Scale No. 2, Light labour	173·6	3,528
On Scale No. 3, Bare sustenance	136·7	3,195

These quantities are represented respectively by the following weights in ounces (*a*) of jowari and pulse; (*b*) of bajri and pulse, plus in each case half an ounce of fat:—

	Jowari.	Pulse.	Total.
(<i>a.</i>)—Scale 1, Table VII., columns 3 and 6	16·98	5·62	22·60
" 2, " VIII., " "	15·08	4·68	19·76
" 3, " IX., " "	15·23	2·56	17·79
	Bajri.	Pulse.	Total.
(<i>b.</i>)—Scale 1, Table VII., columns 3 and 9	18·60	4·00	22·60
" 2, " VIII. " "	16·50	3·26	19·76
" 3, " IX., " "	16·67	1·12	17·79

TABLE I.

DAILY ALLOWANCE (exclusive of salt and condiments) of certain INDIAN JAILS.

(*a.*) *Bombay House of Correction (for Labouring Prisoners).*

	Ounces.
Rice	8·0
Wheat	4·57
Bajri	3·43
Dhall	5·0
Vegetables	8·0
Fat	·5

On this diet 534 Native prisoners, all on hard labour, discharged during 1876, gained in weight on an average 1 lb. 10½ oz. each. The average weight of the prisoners on admission was 7 stone 7 lbs. Of the 534 discharged during the year:—

295 gained in weight on an average	4 lbs. 3 oz. each.
102 lost in weight on an average	3 lbs. 8 oz. each.
137 neither gained nor lost weight.	

534

Of these prisoners—

130 had been under 3 months in jail.
89 had been over 3 and under 6 months in jail.
217 had been over 6 and under 12 months in jail.
71 had been over 12 and under 24 months in jail.
27 had been 2 years in jail.

534

The non-labour diet of the Common Jail, Bombay, is the same as the above, less daily—

	Ounces.
Wheat or bájri - - - - -	2
Dholl - - - - -	1
Vegetables - - - - -	2

On the sufficiency of the reduced scale of wages.

Other Diets.

- (b.) Jails, Hyderabad Assigned Districts, labouring prisoners.
 (c.) New proposed scale for all Indian jails
 (d.) Jails, Hyderabad Assigned Districts, non-labouring prisoners.
 (e.) Oudh jails, non-labouring prisoners.

Daily (exclusive of Salt and Condiments).	Cereals.	Pulses.	Vegetables.	Fatty Matter.
	Ozs.	Ozs.	Ozs.	Grains.
(b.) Hyderabad Assigned Districts (labour) - -	20·7	4·8	3·4	192
(c.) New scale (labour) - - - - -	20·0	4·0	6·0	218·75
(d.) Hyderabad Assigned Districts (non-labour) - -	16·3	4·5	3·4	144
(e.) Oudh (non-labour) - - - - -	17·5	1·5	5·5	90

Dr. Cruickshank, Inspector-General of Prisons, Bombay, in forwarding the above scales, writes:—
 “Please look at the diet scales of the Hyderabad Assigned Districts, where the prisoners are very
 “healthy.”

13. Mean of English, Scotch, Welsh, and Irish farm labourers (E. Smith)	300	6,478
14. English farm labourers, lowest of the four (E. Smith)	228	5,810
15. Low-fed operatives average (E. Smith)	214	4,881
16. Bare sustenance diet (E. Smith)	200	4,300
17. " " (Letheby)	181	3,888
18. " " (Playfair)	161	3,103

Notes to Table IV.

1. For a male European adult of average height and weight (5 feet 6 inches to 5 feet 10 inches, and 140 to 160 lbs.), in moderate work.
2. Average weight (154 lbs., Church) and moderate work.
3. Mean calculated from researches of various physiologists for adult males.
5. Soldiers during war.
6. Calculated from amount of food consumed by 495 men of the Royal Engineers at work at Chatham.
7. Mean of English, French, Austrian, and Prussian soldiers during peace.
16. Average representing the daily diet of an adult man during periods of idleness.
17. Mean calculated from researches of various physiologists, representing the amount required by an adult man during idleness.

18. Mean of diet of needle-women in London, certain prison dietaries, common dietary for convalescents, Edinburgh Infirmary, average diet during cotton famine of 1862 in Lancashire.

The three diet scales now given (see Tables V. to IX.) are calculated as follows:—

Diet Scale No. 1.—This is the Bombay House of Correction diet ([a.] Tables I. and III.) raised and lowered in proportion to weight. The average weight of the prisoners on admission into the House of Correction being 105 lbs., nitrogen 201.6 grains, carbon 4,011 grains (the value in nitrogen and carbon of the House of Correction diet) is placed opposite the weight, 105 lbs. For every 5 lbs. in weight over or under 105 lbs., $\frac{1}{5}$ of these quantities of nitrogen or carbon is added or deducted as the case may be. It will be observed that at weight 150 lbs., the quantities of nitrogen and carbon become respectively 288 and 5,730 grains. At 150 lbs., therefore, the nitrogen is very slightly above the nitrogen of the English convict hard labour diet (Table IV., 10), viz., 281 grains; the carbon, however, is considerably higher than the carbon of the English convict hard labour diet, viz., 5,730, as compared with 5,140 grains, or 11.47 per cent. higher. Letheby's mean estimate for ordinary labour (Table IV., 3), viz., nitrogen, 307 grains, carbon, 5,688 grains, comes as regards carbon very near diet scale No. 1, at weight 150 lbs. The quantity of nitrogen in Letheby's estimate, however, is higher, viz., 307, as compared with 288 grains.

Diet Scale No. 2.—This is (Diet Scale No. 1) lowered in the same proportion as English convict light labour diet (Table IV., 12) is lower than English convict hard labour diet, i.e., as 281 is to 242 for the nitrogen, and as 5,140 is to 4,250 for the carbon. Lowered in this proportion, the quantities become—

At 105 lbs., nitrogen 173.6 grains, carbon 3,528 grains.
At 150 lbs., " 248.0 " " 5,039 "

At 105 lbs., therefore, Diet Scale No. 2, is very similar in value to the non-labour diet of the Common Jail, Bombay (Table III. [d.]), and somewhat better than the Oudh Jails non-labour diet (Table III. [f.]) at 150 lbs. Diet Scale No. 2 is better than the average diet of low-fed English operatives, as estimated by Edwin Smith (Table IV., 15); it is, of course, also better than the light labour diet of English convict establishments in the same proportion that Diet Scale No. 1 is better than the hard labour diet of the same establishments.

Diet Scale No. 3.—This is calculated as follows:—Of the three estimates for bare sustenance diet the mean of the two highest (Edwin Smith's and Letheby's Table IV., 16 and 17) is nitrogen 190.5, carbon 4,094 grains; both these estimates are for average adult males. Playfair's estimate, (Table IV., 18), which is considerably lower than the other two, is excluded, as it does not wholly refer to adult males. Raising this mean in the same proportion as diet scale No. 1 at 150 lbs., exceeds

English convict hard labour diet, the figures become nitrogen 195·3 grains, carbon 4,564 grains. These quantities placed opposite weight 150 lbs. form the foundation of diet Scale No. 3. For the other weights shown in the table, the quantities are proportionally reduced. Comparing diet Scale No. 3 with Playfair's estimate for bare sustenance (Table IV., 18), it will be seen that the nitrogen of the scale does not run below Playfair's estimate until after weight 125 lbs. is reached, and, similarly, it is only when the weight runs below 105 lbs. that the amount of carbon becomes lower than that given in Playfair's estimate.

On the sufficiency of the reduced scale of wages.

TABLE V.

SHOWING the quantity of NITROGEN and CARBON required daily on each of three scales, viz. :—

- Scale 1.* A labour scale, the Bombay House of Correction diet raised and lowered in proportion to weight.
Scale 2. A light labour scale, Scale No. 1 reduced in the same proportion that English convict light labour diet bears to English convict hard labour diet.
Scale 3. A bare sustenance scale, Scale No. 1 reduced in same proportion that a mean bare sustenance estimate for Europeans (mean of 16 and 17, Table IV.) bears to English convict hard labour diet.

Weight—lbs.	SCALE No. 1, DAILY.		SCALE No. 2, DAILY.		SCALE No. 3, DAILY.

TABLE VI.

SHOWING the Total Quantities of mixed CEREAL and PULSE which, plus half an ounce of Fat, are equivalent to the quantities of Nitrogen and Carbon shown in each of the three Scales of Table V.

Weight—lbs.	Scale No. 1, ounces daily.	Scale No. 2, ounces daily.	Scale No. 3, ounces daily.
80	16·98	14·81	13·32
85	18·10	15·80	14·21
90	19·23	16·79	15·11
95	20·35	17·78	16·00
100	21·48	18·77	16·90
105	22·60	19·76	17·79
110	23·72	20·74	18·69
115	24·85	21·73	19·58
120	25·97	22·72	20·48
125	27·10	23·70	21·37
130	28·22	24·69	22·27
135	29·35	25·68	23·16
140	30·47	26·66	24·06
145	31·59	27·65	24·95
150	32·71	28·64	25·85

The three tables which now follow, viz., Tables VII., VIII. and IX., show in what proportions each of the eight cereals—rice, barley, jowári, common millet, báji, maize, oats, and wheat—must respectively be mixed with pulse in order to furnish the quantities of nitrogen and carbon shown on each of the three scales of Table V.

In Tables VII., VIII. and IX. the first two columns give average weights of persons to be fed, and the third column the total quantity in ounces of mixed cereal and pulse which, plus half an ounce of fat,

On the sufficiency of the reduced scale of wages.

will furnish the necessary carbon. The remaining eight columns, each headed by the name of a cereal, give the quantities in ounces of the cereal, which must be abstracted from the total quantity shown in column 3, and replaced (in order to furnish the required nitrogen) by an equal weight of pulse. The examples at the end of the tables show how they may be employed, all three tables are subject to the general remarks following the examples.

TABLE VII.

DIET SCALE No. 1.—LABOUR SCALE.

1. For the weight shown in columns 1, 2, take the quantity (plus always half an ounce of fat) of mixed cereal and pulse shown in column 3.

2. Opposite the quantities shown in column 3, under the name of each cereal, is a number representing the number of ounces of the quantity shown in column 3, which must consist of pulse, the remainder to consist of the cereal heading the column. (See Examples.)

EXAMPLES illustrating the method of employing Tables VII., VIII., and IX.

Average weight of individuals to be fed say 105 lbs. (= 7 stone 7 lbs. (Table V. shows that—for this weight, the amount of nitrogen and carbon daily required is in grains—

	Nitrogen.	Carbon.
On Scale 1.—The labour scale	201·6	4,011
On Scale 2.—Light labour scale	173·6	3,528
On Scale 3.—Bare sustenance scale	136·7	3,195

Table VI. shows that these quantities of nitrogen and carbon may be supplied by the following quantities of mixed cereal and pulse plus half an ounce of fat, *e.g.*, ghee or oil, viz.:—

For Scale No. 1	22·60 ounces.
For Scale No. 2	19·76 „
For Scale No. 3	17·79 „

The proportions which the cereal and pulse should bear to one another in the 22·60 ounces required by Scale No. 1 are shown for each of 8 cereal grains in Table VII. Tables VIII. and IX. show similarly the proportions which the cereal and pulse should bear to one another in respectively the 19·76 ounces required on Scale 2, and the 17·79 ounces required on Scale 3.

One or two examples will serve to show how from the tables these proportions can be ascertained. Take for example the 22·60 ounces of cereal and pulse required for men averaging 105 lbs. in weight on Scale No. 1. A reference to Table VII. shows, opposite 105 lbs. in the column headed Rice (column No. 4), the number 6·81; this means that if rice is the cereal given 6·81 ounces out of the 22·60 ounces of mixed cereal and pulse must consist of pulse and the remainder 15·79 ounces of rice. These quantities, plus half an ounce of fat, will supply the amount of nitrogen and carbon required. The calculation may be proved by employing the factors given in Table II., thus—

Rice	15·79 × 5·07 =	Nitrogen grains	80·0
Pulse	6·81 × 17·86 =	ditto	121·6

22·60 oz. mixed rice and pulse = 201·6

Calculation for carbon 22·60 × 170 = 3,842 grains
plus for half an ounce fat - 172 „

= Total carbon grains - 4,015

or if instead of rice the cereal employed is *bājri*, in column 9, Table VII. under *bājri*, opposite 105 lbs., is the number 4·00. Hence of the 22·60 ounces of mixed cereal and pulse (column 3, Table VII.) 4·00 ounces must be pulse if *bājri* is the cereal used.

Proof.

Bājri	18·60 × 7·00 =	Nitrogen grains	130·20
Pulse	4·00 × 17·86 =	ditto	71·44

22·60 oz. mixed *bājri* and pulse = 201·64

Calculation for carbon as in previous example.

On the sufficiency of the reduced scale of wages.

Where, as in column 11, Tables VII., VIII., and IX., and in column 10, Table IX., and the last portion of column 10, Table VIII., the figures of the column are preceded by a minus sign, no pulse need be employed; the number of ounces of the cereal heading the column shown opposite the weight containing more than the required quantity of nitrogen,—*e.g.*, the 22·60 ounces required on Scale 1, for men averaging 105 lbs. in weight contain in the case of wheat $22·60 \times 9·22 = 208·37$ grains of nitrogen, a quantity slightly in excess of that (201·6) required by the scale. These minus figures come into use when mixed cereals are employed, as will be seen by the following examples:—

1. Men, averaging 120 lbs., require on Scale 1 (*see* Table V.) nitrogen 230·4 grains, carbon 4,584 grains daily. The number of ounces of cereal and pulse necessary (*see* Table VI.) is 25·97. If the cereals available are rice and bājri in about equal proportions the calculation becomes—

$$\begin{array}{rcl} \text{Rice} & - & 25·97 - 7·72 \text{ (see Table VII., col. 4)} = 18·25 \div 2 = 9·12 \text{ oz.} \\ \text{Bājri} & - & 25·97 - 4·48 \text{ (see Table VII., col. 9)} = 21·49 \div 2 = 10·75 \text{ „} \\ \text{Pulse} & - & 7·72 + 4·48 = 12·20 \div 2 = 6·10 \text{ „} \end{array}$$

Proof.

$$\begin{array}{rcl} \text{Rice} & - & 9·12 \times 5·07 = \text{Nitrogen grains} & - & 46·24 \\ \text{Bājri} & - & 10·75 \times 7·00 = & \text{do.} & 75·25 \\ \text{Pulse} & - & 6·10 \times 17·86 = & \text{do.} & 108·95 \end{array}$$

$$25·97 \text{ oz. mixed cereal and pulse} = 230·44$$

Calculation for carbon $25·97 \times 170 = 4,415$ grains.

Plus for $\frac{1}{2}$ an oz. fat 172 „

= Total carbon 4,587 „

2. If, however, the cereals to be used are rice and wheat, then the use of the minus figures under wheat is shown as follows:—

$$\begin{array}{rcl} \text{Rice} & - & 25·97 - 7·72 \text{ (see Table VII., col. 4)} = 18·25 \div 2 = 9·12 \text{ oz.} \\ \text{Wheat} & - & 25·97 + 1·05 \text{ (see Table VII., col. 11)} = 27·02 \div 2 = 13·51 \text{ „} \\ \text{Pulse} & - & 7·72 - 1·05 = 6·67 \div 2 = 3·34 \text{ „} \end{array}$$

Proof.

$$\begin{array}{rcl} \text{Rice} & - & 9·12 \times 5·07 = \text{Nitrogen grains} & - & 46·24 \\ \text{Wheat} & - & 13·51 \times 9·92 = & \text{do.} & 124·56 \\ \text{Pulse} & - & 3·34 \times 17·86 = & \text{do.} & 59·65 \end{array}$$

$$25·97 \text{ oz. mixed cereals and pulse} = 230·45$$

Calculation for carbon as in previous example.

It will be observed that in this last example the minus figures of the wheat column are added to the wheat and deducted from the pulse, and are employed in fact in exactly the reverse way to that in which the figures unpreceded by a minus sign are employed.

General Remarks applicable to all Three Scales.

1. It of course must be understood that the weights for which these scales are calculated are weights of individuals fairly nourished, not weights of individuals reduced by disease or famine below the normal condition.

2. The Tables VII., VIII., and IX. are based on the supposition that grains fairly clean and fairly free from husk are employed. Should this not be the case a proportionate allowance must be made. Taking all circumstances into consideration, it seems to me that (save in very exceptional cases) an increase of 5 per cent. on the quantities of grain shown in the tables would fairly suffice as compensation for husk.

3. Where a cereal is so deficient in nitrogen that a large proportion of it requires to be replaced by pulse, it is desirable to mix it with a more nitrogenous cereal, so that a smaller quantity of pulse may suffice, *e.g.*, rice, especially on Scale 1, and in a less degree on Scale 2, (*see* Tables VII. and VIII., column 4), may advantageously be mixed with wheat or bājri.

4. Where a cereal is so rich in nitrogen that according to the tables little or no pulse is required to be mixed with it, no objection exists to replacing a larger proportion of it by pulse than is by the tables shown to be necessary, provided always that the total quantity of pulse given is kept within reasonable limits, say under 4 to 5 ounces.

5. If on any of the scales the quantity of fat given is raised from $\frac{1}{2}$ an ounce to 1 ounce, a withdrawal of $1\frac{1}{2}$ ounces of cereal and an addition of $\frac{1}{2}$ an ounce of pulse serves to compensate for the change.

Note in regard to the Limits of Error of the Tables.

It will be observed that the amount of carbon required regulates the aggregate quantity of cereal and pulse, while the amount of nitrogen required regulates the proportion which pulse ought to bear to cereal.

In calculating the value of the Bombay House of Correction diet and in constructing Tables VI. to IX., all cereals and pulses have been assumed to contain 170 grains per ounce of carbon.

The probable limits of error due to this assumption of a uniform carbon value for all cereals and pulses may be stated as follows.

It will be observed that the three scales of Tables V. to IX., are comparable (weight for weight) with certain European scales, viz. :—

Scale No. 1 with English convict hard labour diet.

Scale No. 2 with English convict light labour diet.

Scale No. 3 with a mean bare sustenance estimate for male European adults.

And that as regards carbon the three scales of the tables are just 11·5 per cent. richer than the corresponding European scales.

Now suppose that the cereals and pulse supplied to the Bombay House of Correction were exceptionally rich in carbon and contained 175 instead of 170 grains of carbon per ounce, then in order to keep up the correspondence of the three scales with the amended value of the Bombay House of Correction diet, the quantities of carbon shown in Table V. would have to be raised from 11·5 to 14·4 per cent. above the quantities of carbon contained in the corresponding European scales.

Taking an extreme case the other way, suppose that in any particular instance the cereals and pulse available for food-supply happen to be so exceptionally poor in carbon as to contain only 155 instead of 170 grains per ounce,—then the amounts of carbon yielded by the quantities of cereal and pulse laid down in the tables for the three scales would only be 1·9 per cent. higher than the quantities contained in the corresponding European scales.

Hence, even with the cereals and pulses exceptionally poor in carbon, the quantities of cereal and pulse provided by the three scales would still yield 1·9 per cent. more carbon than is contained in the corresponding European scales ;

Hence also, even with cereals and pulse exceptionally poor in carbon, an increase of ten per cent. on the quantities laid down in Tables VI. to IX., would raise the carbon value of the three scales to that shown in Table V. ;

Hence also, even supposing that the cereals and pulse supplied to the Bombay House of Correction were exceptionally rich in carbon and the cereals and pulse available for food-supply happen to be exceptionally poor in carbon, an increase of 12½ per cent. on the quantities of cereals and pulse, laid down in Tables VI. to IX., would bring the carbon value of the three scales into correspondence with the carbon value of the Bombay House of Correction diet, and would raise the carbon value of the same scales to 14·4 per cent. above that of the corresponding European dietaries.

The possible nitrogen error of the scales is more difficult to estimate. An error due to over-estimation of the quantity of nitrogen in a cereal or pulse would be always to some extent met by any increase (as allowance for deficient carbon [see above]) of the aggregate quantity of cereal and pulse laid down in Table VI. Any minus nitrogen error not met in this way must be met by increased replacement of pulse for cereal.

No. 256.

No. 249.

No. 423, dated Simla, 8th May 1877.

From the ADDITIONAL SECRETARY TO THE GOVERNMENT OF INDIA to the ADDITIONAL SECRETARY TO THE GOVERNMENT OF MADRAS.

On the large employment of Public Works agency in Madras.

His Excellency the Governor-General in Council having had under his consideration the subject of the larger employment of Public Works agency in the Madras Presidency, I am directed to communicate the following observations.

2. Sir Richard Temple has made to the Government of Madras, on the dates specified in the margin, various representations on this important subject. While admitting that in many of the Madras districts relief has been economically managed from the first, he points out that in others the numbers in receipt of relief are apparently excessive compared with equally distressed localities elsewhere, that the number of relief labourers in the Madras Presidency under Public Works agency is only $11\frac{1}{2}$ per cent. of the total number on the works, and that the utilisation of such agency in the Salem district has been attended with the most beneficial results. He also dwells on the advantage of the Civil officers being so relieved as to give more time to village inspection.

3. The Madras Government, in paragraph 8 of their Despatch to the Secretary of State, No. 25 of the 7th ultimo, while recognising the advantages of Public Works agency, apparently consider its employment to a greater extent than at present not practicable owing to the insufficiency of large works in the presidency generally, and the impossibility of devising them in certain districts.

4. There would appear, I am directed to observe, to be some misapprehension arising from different applications of the term "large works." In so far as it extends to undertakings of primary magnitude, such as the East Coast Canal and other irrigational projects, there may be, as indicated in Sir Richard Temple's own minute of February 10th, some difficulty in devising them in the Madras Presidency, or at any rate in doing so in time to be of use in the present juncture. But the term would appear to be used by Sir Richard Temple in his minutes above referred to in the more limited sense of works capable of employing about 1,200 to 1,500 labourers and upwards. This is the sense in which the term is used in the Bombay Presidency, and a reference to paragraph 9 of the Bombay Weekly Statement No. XXIV. ("Gazette of India," May 5th) will show that of the large works upon which the Public Works agency is found to be so advantageous 15 have less than 2,000 labourers, and only 16 more than 5,000, employed upon them. And of large works, using the term in the same sense, there would appear to be no lack in the Madras Presidency, for it appears from the proceedings of the Board of Revenue, No. 1,817 of the 20th ultimo, paragraph 9, that 66 per cent. of the total number of labourers are employed upon works having 1,500 and upwards, and that the average number per work is no less than 4,591.

5. His Excellency the Governor-General in Council has observed with satisfaction that the Madras Government have, in their proceedings No. 1,331 (Revenue Department), dated the 4th ultimo, invited the opinions of the Collectors and the Public Works Department upon the question of further utilisation of the latter, but trusts that in view of the explanations above given and the success of the system in Bombay after ample trial, his Grace the Governor in Council will be able at an early date to authorise its introduction, especially in Bellary and Kurnool, where the numbers on relief works are apparently the most excessive.

No. 250.

No. 256.

No. 1,384 R., dated 9th May 1877.

From the SECRETARY TO THE GOVERNMENT OF INDIA, Public Works Department, to the CONSULTING ENGINEER TO THE GOVERNMENT OF INDIA.

I am directed to acknowledge the receipt of your letters Nos. 915 and 929, dated the 17th and 19th April 1877 respectively, the former forwarding a comparative statement of the goods lying at stations on the East Indian Railway, and the latter a statement showing the accumulations of grain at stations on the Jubbulpore line on the 1st and 28th March, and the quantities despatched between these dates. Railway grain traffic.

2. From the latter statement it is observed that between the 1st and 28th March 136,528 maunds, about 5,000 tons, were removed, 500 waggons in 28 days, or say 18 waggons daily, and the accumulations were reduced from 49,485 to 39,700 maunds, *i.e.*, by 10,000 maunds=360 tons, but the figures given in the first-named statement show that the accumulation increased during the month of March by 900 tons. I am to invite your attention to this apparent discrepancy.

3. On the whole the Government of India accepts the work done, and considers the clearances on the main line satisfactory.

4. I am to take this opportunity to forward, for the purpose of being placed before the Agent, East Indian Railway, for any observations he may desire to make, extracts from a communication from the Agent, Great Indian Peninsula Railway Company, written after perusal of Lieutenant Scott's note dated 13th February 1877, on the accumulation of grain at stations on the East Indian Railway.

5. I am to add that the Government of India is of opinion that on the whole more good may probably be done by the managements of the two Companies looking the difficulty fairly in the face and endeavouring to meet it by mutual concessions and friendly co-operation than by indulging in charges and counter-charges. The traffic, it cannot be denied, on these two principal railways, notably on the Great Indian Peninsula Railway, is more than can be dealt with by existing means and appliances, but the agreement for through traffic which, as it stands, and during the present pressure, is inconvenient for the East Indian Railway Company, cannot be ignored.

No. 251.

From the SECRETARY OF STATE to the GOVERNOR-GENERAL OF INDIA IN COUNCIL.
Revenue, No. 43.

India Office, London, 10th May 1877.

Para. 1. I have to inform your Excellency in Council that, on the 3rd of May, the following message was addressed by me to your Lordship:—

“ Secretary of State to Viceroy.

On the sufficiency of the reduced scale of wages.

“ Accounts reach me from many quarters expressing serious fear that insufficiency of relief food on famine works, especially in Madras, is producing diseases of exhaustion, and will end in great mortality. Matter requires extreme vigilance, and if there is any real cause for apprehension, it will be better not to place too much restriction on Local Government. Our medical authorities are alarmed by accounts, official and other.”

2. To this telegram I have received your reply, dated 6th May, and returned by telegraph the following message on the 8th:—

“ I think, if it has not already been done, that my telegram of the 3rd, and yours in reply, should be communicated to the Government of Madras.”

I have, &c.

(Signed) SALISBURY.

No. 340 E.—1098, dated 11th May 1877.

From the SECRETARY TO THE GOVERNMENT OF BOMBAY, Public Works Department, to the SECRETARY TO THE GOVERNMENT OF INDIA.

No. 248.

I am directed by his Excellency the Governor in Council to forward, for the information of the Government of India, a memorandum, prepared by Surgeon-Major Lyon, chemical analyser to Government, and to observe that this able and interesting paper appears to throw light on the question recently raised, and still under discussion, as to the sufficiency of a ration based on 1 lb. of grain a day for a relief labourer.

2. The calculations by Dr. Lyon, which are deduced from actual experience, and are not purely theoretical, seem to show that a ration based on 1 lb. of grain is sufficient for the sustenance of persons not performing severe labour.

No. 253.

Telegram dated 12th May 1877.

From REVENUE ADDITIONAL SECRETARY, Simla, to SECRETARY OF STATE, London.

The deputation of Dr. Townsend.

Paragraphs 7 and 9 of Madras Government's Despatches to your Lordship, dated 7th and 14th ultimo. We have explained to that Government that Dr. Townsend, our

Sanitary Commissioner, was not sent on an independent mission, but merely placed under Temple at his request to aid him in conducting certain inquiries which he desired to institute in Madras and Bombay Presidencies, and that for this reason we did not deem it necessary to make any communication to either Government on the subject. We have since received a letter from Temple drawing attention to passage of Madras Despatch above referred to, and explaining that Townsend's early departure from Madras Presidency was imperative, owing to ill-health.

No. 254.

No. 256.

No. 441, dated Simla, 12th May 1877.

From the ADDITIONAL SECRETARY TO THE GOVERNMENT OF INDIA to the ADDITIONAL SECRETARY TO THE GOVERNMENT OF MADRAS, Revenue Department.

His Excellency the Governor General in Council has had under his consideration Sir Richard Temple's Minute of the 22nd ultimo, in which, after recognising the humane care and the skill with which the large relief camps are conducted, he remarks as follows:—

No. 229.

“But still the fact remains that the death-rate among the inmates of camps is terribly high; that such diseases as are engendered among gatherings of poor people appear and re-appear, and that the air and surroundings of these camps are very depressing. For the little children especially the life must be very depressing indeed. Some of these troubles will, I fear, be aggravated when rain and cold come on, and make relief camp life even less endurable than it now is.”

On the removal of the very helpless from relief camps to their own homes.

The remedy which Sir Richard Temple suggests is the gradual drafting off of the inmates of these camps to their own homes, to be there cared for under the system of house-to-house visitation and village relief.

2. His Excellency the Governor-General in Council considers Sir Richard Temple's suggestion to be deserving of consideration, especially in view of the approach of the rainy season, and would be glad to be informed of the views of his Grace the Governor in Council on the subject. It is obvious that, in order that the measure proposed may be safely carried out, considerable efficiency in the system of village relief is indispensable. The system has now, it is believed, been organised in most of the distressed districts, but his Excellency the Governor-General would wish that no pains or expense should be spared to render it thoroughly efficient, while confining, of course, its action to those only who are not able-bodied and capable of being drafted on to the works. There seems every reason to hope that this end would be materially furthered if the civil officers were enabled by the larger employment of Public Works agency, as suggested in my letter No. 423 of the 8th instant, to give more of their time and attention to the subject.

No. 255.

No. 262.

MEMORANDUM by Dr. J. B. LYON, Chemical Analyser to Government, as to the Dynamic Value of the task exacted from Labourers on Relief Works.

Bombay, May 12, 1877.

Parkes' (Manual of Hygiene, page 389) states:—“It would, therefore seem certain that an amount of work equal to 500 tons lifted one foot is an extremely hard day's work, which, perhaps, few men could continue to do. 400 tons lifted a foot is a hard day's work, and 300 tons lifted a foot is an average day's work, for a healthy strong adult.”

The Dynamic value of the task demanded from relief labourers.

“The Reverend Professor Houghton, M.D., has shown that walking on a level surface is equivalent to raising $\frac{1}{10}$ part of the weight of the body through the distance walked. * * * The formula is $\frac{(W+W') \times D}{20 \times 2240}$, where W is the weight of the person, W' the weight carried, D the distance walked in feet, 20 the coefficient of traction, and 2,240 the number of pounds in a ton, the result is the number of tons raised one foot” (Parkes *loc cit*).

The Dynamic value of the task demanded from relief labourers.

Taking 105 lbs. as the weight of a native labourer, and reducing Parkes' estimate of an average day's work in proportion to this weight as compared with 150 lbs. (the weight of an average male European adult), we have as $150 : 105 :: 300 : 210$. 210 tons lifted a foot is, therefore, Parkes' estimate of an average day's work, reduced proportionally to weight.

Using Haughton's formula, we find that a man weighing 105 lbs. and carrying 10 lbs., walking on a level, does work equal to lifting 13.51 tons one foot for each mile walked; for $(105+10) \times 5280 \div 20 = 30,260$ foot pounds $\div 2,240 = 13.509$ foot-tons.

Also $210 \div 13.51 = 15.55$. Hence, a man weighing 105 lbs. and carrying 10 lbs. in walking on a level 15.55 miles, does work equal to raising 210 tons one foot, *i.e.*, an average day's work of 300 foot-tons reduced proportionally to his weight.

"The basis of the task system upon irrigation works is that in ordinary times, when the lift does not exceed 4 feet, and the lead does not exceed 50 feet, 100 cubic feet of black or red soil can be excavated and disposed of by one man, one woman, and one child, and therefore at the present time 75 cubic feet only is to be exacted * * * I am therefore of opinion that under the existing orders of Government the present task set by Colonel Finch is too high, and should be reduced to 75 cubic feet for Public Works Department, and to 50 cubic feet for Civil Agency Works."—(Colonel Merriman, R.E., Chief Engineer for Irrigation, Bombay. No. 1,516, dated 5th March 1877, para. 3.)

Estimation of the Dynamic Value of a task of excavating and disposing of 75 cubic feet of black or red soil with a 4 foot lift and 50 feet lead, the task demanded on relief works under Public Works superintendence from a man, woman, and child.

For the purpose of calculation, the above task may be stated something in the following way:—

1. Excavation and filling baskets, say 3 baskets to a cubic foot.

2. Lifting the baskets on to the heads of the carriers, say 5 feet 6 inches; say 80 lbs. to the cubic foot; allow 2 lbs. for weight of basket.

3. Carrying away the earth and returning with the empty baskets.

1. *Excavating and filling baskets.*—A rather low estimate of a day's work for an English labourer employed in excavating earth and filling wheelbarrows is 270 cubic feet. Taking the dynamic value of this to be 350 foot-tons, 75 cubic feet = 97.2 foot-tons.

2. *Lifting the baskets on to the heads of the carriers.*— $86 \times 75 \times \frac{1}{2} = 35,745$ foot-lbs. $\div 2,240 = 15.84$ foot-tons.

3. *Carrying.*—Take for this $75 \times 3 = 225$ trips. The work of each trip consists of *a'*. 105 lbs. (weight of body) + 5 lbs. (for clothes and baskets) + 26.66 lbs. ($= 80 \div 3$ or weight of earth) lifted 4 feet + $50 \div 20$ (for lead) = total lift $6\frac{1}{2}$ feet = 136.66 lbs. $\times 6.5$ feet = 888.3 foot lbs.; *b'*. Return with empty basket $110 \times 2.5 = 275$ foot-lbs. —Hence $888.3 + 275 \times 225 \div 2,240 = 116.85$ foot-tons.

Hence, supposing the whole task to be done by a man weighing 105 lbs., its dynamic value is $97.2 + 15.84 + 116.85 =$ say 230 foot-tons. This, however, is the whole task demanded from a man, woman, and child. Taking the man's work at half of this, we have 115 foot-tons as the dynamic value of the day's work of a man weighing 105 lbs. employed on relief works under Public Works superintendence.

Again, on relief works under Civil Agency two thirds only of the above task is required = $153\frac{1}{3}$ foot-tons for the whole task of a man, woman, and child; and taking, as before, half of this to be the proportion done by the man, we have $76\frac{2}{3}$ foot-tons as the dynamic value of the task demanded from men weighing 105 lbs. employed on relief works under Civil Agency.

Hence, taking 210 foot-tons as an average day's work for a man weighing 105 lbs. (see *ante*) the task of 115 foot-tons demanded from a man (weight assumed as 105 lbs.) on relief works under Public Works superintendence amounts only to 54.75 per cent. of an average day's work. Similarly, $76\frac{2}{3}$ foot-tons, the task demanded on relief-works under Civil Agency from a man (assumed weight 105 lbs.) amounts only to 36.6 per cent. of 210 foot-tons, *i.e.*, 36.6 per cent. of an average day's work.

Stated in another way:—it has already been shown that a man weighing 105 lbs. and carrying 10 lbs, walking on level ground does work = 13.51 foot-tons for every mile

walked. Hence, as $115 \div 13.51 = 8.52$, and as $76\frac{2}{3} \div 13.51 = 5.68$, the task demanded from a man weighing 105 lbs. on relief works under Public Works superintendence is just equal to the work which he would do in walking 8.52 miles on level ground carrying 10 lbs. Similarly, the work demanded from a man weighing 105 lbs. on relief works under Civil agency is just equivalent to the work which the same man would do in walking 5.68 miles on level ground, carrying 10 lbs.

The Dynamic value of the task demanded from relief labourers.

To show now that Natives of India are capable of doing work in proportion to their weight, reckoning 300 foot-tons as an average day's work for a man weighing 150 lbs., I cite the two following instances :—

1. An ordinary day's work for 12 palkee bearers is to carry a palkee down from Matheran to Narel and bring it back from Narel to Matheran with a person inside. The distance from Narel to Matheran is 7 miles; the height of Matheran above Narel is 2,377 feet. One of the palkees was found to weigh 195 lbs., and the average weight of the bearers was found to be 117 lbs. as they stood, say, 115 lbs. + 2 lbs. for clothes. Taking the up-journey only, and supposing the individual inside the palkee to weigh 125 lbs., the load of each bearer = $195 + 125 \div 12 = 26.66$ lbs; and $26.66 + 117 = 143.66$ lbs. lift 2,377 feet; + for the seven miles carried $5,280 \times 7 \div 20 = 1,848$ feet; $143.66 \times (2,377 + 1,848) \div 2,240 = 270.96$ foot-tons. The work, therefore, of the up-journey only = 270.96 foot-tons, considerably above 230 foot-tons, i.e., 300 foot-tons reduced in the proportion 150 to 115.

2. The recognised load for a Narel coolie is 40 lbs. This, although brought up to the same height, is carried generally a part of the way by short cuts, reducing the distance walked to about 5 miles. Hence, $117 + 40 = 157$ lbs. lifted 2,377 feet + for the five miles $5,280 \times 5 \div 20 = 1,320$ feet, and $157 \times (2,377 + 1,320) \div 2,240 = 259$ foot-tons. Taking no account of the walk back unloaded, this is also considerably above 230 foot-tons, i.e. 300 foot-tons, reduced in the proportion 150 to 115.

No. 256.

No. 24 of 1877.

GOVERNMENT OF INDIA, Department of Revenue, Agriculture, and Commerce, to the
SECRETARY OF STATE FOR INDIA.

Simla, the 17th May 1877.

By the last mail your Lordship will have received, in an extra supplement of the "Gazette of India," our proceedings of the 5th instant,* reviewing the returns received from the Government of Madras in reply to our calls of the 25th October and 2nd December last.

Review of Madras returns.

* No. 246.

2. We have felt it our duty not to pass by without comment the great delay in submission, and the inaccuracy and incompleteness, which are, with some exceptions, characteristic of the reports of the local officers, because we feel assured that a careful and temperate inquiry into the real facts of the case at a very early stage is essential to the successful combating of famine, and that had any such inquiry taken place in the instance of the Presidency of Madras, the general policy of the Government would probably have been different in some important respects from what it actually has been. The inaccuracy and incompleteness of the reports had, indeed, been already noticed by the Madras Board of Revenue, who have recorded in various instances, with reference to particular items, that they have "not been estimated on any uniform principle," "are based on no careful calculation," "are decidedly wrong," and have more than once pointed out that errors arose from the omission of some important and obvious element in the calculations or the returns. While noticing these defects, which have impaired the value of a public record, and prevented its use at the time and in the manner which we had contemplated, we have had great pleasure in hearing testimony to the individual zeal, humanity, and loyalty, which have been exhibited by the local officers of the Madras Presidency under the very difficult and exceptional circumstances by which they were surrounded.

3. The returns embrace particulars of 121 taluks or subdivisions of districts, with an area of 81,852 square miles, and a population of 18,592,534 souls. Considering as affected by famine all taluks in which the crop saved has reached but has not exceeded one-half, a proportion which we think the most appropriate because the returns tend from various causes to make matters seem better than they are, the actually affected area is 71,849 square miles, and the affected population 15,432,393. The affected area and population thus exceed considerably the similar figures for Bombay and Mysore

Review of
Madras re-
turns.

combined, and the proportion affected to the total similarly preponderates. The statistics of rainfall give results only slightly more unfavourable than those of the Bombay Presidency, but the peculiarity that Madras depends, in varying proportions, upon two monsoons instead of one, renders any totals of little value for comparison, since failure at one particular period may suffice to produce severe distress. The local officers estimate the probable remissions at Rs. 1,24,33,758, but the Board of Revenue reduce this amount to about a crore of rupees, and express their belief that even less than this may eventually be remitted. Among the cattle and agricultural stock, the mortality has already been very heavy, especially in Nellore, Cuddapah, and Kurnool, but such relief as was attainable by digging and improving wells has been freely resorted to, and it is believed that recent showers have in many places freshened the pastures and checked the further severe loss which was apprehended. The water supply has not, on the whole, proved so deficient as was anticipated.

4. The extent of local stocks must always be greatly a matter of conjecture, but it seems probable that in all districts which had already suffered from preceding bad seasons it was not considerable, and that in others it was reduced at an early stage by the temptation of higher prices elsewhere. Ample evidence is, however, afforded by the reports to show that the advantages possessed by the Madras Presidency in railway and road communications, and in an active and intelligent body of merchants, rendered superfluous and prejudicial all attempts on the part of Government at interference with the grain trade. In connexion with this subject we would invite attention to a minute by Sir Richard Temple, dated the 28th ultimo, and its accompanying memoranda and notes by Captain Bisset, which we forward herewith. These papers show that importation by sea of food grains in response to the demand occasioned by impending famine were considerable as early as August, September, and October, during which months they reached 44,000 tons. The imports subsequently rose largely, and culminated in January, since which date they have been gradually declining. The total imported by all routes between the beginning of August and the end of March amounted to 535,000 tons. The decline in imports which has just been alluded to is probably attributable to several causes combined. The various railway companies appear to have made creditable exertions to grapple with the vast access of traffic thrown upon them, and Captain Bisset states in his memorandum of the 25th ultimo, that there is now train-room for more waggons from the north into the ceded districts. At the same time there appears to be little room for doubt that the traffic on our great railways is more than can be dealt with by existing means and appliances, and that there is no sufficient reserve of rolling-stock to meet any sudden or unusual increase. The difficulties which have occurred between the East Indian and Great Indian Peninsula Railways with reference to the accumulations of grain at various stations, are illustrated by a correspondence with the Government of India in the Public Works Department, of which copies† are enclosed.

† Nos. 194,
211, 250.

5. In continuation of our notice of the Madras returns, we may remark that owners of large zemindari estates are not a very numerous or influential class in that presidency, and that little assistance appears to have been obtainable from them. The emigration has on the whole been quite insignificant, and amounts to little more than a somewhat larger resort than usual to the ordinary labour outlets of Ceylon and the Nilgiri hills. Regarding the estimates of the local officers of the numbers who were likely to be on relief works and in receipt of charitable relief on the 1st of March, 1st of May, and 1st of July, little more need now be said than that at the close of the year, when 1,030,592 persons were employed, there appeared to be every prospect of their being verified, but that the introduction of a more stringent and discriminating system than then prevailed has led to a divergence between the estimates and the actuals even more remarkable than in the case of Bombay.

6. With reference to the differences of opinion which have arisen as to the sufficiency of a 1 lb. ration, we enclose an able and interesting paper by Dr. Lyon, the Chemical Analyser to the Government of Bombay, based upon actual experience in the jails of the presidency town. The Government of Bombay remark that "the calculations by Dr. Lyon, which are deduced from actual experience, and are not purely theoretical, seem to show that a ration based on 1 lb. of grain is sufficient for the sustenance of persons not performing severe labour."

* Nos. 249,
254.

7. We enclose copies of letters* which we have addressed to the Madras Government, in accordance with the intention expressed in paragraph 3 of our Despatch of the 3rd instant, regarding the larger utilisation of the Public Works Department in superintending relief works, and the gradual abolition of the larger relief camps. On

the former subject we have pointed out that there is probably some misapprehension as to the meaning of the term "large works." The Madras Government appear to understand it only in the sense of undertakings of the first magnitude, such as the East Coast Canal, and in this sense there may be a difficulty, arising from paucity of such works, in extensively employing the Public Works Department. But Sir Richard Temple employs the term, as the Bombay Government do, to denote works on which from 1,200 to 1,500 labourers and upwards are engaged, and it is on such works that the supervision of the Public Works Department has in the Bombay Presidency been found so highly beneficial. The proceedings of the Madras Board of Revenue of the 20th ultimo show that 66 per cent. of the relief labourers in Madras are employed upon such works, and that the average per work is 4,591. We observe from the Despatch of the Madras Government to Your Lordship, No. 34 of the 5th instant, that they have recently stated in detail their reasons for not having yet adopted the course he advocates and for believing that course to be unadvisable, but as their proceedings on the subject have not yet reached us, we will, on the present occasion, only express our hope that the explanation which has been suggested, and the experience of the sister presidency, will lead them to an early change of policy in this respect. Upon Sir Richard Temple's suggestion for the gradual abolition of large relief camps we have invited the opinion of the Government of Madras, pointing out the connexion of the subject with the improvement of house-to-house visitation and the relief of civil officers by means of the Public Works Department.

8. We have to mention with deep regret the deaths of Messrs. Cotton, Caldwell, and Wainwright of the Bengal Department of Public Works, in the energetic and efficient discharge of their duties in connexion with relief works in the Cuddapah and Salem districts, to which they had been deputed. Two of them have left widows and children, for whom passages to their respective homes have been provided by the Madras Government.

9. With reference to our telegram to Your Lordship of the 12th instant, and to paragraphs 7 and 9 of the Despatches of the Madras Government to Your Lordship of the 7th and 14th ultimo, regarding the deputation of Dr. Townsend, we enclose copies of a letter which we have received from the Secretary to Sir R. Temple, and of one which we have addressed to the Madras Government. As Dr. Townsend was not sent on an independent mission, but merely placed temporarily under the orders of Sir R. Temple to conduct certain inquiries in the Madras and Bombay Presidencies, no intimation on the subject to either Government was considered necessary.

Nos. 223,
227, 253.

10. We have lately received what are technically known as the "approximate actuals" of the accounts of the Madras and Bombay Presidencies. A comparison with the regular estimate gives the following results. In Madras the collections of land revenue and stamps are Rs. 20,76,000 worse, and those of excise Rs. 1,29,000 better, while famine relief expenditure is Rs. 29,97,000 worse, thus giving a net loss compared with the regular estimate of Rs. 49,44,000. This result was unexpected, considering the great decrease in relief labourers which took place, and we have requested the Madras Government to afford a full explanation of the causes to which it is attributable. In Bombay, on the other hand, we are glad to be able to state that the revenue collections have been Rs. 9,53,000 more, and the famine relief expenditure Rs. 12,77,000 less than the "regular estimate," thus giving a total improvement of Rs. 22,30,000.

11. According to the latest returns which we have received, the numbers in receipt of relief were as follows :—

In Madras	-	-	-	{	670,851 on relief works.
				{	328,732 charitably relieved.
In Bombay	-	-	-	{	296,094 on relief works.
				{	92,153 charitably relieved.
In Mysore	-	-	-	{	63,253 on relief works.
				{	87,693 charitably relieved.

There have thus been increases in Bombay and Mysore under both heads during the week, which amount to 13,037 and 10,217 respectively, while in Madras the reduction of 29,923 on relief works is only apparent, being due to incomplete returns, and there has been an increase of 43,749 in the numbers charitably relieved. We regret to observe the continued increase in the numbers receiving charitable relief in Mysore, which now considerably exceed those of relief labourers, and shall address the Chief Commissioner regarding the very severe distress which the fact betokens.

12. The prospects of the season in Madras appear so far to fulfil what might be deemed reasonable expectations, and the rainfall, though somewhat fitful, is on the whole

Review of
Madras re-
turns.

up to the average. Regarding the condition of the Bombay Presidency, Sir Richard Temple telegraphed as follows on the 15th instant:—

“ Good rain fallen Dharwar, Belgaum, Kaládgi; showers elsewhere. Onica growing crops sown considerable breadth Dharwar, Belgaum. People southern districts good spirits, situation central eastern districts more stringent increase this week. On works 33,000 caused by improved working village inspection, which sends people to work who would otherwise need charitable relief or suffer great distress at home. Increase of people, charitable relief 3,000, numbers on works will probably continue increasing till monsoon. Concentration on large works whereon five-sixths of total number are employed. Condition people continues good, except some cases of recent applicants for relief and their young children, which were bad. These cases specially treated. Condition cattle, central and eastern districts, still causing anxiety, but cannot be accurately ascertained till animals reassembled in villages; believed that enough will survive for agricultural purposes. Grain trade active, prices slightly rising, exportation Bombay to Western Coast ports trade endeavouring to throw in supplies before ports close. Position hopeful, but vigilant activity needed. Arrangements working well.”

We have the honour to be, &c.

(Signed) LYTTON.
A. J. ARBUTHNOT.
J. STRACHEY.

No. 257.

From the SECRETARY OF STATE to the GOVERNOR-GENERAL OF INDIA IN COUNCIL.

Revenue, No. 44.

India Office, London, 17th May 1877.

Para. 1. I have had under my consideration two Despatches from the Government of Madras, dated respectively the 7th and 14th of April, Nos. 25 and 28 of 1877, both of which contain remarks on the deputation of Dr. Townsend, your Sanitary Commissioner to the distressed districts in the Madras Presidency.

2. I do not propose to make any further remarks on the vexed question relative to the sufficiency of the scale of rations allowed to labourers on relief works, especially as Sir R. Temple has now returned to Bombay and assumed charge of the Government of that presidency.

I have the honour to be, &c.

(Signed) SALISBURY.

No. 258.

Telegram, dated 21st May 1877.

From GOVERNOR, Madras, to VICEROY, Simla.

Lowest scale
of wages in-
sufficient.

Yours of 12th* received. Lowest scale of wages to workers of one pound grain with half anna is insufficient. Much influenced by entire want of vegetables, and increased heat. Prices slowly rising, recent rain general over eastern plains, but heavy only near Madras. Damages immaterial. Water-supply good for some time. Some irrigation tanks fairly supplied. Cultivation being commenced; if this checks upward prices, matters will go well; if prices continue rising, distress and number must increase. Hope to visit southern districts next week.

From the ADDITIONAL SECRETARY TO THE GOVERNMENT OF INDIA to the SECRETARY TO THE GOVERNMENT OF BOMBAY, Public Works Department.

Simla, 28th May 1877.

I am directed to acknowledge the receipt of your letters quoted in the margin, for-
 No. 20E.—85 of January 17th. warding, as requested in paragraph 6 of my letter of
 No. 177E.—627 of March 20th November 30th, 1876, information regarding the condition
 of Native States comprised in the portion of the Bombay Presidency affected by
 famine.

The Native
 States in
 Bombay
 Presidency
 affected by
 famine.

2. This information being in some cases imperfect as regards area, population, revenue, or proportion of kharif and rabi cultivation, it has not been found possible to compile it into a definite review such as that regarding the British districts which was issued in the Resolution of the Government of India, No. 212, dated February 21st. In view, however, of the difficulty which has no doubt been experienced in obtaining reliable statistics regarding Native States, and of the general view of their condition which has been afforded by the weekly statements, and by the correspondence which has passed in certain cases, his Excellency the Governor-General in Council considers it unnecessary to trouble the Government of Bombay with further calls upon the subject.

3. From the various sources of information which are available, it would appear that the States which have been affected by famine, or the condition of which, in view of their probably becoming so, has been the subject of careful inquiry, comprise, roughly speaking, an area of 9,708 square miles and a population of 2,073,066, and that the portion actually suffering from scarcity is at present estimated by the Bombay Government at 4,804, square miles, with a population of 847,848 persons. The following table shows some of the more prominent points regarding each State :—

Names of States.	Approximate Gross Revenue.	AREA.		POPULATION.		BY LATEST ACCOUNTS.		
		Total.	Affected.	Total.	Affected.	Numbers on Works.	Actual Expendi- ture.	Price of Staple Grain in Lbs. per Rupee.
Alakote—under Sho- lapur.	Rs. 2,28,500	498	373	78,222	58,000	3,130	Rs. 41,389	18½
Jinjeera—under Colaba	3,20,000	324	—	72,000	—	—	—	—
Satara Jagirdars, viz. :—								
Jath - -	79,857	884	879	64,000	63,628	2,261	26,071	14½
Phaltan - -	1,20,175	397	397	59,124	59,124	657	8,440	?
Pant Pratinidhi - -	1,24,163	213	138	68,335	44,594	727	9,061	15
Pant Sachiv - -	4,92,775	500	—	111,689	—	—	—	—
Kolhapur State and its feudatories, viz., Bawra, Inchalkaranji, Kagal, and Vishalgadh - -	24,29,000	3,184	2,999	802,691	620,482	21,985	3,73,020	15½
Southern Mahratta States, viz., Miraj (two), Sangli, Kurandwar (two), Jamkhandi, Mudhol, Ramdurg - -	14,90,000	2,734		610,434				
Savanur—under Dhar- war.	8,16,71	70	18	15,757	2,020	324	1,514	16½

	56,57,781	9,708	4,804	2,073,066	847,848	—	—	—

The Native States in Bombay Presidency affected by famine.

4. As regards failure of crops the case of each State appears to be somewhat as follows :—

Akalkote.—The failure has been about five-sixths of an average crop, or nearly as bad as in the adjoining district of Sholapur.

Jinjeera.—Half the rice crop and three-fourths of the warkas crop have failed, and heavy remissions have been given, but the proximity to Bombay has prevented scarcity of grain.

Jath.—The failure has been almost complete, and the distress similar to that in the adjoining Sholapur and Kaladgi districts.

Phaltan.—Failure nearly the same as in Jath.

Pant Pratinidhi.—A portion of the State is alone much affected, but the failure there has exceeded half the crop.

Pant Sachiv.—This State, owing to its proximity to the Ghâts, has almost entirely escaped loss.

Kolhapur.—The eastern taluks have alone suffered, and that not very severely. The four feudatories likewise have done fairly. On the whole, it would seem that the average loss in affected parts does not exceed half the crop; about two-thirds of the land revenue will be recovered.

Sangli has lost nearly the whole of both *kharif* and *rabi* crops.

Miraj.—Both the senior and junior branches of this State have saved about one-fifth of their crop, on an average, but in some parts the failure has been complete.

Koorundwar.—The senior branch has got about a half crop, and the junior branch considerably more, so the distress is very slight.

Jamkhandi.—The failure may be said to be complete.

Mudhol.—About one-fifth of the crop has alone been saved.

Ramdurg.—Nearly the whole *kharif* crop has been lost, but the *rabi* has yielded about one-third of an average.

Savanur.—The failure has been slight, except in a few villages.

Sawant Wari.—The yield has been from one half to three-fourths throughout, so that the distress, if any, is very slight.

5. The circumstance that Akalkote, Jath, Kolhapur, with all its four feudatories, Miraj (senior), Sangli, Mudhol, and Sawant Wari, are all under British administration, in consequence of the minority of their Chiefs, has tended materially to strengthen the hands of the Government in extending to the suffering people of the territories under their political jurisdiction the measures of relief applied to British subjects. The same fact has tended to render available ample funds for the purpose, the accumulated revenues of Kolhapur and its feudatories, for instance, aggregating 27½ lakhs of rupees, and those of Miraj (senior) and Mudhol about 15 lakhs more.

6. The organisation of relief works has been found necessary in all the States excepting Jinjeera, though in some the works are only of a trifling nature. The necessity of every State providing for its own distressed population was brought prominently to the attention of the Bombay Government by the Government of India (No. 1T., dated December 20th, 1876), and the principle was approved of by the Secretary of State in his Despatch No. 21 of the 28th February last. His Excellency the Governor-General in Council fully concurs in the efforts in this direction which have

No. 276E.—892 of 19th April.

No. 317E.—1,021 of 2nd May.

been made by the Bombay Government in its orders quoted marginally, and has every confidence that at the present time, when the famine is pressing with daily increasing stringency, no means will be spared to ensure that the relief works in Native States, and the house-to-house visitation, shall be equal to the occasion.

7. With reference to the important question of the freedom of the grain trade, his Excellency the Governor-General in Council has only to repeat the full concurrence, expressed in my letter No. 272 of March 7th, in the efforts of the Government of Bombay to suppress the tendency to interference which has been somewhat marked in certain cases, especially in the recent one of Sawant Wari.

8. In conclusion, I am desirous to express the sympathy of his Excellency the Governor-General in Council with the political officers of Bombay in the arduous and delicate task which has fallen to them, and his appreciation of the measure of success which so far, under the guidance of the Local Government, appears to have attended their labours.

No. 262.

No. 25 of 1877.

From the GOVERNMENT OF INDIA, Department of Revenue, Agriculture, and Commerce,
to the SECRETARY OF STATE FOR INDIA.

Simla, the 4th June 1877.

We enclose a minute by Sir Richard Temple, dated April the 14th,* reporting generally on his late mission to the distressed districts of the Madras Presidency. Regarding the operations of the mission in the presidency of Bombay, it has seemed to him unnecessary, under existing circumstances, to add anything to his minute of 24th March, which was submitted to your Lordship with our Despatch of the 12th April, No. 20.

* No. 214.

Review of
Sir R. Tem-
ple's Report
on his mis-
sion to
Madras.

2. This interesting and important State paper is divided into the following parts:—
- 1st. The extent of the drought, the failure of the harvests, and the effect of these disasters upon the fortunes and the physical condition of the people.
 - 2nd. The measures adopted by Government to help the people in meeting or bearing up against these misfortunes.
 - 3rd. The several points towards which the proceedings of the mission have been principally directed.
 - 4th. The state of affairs at the present time of writing.
 - 5th. The lessons to be deduced from all the circumstances which have yet occurred in connexion with these affairs.

We propose to recapitulate some of the more leading points in each part.

3. The drought of 1876, Sir Richard Temple points out, affected the whole of the Madras Presidency except the littoral tract south of Orissa and the deltas of the Godavery and the Kistna. The rainfall of the year ranged from three to twenty inches, and in large tracts from only to six to ten inches, whereas the ordinary average ranged from twenty to forty inches. The misfortune threatened first in July, and became more pronounced from month to month, till it culminated in November. Its severity was aggravated by the fact that the Deccan districts of Bombay, the greater part of Mysore, and a part of the Nizam's dominions were similarly affected. Ten Madras districts, with an area of 74,000 square miles, were thus more or less seriously injured, and of their population of sixteen millions, eleven were distressed in a greater and five in a lesser degree.

4. In the distressed tracts there are two harvests in the year, one depending on the summer rains and the other on the autumnal. Rice and various sorts of millet are the principal crops. The cultivation is to a small degree "wet," that is, dependent on tank irrigation, but principally "dry," or watered by rainfall, with some aid from wells. In the "wet" lands the failure was worst, the tanks being transformed into dusty hollows. The "dry" lands suffered to a somewhat less extent, and some of the more valuable crops were in part preserved, as the wells more or less held out, and the cultivators struggled bravely for water by digging pits in river beds, by deepening existing wells, and by sinking new ones. The failure varied in extent in different districts. Bellary and Kurnool saved only one-sixteenth of an average crop, Cuddapah and Chingleput three-sixteenths, Nellore, North Arcot, Coimbatore, and Madura one-quarter, Salem one-third, and Tinnevely six-sixteenths. The difficulty of dealing with famine is aggravated if the population is dense, but in Madras the most distressed districts are fortunately the more thinly peopled. Some districts, moreover, were at the disadvantage that the previous year had been an unpropitious one, and Bellary had suffered from two previous bad seasons. On the other hand, splendid harvests had been reaped in Burma, Guzerat, the Central Provinces, Malwa, and Northern India, as also in Bengal, Behar, and Orissa.

5. As regards the effect of the drought upon the people, while there was ample ground for anxiety and for exertion, there were many circumstances justifying hopes of a not unsuccessful issue. Grain rose, indeed, to 12 and 14 lbs. per rupee, but the sea-board afforded easy communication on both east and west with grain-holding provinces, railways and excellent roads traversed in all directions the distressed tracts, and enterprising traders, European as well as Native, were at hand to push their opportunities. As to the people themselves, while there were low-caste and wandering classes, and humble artizans, whose condition inspired alarm, there was a mass of well-to-do peasant proprietors, strong to bear passing adversity and often neither unable nor unwilling to aid the farm labourers dependent on them, and, finally, there stood behind all the British Government, with a will to save, and all the strength which money, ability, and devotion could contribute to that end.

Review of
Sir Rd. Tem-
ple's report
on his mis-
sion to
Madras.

6. The measures adopted by the Madras Government were at the outset confined to the opening of relief works on a small scale, but when the failure of the autumn rains was no longer doubtful, a great expansion took place. Some large works were proposed, and the East Coast Canal was sanctioned. But in the main the course of opening small works, within easy reach of all who might need relief, was adopted with the approval of the Government of India, which by the end of October was fully alive to the magnitude of the impending calamity, and seeking detailed information as a secure basis of action. These works were almost entirely under the guidance of the civil officers, the Public Works Department being mainly utilised in advising, designing, and measuring up, but not being in actual command of works or of the tasking of labour. The relief wages were at first fixed at $2\frac{1}{2}$ annas for a man, and in some places even 3 annas were paid, but soon after the end of the year the introduction of a 2-anna rate was enjoined, together with a fixed task. The latter, however, rarely became effectual, as no test of admission was prescribed, nor was any discretion to reject applicants vested in the local officers. It was assumed that none would come on the works who did not need relief, and it was, apparently, also considered to be the duty of Government to alleviate all suffering, not merely to prevent death from starvation. The local charities and the habits of the people having contributed to a vast influx of starving wanderers into the city of Madras, relief camps on a large scale were organised for them, and the system was ordered to be adopted near Arcot, Vellore, and elsewhere.

7. During the months of August, September, and October the importations of grain into the presidency by sea amounted to 43,637 tons, and 20,446 tons were carried by rail from Madras into the distressed tracts. The grain trade, though thus not inactive, was in some places sensitive and excitable, grain riots occurred, and the influx into Madras above referred to followed. These circumstances caused anxiety to the Madras Government, who purchased from without the presidency 30,000 tons of Government grain as a reserve, to be sent to any localities where a dangerous deficiency of grain arose. Payment of relief wages in grain being also contemplated, about 13,000 tons more were purchased for this purpose. With the view of distributing the grain reserve in a way to control the markets favourably, a transport agency was established, with head quarters at Bellary, and efficiently organised so as to be capable of expansion as might be required.

8. The relief provided by the measures above described was largely resorted to—

“The progress of the number of relief labourers, men, women, and children, up to the first week in January when the highest number was reached, may be thus seen:—

	Number of Persons.
1st November -	160,000
1st December -	310,000
15th ditto -	656,000
31st ditto -	982,000
7th January -	1,066,000
14th ditto -	1,055,000

and the last-named number was increased to 1,165,000 by the addition of 110,000 persons on gratuitous relief,”

which was dispensed from centres established throughout the districts, and largely supplemented by private charity. The expenditure up to the end of December 1876 was—

	£
“On relief -	372,500
On purchase of grain -	302,400
Total -	674,900

“There were other items, such as transport agency and local purchases of grain, which brought up the total to nearly three-quarters of a million sterling.

“The members of the Revenue Board were deputed to visit the most distressed districts and to make reports to Government of all that they ascertained.

“In every part of the distressed districts the civil officers of all grades exerted themselves with the utmost zeal, devotion, and humanity, and in a manner entirely worthy of the urgency and magnitude of the occasion.”

9. Such was, very briefly described, the position of affairs when Sir Richard Temple entered the Madras Presidency on January 14th. He thus summarises the instructions he had received verbally before starting, and which reached him formally on the 23rd of that month—

Review of
Sir Rd. Tem-
ple's report
on his mis-
sion to
Madras.

“Every effort is to be made for the prevention of deaths by famine.

“Severe economy in relief should be practised. Indiscriminate charity on the part of individuals is admitted to be bad, but on the part of a Government is worse. A Government has no better right in a time of scarcity than at other times to attempt the task of preventing all suffering, and of giving general relief to the poorer classes of the community.

“The numbers on relief works are so great that there is reason to fear that many persons must be employed who without such relief could sustain themselves for a time at least.

“The collection of such numbers should be restricted on works where labour is not exacted, where supervision is wanting, and where people can obtain, for the asking and in return for next to no work at all, wages in money or in grain.

“No time should be lost in giving to the people, to the greatest extent practicable, the means of employment on large public works, which need not always be in the distressed districts or near the homes of the people.

“The Government may be driven to set up petty relief works near the homes of the people, but not until distress becomes extreme, or a state of famine has been reached.

“There is great advantage in paying relief labour in money (not in grain) wherever and so long as this mode of payment is practicable. But if money payment is not practicable, there is no more objection to Government purchasing grain for payment than there is to its making purchases through the Commissariat for the troops.

“There is to be no interference of any kind on the part of Government with the object of reducing the price of food.

“Inquiry should be made as to how far private trade, if unfettered, can supply the wants of the country.

“In certain localities remote from railways and large markets which private trade is unable to reach, it may become necessary for Government to intervene.

“The transport of grain by the trade, by railways, by roads in the interior, and by the seaports, should be carefully observed.

“A question shortly arose as to what degree of distress was to be prevented by Government. I understood from the first that practically there would be two principal degrees of distress. Firstly, there might be distress which, however sore and lamentable, can yet be borne without physical health being impaired, or bodily power being disabled, or life being imperilled; and this the Government could not undertake to prevent or alleviate. Secondly, there might be distress which, increasing slowly perhaps but surely, must lead to extremity which would sooner or later end in death;—and this the Government would, to the utmost of its means and ability, prevent. It was necessary, by the best diagnosis which could be made, to discriminate between the one kind of distress and the other; and if there should be a doubt whether any person or persons come within the first or the second category, then to give the people the benefit of that doubt. These principles were fully borne in mind in the discussions and conferences of the third week of January in Bellary, Kurnool, and Cuddapah. Shortly afterwards similar principles were enunciated by the Government of India in reply to some references which had been made.”

The application of these principles to the actual state of affairs was the practical question presented to the mission.

10. The first point was the dealings of the Government regarding grain. Finding the local markets everywhere well supplied, the railway carrying to the utmost of its power, the merchants confident in their own powers of importation and distribution, but apprehensive of Government interference, Sir Richard Temple represented this to the Madras Government. The purchase of grain and the payment of grain wages soon afterwards ceased, and the operations of the transport agency were confined within the narrowest practicable limits.

11. Another important question was that of the accumulations of grain existing at various stations along the railways. The deficiency of engine power was found to be the principal cause of the “blocks,” and it was supplemented by engines obtained from other parts of India. The doubling of the line from near Madras to Arcot was recommended and put in hand, and facilities for importation for Mysore, via Negapatam

Review of
Sir Rd. Tem-
ple's report
on his mis-
sion to
Madras.

were afforded by the Madras Government. By these measures, and the unremitting and praiseworthy exertions of the Traffic Departments of the several railways, aided by the suggestions of an Engineer officer specially deputed to watch over the matter, the pressure was greatly relieved.

12. The character of the relief afforded was also one of the earliest matters for the consideration of the mission. Of this, Sir Richard Temple observes—

“There could be no doubt that, on the whole, the grave consequences with which the people had been threatened by the drought were being successfully averted. In the interior of the presidency, and especially in the most distressed districts above the Ghât mountains, there was no information of any mortality or even of any deaths of individuals from starvation. There was indeed information to the effect that nothing of the kind had occurred or was likely to occur. There was no sign of distress. Whatever distress had been threatened was being thoroughly relieved. Irrespective then of cost, present or prospective—irrespective also of any possible demoralising influences on the people—there was no doubt that the famine was being completely subdued.”

But the question remained whether the relief was not more than sufficient, and consequently unduly attractive to the people and unduly burdensome to the finances of the State. This question Sir Richard answered in the affirmative. It appeared that the proportions of the population on relief works and gratuitously relieved in the Bellary, Kurnool, and Kuddapah districts were 27, 35, and 16 per cent. respectively, while in the Bombay Presidency, in the Sholapur and Kaladgi districts, and part of Poona, which were similarly drought-stricken, the proportions were only 13, 3, and 11 per cent. In part this seemed attributable to the great size of the jurisdictions of the Collectors, and to the want of superior controlling authority on the spot. Sir Richard remarks as follows :—

“It has been already stated that on behalf of the Madras Government, one member of the Board of Revenue after another had visited temporarily the most distressed districts, had consulted with the local officers, and had made reports to the Government which had been very useful so far as they went. But these high officials did not always possess authority to give orders or instructions on the spot. Whatever authority they indirectly exercised was in its nature undefined, and was insufficient for conducting urgent and critical affairs. Each of them stayed but for a short time and then returned to Madras. There was no superior authority resident in the scene of trouble, vested with power, and imbued with that sense of personal responsibility which conduces to forceful and thoughtful administration. Consequently there was no policy laid down in adaptation to local circumstances. The District Collectors had not enough of guidance under circumstances transcending their ordinary experience. And junior Civil officers in out-stations and in remote subdivisions were sometimes obliged to confront extraordinary difficulties, to incur large expense, and to commit the Government to important decisions, without having received any definite instructions.”

Besides this, other causes for the large numbers relieved in the ceded districts and Kurnool were found to be at work. They were—

- “Offering of work close to the homes of the people.
- “Rendering the work light and easy.
- “Making the wages worth having irrespective of bare subsistence.
- “Admitting all comers without any question as to whether they could sustain themselves for a time.
- “Allowing all applications for employment without exception.”

“The wages were, at the outset, supposed to be low relatively to the dear prices of food. But they were not really low, when every member of the family was able to earn them close at home. The monthly earnings of a poor family, at this time on the relief works, was equal to the salary in ordinary times of the lowest paid classes who can read and write.”

13. The enforcement of the orders already given to the Madras Government for the introduction of task-work, and the strengthening of the local establishments by officers, Civil and Military, from whatever locality obtainable, were among the earliest points urged upon the authorities. Sir Richard also on the 21st January laid before the Madras Government proposals for—

- “Stopping all fresh admissions to relief works in Bellary, Kurnool, and Cuddapah, save under an order from some responsible official.

"Examining every gang person by person with the view of discharging for the present every one not in absolute need of State relief."

"Reducing the relief wage for men from 2 annas to $1\frac{1}{2}$ annas per diem, the wage for women and children to be adjusted accordingly."

"It was shown that at the price of common grain then prevailing and likely to prevail (namely, one rupee for eight seers or 16 lbs.) during the time of distress, the $1\frac{1}{2}$ annas rate would enable a man to buy 1 lb. of grain per diem, and to have a margin for buying vegetables and condiments. Besides the financial saving, which would be considerable, the foregoing narrative will have shown the importance of lowering the relief wage to the standard of subsistence, of sustaining life in ordinary health, and nothing more."

These views were accepted by the Madras Government on the 31st January, but with some modification—

"Instead of the wage of $1\frac{1}{2}$ annas per diem as proposed by me, the Madras Government ordered that the wage should be fixed for all relief labourers, not under professional supervision, at an amount representing the price of 1 lb. a day of grain plus $\frac{1}{2}$ anna for vegetables and condiments. This rate was as economical as mine, but it had this disadvantage that doubts would arise in different districts as to what kind of grain was meant, that time would be lost in discussion, and that, in the midst of doubts, the reduction of wage would in some localities fail to take effect. All this actually happened. The reduction did not take effect till nearly the end of February, and in many places it settled itself into the $1\frac{1}{2}$ annas rate,—the very rate first recommended."

"For those relief labourers who were employed by the Public Works Department under the departmental rules of work, or who, though supervised by other agency, might be working up to the departmental standard, a rate of 2 annas per diem was allowed."

14. Another important point was—

"To provide for the inspection of the poorer classes in the distressed districts from village to village, from house to house, in the highways and byeways, in every place where men either congregate or wander."

On this Sir Richard Temple reports as follows:—

"The orders of the Madras Government were that relief camps for the reception of destitute persons should be formed at all the principal places, and that the residuum of such persons should be relieved by the village headmen under the supervision of the district authorities. These orders were doubtless excellent so far as they went. But being general in their terms they needed to be followed up with more specific directions. On the 16th January I caused a detailed memorandum to be drawn up of the manner in which the Kurnool district might be divided into circles and sub-circles for the inspection of every house in every village for the purpose of searching out cases of destitution; which memorandum was immediately transmitted to the Madras Government. On the 19th January I drew attention to the importance of impressing upon the headmen of every village their responsibility for bringing before the nearest authority every case of dangerous distress. On the 8th February I formally represented to the Madras Government the general importance of the subject, observing that, however comprehensive the relief measures might be, still experience showed that individuals or families might be suffering in silence, and might compose themselves for death without complaining."

15. After submitting these various matters for the consideration of the Government, Sir Richard Temple made a series of visits to various parts. He observes:—

"My next care was to visit rapidly the distressed districts below the Ghât mountains. As already seen, some parts of those districts were much distressed. And if the ideas which had for a time prevailed in the districts above the Ghât mountains (Bellary, Kurnool, Cuddapah) should take possession of the people below them, the crowding of large numbers on relief works might become very embarrassing. I therefore passed through parts of Chingleput, North Arcot, Salem, Coimbatore, Trichinopoly, Madura, and Tinnevely. This visit was decidedly re-assuring. The failure of the autumn and winter harvests had been less; the promise of the spring harvest was better; the resources of the people were in several respects greater. Nothing like indiscriminate relief had prevailed; the local officers had been cautious and thrifty; the people had been taught the lesson of self-control under threatening circumstances. The recipients of relief were comparatively few, and their number did not seem likely to increase largely."

After the tour above noticed and a brief visit to Mysore, Sir Richard returned to Bellary, Kurnool, and Cuddapah to watch the effect of the new orders, and spent nearly a month there. He describes in the following graphic terms the change he found going on—

Review of
Sir Rd. Tem-
ple's report
on his mis-
sion to
Madras.

"The local officers, despite much difficulty, exerted themselves most loyally to restrict relief to those who absolutely needed it; to reject those who were making a convenience of the State bounty; while they extended discriminating charity to all cases of real misery. Many persons were discharged as being manifestly without claim to support from Government. This doubtless discouraged applicants who knew themselves unworthy. To such persons the reduction of the relief wage served as a further discouragement. This tended to keep the numbers down. As might be expected, the increased supervision brought to light the various sorts of frauds, malpractices, and false returns, which are sure to be found on these occasions everywhere. The returning of persons who never existed is expressively termed in these districts, the 'counting of crows in the air and entering them in a roll.' Sometimes outbreaks of small-pox or cholera or other sickness, sometimes also holidays and festivals, would cause gangs to break up, and not to re-assemble. Again, the relief works were systematically re-arranged in order to take the relief labourers to some reasonable distance from their homes, and to make the tasks in some degree irksome—so as to apply some test and trial of the reality of their need. The manner in which the gangs thinned their ranks—when required to move away, to perform a day's march, to render a fixed tale of work, to bivouac or encamp in the open fields—was quite remarkable. Then it was that tens of thousands proved by their own behaviour that they had been taking State wages for gain or convenience, and not for the support of life. More than this, many gangs, on receiving orders which would have been obeyed unhesitatingly by persons really in need, struck work, hoping to make terms with the authorities. Finding themselves unable to dictate their own terms, some would come back after remaining for a while on strike; but many stayed away altogether. Instance after instance occurred of gangs, some thousands strong, disappearing from muster on being told that the road running through the middle of their villages, to which they had sauntered leisurely day by day for weeks past, was now finished and that they would be assembled at another road one day or two days' march off. Other gangs equally large, on being set to do an augmented task, would cease working and run off shouting that this new burden was unjust, and that Government, having let them become accustomed to easy work, should allow them to continue in ease to the end. The effect of all this was to bring down the numbers week by week. In Bellary, Kurnool, and Cuddapah, the highest total in January of persons on relief works amounted to 950,000. It fell to 540,000 by the end of February, and to 490,000 by the middle of March. And the decrease is the more remarkable, inasmuch as the season was advancing during which the distress was expected."

Inquiries showed that in some cases the labourers were able to hoard a small portion of their wages, that in others only the women of a family were on the works, the men following other occupations of their own. The robberies and thefts which had been rife in November and December had for the most part ceased. Of village relief Sir Richard states—

"It was found that much was being done in this direction; that the village headmen had received strict injunctions to inspect, report, or relieve; that they had in many cases received small advances of funds, so that they would be without excuse for failing to afford relief in emergency; that circles had been formed, each containing a few villages only, there being a special relief centre in the midst of each circle; that there was a larger relief centre at the head-quarters of each subdivision comprising a cluster of circles. But still here and there among the villages, and sometimes among the gangs of sturdy and vigorous relief labourers, I found weakly or wretched individuals. And sometimes inquiry into these miserable cases showed that the poor people were sharing their wages with infirm people at home. Such infirm persons ought, of course, to have been sought out and brought forward for succour under the system of village inspection and relief. These and other circumstances induced me again to address the Madras Government, reiterating the recommendation made on the 8th of February, and suggesting the issue of more definite and detailed orders, compelling all village headmen to pay thorough attention to this part of their duties, and ensuring an effective watch over the headmen on the part of relief officers and officials of all grades."

In the course of the same period the necessity for a superior officer in the ceded districts, to direct and control all the relief operations, was formally represented. The commencement of the earth-work of the projected railways from Bellary towards Dharwar, and from Chingleput to Conjeveram, was also recommended and sanctioned by the Government of India. A visit to Nellore resulting in orders for the transfer of large bodies of labourers from the village works to the East Coast Canal completed the inspection of the distressed districts.

16. The probable cost of the famine was naturally the subject of careful calculation. In December the Madras Board of Revenue had made a rough estimate showing an expenditure of nearly $3\frac{1}{2}$ millions sterling, exclusive of losses of revenue. On the data furnished by the Collectors, which appeared high, but which were adopted in order that the Government of India might be prepared for all eventualities, a fresh estimate of 2,920,000*l.* was submitted on February 5th, being about half a million below that above referred to. On the 4th of March a third estimate was formed at the desire of the Government of India, which, owing to the extensive fall in the numbers relieved, amounted to only 2,176,000*l.* This, however, was expressly said to be contingent on the maintenance of all the existing economical checks, and on the propitiousness of the coming summer rains. The last estimate at the close of the mission was 2,050,000*l.*, exclusive, as before, of loss of revenue.

Review of
Sir Rd. Tem-
ple's report
on his mis-
sion to
Madras.

17. After a brief visit to Salem and Coimbatore, and an examination of relief camps near Madras, representations were made regarding the insufficient arrangements for separation of castes in relief camps, the provision of light relief work for weavers of fine fabrics, the failure of certain zemindars near Madras to perform their duty towards their tenantry and dependants, and the indiscriminate dispensation of private charity by benevolent Native gentlemen. All these subjects received in consequence suitable attention.

18. Early in March a controversy was commenced by the Sanitary Commissioner of Madras regarding the sufficiency or otherwise of the reduced relief wage. Sir Richard observes :—

“The Sanitary Commissioner of Madras had raised objections to the reduced scale of wages for relief labour, based on theoretical and scientific grounds, and supported by his previous experience of the people in Southern India. It was thought by him and by some others that the wage ought to be raised to the rate at which it had stood in the beginning of January. I, however, represented to the Government of Madras that the reduced wage had not received any proper trial, and that it ought, in justice to the public interest, to be fully tried. This view was accepted. It was at the same time ordered that any person in the relief gangs who might be found in a condition below par should be specially treated, either by extra allowance or by diminution of task.

“It was arranged that, when relief labourers brought to the work children of tender age unfit for labour, such children should receive a special allowance. This concession, on which the Madras Government laid great stress, obviated a risk which might otherwise have been run, when the relief wage was reduced.

“Besides the advantage of economy, which is considerable, there are obvious reasons for keeping the wage down to the lowest rate compatible with the health of the relief labourers. The people are less tempted to resort to relief except under necessity, as they are known to be much influenced by the rise or fall of the relief wage. The margin for illicit practices on the part of ministerial officials is narrowed. If the wage is liberal, a part of it is sure to be absorbed by these officials; if it be just enough and no more, then the labourers cannot afford to give anything to the officials. The question whether the wage representing 1 lb. of grain a day, and half anna for extras, is sufficient, can be decided by experience. There is reason to infer from the rates of wages in ordinary times—not of trained labourers or of persons employed in central places or on special work—but of the labouring poor among the villages, and from the ordinary prices of food grains, that a man of this class can hardly get more than 1 lb. a day besides extras. If that be so, it becomes important to establish a relief wage on this basis. It may be that somewhat more liberal terms have been allowed on former occasions. But that is no reason why these more economical terms should not be now introduced if experience proves them to be feasible. And although some instances to the contrary were adduced, still, at that time, the middle of March, large gangs of labourers in Bellary and Kurnool were known to have been working for some little time on the reduced wage without physical detriment. Opinion at Madras was apparently affected by the wretched condition of the wanderers who strayed into the capital or its suburbs, in quest of food, and who doubtless may need generous sustenance for a time. But these were cases of special distress, and were quite apart from the mass of relief labourers in the interior of the country, who had been employed before they could lapse into wretchedness, and had since been maintained in good case.”

* * * * *

Review of
Sir Rd. Tem-
ple's report
on his mis-
sion to
Madras.

"On this occasion* I was accompanied by Dr. S. Townsend, the Sanitary Commissioner to the Government of India, whose assistance had been asked for to enable me to judge of the physical condition of the relief labourers, and to estimate under professional advice the objections raised by the Sanitary Commissioner of Madras. After inspecting nearly 40,000 of these people in different parts of the country, Dr. Townsend stated his deliberate opinion that their physical condition was fairly good, and that there were no grounds perceptible for raising the wages. This opinion I duly reported to the Government of Madras.

"The Sanitary Commissioner of Madras has, however, admitted that with the special allowance given to the little children of relief labourers, perhaps also with the allowance of wages on Sundays, the reduced wage is about equal to that which he himself recommended.

"Still in some quarters it seems to be supposed that there is some connection between the mortality among the recipients of gratuitous relief and the reduced relief wages; if persons die at the gratuitous relief camps, or are picked up in a famishing state on the roads or elsewhere, that is imagined by some to be a proof that the relief wages must be too low. But evidently there is no connexion whatever between the two cases. Those who are found starving (with exceptions so rare as to prove the rule) are not, and have never been, relief labourers at all, and have not been earning any wages. Most of them are not accustomed or not able to work; and this is mainly the reason why they have been admitted to gratuitous relief. How, therefore, can the rate of relief wages possibly affect them? Any inference drawn from these conditions would be wholly irrelevant if applied to relief labourers. These poor people have sunk into danger, either because they themselves failed to apply for charitable aid, or because those who ought to have brought them forward for gratuitous relief failed to do so. But that is a matter quite separate from the question of relief wages, which refers to a totally different class of persons.

"Even though the reduced wage may, as now stated by the Sanitary Commissioner of Madras, be much the same as that which he recommends, and may so far have the support of his authority, still its effect ought to be carefully watched; and if any signs of real deterioration in the physique of the relief labourers should hereafter appear, there need not be any difficulty in raising it."

Before quitting this subject we may invite attention to two telegrams from the Madras Government which we enclose, from which it will be seen that on the 23rd instant the "reduced relief wage" was abolished. All labourers on civil works will consequently now receive the rates sanctioned on January 31st for those under Public Works supervision, but with an obligation to perform a task of only 50 per cent., instead of 75 per cent. of an ordinary task. The reasons which have induced the Madras Government to make this change are stated in their Despatch to your Lordship of the 26th ultimo, No. 38. We are not aware on what data it is calculated that the increased cost will be only one lakh and three-quarters per mensem, unless indeed the reduced wage was far less generally adopted than was supposed.

19. Another subject noticed by Sir Richard Temple is that of his recommendations for the suspension of land revenue demands, with a view to collection in future years, instead of absolute remission. He thus states the case:—

"In the Bengal Presidency the theory of the land revenue settlement is that the landholder bears any loss in bad years, for he enjoys all the profits of good harvests or high prices. In years of grievous failure of harvest it is customary to suspend collection of a part of the land revenue until the next good season comes. And in temporarily settled tracts some remission is often granted where all the crops have been lost. The theory of the Madras revenue system is somewhat different. In the districts under regular settlement the rule is, that if the water supply to any "wet" lands (that is, lands irrigated from tanks or rivers) wholly fails, then the land revenue on such lands is remitted in full, but not otherwise. For either it is a part of the implied understanding between Government and the ryot, or else it has been the practice, that water shall be provided to irrigate "wet" lands. On "dry" lands (that is, lands not irrigated at all, or irrigated only from wells) a reduction of 20 per cent. is made on the Government demand to meet vicissitudes of season; and on these lands no remission is granted save under very exceptional circumstances. In the districts not under regular settlement, remission of land revenue is granted on account of partial failure on "wet" lands, and it is also allowed more freely for loss of crop on "dry" lands.

"The present season of scarcity deepening into famine is indeed very exceptional; and the Madras revenue authorities considered that very large remissions of revenue

would be required; while they regarded it as inexpedient to hold in suspense over the ryots any part of the land revenue that could not with fairness be collected this year."

"The Madras land revenue has been moderately assessed, and falls comparatively light on 'dry' lands; and an ordinary ryot might well afford to pay the arrear land revenue of a bad year out of his profits, if the succeeding two years shall be good. The circumstance that lands irrigated from wells are taxed at 'dry' or unirrigated rates of land revenue, greatly strengthens the position of ryots on 'dry' lands; for crops irrigated by wells yield an outturn on which the assessment falls with very light incidence. On the other hand, a considerable portion of the whole land is held by very petty ryots, whose standard of living is low, and who might be unable to pay up the arrears of their land tax in full. I estimated, however, that perhaps two-thirds of the land revenue which could not fairly be collected this year, might be paid by the ryots during the two succeeding years, if the seasons should be propitious. And I recommended that the arrear land revenue of the present year should be kept in suspense, and that no remission should at present be promised on 'dry' lands, in order that the public treasury might have a chance of recovering part of the arrears, if the future seasons shall be favourable. If the people should be found hereafter unable to pay the revenue for this year, which by settlement or other arrangement they had engaged to pay, neither I nor anyone else would recommend their being unduly pressed."

"The Government of Madras held that his view could not be accepted, and that the practice of Northern India is not applicable to the different circumstances of Madras. In Bombay, where, as in Madras, the land is held on ryotwari (petty proprietary) tenure the Government after consideration accepted this view, so far that the arrears of the present year in the famine tracts of Bombay are in part 'remitted,' and in part 'suspended' for collection in future years if seasons permit. The Government of India decided that the question of remitting or suspending the land revenue should be left to the discretion of the Local Governments. And the latest estimate of the Madras Board of Revenue is that 143 lakhs of rupees (1,430,000L.) of land revenue must be remitted on account of the recent failure of harvest. I see reason to hope that the total remissions, which will not be precisely known till August next, will fall below this estimate; for the Board has inculcated and enforced on Collectors carefulness and regard for the public treasury within the broad lines laid down for the settlement of the affair."

The decision of the Madras Government is taking effect. The question has, however, an important bearing on the finance of famines in general, and we have under consideration a separate paper by Sir Richard Temple on the subject, prepared after perusal of the detailed papers which were lately supplied to him by the Madras Government.

20. After a further visit to Salem, Arcot, Bellary, and Kurnool, Sir Richard Temple's mission to Madras terminated. He thus summarises his movements and proceedings:—

21. In summarising the state of affairs at the date of his minute (April 14th), Sir Richard Temple points out that the numbers relieved rose in the last week of March from 761,000 to 810,000, and expresses his expectation that they must rise further. Of persons on the works, he considers that the great majority do really need and deserve relief, but that there are many thousands not in absolute want who would still leave the works if task-work could be properly enforced. More he considers might have been, and might still be, done in this respect, especially by greater utilisation of the Public Works Department. At the same time he admits that the distressed districts are unfortunate in having comparatively few large and practicable projects suitable for relief labour. Of gratuitous relief he remarks:—

"The total of those on gratuitous relief amounts now to 115,000 persons. It is in some degree swollen by little children whose parents are on the relief works. Excluding these children, I am sure that the total is not larger than it ought to be. Indeed, I fear that it is not large enough. Despite the persistent efforts which have been made, the system of village relief and house-to-house inspection is far from perfect. Disappointment may reasonably be felt at the shortcomings in this matter under a ryotwari system which offers such advantages in this behalf. Much was to be expected from the hereditary headmen and the hereditary accountants in the villages, who represent ancient institutions, which have been studiously fostered by the Madras Government for generations. These men may yet do well, and are doing better than they did, but at first they were backward in their duty."

Review of
Sir Rd. Tem-
ple's report
on his mis-
sion to
Madras.

On the general condition of the people he makes the following remarks :—

“The physical condition of the people in the distressed districts of the Madras Presidency is fairly good; better decidedly than it was expected to be. An impression (which I quite share) seems to be gaining acceptance that the agricultural classes have more self-sustaining power, more life-supporting resources than was originally anticipated. There is reason to think that the relief wages earned by so many thousands have not been entirely spent in buying food, but have in part been hoarded. This circumstance may be expected to facilitate the discharge of these people as soon as the season shall improve. There is still some lamentable mortality in or about Madras itself, and in some other central places below the Ghât mountains, which, though immediately caused by disease, is in part traceable to insufficient nourishment. The death-rate among the people received into the relief camps in and about the city of Madras continues extraordinarily high. These occurrences, happening at or near the capital, naturally make a painful impression on the public mind. Elsewhere the physical condition of the peasantry is in the main satisfactory, although to a broad and important statement of this kind there are, and must be, some exceptions. On the whole, the consequences of the drought are being well subdued.”

With reference to their frame of mind, he considers that, while the relief operations must bind the people to the Government with ties of gratitude and respect, the constant recurrence of scarcity in one part or another of the Madras Presidency, and the quickening sense of responsibility for relief on the part of the Government may have tended, and tend, to foster a disposition to rely on the State and to lower among the labouring classes the sense of the duty of being independently industrious.

22. The activity of the grain trade, the early symptoms of which have already been referred to, has been unremitting, but was rather more conspicuous in January and February 1877 than subsequently.

“From the beginning of the present trouble down to the end of March 1877, the quantities of food grain brought into the distressed districts of the Madras Presidency amounted to about 535,000 tons. This great supply was drawn from several sources, thus :—

By sea into Madras, Tuticorin, and other east-coast ports from Bengal,	
Burma, Orissa, and Ganjam	- - - - 356,000 tons.
By sea into Bey pore and other west coast ports	- - - - 118,000 „
By the Great Indian Peninsula Railway from Northern and central	
India into the Madras Presidency	- - - - 61,000 „

“The pressure of the scarcity was felt in the interior of the country before imported grain began to arrive from distant provinces. And the earliest movement of the grain trade was the transport of grain by rail from old stocks on the coast into the interior. Considerable importations from without began in November, and the imports went on increasing till they culminated in January with a total of 101,000 tons. The imports slackened somewhat in February, when the total was 80,000 tons; and they were still less during the month of March.

“Only 30,000 tons of all this quantity were imported on Government account; the rest, 505,000 tons in all, were brought into the country by private trade. The imported grain was distributed by the Madras railways into the interior of the country, thus :—

Bellary, Cuddapah, and Kurnool received	- - - 147,000 tons.
The Mysore province received	- - - 81,000 „
The districts of North Arcot, Salem, Coimbatore received	73,000 „
The districts of Chingleput and Malabar received	- 10,000 „
	311,000

Of this total some was sent into the Nizam's territory, and the remainder has either been distributed by the South Indian Railway, by cart or by canal-boat, through the coast districts, or is still awaiting means of railway carriage into the interior. There were some considerable grain imports by cart from the southern parts of the Bombay Presidency, and much grain was carted from Raichore and other places in the Nizam's territory into Kurnool.

It is estimated that if imported grain did not come into consumption before November, the grain carried into the interior by rail up to the end of March was sufficient to feed $3\frac{3}{4}$ millions of people for six months, or to support 25 per cent. of the population of the more distressed parts of Madras and Mysore from 1st November to the end of April. The sufficiency of these importations is shown by the fact that the price of common

food-grain at the larger marts has since January 1st usually been cheaper than 16 lbs. per rupee, while at the lesser marts in the interior it has rarely been so dear as 14 lbs.

Review of
Sir Rd. Tem-
ple's report
on his mis-
sion to
Madras.

23. With a view to the future and the frequent recurrence of famine in Southern India, Sir Richard Temple makes some interesting and valuable remarks on the destruction of forests and jungles owing to a variety of circumstances, which shall have our careful separate consideration.

24. The concluding part of the minute is devoted, in the first place, to a summary of the lessons to be deduced from all the circumstances which have yet occurred in connexion with these affairs, which is full of practical wisdom, and will not bear any further condensation. Much of what is here so ably stated commands our full concurrence, but as the famine is unfortunately not yet over, we shall defer detailed notice of the several points brought forward until we are in a position to review, as a whole, the operations of 1876-77 in Madras, Bombay, and Mysore.

25. Sir Richard Temple records in the following terms his appreciation of the courtesy and consideration which he has experienced during his very delicate and responsible duties, and of the admirable tone and conduct of the Madras local officers engaged on relief works, with whom he has been brought so much in contact :—

“I must declare my cordial thanks to the Madras Government and its principal officers for all the kindness and consideration received from them during my mission. And though the Government is doubtless well aware of the merits and services of its officers throughout this trying time, yet I must state my sense of, and add my testimony to, the excellent conduct of the local officers, the Collectors, Sub-Collectors, Assistants, and other Civil and Military officers employed on relief. Having travelled, worked, and lived among them for three months of strenuous exertion, I have unsurpassed means of knowing how unremittingly they have toiled, how thoughtfully they have planned, and how anxiously they have striven, in the service of the Government and for the good of the people.”

26. Regarding his personal staff Sir Richard Temple, who is always conspicuous for his readiness in acknowledging the assistance he receives from those who are employed under him, makes these remarks :—

“My thankful acknowledgments are due to the members of my staff, Mr. C. E. Buckland, C.S., Captain S. Rivett-Carnac, and Dr. R. Harvey, for their zealous and useful assistance in the work of the mission; also to Captain W. S. S. Bisset, R.E., for his vigilant attention to all affairs connected with the grain traffic on the railways.

“From my Secretary, Mr. C. E. Bernard, C.S.I., I have received valuable aid and counsel in every branch of the work, and I would represent his good service and his administrative ability for the favourable consideration of the Government of India.”

We have great pleasure in bringing to your Lordship's notice the excellent service rendered by the gentlemen named. While doing so, however, we must not omit both to express our own acknowledgments for the very able and exhaustive minute which we have just passed under review, and to repeat our warm admiration of the inexhaustible energy, the untiring zeal, and the conspicuous ability which have enabled Sir Richard Temple himself to endure, without, we are glad to know, any personal detriment, the enormous physical labour and the exposure to climate which his mission has involved, and to accomplish, by his tact, firmness, and discrimination, the objects which that mission was designed to achieve.

27. We enclose a letter* which we have addressed to the Government of Bombay, briefly reviewing the condition of the Native States in that presidency affected by famine. These States are 18 in number, and the portions affected comprise an area of 9,708 square miles, and a population of 847,848. Some parts of these States have suffered severely, but on the whole we are glad to find that there has been in them no extreme distress, and that the Native Chiefs and the political officers have taken measures sufficient to meet the necessities of the case.

* No. 261.

28. With reference to the 2nd paragraph of your Lordship's Despatch of the 26th of April, we enclose copy† of the proceedings of the Madras Government regarding the Sangam project, which would appear not to be yet ripe for execution. We also enclose a memorandum on the dynamic value of the task exacted from labourers on relief works, by Dr. Lyon, the Chemical Analyser at Bombay.

† No. 247.

29. We are glad to state that the prospects of the season are satisfactory, good rain having fallen in Bombay, Madras, and Mysore, and a fresh of upwards of four feet

having occurred in the Toombadra River. The numbers in receipt of relief were as follows according to the latest returns:—

In Madras	-	-	-	{ 772,947 on relief works.
				{ 412,461 charitably relieved.
In Bombay	-	-	-	{ 376,920 on relief works.
				{ 134,833 charitably relieved.
In Mysore	-	-	-	{ 64,399 on relief works.
				{ 108,482 charitably relieved.

We have, &c.
(Signed) LYTTON.

No. 263.

To his Excellency the Right Honourable the GOVERNOR-GENERAL OF INDIA IN COUNCIL.

Revenue No. 46. India Office, London, 7th June 1877.

No. 221.

Para. 1. The Despatch of your Excellency in Council dated 19th April, No. 21 of 1877, relative to the progress of the famine in the Madras Presidency, has been considered by me in Council.

2. The Despatch chiefly refers to the discussion on the question of the sufficiency of the scale of rations to labourers on relief works. On this point I have very recently been in telegraphic communication with your Excellency in Council, and you have stated that no restriction has been placed on the Government of Madras in relation to this matter, and that if that Government is satisfied that the present rate is unduly low, it would doubtless raise it. Under these circumstances, I have no further instructions to give on the subject.

3. The favourable opinion again recorded by Sir R. Temple on the progress of relief administration in Mysore is satisfactory; but some explanation seems necessary as to the remarkable disproportion of the gratuitously relieved to those who are employed on works in Mysore, as compared with both Madras and Bombay. This disproportion seems to be increasing every week, and I should be glad to be informed of the causes. With respect to the migration of inhabitants of Mysore to the adjoining districts in Madras, and the incidence of the charges incurred for their relief, the facts do not appear quite clear, but no orders are at present demanded on the subject.

4. I concur, in conclusion, with your Excellency's Government in regarding as satisfactory the prospect of the supply of grain to the ceded districts from the north, as detailed in Captain Bisset's memorandum of the 31st of March.

I have, &c.
(Signed) SALISBURY.

No. 264.

From the SECRETARY OF STATE to the GOVERNOR-GENERAL OF INDIA IN COUNCIL.

Revenue, No. 48. India Office, London, 14th June 1877.

No. 213.

Para. 1. The Despatch of your Excellency in Council, dated 12th April, No. 20 of 1877, relative to the famine in the Presidencies of Madras and Bombay, has been considered by me in Council.

2. The intelligence contained in this Despatch has been in some degree anticipated by telegrams, and I have also, by the same mail, received another Despatch, of the 19th April, from your Lordship's Government, containing information of a later date. It will not, therefore, be necessary for me to notice at any length the topics to which allusion is made in the present communication.

3. I concur with your Excellency's Government in considering that the Government of Bombay is entitled to great credit for the firmness and care with which it has dealt generally with the famine, and especially with the organised combinations to oppose its orders as to the grant of relief.

4. The statement of Sir R. Temple, that in the Deccan districts of Bombay no abuse of State charity is allowed, no appreciable amount of Government money is wasted, and no demoralisation of the rural classes is going on, is very satisfactory.

I have, &c.
(Signed) SALISBURY.

No. 265.

From the SECRETARY OF STATE to the GOVERNOR-GENERAL OF INDIA IN COUNCIL.

Revenue, No. 49.

India Office, London, June 14, 1877.

Para. 1. The Despatch of your Excellency in Council, dated 3rd May, No. 23 No. 245. of 1877, on the subject of the famine in the Presidencies of Madras and Bombay, has been considered by me in Council.

2. On the question of more effectually utilising the Public Works Department in the superintendence of relief works in the Madras Presidency, I do not propose at present to offer any remark. This subject has been alluded to by the Madras Government in a Despatch just received, and I am promised a more detailed communication on the question involved by an early mail. It would, therefore, be premature for me to enter on the discussion at the present juncture, and my abstaining from any remark now will enable me to receive a copy of your proposed Despatch to the Government of Madras, and a further expression of the views of that Government, before recording any opinion on the issue which has been raised.

3. With respect to the discussion between the Sanitary Commissioner at Madras and Sir R. Temple as to the rate of wages, I have addressed your Excellency by telegraph.

4. I fully concur in the estimate formed by your Lordship in Council, to which you have given public expression in the notification dated 30th April, of the valuable service rendered by Sir Richard Temple in the execution of the arduous duty connected with his recent mission to the distressed districts in the Presidencies of Madras and Bombay.

I have, &c.
(Signed) SALISBURY.

REPORT.

I.—EUROPEAN ARMY.

The total death-rate in the European Army of India during 1875 was 17·48, or, excluding cholera, 14·16 per 1,000. In 1874 the rate was 13·58 per 1,000, the lowest that had ever been recorded. The following statistics may be compared with those of former years by reference to previous volumes :—

Per 1,000.

	Admissions.	Daily Sick.	Deaths.
Bengal - - - -	1,387·5	57·6	17·32
Madras - - - -	1,109·7	56·8	14·85
Bombay - - - -	1,404·0	53·6	20·92
Army of India - -	1,337·8	56·8	17·48

Except in the case of Bombay the ratios of sickness showed improvement, while the death-rate in all cases was considerably higher than in the preceding year.

The main causes of sickness were malarial fevers and venereal diseases; the latter stood first in the Madras Presidency. The following were the principal sources of mortality :—

Cholera	-	-	-	194 deaths.
Hepatitis	-	-	-	108 „
Apoplexy	-	-	-	101 „
Enteric fever	-	-	-	84 „
Phthisis pulmonalis	-	-	-	73 „
Malarial fevers	-	-	-	61 „
Heart diseases	-	-	-	60 „

The rate of invaliding was 40·25 per 1,000, against 43·78; the comparison being favourable to 1875 as regards both the number sent home for change and the number sent home for discharge. Of the discharges none were due to specially Indian diseases.

The year 1874 had been remarkable for the general immunity from cholera; among British troops there were only 12 cases. In the succeeding year the disease prevailed as an epidemic throughout the country. The cases in the European Army were as follow :—

Army.	Cases.	Deaths.
Bengal - - - -	201	136
Madras - - - -	7	4
Bombay - - - -	80	54
Total	288	194

The ratios, however, compared favourably with those of former epidemics. Great advantage was found to result from the removal of troops out of affected localities; and as the result of long and careful observation points very decidedly to the local rather than personal influence of cholera, it is probable that in future epidemics this policy will be generally carried out.

In the whole Army only 12 cases of small-pox occurred, of which 2 were fatal. Small-pox.

Malarial fevers were generally less prevalent than in either of the four previous years. There were 166 cases of enteric fever, 84 of which were fatal. Consequent on a previous suggestion by the Army Sanitary Commission (*see* Vol. VIII., p. 132), special attention was bestowed in all the Presidencies on the local examination of stations where cases occurred. Fever.

- Hospitals.** The mortality from hepatitis in the Army generally was less than it had been in the four past years, but in Madras it headed the list, as it had always done since 1871.
- Apoplexy.** Apoplexy was more fatal than it had been for many years back, excepting 1872: there were 240 cases and 101 deaths from this cause.
- Venereal disease.** The statistics of venereal disease were generally more unfavourable than in any of the previous four years. The Sanitary Commissioner (Dr. Cuninghame) is much disappointed with the results of the lock hospital system.
- Drunkenness.** In Bengal and Madras the returns of drunkenness among British soldiers showed an improvement; in the former the cases reported fell from 10,988 to 8,926. On the other hand, in the Bombay Army a considerable increase of intemperance appeared from the returns.
- Indian service.** The statistics show that, while, as regards length of service, British troops suffer much more during the first year than afterwards, as regards age, the excess of mortality as compared with the English rate becomes more decided as years advance. The health of soldiers commencing Indian service continued to be carefully attended to.
- The number of European troops and their families quartered in the hills of the Bengal Presidency has steadily increased since 1870; in 1875 the men numbered 9,150, women 839, and children 1,810.
-

II.—NATIVE ARMY.

The ratios of admissions and of daily sick in the Bengal Native Army, calculated on the strength present, were 1,287·5 and 40·3 per 1,000 respectively; and the death-rate, reckoned on the total strength, was 16·3 per 1,000. These figures do not include the Madras troops serving in Bengal, for which the ratios were 897·7, 26·2, and 14·2. In both cases the sickness was less, and the mortality greater, than in 1874. The increase of mortality occurred chiefly in the Punjab Frontier Force.

The comparison with the statistics of the previous 10 years is very favourable to 1875 as regards both sickness and mortality.

Malarious fevers and bowel complaints caused a large proportion of the sickness in the Presidency and Eastern Frontier districts and in the Lahore and Peshawur commands; and the same diseases occasioned a great deal of the mortality. An unhealthy condition also prevailed very generally among the sepoys induced apparently by insufficiency of diet. The food available for them was, as a rule, plentiful, cheap, and of good quality, but, from motives of parsimony, and in a few cases also in consequence of a religious vow, underfeeding was very common. The fact that the death-rate among the Mussulmans is always lower than that among the Hindoos may possibly be connected with the use among the former of a more varied and generous dietary.

Of 132 cases of cholera, 58 were fatal. Only 34 cases of small-pox were treated, showing that the men were well protected.

It was found that marching and camp life produced a most beneficial effect on the health of the men. Tree-planting was also much resorted to, experience having shown that trees, planted with certain precautions, prove advantageous to health by preserving the purity and increasing the moisture of the atmosphere, as well as by protecting from extremes of temperature, and affording a grateful shade by their foliage.

The following table shows that in the Madras Native Army during 1875 both the numbers of admissions and of daily sick were below the averages of the preceding three years, while there was a marked increase of mortality and of the numbers invalided for discharge and sick leave:—

Years.	Ratio per 1,000 of Strength.				
	Admissions.	Daily Sick.	Deaths.	Invalided for	
				Discharge.	Sick Leave.
1872 - -	1,011·5	31·1	12·2	17·2	22·2
1873 - -	874·6	29·1	9·2	19·4	18·2
1874 - -	812·0	30·6	9·9	29·5	21·2
Average -	899·3	30·2	10·4	22·0	20·5
1875 - -	798·2	30·2	11·7	30·1	24·0

By far the largest number of admissions in 1875 was due to malarious fevers, but, although this was the case, the actual admissions under this head were very much fewer in 1875 than in the previous year. The diseases from which the next greatest numbers of admissions occurred were skin diseases, rheumatic complaints, and eye diseases. In the year under report bowel complaints were more prevalent than in the preceding year, but there was a marked decline in eruptive and continued fevers.

Malarial fevers and lung diseases produced the largest numbers of deaths, and next to these came bowel complaints. Lung diseases however were, with reference to the number of admissions, by far the most fatal, the percentage of deaths to admissions under this head having been no less than 7·4.

Considering the great prevalence of cholera amongst the civil population in 1875, it is remarkable that in the Native Army there were but 88 seizures, and 34 deaths. As

NOTE.—The figures in this Section are taken from the Surgeon-Generals' returns, not from the Sanitary Commissioners' Reports.

some of the regiments were quartered in stations in which the disease was very prevalent, such an immunity could not be considered as merely fortuitous, but it was probably due, in a great measure, to the various sanitary improvements which had been carried out in the lines, and to the care exercised over both men and followers during the prevalence of an epidemic.

Bombay
Army.

During the four years 1872 to 1875, while the average strength of the Bombay Army remained almost stationary, there was a progressive annual diminution in the statistics of sickness, showing apparently that the measures taken to preserve the health of the soldiers have, except in some notoriously insalubrious stations, borne year by year more valuable fruit.

The ratio per 1,000 of admissions to hospital during 1875 was 1,116·3. The mortality, however, was greater than that of 1874, the ratios being 12·2 against 10·9 per 1,000; the principal cause of this was the epidemic of cholera which prevailed amongst a portion of the troops.

This epidemic, which raged severely among the civil population over all the districts of the Presidency except Sind, touched the Native troops comparatively little, although many regiments were stationed in affected localities. The Presidency and Sind divisions were wholly untouched by it. In the Poona Division there were 22 cases and 15 deaths, and in the Northern Division 98 cases and 56 deaths. Surgeon-General Thom "cannot speak too highly of the efforts of all the regimental medical officers to prevent the disease reaching the lines, to check it by careful treatment, and to thoroughly cleanse every place and article which had any connexion with cholera." But, while according every credit to such deserving efforts, he adds that similar efforts failed to keep the disease out of the lines in several stations.

Malarious fevers were the principal cause of sickness. At Poona a considerable increase in the number of fever cases took place, due no doubt to the continued wet weather which occurred there in August. In the 1st Regiment Light Cavalry, owing to the flooding of the camp and to the insanitary state of the grass-cutters' lines, a very severe type of ague showed itself, and continued to prevail till the end of the wet season. Similarly the increased insalubrity of Jacobabad was attributed to the floods of 1874. The percentage of malarious fevers to the total diseases treated was, for the Presidency 35·2, for Poona 37·7, for the Northern Division 39·7, and for Sind 52·8.

Vaccination was thoroughly carried out, and only infants of tender age remained unprotected. There were no deaths from small-pox.

Food was reported to be generally cheap and good, but vegetables were in many places scarce. The officer commanding the wing of Her Majesty's 10th Native Infantry at Augur established a regimental garden, well stocked with vegetables of all kinds, which were distributed to the men at the small charge of six pies each per mensem.

III.—GENERAL POPULATION.

The following tabular statement gives a concise view of the comparative mortality in the different provinces of British India from the four principal death causes :—

Mortality
from chief
diseases.

1875.

PROVINCES, &c.	CHOLERA.		SMALL-POX.		FEVERS.		BOWEL COMPLAINTS.	
	Total Deaths.	Ratio per 1,000.	Total Deaths.	Ratio per 1,000.	Total Deaths.	Ratio per 1,000.	Total Deaths.	Ratio per 1,000.
Bengal (excluding Calcutta)	108,262	1·80	5,280	·09	368,087	6·14	35,645	·59
Calcutta	1,726	4·01	775	1·80	5,444	12·67	2,095	4·87
Madras	94,546	3·12	24,775	·82	252,042	8·32	37,484	1·24
Bombay	47,629	2·93	3,461	·21	219,156	13·50	33,650	2·07
Punjab	6,246	·36	13,611	·78	279,825	16·00	27,549	1·57
North-West Provinces	41,106	1·33	25,819	·83	456,485	14·83	80,337	2·61
Oude	23,321	2·09	5,612	·50	130,609	11·69	6,515	0·58
Assam*	6,618	1·72	159	1·11	1,113	7·79	484	3·39
Central Provinces	14,643	1·98	20,226	2·73	120,480	16·26	15,562	2·10
Berar	22,465	10·28	927	·42	26,076	11·93	20,818	9·53
British Burma	761	·27	752	·26	25,075	8·74	5,212	1·81

* The figures for Assam, except those relating to cholera, are limited to the "selected areas."

Some facts brought out by this table are the excessive loss from cholera in Berar, the great fatality from bowel complaints in the same province, the high death-rate due to small-pox in the Central Provinces, and the very large proportion of the mortality in all the provinces registered under the head of fevers.

In the Bengal Sanitary Report for 1875 the following opinion is given with reference to the working of the system of registration in selected areas :—

"It has been shown that the system of selected circles of registration has not answered, in that no decided improvement in results has taken place since its introduction, while a small, but steady, advance has been made in the general circles. It is also evident that the chief object of registration, namely, to ascertain the locality and potency of disease-causes with the view to their abatement or removal, cannot be attained by a scheme which includes but 4·48 per cent. of the population and 2·28 per cent. of the area of the province. There can be no doubt, too, that the mere selection of special circles of registration implies the admission that general registration is, for the present at least, of less importance, and, as a consequence, general registration is undervalued, and in some districts, it is feared, neglected."

The Sanitary Commissioner with the Government of India is in complete accord with these views.* The Local Government, however, remark on the subject :—

"The objections brought forward have been separately disposed of and need not be now repeated. It need only be said that they have not been accepted by Government. The general opinion of the local officers who have been consulted is very decidedly against making any change in the present system, and in the opinion of the Lieutenant-Governor that system should be maintained. The greatest respect is entertained for the views of the sanitary authorities, and their endeavours to improve the registration are most cordially acknowledged; but it seems to be the case that their endeavours can be most efficiently met by the gradual extension of the system of selected areas, and this is an object which accordingly will always be borne in mind by Government."

* The Sanitary Commissioner for Bombay objected in the following terms to the introduction of a similar system in that Presidency :—

"If no use were to be made of what may here be termed the outside returns, there would be little use in transmitting them to a central office; but, seeing that we have them for the past ten years, it would be a pity to give up the ground already gained, more especially as the prospect is more promising. If, again, in these outside areas it were known that the deaths, though registered, were not returned to an office in which they are so closely scrutinised, they would gradually become less and less accurate. I cannot but think it will be better to lighten the mass, and let it work—no matter how slowly."

At the same time, the following measures have been carried out, with the approval of Government, with a view to the improvement of general registration :—

1st. A modification of the registers and statistical forms; the new forms being brought into use on 1st January 1876.

2nd. The increase of registering stations.

3rd. The extension of compulsory registration. With regard to this, however, the Lieutenant-Governor states that, except under special circumstances, the operation of the compulsory Act will be restricted within the limits of municipalities and of selected town areas, the country at large not being yet ripe for such a measure.

4th. The early publication of the results of registration in each district.

5th. Prompt intimation to district officers of the nature and locality of defects appearing from the monthly returns.

The death-rates in the selected circles show nearly equal results for three years :—

		Urban.	Rural.	Combined.
1873	- -	26·84	23·26	24·85
1874	- -	28·59	21·20	24·72
1875	- -	29·27	20·72	24·80

As a whole, the figures of the selected areas, especially of the country districts, cannot be accepted as even approximately correct, but for some towns and rural circles they are believed to be fairly complete. Howrah gives a ratio of 49·03 per 1,000; Darjeeling of 43·07; Gya of 36·63.

The death-rate in Calcutta, calculated on the census of 1872, was 33·67 per 1,000; or, according to the special census taken of that town in April 1876, 35·08 per 1,000.

The proportion of births per 1,000 in the selected circles rose from 21·81 to 24·07.

No single district in the province escaped altogether from cholera, and in some the disease was in operation all the year round. More than one fifth of the total mortality was attributed to this cause. The number of deaths in each month was as follows :—

January	- -	4,993	July	- -	6,140
February	- -	5,580	August	- -	4,297
March	- -	11,191	September	- -	2,623
April	- -	12,395	October	- -	5,425
May	- -	10,695	November	- -	18,363
June	- -	7,998	December	- -	18,562

Thus there appear to be two distinct periods of the year in which cholera prevails with greater intensity in Bengal, viz., in the hot season from March to July, and in the two last months of the year, which are always full of malaria. The rainy season was the period when there was least cholera.*

Small-pox was present during the year in every district. It prevailed with slightly increased intensity as compared with 1874 in 11 districts, and with considerably abated activity in the remaining 33 districts. It was, on the whole, very mild in character, and considerably less fatal than in 1873 and 1874. Only 5,280 deaths were reported to have occurred in 1875, against 10,933 and 12,056 in the two preceding years.

As usual, the disease recurred with the greatest severity in the hot months. Prevailing in February, it advanced in activity and fatality as the hot weather progressed, culminating in intensity in April. Hooghly, Backergunge, and Tipperah were exceptions in this respect, for in these districts the greatest mortality occurred in November and December.

Deaths from fever numbered 368,087, against 328,721. The reports indicate, with few exceptions, that it occurred with less severity than it did in the previous year, and the apparent increase which the results of the year show are probably due to improvement in registration. By far the largest proportion of the fever of this province is of malarial origin, and the specific fevers of Europe are seldom met with or recognized except in Calcutta and its neighbourhood.

The seasonal activity of this cause of death in Bengal was found to be similar to that of previous years. Fever declines in fatality from January to February, increases

* Further information on cholera in Bengal will be found under SPECIAL DISEASES (p. 40).

somewhat in March, April, and May, and returns fewest deaths in June. From June there is gradual increase again, month by month, till November, when the maximum intensity is reached. From November the decline in the mortality is rapid, and continues till February of the following year.

The recorded deaths from bowel complaints amounted to 35,645, but it is believed that much of the mortality which should be registered in this class is included with fever and other diseases.

The year was characterised in the Madras Presidency by a prolonged and trying hot season. The rainfall was at the same time below the average, and very much less than in 1874. The most notable result of these peculiarities was a deficient supply of potable water, and this, combined with the depressing influence of a long sustained high temperature, had an injurious effect on public health, which was also greatly disturbed by a very severe epidemic of cholera, and by the prevalence of small-pox and fever. So far as the civil population were concerned, 1875 was, from these causes, one of the most unhealthy years that had been experienced in Southern India for a considerable period. Madras.

Among the native population of this Presidency 641,260 deaths were registered, the proportion per 1,000, calculated on the census of 1871, being 21·1, against 17·1 in the previous year. The prevalence of cholera was one cause of the higher rate. In some of the municipal towns the mortality was very high, reaching 73·8 per 1,000 at Cumbum. The death-rate in the capital was 35·6, comparing favourably with 37·1* in 1874.

Deaths from cholera numbered 94,657†. Small-pox was universally diffused, but the number of deaths (24,787) was less than in any year since 1871. Fever deaths amounted to 252,131; the mortality from this cause is said to have been increasing year by year since 1868. Under bowel complaints 37,613 deaths were registered.

The birth-rate in the Bombay Presidency for 1875 was the highest recorded, namely, 21·01 per 1,000. For every 100 male there were 90·52 female births. The death-rate was 23·15; the maximum was in July, and the minimum in February. Bombay.

The Bombay Government propose, until a separate agency can be found, to work the registration under the orders of the Collector; and an important element in the change is, as the Army Sanitary Commission observe, that the people themselves will be "called on to assist in providing correct information for entry in the records, and may thus be led to take greater interest in measures for diminishing their village death-rates. So far as concerns the general sanitary work of the Presidency, these proposals will have the immense advantage of liberating the Sanitary Commissioner from statistical details, and thus enabling him to devote his whole time to his proper functions. The plan, as a whole, is worthy of a full trial, and will doubtless lead to greater completeness in registration, and possibly in time, and by the influence of the inspectors, who are all medical men, to more accurate knowledge of the chief death causes than has hitherto been possible."‡

There were 47,555 deaths from cholera among the civil population, out of 96,012 attacked; in the previous year there had been only 37 deaths.§ The monthly distribution was as follows:—

January - - -	1	July - - -	12,906
February - - -	1	August - - -	8,609
March - - -	10	September - - -	3,493
April - - -	795	October - - -	3,548
May - - -	5,359	November - - -	1,640
June - - -	10,374	December - - -	819

From small-pox 3,461 deaths were recorded, against 3,903. The highest mortality was in April, and the lowest in October.

The fever deaths were 219,156 in number, exceeding those of any past year of registration.

* Not 36·6, as stated in last volume, p. 6.

† Full information respecting the rise and advance of the epidemic of 1875 in the Madras Presidency will be found at p. 110.

‡ See MEMORANDUM, p. .

§ For a table of deaths in the ten years 1866-75, and the particulars of the epidemic, in the Bombay Presidency, see p. 118.

Punjab.

The registration of vital statistics in the Punjab showed some further advance, but was still generally in an unsatisfactory condition. The Government having advised all municipal committees to pass a byelaw rendering registration compulsory, in the year under review 33 municipalities complied with this advice, and altogether there were 157 municipalities, inclusive of 7 cantonments, in which the registration of births and deaths was rendered legally compulsory. In the five principal cities*

*Umritsur	-	62
Delhi	-	51
Lahore	-	43
Peshawur	-	45
Mooltan	-	34

the death-rates were very high, owing partly to improved registration and partly to the peculiar unhealthiness of the year.

The total number of deaths registered in the province was 130,495 in excess of the number in 1874. The great bulk of the increase was under the head of fevers, to which 279,841 deaths were assigned, being 89,210 more than in the preceding year. There was an enormous mortality from remittent fever. The state of the Jullundur Doab attracted special attention in this respect. In the town of Jullundur upwards of 500 people died in a single week out of a population of 33,673. The popular belief is that this increase of fever in the Doab is due to the country having become waterlogged (the height of the water in the wells having risen two or three feet), and that the only effective remedy is thorough drainage.

Deaths from bowel complaints increased from 16,407 to 27,550.

The statistics of deaths from cholera for a period of ten years are as follow:—

1866	-	1,051	1871	-	369
1867	-	43,146	1872	-	8,727
1868	-	532	1873	-	148
1869	-	9,258	1874	-	78
1870	-	469	1875	-	6,246

The deaths from this cause registered during 1875 were thus distributed:—

January	-	4	July	-	747
February	-	4	August	-	1,515
March	-	4	September	-	2,117
April	-	10	October	-	1,358
May	-	41	November	-	129
June	-	316	December	-	1

The disease made very slow progress till the week ending 31st July. After that date the mortality rose rapidly till the week ending 4th September, when it reached its climax. Then for five weeks it fluctuated. In the week ending 16th October a downward tendency was very marked, and the mortality declined without a check to its final extinction at the close of November.

The outbreak of cholera at Simlā was referred to at length in the last Report (p. 29).

In the returns of deaths from small-pox there was an advance from 12,026 to 13,594. Compared with 1873, however, the mortality from this cause continued to show a remarkable diminution, which is distinctly traced by the authorities to the effect of vaccination.

North-West
Provinces.

The death-rate recorded in the North-West Provinces for 1875 was 21·8 per 1,000, the same as in the preceding year. It is considered to be much below the reality. For town circles the rate was 31·70, and for rural circles 21·07; but it is not probable that an average of one-third more deaths occur amongst the urban populations than amongst the rural. In many districts the registration was well effected, and the Sanitary Commissioner is of opinion that the failure, seen in the results for the whole province was due to neglect of registration in a few districts, especially in those of Bustee and Allahabad.

The following statement shows the number of cholera deaths registered for some years back:—

1865	-	76,322	1871	-	3,473
1866	-	8,175	1872	-	50,565
1867	-	57,837	1873	-	15,268
1868	-	20,680	1874	-	6,396
1869	-	90,770	1875	-	41,106
1870	-	13,123			

The Army Sanitary Commission make the following comment on these figures :—
 “ We know little as yet of the laws which determine the intensity of epidemic cholera, but it is not an unimportant feature in this record of mortality that the aggravations of the disease have been less intense during the latter than during the former years of the series, and that the total mortality has diminished.”

The disease prevailed in all parts of the province, excepting Jhansi and Lalitpur in the south and Kumaon in the north. During the months of January and February a few sporadic cases occurred in all parts of the province; in March the disease commenced to be epidemic in the eastern districts; in April it had become epidemic in all those districts; in May the epidemic influence had extended to nearly all the central and western districts; during June, July, and August this extended prevalence continued, the mortality being nowhere very severe; in September and October it declined in the eastern, while it increased in the western districts; in November the disease prevailed only in Rohilkund to any extent, and in December only in Bustee.

Deaths from small-pox numbered 25,819, against 93,247 in 1874. Omitting Kumaon, Gurhwal, and Dehra Doon, which have been practically exempted by the protecting influence of vaccination, the disease was present, in a fatal form, in some part of every other district of the province.

The usual great mortality was recorded from fevers.

Bowel complaints were the cause of 80,337 deaths, against 60,865. The mortality from this cause appears to fall principally upon the people of Bundelkund and the Himalayahs, and of certain districts of the Doab and Rohilkund. It is noteworthy that no deaths were recorded in any eastern district, although dysentery might be expected to prevail more in the eastern than in the western districts.

With respect to the mortuary tables for Oude, the Sanitary Commissioner remarks :— Oude.

“ It is needless to dwell on the known untrustworthiness of these returns, which is the natural upshot of employing the agency that is used to collect them; for, as the Deputy Commissioner of Sultanpur writes of the chowkedars, ‘ it has been found on actual enquiry that young children, girls especially, count for nothing, so too aged women; what they consider it necessary to report is the deaths of able-bodied men and males in general, and next adult women, with a limit of discretion.’ * * * As long as we have to depend on the chowkedars and relatives of the deceased, no great improvement is to be looked for; nor, indeed, do I believe that we shall get anything of a satisfactory nature until the work is carried on by paid officials,* either by the village putwarees, or, if we can get nothing better, by the chowkedars, who would no doubt be far more careful and zealous if a portion of their stipend were to depend on the attention paid to mortuary registration.”

With regard to Sitapur, where the deaths were registered at the rate of 47·58 per 1,000, he observes :—“ This return makes one almost believe that the high number was the result of that complacent urbanity which induces a native to endeavour to suit his returns to his superior’s wishes.” The rate given for Pertabgurh (38·3) is considered to be probably an approach to the truth.

The mortality from cholera amounted to 23,321. The comparison with previous years brings out the remarkable immunity of 1874 :—

1869	-	-	23,134	1873	-	-	3,961
1870	-	-	15,318	1874	-	-	68
1871	-	-	16,032	1875	-	-	23,321
1872	-	-	26,566				

The monthly progress of the disease was as follows :—

January	-	-	—	July	-	-	1,050
February	-	-	56	August	-	-	979
March	-	-	824	September	-	-	1,636
April	-	-	8,726	October	-	-	1,856
May	-	-	4,206	November	-	-	862
June	-	-	2,137	December	-	-	989

* The Government of India do not concur in this view, and observe :—“ The chronicling of domestic events is a duty which must be performed by the people themselves, and it is only by urging on them its practical importance that they will gradually become accustomed to its performance.”

Throughout the epidemic there was no regular progress in any one definite direction either from east to west, or otherwise along main lines of communication. There was rather a series of isolated outbreaks, commencing in given spots and spreading thence in every or any direction.

The Sanitary Commissioner sees no reason to believe that the disease was imported, as the experience of previous years seems to point to the fact that cholera has taken up its permanent residence in Oude.

Small-pox occasioned 5,612 deaths, being 9,618 fewer than in 1874. The decrease is probably due in part to defective registration, and in part to the fact that every great epidemic is followed by a lull, the number of possible victims being reduced by previous years' outbreaks. Vaccination has made too little advance to receive any of the credit.

There were 130,609 deaths attributed to fevers. Some remarks in regard to this death-cause will be found under SPECIAL DISEASES (p. 44).

Central
Provinces.

The registration in the Central Provinces produced a mean birth-rate of 35·35, and a death-rate of 26·32 per 1,000, being an increase on the rates of the previous year of 0·42 and 2·83 respectively. Of 261,906 births, 139,412 were of males and 122,494 of females. The increase of mortality was the result chiefly of the great prevalence of cholera and small-pox. The deaths of infants under one year of age formed 27·2 per cent., and of all children under six 48·7 per cent., or nearly one-half of the total deaths. In the district of Narsingpore, which suffered very severely from small-pox, the deaths of children under six years of age formed 64 per cent. of the deaths from all causes.

The following table shows the number of deaths from the four chief causes, as compared with the previous year:—

	1874.	1875.
Cholera	14	14,643
Small-pox	17,696	20,226
Fever	118,043	120,480
Bowel complaints	14,535	15,562

In the course of the five years intervening between 1869 and 1875 the amount of cholera had been very slight and limited to small areas, but in 1875 it became widely prevalent, and although the mortality it occasioned was not so great as in 1869, cases occurred in every district of the province with the exception of Damoh. A reference to the Memorandum of the Army Sanitary Commission (p. 169) will show the distinct effect upon cholera in various towns and districts of cleanliness and of an abundant supply of good water.

The year 1869 was marked by great prevalence of small-pox as well as of cholera. In the following year cholera became almost extinct, but small-pox, though it declined to less than a tenth of its prevalence over the province in the previous year, and had altogether died out in the districts in which it had prevailed with the greatest severity, continued to spread in the remote districts of the Satpuras, and it was not until 1871 that it reached its minimum of prevalence. But in that year, although it was almost entirely absent from the greater part of the province, a new epidemic commenced in the extreme west, which continued to spread during the four subsequent years, reaching its maximum of prevalence in 1875.

The excess in the fever mortality over that of 1874 occurred chiefly in the first six months of the year. The mortality of the last six months (the fever season) was on the whole less in 1875 than in 1874.

Berar.

Progress continued to be made in securing more correct registration of vital statistics in Berar, but the calculations lose much of their value from being based on census returns taken in 1867. The average death-rate from all causes, which in 1874 had been 27·9, rose to 40·2 per 1,000; this large increase was chiefly due to the cholera epidemic, to which 25·4 per cent. of the total death-rate was due.

Cholera* was more general and more severe in Berar than in any other province of India; the deaths from this cause numbered 22,465. Its first appearance was on the 9th of May in the Buldana district, and its monthly progress was as follows:—

May	249	September	2,007
June	3,625	October	318
July	10,374	November	52
August	5,840		

* See also remarks under SPECIAL DISEASES, p. 43.

No efforts were spared to alleviate the sufferings of the people and to check the spread of the disease.

The small-pox* deaths numbered only 927, being fewer than in any year since 1871. There were 26,076 deaths registered under fevers; and 20,818 under bowel complaints. The mortality from the latter cause continued to hold its high place in this as compared with other provinces.

In British Burma efforts were made to secure trustworthy vital statistics, and there was some improvement. The district officers, however, are stated to have taken very little interest in the work. The death-rate, reckoned on the population shown by the capitation tax returns, was 14·08 per 1,000. The statistics of towns were not satisfactory; the death-rates varied from 9·41 and 10·69 for Pongday and Akyab to 38·55 and 40·55 for Shwe-doung and Bassein. Amongst children under five years of age the mortality was 30·13 per cent. of the total number of deaths at all ages.

There were only 761 deaths reported from cholera, which did not assume an epidemic form anywhere but in the town of Bassein.

It appeared in the district of Moulmein in April, and continued in a sporadic form until August, causing 84 deaths. In the town there were 27 deaths, scattered over its large area.

The next cases were in the town of Rangoon and the neighbouring district of Thonkwa, where it appeared simultaneously on the 3rd November; those in the town of Rangoon appeared on the river-bank. In the Thonkwa district 206 deaths occurred; the civil surgeon, however, was of opinion that the disease there was not genuine cholera.

On the 12th December a healthy girl was attacked in the town of Bassein, and died in a few hours; this case was rapidly succeeded by other fatal cases, and on the 16th 11 died: all the cases were on the river's bank, and within a circumscribed area. There was no cholera in the district at the time, nor any history of importation. This epidemic ceased at the end of the year. In the district 54 deaths were recorded.

There were 10 deaths in the Prome district from August to the end of the year.

The mortality from small-pox was only 752 as compared with 1,191 in 1874, and 1,416 in 1873, and it was less than during any previous year of which there is a record. In no case did it assume an epidemic form; the greatest number of deaths was in March, at which season the inoculators do the greatest part of their work, and the lowest number in November. Vaccination contributed in some degree to the comparative immunity of the province from small-pox, the improvement being marked wherever an interest was taken in the work.

From bowel complaints 5,312 deaths were recorded, against 4,390 in the previous year. In the towns of Shwe-gyeen and Shwe-doung the death-rates from this cause were very high; in the latter it was 38·55 per 1,000. A special enquiry was ordered with reference to this excessive mortality.

With the exception of malarious fevers,† the prevalence of the various diseases in Rajpootana showed similar proportions to former years. Diseases of the skin, and abscess and ulcer, afforded the highest ratios; among the reasons specified for this are filth, use of country-made soap (which contains an undue proportion of alkali, not well combined with the fatty matter), use of brackish water, poor living, and indifferent protection against changes of temperature.

Cholera raged in 1875, being generally more prevalent in those places which afforded it a habitation in the former epidemic years of 1869 and 1872. The first intimation of cholera during the year was in the end of April, when three cases were reported from Bhurtpore. About the 7th and 10th of May other cases occurred in Bhurtpore, where the epidemic soon assumed large proportions, there being no less than 1,668 cases reported in this State, with a mortality of 53 per cent. On the 10th of May cases occurred at Sokait in Holkar's territory; after which it became dispersed all over the country. Altogether there were 2,776 deaths reported. Generally the epidemic was over by the middle of September, but it lingered in Bhurtpore until November.

There was very little small-pox; but bowel complaints were numerous.

The total number of deaths from all causes in Mysore was much the same as in the previous year. The deaths from cholera rose from 2 to 3,139. On the other hand, small-pox, which in 1873 and 1874 respectively had numbered 3,052 and 1,535 victims, showed a further marked decrease in 1875, when the casualties amounted to 544 only.

* See remarks under SPECIAL DISEASES, p. 47.

† See remarks under SPECIAL DISEASES, p. 46.

Coorg.

The death-rate in Coorg was returned as 24·76 per 1,000, but the statistics, it is stated, cannot be relied on. Only 5 deaths were recorded from cholera, although the epidemic prevailed severely in Mysore.

Small-pox at
Bombay in
1876.

The first quarter of 1876 was remarkable for an unusually virulent outbreak of small-pox in the city of Bombay. In the three preceding years the mortality from this cause had been—

1873	-	-	-	-	714 deaths.
1874	-	-	-	-	261 „
1875	-	-	-	-	248 „

Towards the close of 1875 ominous signs of an impending epidemic were perceptible, but it was not until the beginning of February that it assumed alarming dimensions. In all, 2,064 deaths were registered during the quarter, the mortality gradually increasing until it reached its highest point in the week ending 14th March, when there were 320 fatal cases. From this time, contrary to all experience, it began to decline, a fact which probably was the result of the prompt and vigorous measures taken to check the disease.

The deaths returned in the first fourteen days of March were equal to an annual rate of 24 per 1,000 persons living, whereas the small-pox rate in London during the two most fatal weeks of the epidemic in 1871-2 was but 4 per 1,000.

IV.—JAILS.

In many of the Bengal jails the sickness and mortality were very great. The hospital admission-rate in the Presidency jail was so high as 2,841 per 1,000; in this case the mortality was comparatively trifling, but in many others it was very high. The principal death-causes were dysentery and diarrhoea. Many serious defects exist in the jails of the Lower Provinces, and overcrowding was a very common evil. These defects were engaging the anxious consideration of the authorities, but very exceptional difficulties were involved.

The total number of deaths in all the jails of Bengal was 1,015, of which cholera occasioned 91, dysentery 360, diarrhoea 114, fever 85, pulmonary disease 146, and other diseases 219. The death-rate per cent. was 4·96, against 5·59 in 1874. The average death-rate for the five years immediately preceding 1875 was 4·94 per cent.

In 20 jails the mortality was above the average and in 29 below. Among the former Julpigoree again headed the list, with a death-rate of 24·66 per cent. No satisfactory solution has yet been obtained of the extraordinary unhealthiness of this jail. The site, which was supposed to be unhealthy, has been examined by a Special Commission and reported to be unobjectionable; the drinking water was brought daily fresh and pure from the Teesta river; there was no overcrowding; the jail, a bamboo structure, was dry and well ventilated; the diet of the prisoners was more liberal and varied than in most jails; the labour was unusually light; and the utmost care was bestowed on the conservancy arrangements: but in spite of every precaution, cholera and dysentery year after year have carried off in nearly equal proportions about 20 per cent. of the prisoners. Prior to 1870 the unhealthiness of this jail was attributed to the site and to the use of earthen beds, and in that year the jail was moved to its present site, and bamboo "machans" were substituted for earthen beds. The year 1873 promised well, for the mortality fell from 42·62 per cent. in 1872 to 5·55; but the statistics of 1874 and 1875 show that the improvement was transient, and that there are deeper causes at work. The fact that this jail takes a singularly high place in every class of disease except fever would appear to point to some widespread climatic rather than to any purely local influence.

The female prison of Russa stood second in the list of mortality; the returns showed a death-rate of 13·89 per cent., which was double the average of the five preceding years. This great mortality was attributed partly to overcrowding and partly to the extreme unhealthiness of the season towards the end of the rains in 1875.

The third jail in order of mortality was Rungpore; the death-rate there was 12·42 per cent., which was however an improvement on that of the preceding year, namely, 17·68. The district is notoriously unhealthy, and almost every prisoner is said to be more or less diseased when he enters the jail. The superintendent observes: "The year was characterised by extreme unhealthiness, and unfortunately with the unusual prevalence of climatic disease there was unavoidable overcrowding in the jail. From my experience as medical officer of the district I can say that the sickness and mortality in the jail was simultaneous with much disease and death among the free population. At the same time, there can be no doubt that, if the jail were capacious, and the influx of criminals were not so great, mortality would have been less than what it was among the prisoners. Although this mortality is to be deplored, it is no small matter of congratulation that cholera did not enter the jail when it was causing terrible havoc in the neighbourhood."

The two jails of Midnapore showed a heavy mortality, the reason for which could not be ascertained. The district, having a dry laterite soil, is believed to be an unusually healthy one. The buildings are large, airy, well raised, and well ventilated, thoroughly drained and on good sites; the water-supply is good; there was no overcrowding. In the central jail the prisoners were employed almost exclusively on out-door labour, in the district jail entirely on in-door labour. Two years previously it was pointed out that prisoners transferred from the damp eastern districts quickly contracted lung diseases and suffered generally in health in the dry atmosphere of

NOTE.—The figures in this Section are taken from the Reports of the Inspectors-General, not from those of the Sanitary Commissioners.

Midnapore. All transfers from these districts were accordingly stopped, but the sickness and mortality were in no way altered or diminished. It appears from the medical officer's report that a large number of the prisoners entered in a weak and emaciated condition. Dysentery of severe type and pulmonary diseases carried off the largest numbers.

On the other hand, the low rate of mortality which has characterised the Orissa jails (Cuttack, Balasore, and Pooree) during recent years is equally unaccounted for. The climate, generally speaking, of these districts is not remarkable for salubrity; fever, small-pox, and cholera, are endemic in them all. The jails are badly constructed, and in a hygienic point of view have many defects, and they are frequently overcrowded; yet they remain extraordinarily healthy. In the case of Pooree this is especially remarkable, for the jail is situated in the midst of a pestiferous town, and within a few feet of the large cholera hospital, which is annually filled with hundreds of dying pilgrims, and across which the sea breeze blows straight into the jail; yet not a single death occurred in the Pooree jail in 1874, while in 1875 the mortality was only 76 per cent.

The Behar jails were much less unhealthy than for many years past. The North Behar group showed a decrease, as compared with 1874, of 4.51, and the South Behar group of 1.31 per cent.

A committee appointed to inquire into the cause of the excessive mortality in the Behar jails submitted their report on the 1st March 1875. They recommended (1) the erection of a new central jail for Behar at Buxar; (2) the early construction of the new district jails which had been already sanctioned for Gya, Mozufferpore, and Chumparun, and the allowance of a sufficient margin therein for the accommodation of surplus prisoners from other districts who could not be sent to central jails; (3) the carrying out in the other district jails of certain improvements in regard to drainage, ventilation, conservancy, water-supply, dietary, and clothing. These recommendations were approved by Government, and steps were at once taken to carry them into execution. The minor recommendations made by the Committee have also been carried out so far as the funds at the disposal of Government would permit.

Madras.

The health of prisoners in Madras generally was good; but the death-rate was 3.90 per cent., as compared with 2.68 in the preceding year. The increased mortality was chiefly due to cholera, of which there were 82 cases with 40 deaths. In 20 jails the percentage of deaths to average strength was under 4 per cent.; in the following it was very high: Tanjore 13.50, Coimbatore District 11.74, Cuddapah 9.69, Mangalore 8.22, Madura 7.02. In the case of Tinnevely the rate fell from 15.16* in the previous year to 5.15.

The difference of mortality in favour of central jails is found to be gradually decreasing; this is partly owing to improvement in the sanitary condition of the district jails, but also to the increasing age of prisoners in the central jails, and to other circumstances.

As had been the case in former years, more than half the whole number of deaths occurred during the first year of prison life.

Bombay.

Throughout the Bombay Presidency the jail accommodation was considerably increased, although it still remained in many cases faulty and inadequate. The death-rate was 3.3 per cent. as compared with 2.3 in 1874. Taking into account the general unhealthiness of the year, the jails do not contrast unfavourably with the free population. Those in Sind maintained their high rate of mortality; while the percentage to strength was in the Presidency proper only 2.2, in Sind it was 6.8. The prisons in the city of Bombay were exceptionally healthy. At Yerrowda there was much sickness, chiefly from fever of a mild type, but a low death-rate.

Punjab.

The general death-rate in Punjab prisons was 3.19 per cent. of the daily average strength. The death-rate in towns was 40 per 1,000; and as among the free population many deaths escape registration, which cannot be the case in jails, the comparison is particularly favourable to the latter.

Although, however, the mortality was less, there was more sickness than in the preceding year. This was caused principally by intermittent fever. The most fatal diseases were bowel complaints and remittent and continued fevers. Cholera was confined to four jails, and occasioned only 30 admissions to hospital. A very fatal malady in some prisons was pneumonia, of a special character, and considered by many medical officers to be distinctly contagious.

* This figure includes all classes of prisoners; the ratio given in last year's Report (16.65) related to convicts only.

In last year's Report (p. 11) five jails were mentioned as having specially high death rates. Three of these showed in 1875 a great improvement, viz. :—

	1874.	1875.
Rawulpindee - - - - -	8·84	3·11
Delhi - - - - -	8·81	3·07
Kohat - - - - -	5·61	0·69

At Bannu the death-rate, which in 1874 was 13·38, fell (certain deaths from accident not being taken into account) to 8·77. Four of the deaths were due to typhus, or a disease very analogous to it, which was endemic in the Bannu valley. It is hoped that, after the completion of a new jail at this place, fever will be less frequent among the prisoners.

The ratio of mortality at the Lahore central jail was 5·95, as compared with 5·39 in 1874. The two most important causes of death were diseases of the bowels and pneumonia. Up to the year under report this prison was surrounded by a ditch some 12 or 14 feet in depth, which received the drainage, an arrangement which manifestly endangered the purity of the water-supply. The Inspector General of Prisons made arrangements for filling up this ditch and providing otherwise for the disposal of the drainage, so removing a serious source of risk to the health of the jail.

There was a high mortality (10·94 per cent.) in the Female Penitentiary at Lahore, for which no reason is assigned.

The Peshawur jail, which was formerly notorious for its unhealthiness, held a very good position both in 1874 and 1875; in the latter year the death-rate was only 1·56 per cent.

The year was, on the whole, marked by a considerable improvement in the health of prisoners in the North-West Provinces, and that notwithstanding the prevalence of cholera in the country, and the overcrowded state of many of the buildings. The average death-rate was 2·7 per cent. of strength. In the last Report (p. 12.) eight jails were noted as showing death-rates over 5 per cent.; in 1875 the rates in these jails were as follow :—

	1874.	1875.
Goruckpore - - - - -	20·14	5·35
Meerut Central - - - - -	12·83	5·40
Bustee - - - - -	10·93	1·96
Boolundshuhr - - - - -	9·28	2·32
Jounpore - - - - -	7·15	4·88
Banda - - - - -	6·04	8·12
Jhansi - - - - -	5·68	5·17
Meerut District - - - - -	5·59	5·10

Of other jails the following showed high death-rates in 1875 :—

	1874.	1875.
Bareilly Central - - - - -	4·92	5·34
Orai - - - - -	1·15	5·08

The improvement in the two Meerut jails and in that of Goruckpore is especially satisfactory, as they for some years past had been notorious for unhealthiness.

The Banda jail has suffered much from constant change of superintendents, and, it is believed, from their want of acquaintance (they having been Madras Officers) with the customs and habits of the natives of the province; but new arrangements have been made under which it is hoped that matters will improve.

The Bareilly jail remained unhealthy. It is noticed that in the Bareilly prisons, as compared with others, the mortality continues at a high rate amongst prisoners who can no longer be regarded as new admissions. In the Goruckpore and Meerut jails, which receive a notoriously unhealthy population, the mortality rises as high as 7·7 and

8·6 per cent. during the first six months of imprisonment, and diminishes rapidly after the prisoners have been two years in jail; at Bareilly, on the contrary, the mortality increases with length of imprisonment. One condition believed by the Inspector-General to militate against the health of the prisoners was the continued and excessive labour of individual gangs on the building works; this, he stated, would be altered in future, while every effort would be made to remove any other preventable causes of mortality.

The high death-rate at Moradabad was an unusual occurrence. Of 19 fatal cases 10 had entered in bad health, 6 were admitted in indifferent health, and 3 only in good health. Two men were cut off by cholera, and the health of the prisoners was probably affected generally by the same conditions as served to cause the extreme prevalence of bowel complaints among the free population.

The death-rate in the Cawnpore jail was especially unsatisfactory, as 11 of the 18 fatal cases were due to dysentery or diarrhoea. The health of the prisoners on admission was worse than in previous years; of the 18 who died 14 were admitted in bad or indifferent health.

Oude. The condition of health in the prisons of Oude was even more favourable than it had been in 1874, the death-rate being only 1·4 per cent. of the average jail population. Although cholera was epidemic throughout the province, the jails enjoyed a remarkable immunity from the disease. In one only, that at Fyzabad, was there any approach to an outbreak; here 7 cases occurred in the month of November, of which 5 ended fatally.

Central Provinces. The year was comparatively a healthy one for the jails of the Central Provinces. The average ratio of admissions to hospital fell from 113·08 to 97 per cent.; and the death-rate from 3·68 to 3·30, or, not including cholera (which was absent in 1874), to 2·85. Cholera occasioned 15 deaths, occurring at Raipore, Hoshungabad, Bilaspur, and Mandla.

Three jails were specially noticed for their unhealthiness in the last Report (p. 12). Of these it was reported in 1875 that the general health of the prisoners at Jubbulpore was not good, although the death-rate was only 2·82 per cent.; that at Raipore there was general improvement; while at Nagpore the health was better than it had been for the past five years, owing, it was believed, to a favourable season and to the liberal supply of vegetables.

Berar. The report on the health of the jail population in Berar was very satisfactory. Notwithstanding that a severe cholera epidemic ran a course of seven months in the province, the disease did not appear in any jail with the one exception of Akola, in which towards the end of the epidemic there were six cases, five of them being fatal. The total proportion of deaths from all causes was 2·3 per cent. of the average jail population, against 4·6 per cent. in 1874. The healthiness of the convicts is advanced as a proof of the good conservancy and other arrangements maintained within the jails.

British Burma. Every attention was paid in British Burma to the sanitary state of the prisons. Conservancy arrangements under the dry-earth system were everywhere unexceptionable. The food and clothing were good and sufficient, and the water-supply generally wholesome and abundant. There was also, on the whole, ample accommodation for the prisoners. On the latter point the Sanitary Commissioner observes: "They" (the jails) "are in most instances built entirely of teak timber, the floors being raised on posts from 12 to 14 feet above the surface of the enclosures, with ample provision for ventilation in the shape of iron-barred doors and windows, side and ridge ventilators; it might be thought that under such conditions a small amount of overcrowding could be borne for a short time with impunity, but experience has shown that, no matter how good the ventilation may be in such jails, any amount of floor space under 36 superficial feet per prisoner is insufficient for the maintenance of health."

The death-rate fell from 2·98 to 2·35 per cent. of average strength. The improvement was most marked in the case of the Thyetmyo jail, in which there were only 3 deaths, as compared with 13 during the previous year.

There were only 5 deaths from cholera. Cases of fever diminished from 773 to 697, but the deaths from this cause increased from 4 to 8, three fatal cases of enteric fever having occurred in the Rangoon jail. This jail had always been very clean, and the food good, but the water-supply from the wells was not good, and, pending the decision of the question of supplying the town with water conveyed in pipes from a pure source at a distance, it has not been thought expedient to go to great expense in providing another source of supply for the jail.

Admissions from ulcers and boils showed an increase from 400 to 471; but the deaths decreased from 13 to 5, of which four occurred in the Rangoon jail. In the previous year there had been 12 deaths from hospital gangrene supervening upon ulcers in this

jail; the decrease in the number of fatal cases was attributed to the better quality of the vegetables. Very fine hospitals have been built inside a new inclosure of the Rangoon jail, and when the sick have been moved into them it is hoped that cases of hospital gangrene will cease: the old hospital is a wooden building, and so low that it cannot be kept clean underneath.

It is always found in British Burma that mortality decreases as length of residence in jail increases; the death-rate among under-trial prisoners in 1875 was 6·61 last year, as compared with 1·91 per cent. amongst convicted prisoners who had been more than 7 years in jail. The explanation of this fact given by the Inspector-General (which, however, the Chief Commissioner thinks "scarcely exhaustive") is that prisoners become accustomed to the restraints of prison life; they are freed from many temptations and means of committing excesses, and lead healthy lives; on the other hand, on first admission to jail opium eaters or smokers are suddenly deprived of their accustomed stimulants, and an abrupt change is made in their mode of life.

The number of deaths in the jails of Mysore amounted to 57, as compared with 38 in Mysore. 1874, and 27 in 1873. The ratio to average strength was 3·4 per cent. The increase was entirely confined to the Mysore jail. From anæmia or general debility there were 17 deaths, and from cholera 21.

The health of prisoners in Coorg was better than in the previous year, in consequence, Coorg. it is assumed, of the fact that during the monsoon months they were all removed from Mercara and kept in confinement at Fraserpet, and also owing to somewhat better accommodation in the jail.

V.—VACCINATION.

Bengal.

It is conclusively shown in the Sanitary Commissioner's Report that the mortality from small-pox in Bengal was highest in the towns and districts in which inoculation was practised, and was lowest where the Act prohibiting inoculation was in operation.

The practice of inoculation is stated to be hedged round by religious rites and ceremonies rendered sacred by the practice of ages. Again, inoculators from other parts, knowing how the minds of the people are disposed, step in and supplant the ex-inoculators in the villages where their forefathers have practised before them, and as a consequence the ex-inoculators are compelled to revert to the old system rather than suffer in their means of livelihood.

In the province of Bengal there were 988,858 persons vaccinated, being an increase of 29,185; in some circles the increase was considerable, while in others there was a marked falling off. The total was vastly less than that required for the protection of the population; the results achieved, however, in the opinion of the Government of Bengal, continue to afford just grounds for encouragement. In dispensary vaccination there was a great decline, which the Government viewed with dissatisfaction, as it is the duty of every medical officer in charge of a dispensary to promote vaccination. There is stated to have been less difficulty than formerly in persuading the people to accept vaccination.

There was a slight improvement in the number of females vaccinated. On the other hand, in the number of infants there was a falling off; the parents are said to be prejudiced from their experience of the risks of inoculation.

The ratio of success in primary cases was 97·2 per cent., against 96·53 in the preceding year. In the Calcutta, Eastern Bengal, and Metropolitan circles it was over 99 per cent.

The comparatively small interest shown in the matter by municipalities attracted the special attention of Government. There was also an unsatisfactory diminution of local contributions.

The system of concentration mentioned in the last Report (p. 14) is stated by the Bengal Government to have worked well. Under this system, when a district has been once gone over and thoroughly protected by the circle establishments, it is to be made over to the exclusive care of the civil surgeon for the maintenance of vaccination in it. In the carrying out of this change, however, the Government of India have urged the importance of proceeding very cautiously. They would regret to see the work of vaccination removed in any district from the special agency which already exists, not only before the large majority of the population are, in the full meaning of the term, actually protected, but also, until vaccination has become so thoroughly understood and popular that the people are willing to pay for it. Dr. Cunningham considers that vaccination will be greatly retarded by this measure.

Madras.

The report on vaccination in the Madras Presidency for 1875-6 is very incomplete, in consequence, it is alleged, of the transition state of the department (*see* Vol. VIII., p. 28). There was a considerable falling off both in the number of operations and in the ratio of success; the former was 381,412, and the latter 93·89 per cent. The prevalence of cholera is said to indispose the people to submit themselves or their children to vaccination; while further the employment of vaccinators in many districts as distributors of cholera medicines appears to have interfered with their proper work.

In the town of Madras there was an extraordinary falling off in vaccination work; 80 per cent. of the decrease was in the case of Hindoos. It occurred almost entirely among adults and children above a year old. The explanation offered was, firstly, the reduction of batta, and secondly, the great prevalence of sickness. The working of the department was also not so satisfactory; only 39·66 per cent. of the cases were ascertained to be successful, as compared with 72·34 per cent. in 1874-5.

Bombay.

Vaccination in the Bombay Presidency was considerably extended, and at a comparatively less cost than in any of the seven preceding years. The number of operations was 808,353. There were 22,573 more infantile vaccinations than in 1874-5; the whole of the increase (18,822) in primary cases having been among infants. The percentage of success in primary operations was 97.

Considerable progress was shown in Kutch, and there was promise of a still further extension.

The epidemic of small-pox in the city of Bombay in the beginning of 1876 (*see* p. 12) gave a great stimulus to vaccination, the operations during the first three months of the year having numbered 25,200, against an average of 4,343 in the corresponding periods of the five preceding years. It also drew the attention of Government to the need of compulsory vaccination, and a Bill for this purpose was prepared, which it was expected would meet with the support and approval of intelligent public opinion. This Bill has since become law as Bombay Act I. of 1877.

The total number of vaccinations performed in the Punjab during 1875-6 was 440,394, which showed a considerable falling off. In operations by the provincial establishment there was a decrease of 71,428; and in those by dispensary establishments of 2,016. No reasons satisfactory to the Local Government are assigned for this decrease of work.

The general percentage of successful cases is given as 94·84, but it is considered that this encouraging figure is open to correction. In one case the returns were found to have been deliberately concocted.

There were 22,274 vaccinations performed by men employed by Native Chiefs. The Maharajah of Cashmere consented to the work being carried on in certain parts of his dominions; and the Rajahs of Bussahir and Bhagat set an excellent example in affording assistance and allowing their children to be operated on.

Although opposition was generally diminishing, it was very strong in some parts. In the Delhi district it was frequently met with, but was overcome. In the large town of Panipat the people had formerly been violently opposed, but, through the able assistance of the tahsildar and the municipal committee, over 1,000 children were vaccinated, a good many of whom were Rajpoots. In the city of Kurnool nothing could be done for several days, but eventually about 600 children were operated on; here some of the members of the committee showed a very bad example by sending their families away. In many parts of the Umballa district the vaccinators were gladly welcomed. There was decided improvement in the district of Umritsur; in the city some members of the committee gave excellent help, while others were either indifferent or opposed; indeed, out of 36 only 5 took any interest in the work. Much opposition was encountered in the Ferozepore district, chiefly where the Sikh element predominated. In Peshawur city the work proceeded far more satisfactorily than formerly.

In the districts south of the Sutlej, where the Hindoo element greatly preponderates in the population, the prejudice against vaccination is very strong, and there the mortality from small-pox continued great. In the district of Gurgaon, in which Sitla, the goddess of small-pox, has a famous temple, no less than 2,741 small-pox deaths were registered. The Mussulman district of Peshawur also suffered severely; 1,018 deaths were registered in it. In Jullundur, Gurdaspur, and other districts the people have become so sensible of the advantages of vaccination that it is not uncommon for them to petition the authorities to send vaccinators for their children. In these districts the small-pox mortality was trifling.

The Superintendent-General in the North-West Provinces observes that the people have to pass through three stages upon the introduction of vaccination; the first, that of terror, when the mothers hide their children in the fields on the approach of the vaccinator; the second, that of apathy or mild dislike; the third, that of a belief in its efficacy. Kumaon perhaps may be said to have arrived at the third stage; Rohilkund to be passing into it; and the other three circles to be still in the second stage. The first stage, he thinks, has been finally left behind everywhere.

In 1874-75, the number of vaccinators in the province was 401, and the number of persons vaccinated was 494,928. In 1875-76, the number of vaccinators was 453, and they performed 529,207 operations, being an increase of 34,279. It is satisfactory to notice that the increase occurred chiefly among the high-caste Hindoos. Of the total operations 486,377 were primary, and 42,830 secondary; almost the whole of the latter were performed in Kumaon.

The percentage of success in primary cases was 90·24, against 87·64 in 1874-5.

The number of children vaccinated below one year of age was 140,109. Assuming 90·24 per cent. of these cases to have been successful, then 10·54 of the children born were successfully vaccinated. Much therefore yet remains to be done.

Only in the three districts of Dehra Doon, Kumaon, and Gurhwal can a sensible impression be said to have been made on the inroad of small-pox.

Municipal vaccinators, as usual, accomplished the least work, although there was much talk about the benefits of vaccination and the philanthropy of the British Government.

Oude. In Oude the number of operations was 27,656; and the ratio of success 84·47 per cent. The natives are reported to be thoroughly opposed, and their minds do not appear to be becoming more enlightened in the matter.

With regard to vaccination in Oude the Government of India remark: "The work makes no advance, and apparently no effort is made in the matter. It would appear that the vaccinators are left to do very much what they like, that the supervision which the civil surgeons exercise over them is merely nominal, and that the Sanitary Commissioner has little or no control over the proceedings of either."

Central Provinces. The number of operations in the Central Provinces was 222,633, being 23 per cent. above the number of the previous year. The primary cases amounted to 211,402, and among these the ratio of success averaged 95 per cent. The high ratio of success in secondary cases (71·4 per cent.) appeared to show that a considerable portion of the adult population was not protected.

The effect of vaccination in reducing the mortality from small-pox was evident in the districts of Betul, Chindwara, Seoni and Sumbulpore. In Nagpore also, although the vaccination rate for five years was comparatively low, operations had been carried on for a longer series of years than in other districts, and the population was to a great extent protected when the epidemic fell with extreme severity on the districts of Nursingpore and Damoh, in which very little vaccination work had been done.

Berar. The vaccinations in the Assigned Districts amounted to 48,658 cases, against 42,949 in 1874-5.

British Burma. The year showed some progress in British Burma in regard to vaccination, but not such (the Chief Commissioner observes) as might well have been achieved had ordinary diligence and activity been exercised. The number of operations was 24,381, and the percentage of success 82·49. If the Rangoon jail (in which most of the operations performed were on adults who had previously been inoculated or vaccinated), the Hill Tracts, and the military hospitals be excluded, the percentage would stand at 83·89, the highest yet attained in Burma.

The people of Burma have a very great prejudice against inoculating or vaccinating infants; children under one year old are seldom or never inoculated, although, on persuasion, they are allowed to be vaccinated. There were altogether only 3,168 operated upon under one year old during 1875. Against vaccination itself they have no deep seated prejudice, but they regard it as a weak form of inoculation, and are not satisfied when they see that it is not followed by vesicles scattered over the body, but that the eruption is confined to the points of insertion. The inoculators of course persuade them that it is not equally efficacious, because, if vaccination *gratis* became general, their fees would cease; and their emoluments are chiefly derived from the after treatment of the disease which they originate.

Rajpootana. Of 103,453 vaccinations in Rajpootana, 87,509 were performed in Native and 15,944 in British territory,—in the latter case showing a considerable increase. The percentage of success generally was 88·40; in Ajmere and Mhairwarra it was 81·69, being not so good as in the preceding year.

Vaccination in Rajpootana is said to be simply a matter of supervision and money, for there is no deep antipathy to it among the people.

Mysore. In Mysore the number vaccinated was 98,848, and the percentage of success was 89·17.

VI.—MEDICAL INSTITUTIONS.

Civil Hospitals and Dispensaries.

The number of charitable hospitals and dispensaries in Lower Bengal at the close of 1875 was 207. Two were closed, and six new ones opened, during the year. These figures do not include the temporary institutions in the Burdwan, Beerbhoom, and Midnapore districts.

The numbers of in-patients and out-patients treated, as far as they had been ascertained, were 22,009 and 698,730, respectively, as compared with 23,842, and 636,289 in 1874. The figures for 1875 are, however, in fact higher, the returns for several dispensaries not having been received in time for incorporation.

Of in-patients treated, 16·89 per cent. died, and 70·26 per cent. were cured or relieved. These results vary little from year to year.

The advantages afforded in the medical schools and colleges of Bengal to those studying medicine are stated to be gradually attracting a superior class of students, which will have a favourable effect on the future management and usefulness of dispensaries. The institutions appear to be steadily growing in favour with the people.

The proportion of income derived from local funds increased from 19·93 to 27·82 per cent. The subscriptions from Europeans rose from 2,386% to 2,523%, while those from Natives fell from 10,833% to 10,569%. The financial position of the institutions generally was very satisfactory.

The following statement compares the attendance and death-rates at the medical institutions of Calcutta for 1874 and 1875:—

INSTITUTIONS.	1874.				1875.			
	PERSONS TREATED.			Died per 1,000 of treated.	PERSONS TREATED.			Died per 1,000 of treated.
	In-door.	Out-door.	Total.		In-door.	Out-door.	Total.	
1. Medical College Hospital - -	4,349	45,199	49,548	108·3	4,456	45,374	49,830	134·20
2. General Hospital - -	2,826	1,107	3,933	49·5	3,234	9,544	12,778	65·24
3. Mayo Hospital and Dispensaries -	1,004	155,611	156,615	137·4	2,006	191,759	193,765	117·14
4. Campbell Hospital - -	7,558	—	7,558	251·6	7,782	—	7,782	280·77
5. Municipal Police Hospital - -	2,341	—	2,341	24·7	2,880	—	2,880	22·56
Total Calcutta Hospitals -	18,078	201,917	219,995	—	20,358	246,677	267,035	—
6. North Suburban Hospital - -	711	—	711	174·4	625	—	625	217·60
7. Sumbhoo Nath Pundit Dispensary -	—	9,608	9,608	—	—	9,907	9,907	—
8. Alipore Dispensary - -	130	6,092	6,222	276·9	119	5,968	6,087	319·32
9. Aratoon Apcar Dispensary - -	—	8,858	8,858	—	—	9,539	9,539	—
10. Howrah General Hospital - -	2,002	15,631	17,633	163·8	2,245	18,024	20,269	154·56
Total Suburban Hospitals -	2,843	40,189	43,032	—	2,989	43,438	46,427	—
Grand Total -	20,921	242,106	263,027	—	23,347	290,115	313,462	—

There was thus a very great increase in the number of patients treated during 1875, the excess being 50,435 patients, or nearly 20 per cent. over the number treated in 1874. These figures, in the absence of any epidemic disease or unusual sickness, are the more satisfactory as they demonstrate that the classes for whose benefit the hospitals and dispensaries were opened are not slow to avail themselves of the medical and surgical advice obtainable at them.

The average death-rate among in-patients was 167·28, or, excluding cholera, 149·52 per 1,000. The latter figure is higher than for any year since 1869. The death-rate of the European patients was lower in all the hospitals than in 1874, with the exception of the Presidency General Hospital, in which the rate was higher by 14·08 per 1,000. The excessive mortality at some hospitals is ascribed to the number of moribund cases taken in.

The total number of admissions for cholera was 787, against an average of 493 during the five preceding years; and of these 405 died.

Of 75 patients received in the Presidency General Hospital, no less than 60 came from the shipping, and though the total number of cholera cases received from the riverside decreased from 143 in 1874 to 104 in 1875, it would seem that the sanitary condition of the port is still far from satisfactory. The figures appear to indicate that those parts of the river are most unhealthy which come directly under the influence of the sewage discharge from the Fort. The state of the hospital and dispensary buildings was generally good, and all sanitary details inside them were closely attended to.

There was a decrease in the number of deaths in the Medical College Hospital ascribed to "hospitalism." In 1875 these amounted to 8, or 25·80 per cent. of those who died after operation, whereas the average of the six years ending with 1869 was 31·06 per cent. The sanitary condition of this hospital was much improved. New furniture and a substantial addition to the hospital equipment were granted by Government. Improvements were made in the bath-rooms, lavatories, and latrines. By the introduction of the municipal system of drainage the hospital was brought into communication with the neighbouring sewer. Sinks and urinals were trapped, and the ground to the west of the hospital was railed in. Other contemplated improvements, when completed, will prove of the highest sanitary value by enlarging the compound and permitting the freest circulation of air in all directions.

Dr. Beatson speaks in the highest terms of the ability, zeal, and humanity displayed in the discharge of their duties by the medical staff of the several institutions.

Bombay.

In the civil hospitals of Bombay there were treated 24,081 indoor and 218,008 outdoor patients; if re-admissions are counted in both years, the increase in the former class of patients was 1,511, and in the latter 14,402. At the dispensaries the total numbers treated were 5,605 and 552,014, showing increases of 96 and 42,748. All the officers employed in charge of these institutions are reported to have worked well and zealously.

There were more admissions at the hospitals for syphilis than for any other cause by upwards of 50 per cent. Of the total number of dispensary patients those treated for malarious fevers constituted 20·11 per cent.; in the Poona Division the percentage was 31·34.

In contributions for dispensaries from local funds there was a creditable increase, as also in private subscriptions; but municipal contributions showed a considerable falling off.

While the statistics show that 1875-6 was a very unhealthy year, they also prove that the dispensaries did excellent and useful work, and were much appreciated by the sick poor.

Punjab.

The statistics for the Punjab for several years past show a steadily increasing appreciation of dispensaries, and confidence in the European method of treating disease. The number of institutions rose in 1875 from 136 to 150; in 1874 there had been an increase of 16. The above are exclusive of 18 dispensaries supported by municipalities or by purely local resources, and of the Mayo General Hospital at Lahore. The attendance at the whole of the institutions aggregated 1,037,835, being an increase of 143,568, and this increase was among all classes, indoor and outdoor, males and females.

The contributions from all sources increased; those from municipalities by 4,238%, from Europeans by 119%, and from natives by 186%. Towards the completion of new wards in the Delhi dispensary 430% were contributed by the native residents of that city; of this, 200% was received from the representative of one gentleman who had bequeathed a large sum to be expended on objects of charity. This dispensary also receives liberal support from a wealthy citizen, Lala Mehr Chand, who supplies food and country medicines to a certain number of indoor patients.

North-West Provinces.

In the North-West Provinces there were, at the close of 1875, 154 dispensaries, including the European hospital. The outdoor patients numbered 762,551, and the indoor 23,168, being in the former case an increase of 20,887, and in the latter a decrease of 773.

Municipalities contributed 775% less than in the previous year; European subscriptions also declined by 127%; and native subscriptions by 537%.

The whole question of Government grants-in-aid has been engaging the attention of the Local Government, the system laid down in 1863-4 having been in a great measure departed from in practice. According to that system the assistance given by

Government was to be "so regulated as not greatly to exceed the income derived from local sources." In 1875 the Government expenditure was 15,288%. The total of local receipts was 11,805%, of which 4,037% was money raised by municipal taxation, which, the Government observe, can only be considered as a subscription by a very liberal interpretation of the meaning of that term. It has accordingly been intimated that the required local income for each class of dispensary should in future be fixed at an amount which will really cover half the expenditure.

Another principle originally laid down was that "each institution, whether large or small, must stand or fall upon its own resources." By the method which has come into use of lumping together all the subscriptions of a district, money subscribed in support of really popular and useful institutions has been made the ground for demanding aid from Government for institutions which are neither useful nor popular. If, Sir John Strachey observes, the result of a stricter adherence to the rule in future is that many branch dispensaries are closed, he will not regret it, as it is too often the case that these institutions, under the management of men possessing no really competent knowledge, are worth little or nothing, and that the money expended on them is thrown away. If, on the other hand, by closing several branch dispensaries, especially in the neighbourhood of any important town, it were found possible to secure the local contribution necessary for the opening of a sudder dispensary under a trained medical man, the Lieutenant-Governor would be prepared to give to such a measure all possible aid and encouragement.

At the close of 1875 there were 48 dispensaries in Oude, being an increase of three. Oude. There was a satisfactory advance in the number of patients from 207,547 to 243,045; of this number 236,924 were outdoor patients. These institutions are shown to be gradually gaining favour with the people. That their popularity depends in a great measure on the demeanour of the medical practitioners was illustrated in the case of the Sitapur dispensary, which stood low in the scale of usefulness, owing to the brusque manner of the native assistant-surgeon, until, during the last three months of 1875, it rose, under the medical charge of another officer, to head the list; the total applications for relief during 1875 were 11,186, against 7,743 in 1874.

Two additional branch dispensaries are reported to have been opened in the Central Provinces. The general attendance continued to be satisfactory; there was an increase in out-patients of 18,095; with greater demands on them, the expenditure on account of dispensaries was smaller. Central Provinces.

The number of in-patients at Berar dispensaries increased from 912 to 1,215, which Berar. was mainly due to the call for treatment by cholera-stricken patients. The out-patients numbered 76,103, an increase of 18 per cent.

A dispensary was opened during the year in the new district of Thonkwa, making altogether 18 in British Burma. The number of indoor patients rose from 5,649 to 5,980, and of outdoor from 53,323 to 58,750. The steady increase in attendance is due, not to increasing unhealthiness of the country, but to the growing confidence of the people in the efficacy of European medicines. British Burma.

The progress of the dispensary in the Northern Arakan Hill Tracts was most satisfactory, the patients having increased from 404 to 1,441.

In the dispensaries of Rajpootana there were treated 3,941 indoor patients, and in the jails 5,789, amounting together to 9,730. Outdoor patients numbered 236,441. The grand total was thus 246,171; of which number 25,068 were treated in British territory, namely, 947 indoor and 24,121 outdoor. Rajpootana.

In Jeypore the year was signalised by the completion of the Mayo Hospital, which was formally opened by the Viceroy on the 8th December 1875. The Medical Officer to the Maharajah (Dr. Husband) says that this is an additional proof how deep and real an interest His Highness takes in the institutions under his government. He had received the Maharajah's instructions to make every arrangement for the comfort of the patients, and to provide the hospital with all that was newest and best in the way of surgical instruments. In view of concentrating the work as much as possible at this hospital, four dispensaries were closed towards the end of the year.

The in-patients in Mysore dispensaries numbered 3,345, and the out-patients 115,648; Mysore. showing increases of 364 and 10,098 respectively. The institutions were resorted to by all classes of both sexes.

Lock Hospitals.

Bengal
Presidency.

Dr. Cuninghame is strongly impressed with the apparent failure of the lock hospital system in diminishing venereal disease among British soldiers in India, and observes that it is very evident either that the women who are the source of mischief escape detection, or that registered women, although apparently healthy, are yet capable of propagating disease. The stations with lock hospitals have, he states, established no decided superiority over those without them. Of 43 stations with hospitals, disease during 1875 decreased at 17, was stationary at 1, and increased at the remaining 25. Looking to the various forms of disease, the general result was very unsatisfactory in the Army of Bengal, where primary syphilis increased from 49 cases per 1,000 in 1873, and 66 in 1874, to 71 in 1875. In the Madras Army a considerable decrease of primary syphilis was balanced by an equally large increase of gonorrhoea. The statistics for Bombay were more favourable.

Bengal
Province.

At Dinapore, while the rules appear to have been somewhat more strictly enforced, there was, nevertheless, an increase of disease among the European troops. This is explained to have been due to the withdrawal from the regiment of a large number of invalid and old soldiers. The report, however, shows that the work of registration is in a very defective state. A great deal of the disease appears to be contracted from native women, employed either as servants in the families of European soldiers, or as coolies about the barracks, and also from Eurasian women living in the bazaar; and it is even asserted by the magistrate that married women of the regiments practise prostitution, and spread disease among the soldiers. Great difficulty is experienced from the refusal by soldiers to give any information or assistance in detecting the diseased women. The question of exercising better control over the native female servants was taken up by the cantonment committee, and a formal representation on the subject was made to the commanding officers; and the Local Government gave directions that the magistrate should take proper steps to have all persons brought on the register whom there might be reason to suspect of receiving visits from European soldiers. The want of sufficient strictness in the enforcement of the rules, and the consequent unsatisfactory results, "constitute," the Lieutenant-Governor observes, "a degree of failure which the Government cannot tolerate any longer."

At Barrackpore the results were more favourable than those of the previous year; there was a large decrease in the number of cases among the troops. There was also improvement shown at the cantonments of Dum Dum, Hazareebagh, and Darjeeling; at the latter it is said to have been due more to the strict supervision exercised over the soldiers than to improved working of the rules.

Punjab.

From the statistics of the working of lock hospitals in the military cantonments of the Punjab it appears that, although there was a diminution both in the total amount of disease and in the virulence of its character, the results were not so satisfactory as might be desired. Out of 16 cantonments all but 3 showed an increase of disease as compared with 1874, and in some of them the increase was very large. The Government of India, while commenting unfavourably on these results, admitted that a single unsuspected woman may do an infinity of harm, and upset the most careful calculations.

North-West
Provinces.

In reviewing the lock hospital reports of the North-West Provinces for 1875, the Government of India state their opinion that the reports are not as favourable as could be desired. Very few unregistered women were brought on the registers, and but little seems to have been done to remedy the evil of unlicensed prostitution.

The Sanitary Commissioner, Mr. Planck, while admitting, and indeed forcibly pointing out, the potency of this source of mischief, gives at the same time a very favourable account of the beneficial action of the lock hospital system itself. There is reported to have been during the year a considerable improvement in the working of the system; there was a better average of attendance for examination, and more disease was discovered and remedied among the registered women. The mean ratio of venereal admissions among the soldiers was 149·7 per 1,000, against 201·2 in 1874; and the disease in 1875 was comparatively mild in character, secondary cases being rare. These satisfactory results Mr. Planck considers must be mainly attributed to the establishment of lock hospitals; and he thinks that the evil may, by perseverance, be soon brought within the limits of reasonable expectation. Unregistered intercourse, he thinks, could be prevented by a combined action of the military and civil authorities. At the Meerut station the very existence of a cantonment sub-committee was apparently unknown to the medical officer in charge of the lock hospital.

At the Cawnpore hospital the monthly average of women presented for examination was 187 in 1875, against 172 in 1874; the cases of disease discovered numbered 660, against 465; the daily average number of women in hospital was 66, against 48. The ratio of venereal disease amongst the European soldiers at Cawnpore was 266.0 per 1,000 of strength in 1875, against 439.5 in 1874. The Sanitary Commissioner observes that, while probably all this gain of improved health to the European soldier was not due to the better working of the lock hospital system, it cannot be doubted that some considerable portion of it was due to that cause. The cantonment committee are of opinion that the improvement may be due to two causes: the restriction placed on soldiers visiting the city during the last nine months of the year (on account of cholera), and the segregation of the majority of the women registered in cantonments in quarters adjoining the lock hospital.

At Agra and Bareilly a considerable diminution of disease was reported; in the latter case, the medical officer thinks that the efforts made in this direction have been crowned with very great success. At Allahabad the number of registered women was steadily increasing. At Meerut the attendance of registered women was fairly good, but the number decreased; a sensible diminution of disease among the soldiers was, however, recorded. Disease was very prevalent at Benares; but a special effort made by the police to detect unregistered women was attended with great success.

During 1875 the lock hospital at Thyetmyo was transferred to the civil department, and there were thus in the Madras Presidency nine military and four civil institutions of this class. Madras and
British
Burma.

The following table shows the ratio per 1,000 of admissions to strength from all venereal complaints amongst the troops from 1871 to 1875:—

1871	-	-	173.75
1872	-	-	164.27
1873	-	-	149.81
1874	-	-	185.73
1875	-	-	193.22

Six of the stations where there were lock hospitals showed a decrease in admissions for syphilis as compared with 1874; at the other seven there was an increase. At all stations where there were no hospitals the disease showed a decided increase. The increase at some stations where the Act is in force was apparently due to the great prevalence of clandestine prostitution; "and could this," the Principal Medical Officer to the British Forces remarks, "be effectually prevented, there is every reason to believe " that inefficiency from this class of diseases would be very considerably reduced."

The Contagious Diseases Act is reported not to have worked well in Bangalore during 1875. Writing regarding the British troops, the medical officer mentions that "a police serjeant and two special constables are entrusted with the duty of serving summonses on " prostitutes who attend weekly on examination days, and also of prosecuting those who " fail to attend; but there appears to be no special arrangement for preventing un- " licensed prostitutes frequenting the lines, and it is said that numbers of these are in " the shape of ayahs, &c., attached to the married quarters." In this, as in other cantonments, the soldiers who are diseased give no assistance for the detection of the women with whom they have associated. The medical officers of all lock hospitals had been advised to obtain from the registered women the names of the unregistered who may be associating with Europeans; the names of twenty were thus reported at Bangalore, but only one of them was brought for inspection, and she was found to be sick. The medical officer remarks that the registration appears to extend only to the poor natives, East Indians, and Europeans, and that there were no convictions for carrying on prostitution without being registered; the result was that the number on the register was very small, and the amount of sickness very great. He considers that the rules on the whole are as good as can be with so deficient an Act, and he adds that, until it is made to apply to all prostitutes, there is little hope for much improvement. There has, he says, been an improvement in the working of the rules during the year, but constant vigilance is required. Everything is done now to try and get the police to carry out the Act in its entirety, but with such agents as native police, who are said to take a bribe of a few pies, it will ever be difficult.

At Bellary there was a considerable diminution in the number of soldiers treated as compared with the two previous years. Here again it is stated that registration is defective as not including the entire number who practise prostitution. It embraces only some of those who are notorious prostitutes, viz., those who consort with European soldiers, and a comparatively few caste women who consort with natives only. Many of the registered women fail to appear at the periodical examinations.

Similar complaints come from Cannanore and other stations. At Kamptee, on the other hand, the medical officer says that the working of the Act has been carefully attended to, and illustrates this by mentioning that, of 52 women brought before the magistrate charged with clandestine prostitution, 47 were found to be prostitutes, and were brought on the rolls; while in 1873, of 60 women so put forward, only 4 had been registered.

In addition to three hospitals in British Burma which are included among the above, there are four other purely civil institutions, and another has been established at Henzada, which, however, does not come under consideration for 1875. Of the whole of these seven institutions the Chief Commissioner remarks: "Generally the application of the rules has not been enforced with that energy and rigour which is necessary to justify the expense or affirm the principle of applying them at all. * * * *"

"At none of these places is there any claim for anything approaching perfection in registration. In Rangoon, where it is probably more extensive than elsewhere, it is admitted that there is a deal of unlicensed prostitution known to the authorities, but with which it is difficult to deal effectively. Whether this be deference to a degraded public opinion, or national moral degeneracy of the inhabitants, the Chief Commissioner cannot tolerate its continuance. It is useless applying rules of this nature with such patent facilities for evading them. Theoretical husbands in no way exempt women who prostitute themselves from the application of the law; and as it is found that a large, if not the largest, proportion of disease is contracted from creatures who rely on this plea, it behoves the officers on whom this disagreeable duty falls to take instant measures for the control of the evil. The registration at all places is badly conducted, and at Bassein and Thyetmyo extremely so."

A mass of papers has been received from the Government of Madras on the subject of the best measures to be adopted to check the spread of venereal disease among the European troops in that Presidency. Surgeon-General Gordon (Principal Medical Officer, British Forces) brings to notice the following important element in arriving at a conclusion as to the beneficial effect of the lock hospital system: "At some small stations there seem to be very few prostitutes, for the obvious reason that little profit is to be obtained; at these a lock hospital may not be required at all, or, if one exist, the admissions into it are few, as are also the admissions by venereal diseases among the troops. At a large station the conditions are altogether reversed, custom and money being alike plentiful, so are common women, so is disease; hence there is an obvious fallacy in the argument brought forward that, because at such and such places where lock hospitals exist disease is more prevalent than at such and such other places where they do not, therefore such establishments are useless."

The Madras Government, after carefully considering these papers, determined not to make any change at present in the existing system, further than to suggest to the Commander-in-Chief that a regimental police supervision might prevent much of the intercourse which takes place between soldiers and the female hangers-on of barracks and their neighbourhood. A recommendation by the Inspector-General of Police that an additional civil police establishment should be employed for detecting breaches of the Act was approved, and orders were passed for carrying it into effect. The Government expressed their belief that by a steady and discreet application of the means provided by the Act much may be done to decrease venereal disease among British troops.

The Army Sanitary Commission gather from the reports that to keep down clandestine prostitution "would require a degree of zeal and hourly watchfulness which is never likely to be carried out."

Lunatic Asylums.

Bengal.

The steady progressive increase in the asylum population of Bengal has attracted serious attention. Since 1868 the average yearly increase has been 62·5. The Government of India have issued instructions to the effect that probably many of those in confinement would be better with their friends, and that asylums should be reserved for criminal lunatics, lunatics who are absolutely dangerous, and those who, having no friends or belongings, may be in the acute stage, in which there may be the greatest hope of recovery. In the carrying out of these orders, the Government direct that care be taken to ascertain that harmless lunatics left in the charge of their friends are not maltreated or subjected to any objectionable restraint; while every facility will be given for the reception of such persons in asylums, provided the relatives are willing to pay for them such rates as will entirely cover all charges incurred on their behalf.

Measures have also been taken to provide increased accommodation. At Hazareebagh the district jail buildings have been utilised for a new asylum capable of receiving 300 patients.

During 1875, 384 patients were admitted into the several asylums, which was a considerably lower number than that of the previous year, and than the average of the past ten years. The admissions were apparently from the most impoverished and necessitous classes of the community; of the total, 79·42 per cent. were males.

There were altogether 127 deaths in the asylums during 1875, being at the rate of 11·27 per cent. of mean strength. In two of the institutions, those at Dacca and Dullunda, the death-rates were exceptionally heavy, namely, 15·63 and 15·82 respectively; in all others the rates were low. Bowel complaints were the principal cause of mortality, and phthisis contributed a large proportion. The latter appears in some cases to have been connected with overcrowding.

Reviewing the results of the year generally, the Surgeon-General remarks that they could hardly have afforded more positive evidence of the favourable conditions in which the insane under treatment have been placed, whether for the cure of their mental derangement by skilled attention to every detail, or for lessening the hardships of their sad lot by gentleness and kindness.

In the asylums of the Madras Presidency (three in number) the percentage of recoveries increased from 45·29 to 51·97, while the mortality decreased from 14·50 to 11·27, as compared with the preceding year. The mortality was lower than in any of the previous 10 years, except 1872-3. A comparatively small number of the inmates are females; this is probably owing to the social customs of the people. Madras.

At the Madras Asylum outdoor labour for the patients was largely resorted to with manifest advantage, and at the same time a great deal of useful work was done in the way of gardening, cleaning and sweeping the grounds, drawing water, and repairing roads, hedges, and drains. Various indoor industrial pursuits were also attempted, and the superintendent hoped to be more successful in these in future. The band of one of the corps in garrison was permitted to play in the asylum grounds once a fortnight, and some of the patients seemed to thoroughly enjoy the performance. The usual Christmas dinner was given; and, owing to the liberality of subscribers for this treat, the superintendent was able to add to the pleasures of the day by introducing jugglers, native dances, fireworks, and illuminations. The library referred to in the last Report was kept in good order, and various books were added to it during the year.

Similar remedial measures were also adopted at the other institutions.

There were five asylums in Bombay and Sind. The number of new admissions during the calendar year 1875 was 303; and of re-admissions 25; 228 were discharged, of whom 91 were cured; there were 78 deaths; and the inmates remaining at the close of the year numbered 568. Bombay.

The following remarks by the Bombay Health Officer relative to an outbreak of cholera in the Colaba asylum point out forcibly the internal defects of that institution:—

“ It would be impossible to find a more wretched, miserable, or degraded class of beings than the poor creatures who are confined in the Colaba Lunatic Asylum. Having been connected with the management of the asylum for a considerable time, I may be supposed to know something of the class of lunatics that are received, and the accommodation provided for them. * * * * The asylum is overcrowded. The accommodation is so scanty that a considerable number of the lunatics are confined in the verandahs at night, and, huddled together, sleep on the boards or bare flags. The smell that arises from a number of people jammed together in a confined space, from the fouling of the ground and of one another at night, is horrible; and the sight that is witnessed when the poor creatures are turned out in the morning is of the most revolting nature. The diet, though fairly liberal, is not sufficiently varied; and, partly owing to this cause, and to overcrowding, and to the want of amusement and of outdoor employment, the health of the lunatics is very low, and not nearly so robust as it ought to be. They are extremely prone and subject to diseases of a low type. The death-rate in 1875 from cholera was 34·4 per 1,000, from diarrhoea 11·4, from dysentery 11·4; and the total rate of mortality was as high as 157·8 per 1,000.”

It appears from the report for 1876 that some measures of a very partial nature were taken during that year to relieve the overcrowding in this asylum; and the whole subject was engaging the attention of the Bombay Government, who referred to the proper department the question of removing various sanitary defects in the building, while they expressed a decided conviction that another asylum must at the earliest opportunity be constructed to meet the serious want of accommodation.

Punjab.

The number of admissions at the Delhi asylum during 1875 was 42, or five more than in 1874. The numbers cured and improved were much below those of previous years, but no reason can be assigned for this fact. The death-rate was 12·85 per cent., rather higher than in 1874.

The health of the lunatics was, on the whole, good, and although cholera prevailed in the city and neighbourhood of the asylum from the beginning of May to the end of November, no case occurred in it.

The following account is given of the diversions supplied for the patients: "Every inducement is given to the lunatics to amuse themselves in any way they can, and for this purpose kites, toys, tom-toms, sittars, &c., are provided for those who care for them. The women have pet pigeons, rabbits, and lambs; swings are also erected for their amusement. On Sundays all are treated to either sweatmeats or fruits in their season. This treat is looked forward to by them, and in cases of misbehaviour it is withheld as a means of punishment."

The lunatics are freely indulged in tobacco at certain hours daily, and their friends are permitted to visit them as often as they wish. On the whole they are said to be as happy as their miserable state will allow.

No manufactures have been attempted, but the males were employed in gardening, in keeping the ridges and walks neat and trim, and in any other light labour they could be induced to turn their hands to. The women do a little spinning of cotton thread, &c.

Cleanliness and conservancy are reported to have been fairly looked after. While it is impossible that these should be so rigidly attended to as in a jail, owing to the extremely filthy and irregular habits of many of the inmates, both barracks and latrines are as far as possible kept clean and free from smell.

At the Lahore asylum there were 375 under treatment, against 373 in 1874; 120 were new cases admitted during the year; and of the total number 296 were males and 79 females.

Here too gardening is the chief occupation. There are three or four rooms for weaving common cloth, but all attempt to increase labour in this direction involves too much loss to Government.

The death-rate was 20·5 per cent., as compared with 11·2 in the preceding year. Cholera attacked the asylum on the 1st September; a single case on that date was followed by another on the 18th; and on the 26th the disease broke out with severity, there being, up to the 9th October, altogether 27 cases and 19 deaths. The whole of the inmates were removed to another locality, and the building was thoroughly cleansed and fumigated.

British
Burma.

The lunatic asylum at Rangoon is well reported of for efficiency. The population increased from 149 at the end of 1874 to 156 at the end of 1875. An increase is shown year by year, and is attributed entirely to increased activity in working the law, not to an increase of lunacy in the province. There were 11 deaths during the year; 19 patients were discharged wholly recovered, and 6 mentally improved. The number of old, feeble, and paralytic patients in the asylum precludes the hope of a low death-rate being maintained.

The water-supply is derived from three wells within the area, and is good and never fails. Every part of the institution is kept scrupulously clean, and the dry-earth system is effectually carried out.

The value of occupation and amusements in the successful treatment of insanity is well borne in mind at this asylum. It is stated that many of the articles in the workshops are excellent samples of skill. A beneficial and tranquillizing effect is produced on the patients by the efforts that have been made to render the surroundings more homelike and of more individual interest. The recreation ground, where the excited and violent male patients take exercise, and which was formerly a bare, uninteresting spot, was during the year carefully laid out, levelled and turfed, and the walks were planted with shrubs. The improvement in the demeanour of the patients attracted, it is said, the comment of all who were familiar with it.

Mysore.

At the Mysore asylum the male lunatics are principally employed in gardening, weaving, manufacture of pottery, and preparation of aloe fibre, and also in domestic duties such as washing, cooking, tailoring, &c.; while the females are engaged in grinding ragi, cleaning rice, and spinning wool. The value of their labour during 1875 was estimated at 139%. Trifling rewards in the shape of tobacco and betel are given to them for their encouragement, and native amusements are provided twice a month for their entertainment. The institution is conducted upon simple and humane principles. The asylum is a healthy one, and the health of the inmates is generally good.

Medical Schools.

The medical schools in Bengal were five in number, new schools at Dacca and Cuttack Bengal. having been opened during the year. Except in the English department in the Medical College, the instruction in all these schools is given in the vernacular. The Dacca school was well attended, and promised to be a very useful and popular institution. The Cuttack school is intended to supply a want which has for some time been felt, owing to the distance of Orissa from the higher educational institutions of Bengal. The total number of pupils in the medical schools was 1,255.

The reports of the Madras Medical College for the sessions 1874-5 and 1875-6 Madras. were very favourable. The success that attended two ex-students (British) in competing in England for the Indian Medical Service affords additional testimony to the sound teaching and training that have for so many years distinguished this college. It is however regretted that the advantages offered by the college do not draw a larger number of students. The insufficient knowledge of English possessed by the native pupils is another subject of regret.

The Madras University has instituted a new degree of Licentiate of Medicine and Surgery, which, from involving a less demand than the present degrees upon the time and previous education of the students, will, it is believed, attract a considerable number of candidates. Young men desirous of qualifying for the L.M. degree will have to undergo a course of professional training at a recognised school of medicine to extend over a period of four years, or else one year's training at a hospital or dispensary and three years at a medical school.

An important scheme instituted by Surgeon-General Balfour for training civil medical practitioners came into operation with the session 1875-6. Under this scheme classes are held at which youths receive the same instruction as that imparted to military students, and, on being declared qualified, they will join the Civil Subordinate Medical Department for employment under municipalities. The college had previously been almost exclusively an institution for supplying the Army with apothecaries and hospital assistants. Much advantage is looked for from the measure referred to, as a great deal remains to be done to place civil medical education in Madras on the level which it has reached in the other Presidencies.

The Principal of the Grant Medical College reported that the result of the past year Bombay. "will bear comparison with the most successful year of the 30 which have elapsed since the foundation of the institution." Fifty-nine freshmen were admitted to the college classes, which, added to the number left after the University examinations, brought the strength of the graduate and undergraduate classes up to 194—"a number unparalleled in the history of the college, and all the more remarkable seeing that the fees paid by a student amounted to Rs. 625 for the full curriculum." In the University examinations the proportion of successful candidates was larger than in any previous year.

An experiment which had been made in the North-West Provinces for the training North-West of female native doctors having been proved to be a failure, orders were given during the Provinces. year under report for the closing of the school established for that purpose at Bareilly. Dr. Corbyn, to whose exertions the existence of the school was due, himself pointed out in the following words the reasons for abandoning the attempt:—

"Another year's working of the school obliges me to confess that, while the European and Eurasian pupils have more than fulfilled my expectations, I feel more strongly than ever the obstacles in the way of utilising the native ones; not that they do not learn quickly and intelligently, for indeed their progress is remarkable, but when they are sufficiently educated to act independently, they do not seem to command the same confidence and respect that the European women do; native prejudices regarding the sex hamper them at every step. If they go out into the world unmarried, they are looked down upon, and all sorts of difficulties arise as to who they are to live with. On the other hand, if they are married, the chances are the husband will insist on their being entirely engaged on household duties, and will object to their pursuing the calling for which they have been fitting themselves."

Several dismissals took place during 1875-6 in the Bulrampur School for carelessness Oude. and inaptitude to learn the medical profession. The Principal says that, while greater strictness will have to be used in future in admitting candidates, it is not always easy to ascertain what a lad will turn out before he is tried.

The professor of medicine, &c., reports as follows :—

“ The subject of pathology appeared naturally very difficult to the boys, but I am glad to say they gradually began to feel an interest in the subject, and some of the students have made fair progress in understanding this most important subject. It will take them considerable time to acquire skill in the diagnoses of many complicated diseases, but a fair beginning has been made, and I hope that in after-life they will be able to take advantage of the knowledge obtained in the medical school. Most of the students showed anxiety to learn the treatment well without paying due attention to the theoretical part of the lectures delivered, but I lost no opportunity in impressing upon their minds the paramount importance of a thorough knowledge of the principles of medicine, and in showing them that the treatment of diseases cannot be properly made without understanding their nature. I hope I have succeeded in my efforts to impress this fact upon the minds of the advanced students. * * * *

“ It was extremely gratifying to me in observing that in the examinations held during the end of the session the students were fairly struggling on to obtain an accurate knowledge of the subject-matter of the lectures, and I hope from this for the very best results in most of the students when they begin to practise their profession.”

The following is from the report of the professor of anatomy :—

“ Considering the paramount importance of our bedside studies, and knowing how very dangerous little learning is, especially when it concerns the life and death of numbers of human beings, it was my special object to make the students ever attend very carefully to the clinical lessons they would derive in this the largest hospital in the province; but I am sorry that with all my energies during the past two years of their connexion with the hospital I have failed in my purpose, and among 22 boys I cannot pick up more than two or three who I can say have really availed themselves of the opportunities offered. The rest of the boys look upon their hospital attendance rather as a hardship, and think they would learn their profession better by looking at a stethoscope, or a test tube, or by hearing a description of their uses, than by carefully attending at the medical requirements of the sick.”

The Government of India, while regretting the facts above adverted to, observe that in Oude, as elsewhere, much depends on the chances the students have of prospering as medical men, and on this point there is as yet no experience to guide young men in that province.

On the whole, the Principal was not dissatisfied with the first batch of students who had just terminated their curriculum. Many of them came from illiterate classes. They were very imperfectly trained to start with, and they were therefore unacquainted with the simplest facts of science. They had not only to understand and remember innumerable facts in various branches of the complicated medical course, but also to learn and remember a vast number of new terms foreign to their own language.

The professors, he adds, did their duty with zeal, and spared no pains in teaching the students. They were three in number (besides the Principal himself), and all natives.

VII.—SANITATION.

Civil.

There was every promise of the new organization of the Bombay Health Department working well. A circular was issued by the Sanitary Commissioner for the general guidance of Health Officers; and Mr. Lumsdaine observes that, when the scheme is in working order, "there will in all directions be constantly moving over the face of the country a set of more or less trained observers, whose special duties it will be to inspect, advise, and report; and, whilst they look to local conditions, they will also turn their attention to the details of registration; so the outcome of the work cannot but be satisfactory."

Organization
of Health
Depart-
ments.

The employment of the vaccination establishments in general sanitary work in the Central Provinces (*see* last volume, p. 28) was kept in view during the year. They were found most useful in distributing medicines in the villages suffering from cholera, and in urging on the people attention to the precautions prescribed with a view to mitigating the ravages of the epidemic. The Sanitary Commissioner believes that, as the men become more trained to the work and gain the confidence of the people, the district vaccination establishments will every year be found more useful in this respect.

An Act (III. of 1876) was passed by the Bengal Government, which provides for the construction, maintenance, and regulation of canals for the supply, under payment, of water for irrigation purposes in the province; for the carrying out of drainage works, or removing obstructions to drainage, when such works or removals are necessary (among other reasons) to protect public health; for the construction of village channels; and for the punishment of persons who damage, alter, or obstruct any canal or drainage work, or corrupt or foul the water of any canal, &c.

Bengal.

Progress in the sanitary improvement of towns in Bengal continued, and, though few very large and costly works were undertaken of a purely sanitary character, there were signs everywhere of activity in promoting minor improvements in connexion with drainage, water-supply, conservancy, &c.

The municipal income of towns is very small, and considering the demands which have to be met as first charges against it, such as maintenance of police, making and repairing of roads, lighting, &c., there is but a small balance left, even in the more flourishing towns, for new works.

In the town of Burdwan sanitary improvements have received for years the most thoughtful attention of the magistrate of the district, and the energy and thoroughness with which they have been carried out are stated to be most creditable to the Municipal Commissioners.

Special attention was devoted to the improvement of tanks in Hooghly and Chinsurah.

In Dacca town sanitary work was well attended to. A new burning ghât was constructed on the banks of the Buragunga at the expense of Baboo Gobind Chunder Dutt. The city is also indebted to Khajah Abdool Ghunny for the liberal gift of 10,000*l.* for the construction of water-works, and 5,000*l.* for the maintenance of the same. The work was slowly progressing.

Much was done for Chittagong during the year. Steps were taken to supply the town with water, and in the meantime ten good tanks were set aside for drinking purposes, and precautions adopted to protect them from pollution. The clearing out of private as well as public tanks was insisted on, and in the district also the clearing and deepening of tanks was encouraged. A professional survey of the town was being taken with the view to drain and embank it. Most of the old burial grounds have been closed, and two new ones were opened. Land has been acquired for three more, so that there will be no excuse for promiscuous burial, which is so common among Mahomedans. The chief Hindoo burning ghât close to the town was fenced in, and a road made to it. Steps have been taken to erect a special hospital for infectious diseases. Twenty public latrines, each with accommodation for eighteen persons, have been built in the town. Ten houses for sweepers, and ten sheds for carts, have also been put up. Forty-five sweepers were imported from the North-West Provinces, men of this class being rare in the district. For the disposal of the collections from the latrines four pieces of land have been acquired. The municipality undertook to do the whole of the cleaning of the town by daily removal of sweepings, ordure, &c., without a costly system of sewerage. It is estimated that a charge of two annas a head per month will cover all expenses in working this system.

In the Tipperah district several new tanks were dug. A canal was being cut through the middle of the *bheel* to the north-west of the station, which will effectually drain the *bheel*, except in the rainy season, and thus remove one cause of sickness.

A large swamp in Patna has been converted into a public garden by excavating a large tank in the centre of the swamp, and raising the level of the surrounding ground with the excavated earth. The sanitary needs of this large town are very numerous, and comparatively little has been done to meet them.

Great improvements have been made in Durbhunga since the famine. Wide streets have been opened out in well chosen lines, and many of the smaller roads have been metalled. Municipal funds are very low, but sanitary arrangements have not been neglected.

Calcutta.

The Calcutta Municipality obtained a loan from Government for proceeding with the completion of the drainage of the town according to Mr. Clark's scheme.

The difficulty of providing a sufficient supply of filtered water for Calcutta led to much consideration, but the necessary works would involve a serious expenditure.

Frequent observations by the Army Sanitary Commission as to the state of the *bustees* or native villages in Calcutta have at length brought the authorities to give the matter their serious consideration. A special committee appointed by the Justices reported fully on the subject (*see* p. 140). In May 1876 the municipality directed that a selection should be made of twelve of the worst villages, and that a report upon them should be prepared with plans and statistical information. It is hoped that the powers given to the new corporation by the recent Municipal Act will enable that body to adopt energetic measures of reform, although progress, it is apprehended, must be very gradual. The Commission, however, object strongly to the condition implied in the committee's report that the needful improvements are to be carried out only "where reasonably practical," and are of opinion that private interests should not be allowed to stand in the way of measures so urgently affecting the public health. A wealthy citizen has set a good example by voluntarily instituting measures of improvement in his own *bustee*.

Referring to the several sanitary measures executed in this capital during recent years, the Army Sanitary Commission remark: "Considering what Calcutta was a short time ago, these are certainly no inconsiderable improvements to have carried out in a few years."

The Calcutta Health Officer, in one of his quarterly reports, gives the following description of the present state of the town:—

"Good work has been done and costly foundations laid for the machinery which public health demands. The results are demonstrable, and have been excellent as far as they have gone; but, so long as any means or powers remain unused, this partial success can only bring the greater discredit for the very much that remains undone. The city can point to great schemes of main drainage and water-supply, to large outlay on conservancy, to a stately market, to works of improvement on the river banks, to lighted thoroughfares, and some dirty *bustees* replaced by wide streets and squares; but vast areas of solid filth and numberless collections of liquid sewage remain untouched, except for baneful use by the people themselves. * * * *

"The masses of the people are worse than savages in the filthiness of their daily lives. Though the chief thoroughfares are cleaned, the city in its inward parts—its greatest area—has its soil saturated with excrement. The habits of past generations, which have made it so, continue in their disgusting details, as free from interruption as though no thought of public health had ever penetrated here. For a plot of unguarded land about his house the tenant sees no use but that of a latrine; and where his fluid filth runs or soaks into a hollow, he calls it a tank and washes in it."

In another report Dr. Payne dwells on the fearfully high rate of infant mortality in Calcutta. The annual average for the five years ending with 1875, was 480 per 1,000 of the population under one year of age; in 1875 of the Hindoo infant population there died 596 per 1,000, and of the Mahomedan no less than 735 per 1,000. The great cause of this mortality is the native practice of obstetric suffocation. "A chamber a few feet square, so situated that at the best of times its atmosphere must be close, has every aperture carefully shut. It is crowded with relatives and attendants, so that there is often barely room to sit, and a fire of wood embers, or even charcoal, is burning in an open vessel. The atmosphere is principally smoke, which is increased by herbs scattered on the fire for the purpose. The woman is lying, generally on the ground, in the midst of this. The feeling on entering the room is that of impending suffocation, and the first step which the visitor takes is to enable himself to breathe. He opens the window and clears the room of as many persons as can be got to leave it, who betake themselves to a balcony outside or block the door-way until his

“ departure. He knows full well that, as soon as his back is turned, all will be as it was when he arrived ; for it is among the first principles of native midwifery that air should be kept away from a newly-born child. This process of asphyxiation seems to be carried on for a variable period, but in no case, as far as I can ascertain, is the period less than seven days ; it often extends to ten, and with Mahomedans much longer, nor does it alter under any extremes of natural heat.”

Dr. Payne urges this infant mortality as a reason for expediting the reform of the *bustees*, and for introducing into the designs such detailed provision for the rebuilding of huts as shall render the suffocation of the inmates difficult, if not impossible.

An important sanitary measure of the year was the appointment of a Health Officer for the Port of Calcutta. Surgeon-Major French took up this appointment on 1st September 1875. The duties of the office are laid down as follows :—

- (1) To superintend the sanitation and conservancy of the port.
- (2) To board all vessels arriving in port with infectious disease on board.
- (3) To inquire into disease among the shipping in the harbour, and into the sanitary condition of vessels.
- (4) To inspect pilgrim vessels before departure, and grant certificates upon which bills of health will be issued by the Commissioner of Police.

Scarcely any information has been received of sanitary works in the Madras Presidency, but an interesting comparison was instituted by the Sanitary Commissioner between the death-rates of particular towns and the expenditure in those towns on conservancy, with the result that those municipalities which spent the most show the lowest rates of mortality. Madras.

Mr. Clark's scheme for the drainage of Madras town* (*see* Vol. VII., p. 24) was submitted in April 1875 to the Government of Madras, by whom it was favourably received. In expectation of this new scheme being put into execution, much was not done during the year in improving existing drains, which, however, were generally very much out of repair, and were a source of much nuisance.

Sewage farms are, in the opinion of the Municipal Commissioners, “ destined to play an important part in the sanitary improvement of Madras, and their development is an object of the first importance.”

The Red Hills water-supply is stated, notwithstanding its imperfections, to be an incalculable blessing to the town. The Army Sanitary Commission, however, consider that its condition is such as to press for inquiry.

In the Madras Sanitary Report for 1873 (*see* Vol. VII., p. 131) the unhealthiness of the municipality of Cumbum was described in forcible terms. The Sanitary Commissioner, after visiting this station in October 1875, recorded the following conclusions :—

“ The site of Cumbum town is not essentially unhealthy ; its facilities for drainage and water-supply were originally good, and there is evidence that until a comparatively recent period it was considered a healthy and pleasant station. Unfortunately there can be no doubt of its present and progressive unhealthiness. This I believe to be remediable by removal of its causes.

“ The chief predisposing causes of the abnormal sickness and mortality of the town were, in my opinion, the crowding of every available spot within its limits with corpses, and the pollution of its water-supply. The exciting cause is malaria arising from a swamp which, owing to partial silting up of an important irrigation channel, has replaced for about two miles the running stream which originally drained efficiently the irrigated lands around the town.

“ More tombs than living persons are visible in the town ; and it is almost literally true that one corpse at least lies buried under every spot not occupied by house or street. The borders of wells and water-channels, so far from being avoided, seem chosen especially for sepulture. The Mussulmans are the principal offenders in this respect. I had an opportunity of ascertaining the views of the Mahomedan community on this point, and I found that they preferred the abandonment of Cumbum as a station, the withdrawal of hospital and dispensary, even death by what they call fate and we call poison, to interference with the *mamul* of burying the present generation in the remains of the past. * * * * If the opposition of the Mahomedan population be regarded as an insuperable obstacle to the prohibition of burial within the town, and if considerations of expense preclude the introduction of an abundant supply of pure water and the draining of the southern swamp, I believe that attention to minor sanitary improvements will have no appreciable effect ; and under such circumstances

* *See also* Abstract of Municipal Report in this volume, p. 144.

" I should recommend the abandonment of Cumbum as head-quarters either of division or of taluq. On the other hand, I am anxious to guard against the inference that a normal rate of sickness and mortality will be an immediate result of the completion of the sanitary improvements suggested. It is even not unlikely that the effects of malaria will be at first intensified by the measures taken for its extinction. A period of three years at least should intervene between the beginning of the needful sanitary works and the re-occupation of the station."

The Army Sanitary Commission observe that the case of Cumbum is without doubt a typical one in India, and points to the necessity of very careful inquiries into local fever death-rates.

The extreme prevalence of cholera at Salem led to an inspection of that town, which revealed the fact that the drainage was exceedingly defective, the water-supply was as bad as it could be, and the habits of the residents were most filthy. As long as this state of things continues, Salem must expect to remain a hotbed of cholera.

Although sanitation generally in this Presidency is in an extremely backward condition, signs of improvement are perceptible in many directions.

Bombay.

A great deal appears to have been done in the city of Bombay during the year both in conservancy and in sanitary works. The Carnac Bunder nuisance is said to have been to a great extent rectified (*see* p. 147). A full discussion of the drainage and sewerage question will be found in the Abstract of the Health Officer's Report (p. 149).

No accounts have been received of civil sanitary works in the Presidency generally. Reports of the inspection of certain towns are summarised at page 133.

Punjab.

The Delhi water-supply project, after having been under the consideration of the Government of India for nearly a year, was returned to the municipality with some suggestions tending to the conclusion that the cost of the project had been underestimated, and recommending that the municipality should content itself with a supply of 10-gallons per head of the population. These suggestions were considered by the municipality, who decided that a reduction in the supply to the limit proposed by the Government of India would not be advisable. It was, however, hoped that action would soon be taken with the project. The municipality offered to raise, at six per cent., from private individuals in the city, the funds necessary for completing the work.

Projects of water-supply and sewerage were prepared for Lahore, the estimated cost of the two projects respectively being 81,055% and 47,233%. It was hoped that the former might be shortly proceeded with, unless the present state of the Imperial finances should make it impossible to advance sufficient funds. It is proposed to take water from wells situated in the clean alluvial soil on the north side of the Fort. An unlimited supply of water, which is practically the Ravi water filtered, is procurable there. The water will be pumped into a reservoir situated on a high mound near the Fort, and will be distributed in iron pipes through the city. With regard to the other project, the sewers being so designed that they would not be self-cleansing if faecal matters were admitted to them, and it being considered of importance that such matter should be carried off by the sewers, the decision of the matter was left in abeyance.

A water-supply project, estimated to cost about 20,000%, was also prepared for Rawulpindee, and the people were most impatient to have it carried out, the inconvenience experienced from the present scarcity of water in that town being very great. Some further inquiries were, however, necessary before action could be taken.

Under the orders of Government, the Sanitary Commissioner held conferences with 18 district committees with a view to impressing upon them the necessity of improving the sanitary state of the villages under their respective jurisdictions. He prepared a pamphlet describing the history, and embodying the elementary principles, of sanitary science; and he accompanied the reading of this pamphlet with ocular demonstrations of the effect of sewage on water. The members were then encouraged to ask questions and to offer any objections that occurred to them, which were discussed patiently and considerately. Dr. De Renzy was most agreeably surprised at the interest which these meetings seemed to excite, and the pamphlet was in such request that it was necessary to print 22,000 copies of it for circulation among the village population. "Before the sanitary evils of the province can be effectually dealt with," Dr. De Renzy observes, "the people must be informed of the nature and extent of these evils. Any attempt to force on sanitary improvements, the need of which would not be appreciated or understood by the people, must inevitably fail. The conferences lately held will, I believe, ultimately be of the greatest use in directing the minds of the people to sanitary evils, of which they had previously no conception."

With reference to the serious defects brought to light (*see* last Report, p. 29) in Simla, the summer residence of the Government of India, the Secretary of State has acceded to a proposal by that Government to spend gradually a sum of 100,000*l.* in making the requisite sanitary and other improvements, of which one half will probably be final expenditure without any financial return.

The most important improvement in the North-West Provinces was the continuation and further extension of the drainage works which are being carried out for the improvement of the canal-irrigated country of the Doab. This work was pushed forward with great vigour during the year. North-West Provinces.

The Meerut drainage scheme (*see* last Report, pp. 1 and 58) was in course of active prosecution. As the work is perfected, a great amount of water will be carried away from the site, and it is hoped that the ratios of mortality will be sensibly decreased in coming years.

Another notable sanitary improvement was effected during the year. It is thus described by the magistrate, Mr. Webster: "On the main road between the kut-cherry and the city were four shallow, stagnant, and noxious ponds, which gave out in hot weather most unpleasant and unwholesome exhalations. Three of these ponds I have filled up, purchasing the land on their margins for this purpose at a total cost of Rs. 2,589. Thus a great sanitary improvement has been effected, and in effect at no cost at all, as I can now sell the land reclaimed at a considerable advance on the sum expended. But I do not wish to bring on the sale yet, as, after the completion of the drainage scheme, these lands will be much more valuable than they are now. The fourth pond I have drained, deepened, and squared into a well-shaped tank, which now holds a constant supply of good water. This was effected at a cost of Rs. 1,298, and is a very great improvement in the neighbourhood, as, instead of a pestilent, evil-smelling, and disgusting-looking swamp, there is now a square pond of clear water."

The Sanitary Commissioner considers the above a valuable testimony in favour of his belief that unwholesome excavations in, or near to, centres of population may be, in many instances, reclaimed without cost, and sometimes at profit.

Fever prevailed at Meerut to a much less extent in 1875 than in the previous year. On this Mr. Planck remarks: "Although it cannot be supposed that this marked improvement has resulted from the filling up of these ponds, yet I believe some amount of this lessened tendency to fever disease may be due to this cause. * * * It may be true, as argued by Dr. Moir, that the greatly lessened fever tendency of 1875 has been due to the fact that a recently prevailing fever epidemic is declining to the normal endemic state. And if that is so, I think our best safeguards against a return to the epidemic prevalence in future years are the completion of the drainage scheme now progressing, and the extended prosecution of improvements of the kind so forcibly described by Mr. Webster."

In the Terai a considerable amount of good work was effected in the way of drainage works, for the purpose of doing away with swamps and marshes in the neighbourhood of centres of population; and especially in the town of Kashipur this work of reclamation was very thoroughly effected.

At Sambhal, in the Moradabad district, a very important sanitary improvement was in process of completion. For many years past a large amount of water stagnated in the immediate neighbourhood of this town, in and after the rains. With a view to effect the removal of this excess of moisture, a cutting, seven miles in length, reaching from Sambhal to the River Sote, was planned, and in great part effected.

At Cawnpore the drainage of the city site was further improved by the construction of new surface drains of proper level.

In the city of Goruckpore attention was given to the cleansing and general improvement of the great excavations in the vicinity of the jail.

In Benares city two works of improvement, having for their main object the better ventilation and improved conservancy of the city, were completed. They consist of two new roadways, each 40 feet wide, provided with stone-made surface drains and raised foot-paths for pedestrians. They are fairly straight in course; houses of the meaner sort have been purchased and removed in a few places to provide the necessary space; and together they constitute a sanitary improvement of the first importance.

In addition to the above, there was a steady continuance of minor improvements in almost all municipalities. These consist generally of well directed efforts to improve the local drainage, to raise and consolidate the public thoroughfares, and to fill up unwholesome excavations.

In many towns which the Sanitary Commissioner visited he noticed very great improvement as compared with their state at his previous inspections a few years back. Moradabad had made such an advance in this respect since 1868 "as to be hardly recognised as the same." An exception was Bareilly, where the appearances of neglect were even more marked than in 1868 and 1874 (the years of previous inspection), and which Mr. Planck describes as by far the worst in regard to cleanliness of any large centre of population which he visited during the year. Agra, too, appears to be in a somewhat backward state, and Mr. Planck observes: "Supplied as Agra now is with railway communication from both the east and west, the city is not unlikely to increase in importance, both as regards trade and population; if that should be the case, it is very necessary that sanitary improvement should be persistently pursued."

The condition of the centres of population which rank, in regard to importance, between the villages and the well known towns, and which are numerous and often of much importance in native esteem, is stated to be still far from satisfactory; and Mr. Planck thinks that any surplus funds at the disposal of district committees could not be better or more justly expended than for the sanitary improvement of such second-class towns, which have no local resources to fall back upon for this important purpose.

It is impossible, the Army Sanitary Commission say, "to peruse those reports without recognising the earnest, active, and intelligent work done * * and at the same time not to express a desire that similar work may ere long be reported from every district of India."

Oude.

The total expenditure by the Lucknow Municipality on sanitary objects was 5,331*l.*, and of this 2,555*l.* was spent on new drains.

The Government of India have recorded the following remarks with regard to sanitation in Oude: "The vaccination establishments have not been employed in general sanitary work as they ought to have been. Altogether there can be little doubt that all branches of sanitary administration in Oude are susceptible of great improvement."

The Army Sanitary Commission observe that the report for the year does not show any advance in real sanitary improvement throughout the province; indeed there appears, they say, to have been less done in this direction in Oude than in any other part of India. They suggest that some systematic method should be adopted of dealing with the more obvious sanitary defects.

Central
Provinces.

No works of any magnitude were undertaken during the year in the Central Provinces, but improvement of the towns in respect of cleanliness, conservancy, and drainage was carried on. To conservancy measures of all kinds, however, the lower classes are everywhere most averse, and every step in advance is therefore uphill work. There is however, the Chief Commissioner observes, good ground to think that what has already been effected has been fruitful of good results, and that where sanitation has been attended to disease has been less prevalent.

The conservancy system which was introduced in Nagpore in 1873 continued to work well. Considerable improvements were effected in the drainage of certain parts of the town and in the Sitabuldee bazaar, but a comprehensive scheme of drainage for the town, which is much required, cannot yet be undertaken for want of funds, the cost of the new water-works being still a heavy burden on the finances of the municipality. The water service was being extended to different parts of the town; the people appeared fully to appreciate the abundant supply of good water.

At Saugor wells were cleaned out and repaired, and drains laid down in parts of the town where they did not exist before. Systematic conservancy has also been brought into force in the other towns of this district.

Conservancy arrangements were introduced into the town of Burhanpore, but the people object to the private houses being brought within the system. All the better houses are provided with cesspools, and their inhabitants are unwilling to close them.

At Raipore conservancy has been well attended to for some years past. The system of surface drains was considerably extended during the year. The great want of this town is a supply of water that will remain pure and sufficient through the hot weather.

Improvements were effected in the drainage of Chanda; conservancy is well provided for. The water-supply is chiefly from wells; many of these were put in good repair by the municipality during the year.

The Nagpore system of conservancy was brought into force in Hoshungabad town, and was found to work very well; and arrangements of this nature were also adopted in the district towns.

The conservancy of Bhandara was greatly improved, and the water-supply also received attention.

No conservancy arrangements have been instituted at Sumbulpore; the people in dry weather resort for the purposes of nature to the bank and bed of the river. The water-supply is drawn in the hot weather chiefly from the river, but in the rains, when the river is muddy, a large tank in rear of the town forms the chief source of supply, and the ground in the neighbourhood of this tank was found by the Sanitary Commissioner to be very much fouled.

A considerable sum of money was spent in deepening the Poorana tank at Damoh, which forms the chief source of water-supply for that town; and a well near the tank was deepened. The drainage of the station was also improved.

Systematic conservancy has not been introduced at either the town or station of Betul. The station and bazaars were clean and well kept, but in the town there was great room for improvement.

The civil stations of Berar are stated to have been all more or less improved during the year. Berar.

While there is not much money to spend in this province on sanitary improvements, the energy both of the officials and of the people themselves in matters of drainage and conservancy is highly commended. The old dwellings, too, were in many parts giving place to a better class of houses.

The supply of water to Rangoon is a matter involving some difficulty, as, the site of the town being nearly on a dead level, any successful system of drainage by gravitation necessitates a full and frequent percolation. The desideratum is a sufficient reservoir, and the choice at present is stated to lie between the Royal Lakes, in the vicinity of the town, and the Puzoondoung river, at a point above tidal influence. There are serious objections to either scheme, to the former from its inadequacy, to the latter from its expense; meanwhile provision is entirely made from wells and tanks. A valuable addition was made to the tanks during the year. The drainage of the city is very defective. The engineer remarks:—"The soil of the low-lying district of Rangoon is "fearfully polluted by liquid sewage deposited on its surface, and constantly giving off "noxious gases; and, were it not for our lengthened rains, the death-rate of the town "would, I am convinced, be increased tenfold." There is no subsoil drainage; and the surface drains are constantly getting out of order, and have to be periodically cleansed out and repaired. The ordinary day and night conservancy arrangements were efficiently maintained, special labourers having been imported from Calcutta.

British
Burma.

In the towns generally, as is observed by the Army Sanitary Commission, a beginning has scarcely been made in initiating public health improvements.

The reports of eleven festivals held in the Madras Presidency between December 1875 and June 1876 are most satisfactory. The usual efficient sanitary precautions were taken; and, inasmuch as cholera was very prevalent in the country, notices were issued warning the people of the danger attending any large gatherings. The result of these notices was a greatly diminished attendance in all cases; at Mylar not one-eighth of the usual number came. In almost every case there was no sickness worth mentioning, even when cholera was actually present in the surrounding villages. At the Kartigai festival, in South Arcot, about 12 deaths from cholera were reported, and at Conjeveram there were 24 deaths out of 40 attacks.

Sanitary
arrange-
ments at
Madras
festivals.

Military.

Numerous sanitary works were carried out during the year for the benefit of the European troops. The system of dry-earth conservancy maintained its reputation for thorough efficiency when properly carried out. Special attention was given during the year to the sanitary supervision of villages in the neighbourhood of cantonments. The area over which such supervision is to extend was fixed at five miles round each cantonment. It is hoped that the utilization of vaccination establishments in sanitary work will afford the machinery for pointing out defects in villages, and impressing on the inhabitants the duty of remedying them.

European
Army.

The Army Sanitary Commission have drawn up a valuable note of suggestions respecting wells and the filtration of water (*see* p. 165), which has been sent to the Government of India with a request that it may be widely circulated.

Bengal
Native
Army.

During 1875 eight new barracks were built in the native infantry lines at Bareilly, on a plan uniform with those previously existing. Each man in these barracks has now 50 square feet of superficial room, and 480 cubic feet of breathing space. At Dehra, also, 20 new barracks (each one for two families) were completed for the married men of the 2nd Goorkhas; and it is reported that they are well raised, and that in them the ventilation, breathing space, and superficial room are all that can be desired.

The drainage in many cases was far from efficient; for instance, in the lines of the 10th Regiment, Bengal Infantry, at Barrackpore, it is reported that, at certain seasons, the drains serve as inlets for the river water and that from tanks. They thus become reservoirs for the surface filth of the station, and give off most offensive odours when drying up.

The conservancy of cantonments and regimental lines, and of latrines, appears to have been carefully attended to. The water-supply in general was abundant and of fairly good quality.

Madras
Native
Army.

At the stations of the Madras Native Army great attention was paid to conservancy of wells, and the water-supply was generally favourably reported on.

As a rule, the hospital accommodation was sufficient, and the condition of the buildings satisfactory. The latrines were worked on the dry-earth system, with the addition of coal-tar; and a considerable number of latrines were enlarged.

On the subject of the hutting of the Madras troops Surgeon-General Balfour remarks:—

“Of late years the efforts to improve the sanitary condition of the huts and lines of native troops have been unremitting, and to the results of these may, in a great measure, be attributed the comparatively favourable state of health enjoyed by the Native Army during an unhealthy year. Scavenging, drainage, water-supply, ventilation of huts and lines, have all received careful attention; and although much remains to be done, nearly all has been effected that could possibly be carried out with the available means, and under existing circumstances. In some cases the sites of the lines are naturally bad, and so long as financial exigencies prevent the construction of proper drains, it is quite impossible to entirely prevent the pollution of the ground by sewage. Again, as to the huts: it is quite easy to describe what a sepoy's hut ought to be, but the native soldier cannot afford to erect a more perfect and, therefore, more expensive dwelling than the one which he now inhabits. It would be a matter of economy were the State to provide quarters for the Native as it does for the European Army, but till that be done we can only try to reduce the unhealthy features of native lines and their surroundings to a minimum. The lines now occupied by the 37th Grenadiers in Vepery, Madras, have, on account of the nature of their site and its surroundings, been long regarded as insalubrious, but since the end of the year under report money has been sanctioned to form new lines in a better locality. During the year new lines were under construction for the accommodation of the regiment at Mercara, so that the old ones, which were so unfavourably noticed in the last annual report, will shortly be abandoned.”

Bombay
Native
Army.

In the Native Army of Bombay the supply of water during 1875 was reported good and abundant; many of the waters were analysed, and some improvements made. The lines everywhere were kept clean, but where the drainage is only by surface trenches it is hardly possible to prevent the soil from becoming impregnated with impurities. The conservancy and sanitary arrangements, as carried out by cantonment committees, were generally satisfactory.

The climates of Aden and Jacobabad are both characterised by great heat, which exhausts the nervous energy, predisposing in the former to malarious diseases and in the latter, it is considered, to scurvy. The medical officer in charge of the 2d Sind Horse observes that the abundant water now found in Sind, and its excellent alluvial soil, afford special facilities for the cultivation, not only of grain and such like commodities, but also of useful timber trees, which might in time be found to be a new source of revenue to Government. The cultivation of an extensive tract of forest trees around Jacobabad would, in a great measure, temper the severity of the excessive heat during the summer months, and at the same time render this highly malarious atmosphere more congenial for human respiration. With regard to this station the Army Sanitary Commission remark:—“There is one very likely palliative measure which might have been tried

“ when the lines were constructed, viz., to raise the huts, like those in Burma, six or more feet above the ground level. All that we can do is to repeat what has been often said, that no effort should be left untried to render this station more fit to be occupied than it is at present.”

VIII.—SPECIAL DISEASES.

Cholera.

Epidemic of
1875. Ques-
tion of con-
tagion.

Dr. Cunningham has devoted a section of his report to the subject of the cholera epidemic of 1875, elaborately and conclusively setting forth the lessons to be derived from this further experience. As was done in 1872 (*see* Vol. VI., p. 72), the evidence of medical officers at different stations was collected by the Sanitary Commissioner in the form of "notes on individual outbreaks;" and this evidence is shown to substantiate the conclusions previously arrived at, as summarised in the last volume (pp. 38 and 39). At none of the stations was there any sufficient evidence that the outbreak was due to importation; the facts are entirely adverse to the probability of the disease having been in any instance contracted from the sick by attendance on them; and the absence of any beneficial effect from measures of quarantine appears also to be fully demonstrated. The deportment of the pestilence, leaving many towns and villages untouched even in districts where it prevailed most severely, points to the existence of some cause or causes whereby it becomes in some way localised in certain spots; and what these causes are, Dr. Cunningham observes, "must be the subject of further investigation, and their removal the aim of all practical sanitary action."*

During the present year Dr. Cunningham, having come to England on furlough, held conferences with the Epidemiological Society on this important question. As the "Lancet" remarked, after referring to the opposite conclusions arrived at by Dr. Cunningham and by the majority of European observers, "the Society, seizing upon this cardinal difference of opinion, and assuming that there can be no essential difference in the mode of spread of cholera in any part of the world, raised the question as to how far the antagonism of opinion might rest upon differences in the methods of observation pursued in India and in Europe. Observing that another great epidemic of cholera was probably in progress, and that Europe, now quite free from the disease, might soon be invaded again, it was held that the opportunity would then occur for correcting, under favourable circumstances, any error of method which might exist among observers here." This is a more satisfactory method of approaching the subject than that alluded to in last year's Report (p. 38).

Bengal.

The Officiating Sanitary Commissioner for Bengal (Surgeon-Major Pilcher) makes the following observations with regard to the cholera of 1875 in that province:—

"There are special circumstances connected with Pooree district and its chief town of the same name which enhance the value of all observations bearing on the origin, progress, locality, and seasonal activity of cholera. The town of Pooree, containing the shrine of Juggernath, is the goal to which constant streams of pilgrims converge from Northern, Western, and Southern India. It is periodically thronged to overcrowding by poor and wearied travellers, and this overcrowding occurs at the most inhospitable season of the year. Cholera is a yearly visitor in the district, and its occurrence is invariably attributed to importation by pilgrims. * * * In all the months except January cholera was present in the district. Unlike the districts of the Presidency and Dacca Divisions, the period of endemic intensity occurred in July, August, and December, instead of March or April and November. * * * Balasore is another district of the Orissa division which suffered severely from cholera in the year, and it may be noted that the chief route to Pooree for pilgrims from Northern and North-Western India passes through the whole length of the district. The disease prevailed all over the district and throughout the year. Though its times of endemic intensity were, as in the case of other districts, March and November,

* The following pertinent remarks on this section of Dr. Cunningham's report occur in the "Pioneer Mail" of 4th November 1876: "Thanks chiefly to Dr. Cunningham himself, 'clear' cases of importation are now neither so numerous nor so clear as they used to be. In former times medical officers sincerely believed in importation, and humbly conceived that it was only their own imperfect abilities and the tangled nature of things which prevented them tracing the importation clearly in every case. This led to the great looseness in the collection and application of evidence. Now-a-days they have, like other people, grown more sceptical, and they also know that, if they do not sift the evidence they have to record with great care, the process will be accomplished for them at head-quarters. Every one acknowledges that in many cases importation *seems* to be *all but* proved (as in the case of Jubbulpore mentioned in the report), but there is always some link in the chain of evidence missing; in other words, the occurrence of importation has never been actually proved; and there are, on the other hand, facts which indicate that importation can never be proved because it does not occur. In the present report it is stated that those medical officers who attributed the disease in particular instances to importation did so merely because cholera was more or less prevalent in the vicinity, a style of reasoning which does not strike us as very powerful or profound."

“ yet the disease was generally severe from February to July inclusive, and during the whole of the last three months of the year.”

The result of his observations “ regarding the locality of cholera in the Midnapore, Balasore, Cuttack, and Pooree districts showed that the disease appeared in *thanas* quite removed from pilgrim routes, and at a time of the year when it usually breaks out ; that the disease appeared almost simultaneously in all the *thanas* of the Durbhunga district in April ; and also that many *thanas* through which the main pilgrim route passes are scarcely affected, while others suffer severely. These are facts not in keeping with the theory that cholera is communicated by travellers from infected districts. It is in the solution of important problems of this kind that the aid of statistics is essential, and it is a matter for regret that more rapid advance has not been made in mortuary registration.”

There was a specially severe outbreak in the village of Sultanpore, in the Patna district. Of this place Mr. Pilcher reports :—

“ The sanitary state of the village could not be worse than I found it. It is built on a narrow strip of slightly elevated land, and is surrounded, except towards the north, by the flood water of the Ganges, which flushes many of the wells in the lower land, filling them with the filth of various kinds thrown out from the village. Several wells visited in the village were found to be in an unsatisfactory state, either from the collections of dirty water about their mouths, or from the deposit of mud within them. The conservancy of the village was, moreover, in a very primitive state.”

He adds : “ In Gya district the disease spread without reference to main lines of traffic, and villages situated long distances from each other and from an affected locality were simultaneously attacked.”

Of a tea garden in the Darjeeling Terai, where the coolies suffered severely from cholera, the following description is given :—

“ This garden is situated in the heart of the Terai, and is bounded on one side by a river. It was opened some seven years ago, and has the reputation of being one of the healthiest for Europeans, but the reverse for natives, who suffer from malarious fevers, dysentery, and diarrhoea, particularly in May, June, September, and October. In 1872 a severe attack of cholera occurred in this garden, but since then only a few sporadic cases were presented. The garden population number about 300, of whom about two-thirds are *pahareahs*, locally recruited, and the remainder are plains people. The cooly lines are too close to one another, and are surrounded by high jungle, which impedes ventilation and is a handy receptacle for all descriptions of refuse and filth. There are three sources of water-supply—the river, a small streamlet, and a well—all of which are good except during the rains ; but the coolies prefer to use water from other sources, however filthy they may be. In the Terai the *hâts* or bazaars are numerous, and the coolies gorge themselves at these *hâts* with putrid fish, pork, flesh of buffaloes, &c., and then consume bazaar liquor until they are drunk, and in this condition they generally lie out all night in the damp and cold, being, as they generally are, improperly clad.”

Dr. French has recorded some valuable notes on cholera in the Port of Calcutta, the result of observations and inquiries during the last four months of the year. There were altogether 34 cases on 20 ships. Of these, one was a captain's wife, 7 were officers, 9 petty officers, and only 17 were seamen. These are considered by Mr. Pilcher to be “ unexpected and important facts,” as tending to show that “ those who have the best accommodation, and who presumably take the greatest care of themselves, are the most liable to the disease.”

Communication with the shore does not seem in any way to be associated with the cause of cholera, and the disease occurs in those who have never landed.

The only serious outbreak in the port was on board the ship “ Marguerite.” Of the water used by the crew Dr. French remarks that it had a foul odour, as of sulphuretted hydrogen, and a very unpleasant taste. An analysis showed that it was most impure, and quite unfit for drinking, and on the 14th it was thrown away, after which no case occurred. It was found that this water had been purchased from boatmen who pretend to supply the Calcutta filtered water to all ships in the harbour not near enough to take a direct supply from the hydrants on the banks. No time was lost in communicating with the Port Commissioners and the Chairman of the Justices of the Peace for the town of Calcutta on the subject, and the result has been that increased facilities will be afforded by the municipality for the direct supply of ships along the banks of the river, and all the ships in the harbour which cannot draw direct from the hydrants will be supplied by the Port Commissioners, who are now organising a service for the purpose.

Dr. Beatson writes, in his report on Calcutta Medical Institutions :—

“ It is, I believe, a matter of fact that we rarely now-a-days find cholera amongst the residents in the Fort, or in those parts of Calcutta which have come under the healthful influence of a pure water-supply, improved drainage, and the more speedy removal of filth of all kinds (animal and vegetable) from our streets and house enclosures ; and an inspection of the statement showing the localities from which cholera cases were admitted into hospital tends to prove that the principal cholera haunts are still to be found in those places where filth, overcrowding, bad drainage, and defective sanitation abound.”

Bombay.

The Health Officer for Bombay reports as follows on the cholera which prevailed in that city in 1875 :—

“ Of those attacked, 1,038 drank Vehar water, and 324 well water ; whereas, of the cases in which the disease ended fatally, 607 drank Vehar water, and 240 well water. The percentage of deaths to the attacked was amongst Vehar water drinkers 58·47, and amongst those who used well water 74·07. * * *

“ It is a remarkable fact that there were only four deaths from cholera amongst that degraded race who from their cradle live in the odour of ordure, and whose lives are spent in handling it. If there is any truth in the belief that the bowel discharges of the affected with cholera contain the active principle of the disease, then the immunity from this disease which those appear to enjoy whose occupation and mission in life it is to handle and remove fecal matter is as remarkable as it was to be unexpected. * *

“ It has hitherto been held as an article of belief that particular localities, owing to their geological formation and surface configuration, had a peculiar attraction for cholera. It has been assumed that the porous soil and low-lying position of some of the districts in this city exerted a great influence, if they did not play a chief part, in the causation and localization of cholera in Bombay. The experience gained regarding the disease in this city, as I read it, goes to prove exactly the contrary, that there is no apparent connexion between the soil and the endemicity of cholera in Bombay, and that, when cholera acquires an epidemic character, its progress is not controlled nor guided by the surface formation of the city. The history of the last epidemic teaches that the causes of the outbreak lay not in the soil but in the people, and that the progress of the disease was not influenced by the distribution of the soil. * * *

“ The manner in which the disease fell on particular persons and passed over others living in the same street, or even in the same house, is very singular. I will give two illustrations, as they indicate how careful we should be before coming to any conclusion regarding the effect and value of segregating cholera patients. * * *

“ The lesson to be learnt from the outbreak is plain. It teaches us that we need not go from Bombay to search for the causes of the epidemic, that they are in our midst, and that they are to be found in a teeming, poverty-stricken population, huddled together in overcrowded, ill-ventilated dwellings ; and that, to eradicate cholera, the masses must have more food and better dwellings, and a higher standard of living must be adopted.”

In Vol. VII. (p. 35.) reference was made to an outbreak of cholera in the Yerrowda jail, which was considered by the Superintendent, Dr. Blanc, to be clearly traceable to infection. In this volume (p. 188.) is contained an analysis of the incident by the Army Sanitary Commission, who show that, as usual in such cases, the conclusions put forward are based on mere hypothesis. While, however, there was no evidence of specific infection in the water used by the prisoners, there was no doubt of its dangerously foul condition.

Punjab.

The decennial table on page 8 of cholera deaths in the Punjab indicates an apparent tendency in the disease to become epidemic about once in every three years.

It is further shown in the Punjab Sanitary Report that cholera epidemics occur under the most diverse meteorological conditions. At Lahore 1875 was a year of profuse rainfall, while 1869 and 1872 had a moderate rainfall. In the hot weather of the years 1869 and 1875, the heat was above the average ; in 1872 it was below the average. Nor, as regards humidity, would there appear to have been any thing peculiar in cholera seasons. In non-cholera years the barometric depression is quite as great as in cholera years.

Cholera seasons in the Punjab are found to be those in which the mortality from other causes, notably fever, is the greatest ; and the statistics would seem to suggest some connexion between the causes which develop fever and cholera. The same circumstance is noted by the Deputy Surgeon-General in Mysore, in the following words : “ The opinion held by some that, when epidemic disease such as cholera is abroad, fever and other ordinary diseases are proportionately diminished, does not hold good as regards the mutual relation of cholera and fever during 1875 in this province. Both aggregates were in excess of the average.”

The Sanitary Commissioner for the Punjab devotes nearly the whole of his report on the diseases of the year to cholera, giving to it, in the opinion of the Local Government, "an attention disproportioned to its importance, when it is considered that deaths from this disease ordinarily form an almost inappreciable proportion of the general mortality of the province."

The following remarks on the diffusion of cholera in the North-West Provinces in 1875 are extracted from the Sanitary Report for that year:—

North-West
Provinces.

"The map of mortuary circles * * shows that geographical position does not apparently influence cholera prevalence. * * * And it may be seen that, although the diseased action was wide spread in patches over the face of the country, its stress fell on few circles in every area of prevalence. * * * The returns received from the Banda district were very carefully prepared. * * * The result is that, of a total of 1,231 centres of population contained in the district, cholera disease prevailed in 220. Of these 220 villages, in only 26 were more than 10 deaths recorded. These places of excessive prevalence are situated principally in two groups, one in the centre, the other in the eastern portion of the district. Indeed the total prevalence may be divided into three portions. * * * In all these portions the disease may be seen in many instances to have affected villages with contiguous lands; so often is this the case that I think it may be accepted as a rule. Deaths in isolated villages occur here and there, but the course of the prevalence may be traced on the map from village to village almost without a break over wide surfaces of the district. In tracing this prevalence, it is seen, too, that centres of population situated on or near to the lines of traffic are very often affected. * * * The figures do not show that the disease passed from village to village in orderly succession of dates; indeed nothing could be more irregular than the dates of first outbreak, villages far from the centre of first attack having been affected before villages quite near in many instances and in all directions."

The Sanitary Commissioner for the Central Provinces enters very fully, in his report, into the meteorological conditions of 1875, comparing them with the conditions of 1874, in which year there was next to no cholera. He states: "The month of March 1875 was marked by the commencement of an epidemic of cholera, which in the subsequent months spread over large portions of the province; and the experience of former years has shown that it is in the early months of the year that epidemics of cholera arise,—that if March and April pass by without cholera having become epidemic within the limits of the province or in the districts bordering on it, immunity from the disease in an epidemic form more or less complete for the remainder of the year may be counted on. A comparison of the meteorological conditions of the early months of 1875 with those of the corresponding months of the previous year, which was marked by complete immunity from the disease, becomes therefore a subject of much interest."

Central
Provinces.

He then proceeds to show that the excessive temperature of March constituted the chief feature in which the meteorology of the early part of 1875 differed from that of the corresponding period of 1874. In January 1875 the mean temperature was much below the average; during the last three weeks of February it was higher in 1875 than in 1874; in the second week of March 1875 a remarkable rise of temperature occurred (while the corresponding period of the preceding year had been marked by a decided fall), and the temperature continued higher through April. The humidity of the atmosphere was slightly greater in February 1875 than in that month of 1874, but it was lower through March, April, and May.

Of the epidemic in Berar it was observed by the Sanitary Commissioner that the general direction was from west to east. "At times, however, it appeared to move in waves, sometimes the back wave taking in villages which the front one had passed over; at others it looked as if it were sending off shoots, some in advance, others laterally, and others again obliquely; nevertheless the advance of the disease was clearly eastward, and its passage—that is, the interval between the date of the first case in Berar and the first case beyond our eastern border in the Central Provinces—through the province (90 miles) occupied 66 days."

Berar.

Dr. Abbott made careful investigations into the connexion of the cholera with meteorological conditions, and the general result he arrived at was that atmospheric phenomena do not occasion the advance or decline of an epidemic, although they may

account for its peculiar deportment. It would not appear that the cholera in Berar was due to great heat, for no parallel appeared between the mean monthly temperature and the monthly cholera mortality; and so also increased moisture did not necessarily bring with it an increase of the malady.

Fever.

Bengal.

The severe and fatal fever which prevailed in the Burdwan, Beerbhoom, Midnapore, and Hooghly districts in past years continued to abate, both in regard to the area affected by it and the intensity of the disease.

The officiating Civil Surgeon in Burdwan expresses the following opinion with regard to this fever:—

“Whatever may have been the name given to the fever which a few years ago decimated the inhabitants of this district, judging by the after effects one can see now, and by the universal prevalence of intermittent fever and ague I am of opinion that it was a purely malarious fever locally intensified into a very virulent type. This type is now rarely met with, either because the exciting cause has died out, or because the disease has exhausted itself on all such as were liable to be affected by it. All those who have had opportunities of studying the disease thoroughly hold the same opinion that it is or was purely malarial fever.

“In conclusion, I may state my opinion that the Burdwan district has regained about as good a condition of general public health as can probably ever be expected. As an almost exclusively rice-producing district, with three-fourths of the soil under water for three or four months of the year, abounding in swamps and old river-beds, with but little natural drainage, with a high-level river, the Damoodah, running through the district from end to end, only kept from overflowing by a bund, and not draining the surrounding country at all, we have nearly every factor for an unhealthy district.”

The Civil Surgeon of Darjeeling writes as follows regarding fever in the Terai:—

“The incubation stage after exposure to the malarious influences seems to vary from a week to a fortnight. Some Europeans and natives, who live constantly in the Terai, may only be subject to occasional and slight attacks, which however undermine the health and power of withstanding disease. When the Terai residents visit Darjeeling, however, they are almost certain to get fever, and that to a much more intensified degree than down below. In such cases relapses are common, and it often takes a long time to exhaust the force of the poison, which seems to have accumulated in their system. The severe cases soon run into the remittent and often continued type with cerebral complications.”

North-West Provinces.

It is noticed in the Sanitary Report of the North-West Provinces that in respect to fever mortality the Terai district stands at the head of the list. It is a moist country, with excessive vegetation, where it would be reasonable to expect much fever. Moreover, the inhabitants are in large proportion immigrants from more densely-peopled parts of the country, and a considerable surface of the district is uncultivated land, thick set with forest and jungle. But nothing of this description will apply to the land of the Doab, which is a region of soft dry land, drained on either hand by wide rivers of sweet water, its surface carefully cultivated, its people the descendants of long settled families. That fever disease should prevail there in any measure approaching its prevalence in the Terai must be due to some unusual cause. The Sanitary Commissioner thinks that cause is the increased moisture brought into the land in recent years by hindrance to the outflow of rainfall. If this opinion is correct, then the only hopeful remedy is the improvement of the natural drainage lines of the country. This has been done with a great amount of success in the upper Doab, and will in time, it is hoped, be thoroughly effected in the central and lower Doab. With clear running streams always passing to the Ganges or Jumna, the increase of moisture in many localities, hurtful both to the fertility of the soil and the health of the residents, is likely to be effectually removed.

Oude.

The inquiry into the prevalence and causes of fever in Oude (*see* Vol. VII., p. 37) was committed by Government to the Sanitary Commissioner in June 1875, but very little was accomplished except during the last three months of the year, and only one of the civil surgeons is stated to have taken much pains in the matter. Any positive results of importance can only be looked for after the inquiry has been carried on for a number of years.

The only conclusion to be drawn at present is that fatal malarious fever is not so universally prevalent over the province as was supposed; and that it is most so in sub-Himalayan tracts of country, and in low-lying lands, where jheels abound and the soil is water-logged.

As regards the sanitary condition of the villages the reports continued the same, that they were filthy in the extreme, with all sanitary rules set at defiance. The water as a rule was stated to be fair in quality, but in this matter appearances are often deceptive, as water that is bright, odourless, and tasteless may yet be contaminated and act as a poison.

The Civil Surgeon of Kheri, who has submitted an interesting report on the fever tract of the Katna river, sums up the evidence obtained from 20 villages as follows:—

1st, That the greatest number of cases and the highest mortality occurred in the months of August, September, and October.

2nd. That in villages situated on low-lying lands the prevalence and virulence of the disease was comparatively greater.

3rd. That the cultivation of particular crops did not appear to exert any influence.

In regard to sanitary condition, state and repair of wells, comforts, &c. of the inhabitants, these villages were similarly circumstanced.

On the subject of fever in British Burma the Sanitary Commissioner makes the following remarks:— British
Burma.

"It has commonly been believed that Burma, with its heavy rainfall, large tracts of low lying lands, which are inundated during the rains, thick vegetation, and low lying deltas, must be a hot bed of malaria, but it is not so; the prevailing fevers of the country being febricula and quotidian intermittent, readily amenable to proper treatment. No doubt these simple fevers often terminate fatally from secondary diseases developed in consequence of the ignorance of the Burmese medicine men, whose treatment is opposed to common sense. These men have really no fixed theories, and in practice each differs from his neighbour; the majority use very violent purgatives, shut the patient up in a house, excluding the air as much as possible, allow no nutritious food, do not allow the body to be cleansed even with warm water, as they evidently think the thicker the skin becomes coated with dirt the greater the protection against chills; others give nostrums, composed of about 20 different ingredients, the principal being spices, nitrate of potash, soot, sulphur, and arsenic; this, which is a more reasonable mode of medicinal treatment, is supplemented by the same general treatment as that adopted by their more energetic brethren, and the result of both modes of treatment is commonly an anæmic condition terminating in general dropsy, which is very frequently fatal by sudden effusion; others, again, pursue a dietetic system principally based on popular ideas that certain foods emit unhealthy smells."

And the following is extracted from a report by Dr. Crombie, of Rangoon:—

"According to Theobald, whereas the Gangetic delta is an area of subsidence with a deposit of recent alluvium (from 60 to 80 feet thick at Calcutta), the Irrawaddy delta is undergoing elevation, and only about 200 square miles of it (of which the greater part, namely 140 square miles, is round Pantanaw), are covered with recent alluvium. The alluvium of the Irrawaddy valley and of Burma generally is the older alluvium, originally deposited at the bottom of the sea, before the elevation took place, and, according to Theobald, except round Pantanaw, where there is a depression in the older alluvium, and within six miles of the river banks between Pantanaw and the frontier, the effect of the yearly flooding of the country in depositing new alluvium is nearly *nil*, because the flooding is really produced by the hill streams, which are dammed back as the Irrawaddy rises, and the level of the flood water is already as high as the Irrawaddy banks before its waters top them. The consequence is that the Irrawaddy, although it tops its banks, overflows them to only a comparatively slight extent, and can be seen flowing through the flooded country like a ribbon of a different colour. On the subsidence of the Irrawaddy at the end of the rains, any deposit that may have taken place is scoured away with a force proportionate to the area flooded. In [this way it happens that the surface exposed on the cessation of rains and the fall of the rivers is the old alluvium, poor in organic matter, and not a new deposit, suited in every way, under a tropical sun, for the evolution of 'malarial gases,' as in the Gangetic delta, where the conditions of the annual flooding are entirely different. The Ganges is a depositing, while the Irrawaddy is an excavating river."

The Chief Commissioner observes that, while the comparative immunity of the province from fevers of a severe type may partially arise, as the above report suggests,

Central Provinces.

“ When the rainfall of the season has been scanty generally over the country, the prevalence of fever will be comparatively slight; but the development of malaria, or whatever the cause of fever may be, is not so closely related to the amount of rain that falls that an excess of rainfall will always be followed by greater prevalence of fever. A comparison of the fever rates of the different districts in the same years, or of the same districts in different years, shows no distinct or uniform relation between the amount of mortality from fever and the amount of rainfall. Sufficient rainfall to thoroughly saturate the soil and subsoil is probably one of the factors necessary to the production of fever, but it may be that an excess beyond this would hinder rather than promote its prevalence.”

With a more than average fall of rain throughout Rajpootana, the amount of malarious fever was below the average. The rains fell late in the autumn; and as in the month of October the sun, though still powerful, begins to lose some of its force, the drying process is less rapid. To this the favourable result mentioned was probably due, as it is the rapid drying of saturated soil, rather than excess of moisture, which is usually followed by the appearance of paroxysmal disease.

It would appear from the Sanitary Report for the North-West Provinces that the seasons of greatest mortality from the four principal death causes are as follows :—

<i>Fever and Bowel Complaints</i>	-	-	-	{ Rains.
				{ Cold.
<i>Cholera</i>	-	-	-	{ Hot.
				{ Rains.
<i>Small-pox</i>	-	-	-	- Hot.

The comparative absence of cholera and of small-pox during the seasons not specified above is very marked. The Sanitary Commissioner for Berar, in his Report for 1874 (*see* Vol. VIII., p. 47.), gave the results of very careful meteorological investigations, and drew the inference that fevers and bowel complaints arise from one and the same cause. In the Madras Report for 1875 an opinion is given that bowel complaints are identical with non-epidemic cholera. Further investigations on this important and interesting subject have been ordered.

Bombay.

The following remarks convey the result of observations on the subject of small-pox by Mr. Weir, Health Officer for Bombay :—

“ Small-pox acquires greater virulence and is more prevalent in the first four
“ months of the year than at any other season. It may almost be regarded as a
“ cold-weather disease. The extent to which small-pox is apparently influenced by
“ the seasons is very remarkable. * * * * The greater fatality of the
“ disease during this period of the year is evidently due either to the season
“ or to the greater prevalence or activity of those causes which give rise to small-
“ pox at this season. From the latter end of January up to the middle of April
“ it is in its greatest maturity. And to what is its prevalence at this time to be
“ ascribed? On what principle is its decline as the weather begins to get warm
“ to be explained? During the cold season people keep inside and sleep inside their
“ houses, all the doors and windows are kept carefully closed, and as much of the cold
“ wind as can possibly be kept out is excluded. The rooms at night are overcrowded.
“ With the windows open this overcrowding would not be so much felt, but with the
“ doors and windows all closed it not only seriously injures the health of those who live
“ under these conditions, but, when there are people affected with small-pox sleeping in
“ the same rooms with people who may not be suffering from this disease, and with
“ children who have not been vaccinated or had small-pox, the exclusion of the fresh
“ air, and the overcrowding, must exercise a tremendous influence in propagating the
“ disease. To comprehend fully how these conditions act, the peculiar views the people
“ of this country hold regarding the nature and origin of small-pox must be understood.
“ They do not realise that small-pox is infectious, and many of them believe that it is

“ one of the ways by which Providence dispenses its choicest favours. Not believing in the infectiousness of small-pox, they despise and neglect precautions.”

It will be seen that the seasonal prevalence of small-pox in the city of Bombay differs widely from that observed in the North-West Provinces as stated just above.

The Sanitary Commissioner for the Central Provinces remarks :—

Central
Provinces.

“ Although vaccination has in a great measure contributed to reduce the rate of mortality from small-pox in many districts, the death-rates from small-pox do not fall in a very constant proportion to the vaccination rates ; there are no doubt influences that produce variations in the mortality from small-pox in different localities and in different seasons.”

Dr. Abbott infers from a comparison of the two small-pox epidemics which culminated in 1869 and 1873 respectively that the life-time of an epidemic is just 4 years, that it takes 18 months to reach maturity, and that its decline is more gradual, occupying about 30 months. He further observes :—

“ The deportment of this disease is peculiar, as, whether it is on the rise or on the decline, the mortality from it increases and decreases according to the seasons of the year. Thus, during the rains, when the weather is moist, there is a marked decrease in the mortality. As the cold weather sets in, the mortality increases, and continues doing so till the hot season, when it reaches its height. Again, when the weather is moistened by the rain in June, the mortality begins to fall. It is remarkable however, and tends to show that meteorology in itself does not influence the advance of an epidemic of small-pox, that each epidemic we have a record of reached its height in the beginning of the hot season, whereas in the other years of each epidemic, whether on the rise or decline, the mortality rose till the weather became moistened by the monsoon rains setting in.”

Leprosy.

It was mentioned in Vol. VII. (p. 31) that the Government of India had determined to employ Doctors Lewis and D. Cunningham on scientific investigations into various special diseases. During the year under review these officers instituted very elaborate inquiries into leprosy and Delhi sore, the results of which are appended to Dr. J. Cunningham's report for the year.

Inquiry
by Drs.
Lewis and
Cunningham.

With regard to leprosy, they commence by pointing out that there are three large tracts of country where it prevails to an extraordinary extent, namely : Beerbhoom and Bancoorah in the Burdwan Division of Lower Bengal ; the Kumaon Division of the North-West Provinces, extending across the southern range of the Himalayas ; and the Deccan and Konkan Divisions of the Bombay Presidency.

The distribution of lepers in the different Presidencies is as follows :—

		Number of Lepers.	Ratio per 10,000 of Population.
Bengal	- - -	71,287	5.2
Madras	- - -	13,944	4.4
Bombay	- - -	13,842	8.5
Total for British India	-	99,073	5.4

The Burdwan Division of the Bengal Presidency contains 12,081 lepers, and the ratio to population is 16.5 per 10,000.

The disease is exceptionally prevalent in the following districts :—

Presidency.	District, &c.	Ratio per 10,000 of Population.
Bengal	Beerbhoom	41.2
Ditto	Bancoorah	30.0
Ditto	Burdwan	22.6
Ditto	Kumaon and Gurwhal	21.1
Ditto	Banda (Tehseel)	19.6
Ditto	Dehra Doon	19.0
Bombay	Barsi	25.6
Ditto	Sowda	25.0
Ditto	Rajapore	23.4

A special inquiry was carried on in Kumaon in pursuance of a suggestion by the Lieutenant-Governor of the North-West Provinces (*see* Vol. VIII. p. 49).

The relation of the disease to the physical features of various localities in this district will be treated by Drs. Lewis and Cunningham in a further report. Meanwhile they account for its extreme prevalence in the eastern part of the district by its contiguity with Nipal, where lepers are not allowed to live, and whence in all probability great numbers cross the frontier to avail themselves of the protection of a more humane government.

Leprosy in Kumaon does not appear to be dependent on dirt, although the habits of the people and their villages are filthy in the extreme, man and beast living in the same dwelling all the year round. The Bhootéas, who inhabit the northern parts of Kumaon, are even dirtier than the natives of the district, it being considered by them unlucky to wash, and yet they are said to be free from this plague.

From the statistics of the Almora Asylum it would not appear that the disease is specially prevalent in any particular class of the community.

Among 79 cases in the asylum the age of attack varied from 3 to 60 years, the average being 23·73. Taking all the varieties of leprosy together, there was no evidence of a tendency to earlier attack in females than in males; indeed, the tendency was slightly the other way. But in the anæsthetic form the average age of attack for females was 24·8 against 27·4 for males.

The inquiry was decidedly unfavourable to the contagiousness of leprosy. Of 52 lepers in the asylum who were married, 18 had leprous wives or husbands, but as 17 of these marriages were contracted between lepers in the asylum, there remains only one case in which the possibility of contagion is to be considered, and certainly this isolated instance cannot be regarded as affording any trustworthy evidence, as in an endemic area the possibility of the occasional occurrence of marriages between predisposed parties must always exist. There was no evidence of attendants or others employed about the institution or of those in any way connected with it having suffered from the discharge of their duties in any way.

The history of the patients pointed to hereditary predisposition, and to a strongly-marked tendency in the disease to follow the female line of descent. Further facts brought out were the comparative sterility of lepers, and the high rate of mortality among their offspring. In connexion with the first of these points, a much smaller number of children was credited to male than to female lepers. This may probably be accounted for by the fact that in India there is often such great disparity between the ages of men and their wives that, allowing the age for the manifestation of disease to be practically alike for both, the females have a much longer time previous to its advent in which to produce children than the males have.

An interesting experiment was in progress at Almora, namely, the retention and observation of the children of lepers in an orphanage. Of 12 such children, 7 were born in the asylum of two leprous parents, and 5 were the offspring of one leprous and one healthy parent, having been born in the villages to which their parents belonged. Their ages ranged from 19 to 5 years, their health and general condition were excellent, and as yet they showed no signs of leprosy. The experiment is as yet imperfect, but it is capable of affording very valuable information if the future history of the children be carefully noted. They have been removed from the surroundings under which the disease manifested itself in their parents, are well fed and carefully attended to, and their subsequent history cannot but throw light on the extent to which the influence of hereditary predisposition can exert itself, or may be modified and kept in abeyance by ameliorated conditions of life.

To the forcible segregation of lepers themselves Doctors Lewis and Cunningham are strongly opposed; and they observe that there would be insurmountable difficulties in the way of carrying out any such measures, as not only those actually suffering from the disease, but all persons supposed to be hereditarily disposed, would have to be secured and confined. Asylums, properly so called, are, they say, very useful and desirable institutions. The one at Almora has been in existence for upwards of 30 years, and has been an undoubted and very great blessing to the lepers of Kumaon, affording them a shelter in which they may live in comparative comfort, in place of wandering at large over the country as beggars. A striking proof of this is the rarity with which leprous beggars, in spite of the prevalence of the disease, are to be encountered in the neighbourhood of Almora, as well as the contented and even cheerful spirit displayed by the vast majority of the inmates. The comparatively small number who leave the asylum also speaks well for the comfort enjoyed by the patients.

In compliance with the Resolution of the Government of India mentioned in last year's Report (p. 49), the Sanitary Commissioner for Madras issued a circular to 33 civil medical officers in that Presidency, requesting them to furnish any facts that might come under their notice bearing on the distribution and causation of leprosy. Up to June 1876 eleven reports, of more or less value, had been received by the Sanitary Commissioner, by whom they have been printed as an appendix to this Report for 1875. Only one of the reports, which is drawn up in a very perfunctory manner, favours the doctrine of contagion, while there is a concurrent testimony to the hereditary character of leprosy. One officer states: "Among the many cases that I have met with during my short experience in this country, not one ever gave me satisfactory proof of contagion. Were it contagious, would not thousands in India be the victims of this loathsome disease?" Another: "I am not aware of a single case in which the disease has been produced by contagion." Another: "I have no experience of the contagiousness or otherwise of the disease, but the following, whilst tending to show contagion, shows also that it cannot be very active. A woman now in the lazaretto got the disease after *four years'* cohabitation with her leprous husband." Another: "That it is contagious in the ordinary sense I see no reason whatever to believe. That it should be so, and yet no popular recognition of the fact have ever arisen in a country such as this, is simply incredible to any one acquainted with the manners, customs, and ideas of the people; whilst the very great frequency with which it is transmitted one degree out of the direct line (as, for instance, to nephews and nieces, and then perhaps to a cousin, second in descent from the original leper) is to my mind an unanswerable argument against the contagion theory; that it may be communicated as between husband and wife is admitted, but this I attribute to blood poisoning through the medium of the foetus in utero, and not to contagion as ordinarily understood."

In conclusion, the Sanitary Commissioner quotes the following extract from a private letter: "Since my conversation with you this morning, I have had some talk with Mr. H. on the subject of leprosy. He has a son afflicted with this disease, the only one of his family. He attributes it to the fact that the native nurse, who suckled his son as an infant, broke out with leprosy herself some years after she had nursed this boy. He told me that the late Mr. F., whose first wife was an European, had two daughters. The eldest was nursed by the mother, and she had no signs of leprosy; the second, owing to the mother's illness, was nursed by a native woman, and *this* girl afterwards broke out with leprosy. Mr. H. told me that so strong is the persuasion amongst East Indians that the disease is taken from native nurses that infants are now frequently brought up on cow's milk or goat's milk." Mr. King adds the remark: "Can all cases of true leprosy occurring in pure-blooded Europeans in India be traced to infection through lactation?"

The results of similar investigations in the North-West Provinces have been embodied in an interesting report by Mr. Planck, the local Sanitary Commissioner. The principal points brought out are the following. North-West Provinces.

It would appear most probable, though the point needs further consideration, that local conditions have no influence as a cause of the disease.

The male constitution, or the circumstances of male life, are peculiarly favourable to the development of the leprous condition.

It is not limited to persons of any special forms of employment, although, as a fact, it seems to be rather more prevalent among persons of sedentary habits.

Its prevalence appears to be tolerably equal among the rich and the poor.

As a rule, it does not appear in a recognisable form until after 20 years of age, that is, after children have presumably been born to those afflicted; so that the sequestration of lepers with a view to the eradication of the disease could not be carried out to any purpose.

Lepers are as prolific* and as long-lived as the rest of mankind.

With regard to the question of contagion, Mr. Planck, while not yet prepared entirely to deny it, shows that the instances are at all events infinitesimally few. If the disease ever originates in contagion, this would certainly be the case in the cohabitation of man and woman, and an apparently authentic case is indeed recorded of a colonel in the Indian Army who some years ago became a leper and could only account for his misfortune by the fact that he had continued to cohabit with a native woman after she had been attacked with leprosy. But of 855 cases which were investigated, in which cohabitation continued after the disease had appeared on either side, the reports expressly stated that in 831 the disease was not communicated to the healthy persons. In 13 out

* This point does not accord with the conclusion arrived at by Drs. Lewis and Cunningham (see last page.)

of the remaining 24 cases both persons were acknowledged lepers at the time of marriage; and there were good grounds for believing that at least the majority of the other 11 were cases of intermarriage between members of leprous families.

The testimony of these reports goes to prove that hereditary taint is a potent, and perhaps the most potent, cause of the continuation or prevalence of leprosy.

Lastly, Mr. Planck states that, as the inquiry proceeds, evidence appears of the commencement of the disease *de novo* in some individuals. What the originating causes in such instances are can at present be only matter of conjecture; they appear to be first and principally such climatic conditions, habits, or mode of life, as conduce to the formation of constitutions in middle life prone to low forms of disease. In the hope of throwing light upon this subject, Mr. Planck intends carefully to record the history and circumstances of all the lepers in some selected village.

Treatment
with gurjun
oil.

Several reports have been received from Madras on the results of treatment of leprosy with gurjun oil. The surgeon in charge of the Madras Leper Hospital bears testimony to the improvement in the general health of patients, and to the comfort which they derive from the use of the oil. He asserts positively that there was some improvement in every patient who was able to persevere in the treatment without interruption. He states, however, that the course of the disease is divided into various stages, each of which is characterised "by a group of symptoms or appearances," and that the absorption of tubercle and temporary return of sensation to parts previously numb may be "simply passing changes incidental to the natural course of the disease." After giving a brief summary of his experience in the use of the oil, he concludes by saying: "The gurjun oil does not possess any intrinsic value in the cure of leprosy. "As a cheap and unctuous oil, it is well adapted to carrying out the principle of "daily exercise instituted by Surgeon-Major Dougall, which, with other hygienic "conditions included in his mode of treatment of this disease, has done much good "in improving the health, condition, and general comfort of the patients. Internally "administered it is a useful purgative, described by the patients as producing a very "pleasant feeling of lightness and inclination for exertion, but if frequently repeated it "ceases to have this effect."

Another medical officer says that, "though gurjun oil may be an excellent remedy for "stimulating and healing leprous ulcers, thereby improving both the mental and physical "condition of the patient, yet it has no power over the constitutional disease."

Many of the other reports are to a similar effect. Some speak of cures, but in such cases there has of course not been time to test the permanency of the beneficial results. There is a general complaint of the difficulty of inducing lepers to remain for any length of time under the treatment.

Surgeon-General Balfour summarises the contents of these reports in the following words: "I have to observe generally that the results of the trial of gurjun oil have been "encouraging. Although it cannot be regarded as a specific, it is of great benefit in "relieving the more distressing symptoms of leprosy, and, as its use is associated with "various valuable hygienic measures, I regard it as one of the best modes of treatment "that have hitherto been brought to the notice of the profession. It is evident, however, "that its actual efficacy can only be ascertained by prolonged use in selected cases."

Careful experiments were carried out in the Agra Leper Asylum with the following results. The application of gurjun oil removed to a great extent the local manifestations, but exerted no specific influence over the constitutional taint or leprous cachexia. As far, however, as the local effects were concerned, ordinary sweet oil was found equally efficacious; and the conclusion was therefore drawn that the benefit experienced was due, not to the quality of the oil, but to the friction producing absorption of the deposits which are effused into the skin and cellular tissue during the course of the disease.

The gurjun oil treatment was fairly carried out at the Leper Asylum in Mysore, with the result thus expressed by the Deputy Surgeon-General: "As a therapeutic agent, it "has been found to improve the state of the skin, to assist in healing up leprous sores, "to corroborate somewhat the general health, and in some cases to recall sensation to "anæsthetic spots; but it has failed to produce any permanent amelioration, or to change "for the better the true leprous cachexia. Most of the patients are, however, averse "to the external use of the oil."

Work by
Dr. Carter.

Dr. Carter's notes of a professional tour in North Italy, Greece, and Palestine, together with the results of his researches in parts of the Bombay Presidency (see Vol. VIII., p. 49), have been printed at the expense of the Indian Government, as a continuation of his large work on Leprosy and Elephantiasis.

Delhi and Sind Sores.

The subject of the Delhi sore, and the proposed investigation by Doctors Lewis and Cunningham, were referred to in Vol. VII. (p. 43). Those gentlemen have now submitted their report, the leading conclusions of which are as follow.

The sore is practically the same as that prevalent in other parts of India, and at Aleppo, Biskra, Bagdad, &c., and therefore comes under the general designation suggested by Dr. Tilbury Fox of "Oriental sore."

It has been identified by Drs. Lewis and Cunningham with a form of cutaneous affection existing in Europe, and is considered by them to be probably one or other of the generally recognised forms of "lupus," although, owing to climatic and other local conditions, it may be in some degree modified from its European prototype.*

The occurrence of the disease appears to depend immediately on the nature of the water-supply. At Delhi the water in many of the wells is extremely hard, and is impregnated with a large quantity of salts. Although the salts which cause the hardness of a water may of themselves not be the actually deleterious ingredients, nevertheless, this quality may serve as an index of properties in it which tend to favour the production of cutaneous disorders.

Surgeon Bartholomeusz (in medical charge of 2nd Sind Horse) has submitted the following observations on the Sind sore:—

"The Sind ulcer may have either an idiopathic or traumatic origin; in the first instance as a small vesicle or papule, which suppurates and gives rise to an unhealthy, purulent discharge, gradually extending by undermining the tissues in the immediate neighbourhood, and forming sinuses under the integument. The ulcer having a traumatic origin generally supervenes upon ordinary injuries, whether it be a simple contusion resulting from the kick of a horse or the apparently trivial abrasion of the skin which follows the scratching of a mosquito sting. The ulcer which results (generally situated in one of the extremities) is characterised in both instances by defective action and low vitality of the part affected, and exhibits the extreme feebleness of the *vis medicatrix naturæ* of the whole system. In some instances the ulcer is filled up with hard warty granulations which appear above the surface of the sore, and which bleed profusely on section. Pain is not a prominent symptom. The ulcer takes a long time in healing, and when it does so it leaves a well-marked cicatrix, highly pigmented, and suspiciously resembling the scar which results from a syphilitic ulcer. I have not succeeded in obtaining any particular results by microscopical examination of the diseased structure, but the blood of the patient contained an excess of colourless corpuscles. With reference to the etiology of the disease, I am inclined to the opinion that the ulcer is merely a visible indication of the peculiar endemic constitution of the residents of Upper Sind, who are exposed to the depressing effects of a high temperature and the peculiar cachexy induced by malaria."

Venereal Disease.

The liability of venereal disease to seasonal fluctuations has attracted the notice of several authorities. Surgeon-General Balfour (Indian Medical Department, Madras) observed in his report on Madras Lock Hospitals for 1871: "There is an element to be considered, bearing on the causes of these diseases, of which I have no doubt, though it has not before been noticed in any printed book. It is that they are decidedly seasonal; the diseases are much more frequent in the cold weather of this country than at any other period of the year; and it is probable that the prevalence may be greater in some years than in others."

The Army Sanitary Commission remarked in 1873 (*see* Vol. V., p. 247): "In estimating the result of preventive measures it would be well to take into consideration other circumstances than those arising out of single personal communication."

Dr. J. Cunningham states, in his last report on Lock Hospitals in Bengal, that venereal disease is, apart from the effects of any precautionary measures, liable to very great fluctuations."

* It should be mentioned that both Dr. Tilbury Fox and Sir J. Fayrer dissent from this conclusion. The latter states: "If there were no other difference, the fact of its evident dependence upon the drinking of certain water would be sufficient to distinguish it."

And the medical officer in charge of the lock hospital at Secunderabad observes, with reference to the passage just quoted, that its truth will be evident from the following table of venereal statistics at that station for the last few years :—

	Strength of Force.	Admitted.	Per 1,000.
1870	2,172	290	133·51
1871	2,237	448	200·26
1872	2,550	488	191·36
1873	2,411	270	111·98
1874	2,459	276	112·24
1875	2,282	512	224·36

In his report for 1875 Surgeon-General Balfour observes on this subject :—“ If future inquiries establish the correctness of this as a law, it will follow that the occurrence of no one year can be taken as a datum to discuss the subject of the beneficial effects of these institutions, but that the results of a series of years are needed for comparison of one station with another.”

India Office,
30th July 1877.

HENRY HILL.

ABSTRACTS
OF
SANITARY AND OTHER REPORTS
FOR
1875.

ABSTRACT OF REPORT OF THE SANITARY COMMISSIONER WITH THE GOVERNMENT OF INDIA FOR 1875.

(*Dr. J. M. Cunningham.*)

SECTION I.

CHOLERA EPIDEMIC of 1875.

AMONG the European troops throughout India in 1875 the cases of cholera numbered 288, of which 201 were in Bengal, 7 in Madras, and 80 in Bombay. The deaths from this cause were 136 in Bengal, 4 in Madras, and 54 in Bombay, or a total of 194,—giving ratios of mortality of 3·66 for Bengal, ·36 for Madras, and 5·30 for Bombay, or a total of 3·32 per 1,000 for the European Army of India. The highest of these compares favourably with those of other epidemics. In Bengal, for example, in 1872 the loss from cholera was 10·66; in 1869, 16·46; in 1867, 13·84; and in 1861, 23·73 per 1,000. These figures refer to the men only. Among the Native troops in Bengal in 1875 there were 142 cases, of which 69 were fatal.

Distribution
of cholera in
1875.

In this section I propose to summarise the evidence which has been furnished by medical officers in their special reports, and to consider how far it adds to our knowledge. But before turning to the instructive facts which these reports contain, the general history of the epidemic may be studied with advantage, and as the first step to this it is necessary to recapitulate very shortly the main events of the previous year.

In 1874 there was considerable prevalence of cholera in Lower Bengal. The fact is corroborated by the statistics of Calcutta, where the mortality from this cause exceeded that of any year since 1870. The returns for Assam, which have been received since the last Report was written, show that over that part of the country also cholera was prevalent. Out of a population of nearly 4 millions, 16,478 deaths were registered as due to it. In British Burma, also, there was some prevalence of the disease; but with these exceptions cholera in 1874 was singularly dormant over the whole peninsula.

Very different has been the history of cholera in 1875. Excepting British Burma, which returns only 761 deaths in 1875 instead of 960, and of Assam, which returns 6,618 deaths in place of 16,478, there has generally been a marked increase in the disease. In the Lower Provinces it was more active, and, extending far beyond the limits of these provinces, it covered most part of the country and affected certain portions of it with great severity. The general results are shown in the following statement. The mortality has been very heavy in many of the provinces, and it is all the more striking when compared with the immunity of the previous year.

	Total deaths from cholera.	
	1874.	1875.
Bengal Proper and Assam - -	73,354	116,606
North-West Provinces - -	6,396	41,106
Oude - - - -	68	23,321
Punjab - - - -	78	6,246
Central Provinces - - - -	14	14,643
Berar - - - -	2	22,465
British Burma - - - -	960	761
Madras and Mysore - - - -	313	97,051
Bombay - - - -	37	47,573
Rajpootana, Hyderabad, and Central India - - - -	4	14,649

In endeavouring to understand the history of cholera, and to form any sound conclusions as to its cause or causes, the vast differences which characterise epidemic and non-epidemic years must be prominently borne in mind;—are the causes to which epidemics have been ascribed in any degree sufficient to account for such differences?

The statistics show that the prevalence of the disease in Bengal proper was general, but most marked in the southern and eastern portions. In the North-West Provinces the violence of the epidemic fell chiefly on the eastern districts. Some of those on the west also suffered severely. Of those bordering on the Jumna, Jhansi and Lalitpur almost entirely escaped. In Oude the disease was very general and severe. In the Punjab the chief point worthy of notice is that the province suffered only in its lower part. The districts above Lahore, except Sialkot and Gurdaspur, return only a very few isolated cases. As regards the Central Provinces, it is important to note that many of the districts escaped with little or no cholera. Jubbulpore returns only 11 deaths, Seoni only 3, Mandla 47, Nursingpore 93, Murwara 26, Damoh 0, Saugor 20, Balaghat 4, and Upper Godavery 20. As the population of each of these districts varies from 24,000 to nearly 400,000, the proportion of deaths in them due to cholera was thus very small. It was on Raipur and Bilaspur on the south-east, and on Nagpur and Wardha in the south, that the brunt of the epidemic in the Central Provinces fell. These four districts alone account for 11,100 deaths out of a total of 14,643 in the whole province. In Berar the disease was severe and widely diffused. The suddenness of its onset is remarkable. During the first four months of the year not a death from cholera was registered; in May there were 249, and in June 3,625. In the Bombay Presidency the whole country was affected to a considerable extent, except Kanara in the south, where only 47 deaths were registered, and Sind in the north. For Upper Sind the return is blank, while Thur and Parkur and Kurrachee return in all only 49 deaths. The Madras statement so far corroborates the accuracy of this account, for South Kanara, which adjoins the Kanara of Bombay, was almost entirely free of the disease. Vizagapatam escaped entirely. In the Godavery and Kistna districts, also, there was little, but over the other parts of the Madras Presidency the people suffered much. The epidemic here, it will be observed, was in the main confined to the latter half of the year.

The areas of prevalence, it is to be observed, are not the areas through which the great highways of traffic lead, nor are the exempted tracts those which are removed from the great lines of communication. Over great part of the country in which cholera was most severe there are no railways, and the roads are often indifferent. Through part of the Central Provinces which escaped one of the great trunk lines of railway, on which there is much and constant traffic, runs. In the Upper Provinces the extension of the disease was not along the high road, but over an area where the means of communication are comparatively difficult and little used.

In looking at the statistics of the districts included in the epidemic, it must not be supposed that the disease was universal, or that it affected every portion of the population. The popular impression with regard to cholera seems to be that when once it attacks a district it spreads from village to village until all have more or less suffered. But this idea is altogether a mistake. In most of the districts where cholera prevailed the villages attacked were the exception, and even in those parts where it was most prevalent, and where it, beyond all question, attained the proportions of a very severe epidemic, many towns and villages escaped.

To take a few examples. In Bengal proper, the district of Burdwan returned 2,127 deaths from cholera in 1875; they were reported from 198 out of a total of 5,191 villages. The district of Nuddea suffered severely; 9,948 deaths from cholera were registered, but of 3,961 villages only 1,001 suffered. In Hazareebagh only 270 fatal cases were reported during the year, but they were spread over 8 months, and occurred in 38 out of a total of 6,703 villages. In Oude the epidemic, as already stated, was very severe. In Gonda there were 3,806 deaths, but of 2,840 villages only 664 were attacked. In Baraich 3,376 deaths were reported from 581 out of a total of 1,943 villages. In Hardoi 2,973 deaths were reported in 365 villages; the total number of villages in the district being 1,976. Yet in all three districts the disease was present for the greater part of the year. In the Punjab the fact of partial distribution is even more strikingly exhibited, as the epidemic in this part of the country was less violent. These instances are cited merely as illustrations. Nor are the phenomena to be explained on the supposition that the disease was confined to one portion of the district, and that the total number of villages attacked in each really represents those lying close to one another in a particular quarter. In Burdwan 21 out of 28 of the circles into which the district is divided for the purpose of mortuary registration were affected; in Nuddea 31 out of 33. In Noakholly all the 8 were attacked. In Umritsur, though 10 of the circles returned cases, only 107 villages were attacked out of 1,024. Similar results may be seen in the returns from every other part of the country.

The Sanitary Commissioner of the Central Provinces, in forwarding his return, observes that many of the villages are mere hamlets consisting of a few houses, but this does not affect the comparison. The question to be determined is how many different communities out of the total of each province were affected by the disease, and in this point of view it matters little whether these communities are generally large or small. It may be urged that the statistics understate the facts because they refer only to those places from which deaths were reported, but with such a fatal disease as cholera any error due to this cause must be small. Or, again, it may be said that the registration is not to be depended upon, and that many deaths have been omitted. The registration is by no means perfect, but the contrast between 1875 and 1874, which has been already so fully discussed, is itself evidence that the returns are by no means so faulty as is supposed. The comparison of contiguous districts, whether in the same or adjoining provinces, tells a story which could not have been pre-arranged, and which bears within it most convincing proof of general accuracy. But the strongest grounds for believing that these returns, illustrating the very partial distribution of cholera even within the limits of a severe epidemic, are substantially correct, is that it accords entirely with what is known of the disease as it appears under the most intelligent medical observation. The distribution of cholera among villages as shown in these returns is not in any degree more remarkable than its distribution in cantonments or jails or towns, where the number of barracks or other dwellings attacked can be ascertained beyond all doubt.

The history of cholera among the people in the different provinces will be more fully recorded by their respective Sanitary Commissioners. It will suffice here to discuss the details of the outbreaks in cantonments and jails, and as the facts regarding them came under the immediate observation of medical officers, their reports afford a mass of evidence of much more value than any that could be gathered from the general population of the country, among whom educated practitioners are as yet almost unknown. To save space, and to avoid all needless additions to cholera literature, which has already become so voluminous, these reports are summarised as succinctly as possible in the "notes on individual outbreaks" which are given in an appendix to this Report. These notes have been prepared on nearly the same plan as those attached to the Report for 1872. They include every report which has reached me, and embrace every fact of the smallest importance which these reports contain. All that can be attempted here is to summarise the facts.

Notes on
individual
outbreaks.

The notes refer to 40 different stations scattered over a very large area. Commencing with Barrackpore and Eastern Bengal, they pass on to Upper Bengal, to the North-West Provinces and Oude, to Central India and the Lower Punjab, beyond which, as has been already shown, the epidemic did not extend in that direction. At these 40 places, 67 different communities suffered more or less from cholera. They consist of 37 European corps, 26 Native corps, 2 jails, the Thomason College at Roorkee, and the Simla sanitarium. Unfortunately from many of the jails no reports have been received, and the record is therefore not so complete as it would otherwise have been. But the facts recorded are still very numerous; they refer to 611 cases of cholera, which were treated in hospitals under the immediate care of many medical officers, of whom 66 furnish the reports. What, then, is the evidence derived from this large body of independent observers? It may be conveniently summarised under the four heads—

1st. The meteorology of the period when cholera was present;

2nd. The influence of contagion as exemplified either in the first appearance of the disease in each community or its subsequent spread;

3rd. The sanitary defects of the place; and

4th. The effect of movement from the locality attacked in checking the disease.

The effect of other measures which were adopted to prevent its entrance will be separately considered.

On the first of these points—the meteorology of the cholera time—the information is scanty and imperfect. In many of the reports it is not noticed at all, and in others the data are vague and unsatisfactory. This arises no doubt in great part from the want of proper instruments, but even in such a simple matter as the direction of the wind the statements are often indefinite and sometimes even contradictory. Generally heavy falls of rain and the unusual prevalence of east wind are noted, but this is not invariably the case. In some places the chief peculiarity was the stillness of the atmosphere. At Gwalior the prevailing wind is reported to have been from the south-west, and at Ferozepore it is said that there was a light wind from the west. Here the disease was

Influence of
meteorology.

confined to a few cases in the cantonment. The district did not suffer. At Sirdarpore, again, the rain is described as unusually light, and the absence of electric phenomena is remarked. Much valuable information on meteorological conditions, in connexion with the prevalence of disease, can hardly be expected from medical officers who are provided with no special means of observation. What peculiar features characterise a cholera-epidemic year as contradistinguished from a non-epidemic year the Meteorological Department of India which has been recently organised may, it is hoped, in time be able to explain.

Question of
contagion.

In regard to none of the 67 communities affected with cholera is there sufficient evidence to show that the outbreak was due to importation. At Agar the only person attacked had come two days previously from Oojein, where cholera was prevailing; in other words, the causes of cholera to which he had been exposed at Oojein apparently did not produce their results until after his arrival at Agar, but there was no spread of the disease. The causes of cholera which existed at Oojein do not seem to have existed at Agar, and the seizure of the one man who was attacked to all appearance in consequence of his having been at Oojein was insufficient to produce any further case. This solitary instance, out of the total of 67, affords an illustration of how cholera may be imported and cause no outbreak. The remaining 66, on the other hand, are examples in which outbreaks occurred without any proof that they were due to importation. In many of the reports the disease is ascribed to importation merely because cholera was more or less prevalent in the vicinity. In the 73rd Foot at Cawnpore, for example, it is attributed to indirect communication with cholera-stricken persons by means of the native servants. In the 35th Native Infantry, at the same station, it is explained by the fact that the first man attacked had only just returned from leave. In the 1-18th Foot at Moradabad, the punka coolies are supposed to have been the medium of communication. In the Royal Artillery at Meerut the barracks were under repair; native workmen were thus about, and moreover some of the hospital establishment resided in a neighbouring village where cholera prevailed. At Dharmasala travellers from Jawalamukhi and Mundi are credited with having introduced contagion. But in none of these or in any one of the 67 bodies concerned, except Jubbulpore, to which reference will be made hereafter, is there any attempt to prove by evidence that the resident in the locality who was first attacked had suffered in consequence of communication, either direct or indirect, with some individual, whether ill of cholera or in good health, who had come from an affected locality. The prevalence of cholera in the vicinity seems not unfrequently to be considered sufficient proof of importation, especially where, as is generally the case, communication, in spite of any attempts to the contrary, continued to a great extent unrestrained; but however strongly an opinion founded on such grounds may be expressed, it is merely an opinion. In some instances the circumstances were adverse even to this theoretical view. In Kasauli, for example, there had been no cases of cholera among the natives before the Europeans were attacked. Although the Europeans suffered severely, the bazaar remained free of the disease throughout, and the only cases among natives were a few chiefly among the servants who were most exposed in camp. So far as is known, at Ferozepore there was no cholera among the natives when the disease attacked the European troops in the cantonment; and at Meean Meer the natives did not suffer at all.

The only one of the military attacked at Jubbulpore was a sepoy of a Bombay regiment who was rejoining from leave. His illness commenced in the train; he arrived at Jubbulpore on the 27th August, and next day applied for relief at the hospital of the 16th Madras Native Infantry. He was placed in a separate building and then transferred to a tent close by. A few days afterwards cholera broke out in the village of Katinga, which is about 300 yards distant, and there were in all 10 cases reported in it. This village is on the banks of a small stream which passes by the hospital, and it was supposed that the outbreak was due to the water having been polluted with the discharges of the sepoy, which the sweeper, instead of burying as he was ordered to do, may perhaps have thrown on the ground. But there is no evidence on any of the points required to substantiate the story. It is not known that the sweeper had thrown the discharges on the ground. The people do not drink from the stream, but from *jiriah*s or wells sunk near it. The water was very foul and the whole village very dirty, but it is not probable that any impurity, even if it had found its way into the stream, could have percolated into these wells. The facts so far as they are known may be regarded as favouring the idea that the outbreak in the village was in some way due to communication, but the most important particulars are too vague to be of much value in determining this matter.

On the subject of importation the evidence must often be more or less indefinite, but the question whether the disease spreads from the sick to the healthy admits of much more precise investigation, especially in these days when cholera patients under medical supervision are carefully isolated, and it is well known what persons come in contact with them. Assuming for the sake of illustration that cholera may be carried by human agency, there must always be difficulty in discovering how this has occurred, whether by direct communication with affected towns or villages, or indirectly by means of the native servants or supplies. But the probabilities of the outbreak having been due to the arrival of a person affected with cholera, a matter of fact in regard to which, especially in this country, there must often be necessarily more or less conjecture, may be weighed to some extent, and estimated more nearly at their real value, by considering what occurred in the case of attendants on the sick who came under medical observation, and in regard to whom all is known with comparative accuracy.

In 59 of the 67 communities among whom cholera appeared, not one of those coming in contact with the sick suffered at all. In some of them the number of cases was small, but in others it was considerable. For example, in the 51st Foot at Fyzabad 24 cases occurred; in the 65th Foot at Lucknow 16 persons were attacked; in the Malwa Bheel Corps there were 21 cases; in the 4th Battalion, Rifle Brigade, at Umballa, 33 cases; and at Simla 58 cases were treated in the cholera hospital; yet in none of these or 54 of the other outbreaks did a single attendant suffer. In 8 of the 67 communities certain of the hospital servants or of the friends who nursed the sick were attacked. In all there were 22 such cases, and it will now be necessary to examine the facts recorded in regard to each of them somewhat in detail.

The first on the list is the 1st Battalion, 25th Regiment, which arrived at Fyzabad from England on the 25th November 1875. Two women were the only persons attacked. In regard to the first it is noted that there is a complete absence of any communication to account for the disease; "not so the second, for here there is plain evidence of communication. The second woman came from a different block, accompanied her friend to hospital, and stayed there for some time ministering to her. Twenty-four hours after being sent away she herself displayed the disease." In the 13th Hussars, at Lucknow, a man attacked on the 22nd September "had been attending his wife in one of the cholera tents from the 14th. The woman had been in a separate tent throughout, and had been moved into a clean tent when convalescent four days before her husband was attacked." In the 1-18th Foot at Moradabad it is stated that a mother attending her child was herself seized. She, however, was ill previously with diarrhoea. The fifth case in this regiment was the father of the other child seized. The child was attacked at midnight of the 4th September and sent to hospital at 6.30 on the 5th. When the child was removed to hospital, the father was transferred to another quarter, and all communication between them ceased. He was attacked at 6.30 P.M. on the 8th. The quarter he occupied then was a building at the other end of which one of the first cases had occurred. The mother, it may be added, nursed the child throughout and did not suffer. A dresser attached to the Royal Artillery hospital at Meerut was attacked. In the Meerut central prison the second case was that of a hospital sweeper. In the 10th Hussars at Muttra, during the first outbreak, a hospital apprentice suffered from painless diarrhoea, and a sweeper was attacked. At Kasauli in three cases parents, after attending their children, were attacked, two in camp and one in the station. The report of the 1st Goorkha Regiment at Dharmsala cites 11 instances in which hospital servants or friends coming in contact with cholera cases were themselves attacked; 8 were attendants on the sick, 2 were doolie bearers, and 1 the hospital compounder.

But small as the number is, the bare statement that 22 attendants on the sick suffered from cholera would convey a very erroneous impression of the facts, for there are other important circumstances connected with many of them that must be taken into consideration. Passing over the cases of the woman in the 1-25th at Fyzabad, and of the man of the 13th Hussars who nursed his wife at Lucknow, there come the instances cited in the 1-18th Foot at Moradabad. One of these is admitted by the medical officer to be more than doubtful, because the woman had been ill of diarrhoea previous to attendance on her child. In the other, the father is with his child for $6\frac{1}{2}$ hours; he is removed to another barrack, in the end of which a previous case of cholera had occurred, and has no further communication with the child. He had taken no food and had not slept for three days before he was attacked. It is not stated if the sweeper in the Meerut jail had had any communication with the only other case which had occurred when he was seized. At Kasauli the cases of three parents attacked are complicated by their recent arrival in camp from the station where the disease prevailed. At Dharmsala the 8 attendants, 2 doolie bearers, and 1 compounder attacked were from among a total

of 127 persons who came in contact with the sick. The outbreak among the Goorkhas at Dharmsala was very severe. There were, in all, 97 attacks in a strength of 1,200, or in the proportion of 8.08 per cent.; and of these 11 were cases of attendants. The proportion of attacks among the attendants was almost the same as among those who did not come in contact with the sick. This is very remarkable, for the attendants were treated on a different principle from any other part of the regiment. In the bazaar and lines each hut, on a case occurring in it, was vacated and cleansed, but no such procedure was adopted with the building occupied by the attendants. The cases among them were attributed to contagion, and the building was not vacated. If there is any virtue in the rules requiring the immediate evacuation of every building in which a case of cholera occurs, the attendants in this instance ought to have suffered far more than the regiment generally. That they did not suffer much more than the regiment appears to have been due to the fact that the movement into camp was so unsuccessful. Instead of moving away from the disease the site occupied by the camp seems to have been even more exposed to it than the lines. The evidence in support of personal contagion which is adduced from this outbreak at Dharmsala seems thus to tell very strongly against it. In not one of the communities in which an attendant on a cholera patient was himself attacked is there evidence to make it even probable that the disease was contracted from the sick. The question of contagion can never be decided by individual cases. It is only by taking the statistics as a whole, and ascertaining whether the proportion of attacks among those who come in contact with the sick is decidedly greater than among those who have nothing to do with them, that any sound conclusions can be drawn. The facts of the outbreaks of 1875 afford no such evidence of contagion among the hospital and other attendants; on the contrary, they testify strongly in quite the opposite direction. In none of the outbreaks is there any history of such attendants having suffered in any exceptional degree. In no instance is there the smallest ground for believing that the sick formed the centre from which others were affected. The first few cases occurred often almost simultaneously in different buildings, at considerable distances apart, and occupied by persons who had no connexion with one another. The other attacks have followed without any apparent relation to those which had gone before.

It may be urged that the escape of the attendants and hospital establishment is only what might be expected from the use of disinfectants, which is now generally had recourse to by those who come in contact with the sick, but this immunity is no new feature in the disease. It has been exemplified for years before disinfection was practised, not only in the Calcutta hospitals, but in other parts of the country. Writing in 1856, Dr. Kenneth Mackinnon quotes the experience of Dr. H. A. Bruce on this point. "In 1848," he says, "I had cholera in the Fusiliers (at Cawnpore) from May till September. During the whole of that time, I may say, the hospital was never free of some cases, and at times it was crowded with them. The whole establishment may be said to have lived in the wards; the coolies for hours together never left the beds of the patients; the medical officers did nothing but administer to their wants; and yet not one man, European, half-caste, or native, ever showed the least symptoms of cholera. I took most particular care to have them mustered and looked at, but there was not in that year even a case of bowel complaint among them." This quotation is but an example of what has been observed again and again long before disinfection in cholera cases was ever thought of.

The singular escape of the hospital establishment and other attendants on the sick in 1875 is all the more remarkable because they were often exposed to depressing influences, such as the want of rest and regular meals, anxiety, and grief, all which predispose to disease, and in these days, when the dangers of personal contagion are so generally inculcated, they were no doubt in many instances also subject to the additional depression of fear, which has long been recognised as peculiarly favourable to the development of cholera.

The evidence as regards the attendants would be more satisfactory if the actual number of those who came in contact with the sick were known. The value of such details has already been illustrated in the case of Dharmsala from which they were specially obtained. Unfortunately this information is not given in the reports of medical officers, but in future they will contain replies to the following questions: How many individuals, including medical and other officers, hospital assistants, orderlies, and others, both European and native, attended on the cases of cholera which occurred, and of these how many were attacked with cholera and on what dates? Of the sweepers employed in collecting and removing cholera excreta (who should also be included in the above) how many were seized with cholera? Were the circumstances connected with any of these attacks such

as to lead to the conclusion that the persons in question were attacked because of such attendance?

Other possible examples of contagion may now be examined. The first instance is that of the sirdar coolie employed by the Royal Artillery at Lucknow "in removing infected clothing." He was attacked. The case is not cited by the medical officer as an example of contagion. On the contrary, he writes: "This man was terribly afraid of cholera, and the fact of his having contracted the disease does not prove that it was communicated to him in the cholera hospital. None of the regular attendants on the sick were attacked." In the 11th Hussars at Muttra, the only man seized during the second outbreak in August, it is suggested, may have contracted the disease by having in his possession a waist-belt which had belonged to the man attacked on the 21st April. The quotation given in the notes regarding the 54th Regiment at Morar narrates what are considered instances of contagion. A father and daughter were attacked. Of two women and seven children in a tent, two women and two children were attacked between 10 A.M. of the 29th August and 7 A.M. of the 30th, and there were six seizures in hospital tents. Again, a mother, having attended one of her children on the 30th August, is believed to have communicated the disease, either directly or indirectly, by her husband, to another of them, who was attacked on the 9th September. In the Gwalior Fort cases Nos. 3 and 5 are ascribed to case No. 1, because they were for 10 hours in the same room where No. 1 was seized; and case No. 6 is also attributed to the same cause, as he had been located in the same barrack as men who had been in the same room as No. 1. At Kasauli, a man, admitted into hospital with diarrhoea on the 7th July, was attacked with cholera on the 9th, and the hospital sweeper's child also suffered from the disease. At Dharmsala, a water-carrier is believed to have contracted the disease from a previous case. At Meean Meer a man was attacked the morning after he had removed soiled bedding and clothing. For details of these cases reference must be made to the "notes;" and from them it may be seen how far they deserve serious consideration. The cases brought forward in the 54th Regiment at Morar are opposed to all ordinary ideas of contagion. The father and daughter were attacked within a few hours of each other, so were the four persons in the tent. As for the six cases in hospital tents, there is no evidence of any of them having been in contact with the sick. Similar remarks apply to the three cases at Gwalior. At Dhurmsala the first case, and the water-carrier, who is believed to have contracted the disease from it, were attacked within a few hours of each other.

The "notes" include mention of any sanitary defects which have been noted in the medical officer's report. In many places everything is said to have been in a satisfactory condition. In others there was a want of proper drainage, and in a few there was overcrowding. It is worthy of notice that in regard to only two outbreaks is it even suspected that the water may have been contaminated with cholera discharges and thereby have caused the disease. The first is the case of Jubbulpore, in regard to which it has been shown that there is no evidence either that the water had been so contaminated, or that it had been drunk by the people affected. The second case is that of Dharmsala, but here, although the medical officer suggests that this contamination of the water-supply may have taken place, he himself sets the idea aside as to all appearance an impossibility.

Local causes
of cholera.

As a whole, the evidence is strongly in favour of the immediate evacuation of buildings or particular quarters in which a case of cholera may have occurred, and of moving into camp away from the affected locality. In many instances no case occurred among the parties thus removed into camp. There were none, for example, in the camp of the detachment of the 109th Foot at Chunar, of the jail at Fyzabad, of the 40th at Lucknow, of the 73rd at Cawnpore, of the 1-5th and the 34th Native Infantry at Allahabad, of the 55th at Delhi, of the Royal Artillery at Morar, of the detachment of the 63rd at Nowgong, or of the detachment of the 81st at Dharmsala. In other instances, again, as in the 51st Regiment at Fyzabad, the 65th at Lucknow, the 1-18th at Moradabad, the 55th at Roorkee, and the 63rd at Gwalior, the disease in camp was limited to one or two cases occurring generally within a short time after removal. The experience of the Thomason College at Roorkee, and of the Royal Artillery at Meerut, was not quite so favourable, and still less so that of the 54th at Morar, the Rifle Brigade at Umballa, and the 1st Goorkhas at Dharmsala. At Kasauli, although 12 cases occurred in the camps, they were chiefly among new arrivals from the station in which the disease prevailed. But even in those instances which were attended with least success strong testimony is borne to the advantages of movement, not only as the best means of checking the disease, but also as a measure which is most beneficial in inspiring confidence, and raising the spirits of the troops and others among whom cholera may appear. In no

instance are any ill effects of any consequence attributed to the exposure in camp. As a rule, the health of those in camp did not suffer at all, and in not a few instances it appeared to be benefited by the change.

Question of quarantine.

Quarantine found no place in the Report of the Special Cholera Commission of 1861, or in the rules for the management of troops in epidemic years which were based on their recommendations; but gradually, under the force of popular belief in the contagious character of the disease, endeavours have been made of late years to protect certain stations by isolating them as much as possible from the surrounding country. The experience of cantonments in this matter has been made the subject of special investigation and the main results may be briefly stated. The system varied much in different places. In many no restrictions whatever were imposed. In three of them pilgrims only were diverted. In others cordons were drawn round the station to prevent all persons ill from cholera from entering, and generally to stop communication with affected localities. In regard to only six—Nowgong, Nagode, Chukrata, Kasauli, Dagshai, and Subathu—was any attempt made to carry out what may be called quarantine. At these places natives desiring to enter were detained under observation for periods varying from three to ten days, but even in them it was impossible to cut off all communication. Supplies came in, the post was delivered as usual, but in most of them the supplies and the letter bags were deposited at the barrier and brought on by persons from within. At some places, such as Mooltan, Jullundur, and Hyderabad in Sind, restrictions were imposed, although there was no cholera in the neighbourhood. They did not suffer from cholera, but it would be absurd to attribute any immunity they enjoyed to these restrictions, when the population of the district as a whole enjoyed equal immunity without any supposed protection of the kind.

Leaving these places out of account, the cantonments of the Bengal Presidency which lie within the area of the epidemic of 1875 may be divided into two great classes,—those where no quarantine or other measures of the kind were attempted, and those where such measures were more or less in force. In the first of these categories come 25 places, none of which suffered to any great extent. Some, as Segowlie and Solun, escaped altogether. In others, such as Ferozepore, Meean Meer, Delhi, Roorkee, and Bareilly, the outbreak was limited to a few cases. Allahabad suffered most, but even here the cases among European troops were only 11 and among Native troops 16.

The facts regarding the cantonments in Madras and Bombay have not been so fully ascertained as those for Bengal. So far as they are known, they entirely accord with the experience gained on this side of India, but it will be more satisfactory to leave them out of account. For the purpose of illustrating the subject, and of giving an opinion as to the benefit to be derived from the so-called quarantine, the statistics of Bengal afford ample evidence.

Of 29 Bengal cantonments which lay within the epidemic area of 1875, and where restrictions more or less stringent were imposed, 20 suffered from cholera. In these 20, therefore, it is self-evident from the results that the restrictions did not succeed in keeping out cholera; the quarantine was a failure. Many of them suffered much.

Nor can the escape of the 9 be in any degree attributed to the protection of quarantine. In order to form any sound opinion on this point, it is necessary to consider the evidence as regards each in the light of former experience. During the period from 1864 to 1875 the troops at Banda enjoyed remarkable immunity from cholera. There were two cases in 1864, one in 1865, and two in 1869, or a total of five cases during 11 years. At Nagode, during the same time, there has been but one case among the troops, and that was in 1873. Chukrata is in the hills. It has never suffered from cholera, except to the extent of one case in 1870, and five in 1872, of which two were fatal. At the neighbouring station of Landour, which occupies a similar elevation and was in much more close relations with affected localities, there were no restrictions, and yet there was no cholera. If Landour without restrictions had suffered, and Chukrata with its attempt at quarantine had escaped, there would have been some ground for inferring that the protective measures had been useful, but as both were equally free of the disease, the escape of Chukrata is no evidence that any benefit was derived from them.

Futtehgurh, at first sight, would seem to be a case in favour of quarantine, for the country in the neighbourhood suffered much in 1875; but, setting aside the necessarily imperfect nature of the attempts to prevent intercourse, there is the evidence derived from the previous history of the cantonment, and this is very remarkable. The district is subject to cholera, but during the 15 years from 1860 to 1874 without quarantine there have been in all only 18 cases among the European troops, viz., 1 in 1860, 11 in 1861, 1 in 1866, and 5 among women and children in 1872. Among Native troops,

from 1866 (the earliest year for which they appear in Dr. Bryden's tables) to 1874—a period of nine years—there has been one case of cholera, and that was in the great epidemic of 1869. Little credit, therefore, can be taken for quarantine at Futtehghurh in 1875.

Dagshai, Subathu, and Jutogh are the next cases of exemption which claim notice, and, as they lie near one another in the Himalayas, they may be considered together. If the neighbouring stations of Kasauli and Simla had not suffered in 1875, the exemption of these three places would require no notice. Hill stations rarely suffer from cholera. In 13 of the 33 years from 1843 to 1875 cholera has appeared at Subathu, but generally in isolated cases. In 7 of the 13 years it caused no deaths; only three times can it be said to have been epidemic in all that time—in 1845, 1867, and 1869. During the 24 years from 1852 to 1875 Dagshai has only twice suffered from an epidemic of cholera, but isolated cases have occurred in four of the other years. Jutogh has never suffered from the disease. Moreover, the quarantine here was merely nominal. Officers went backwards and forwards between Jutogh and Simla daily. As regards natives, the procedure adopted is thus described: "Natives wishing to enter, if seen by the sentries, were turned back, and obliged to wait three days before being admitted; for this period they were permitted to reside in the village at the foot of the Jutogh Hill." At Kasauli in only 3 of the 33 years from 1843 to 1875 has cholera appeared in any force; in 6 of the others one or two cases have been reported. To ascribe the protection from cholera which Dagshai, Subathu, and Jutogh enjoyed in 1875 to the restrictions imposed on human intercourse is to ignore altogether their previous history and the immunity they enjoyed for years without any such restrictions. There is no connection established between the restrictions and the escape or non-escape of any of them from the disease. Kasauli with quarantine suffered heavily. Subathu, Dagshai, and Jutogh, with it, escaped; but so did Solun, which lies in the midst of them, much more exposed to intercourse than any one of the three, and which yet attempted nothing of the kind.

Dalhousie and Bakloh alone remain to be considered among the places where it is supposed that measures of the nature of quarantine prevented the entrance of cholera. But neither of them ever suffered from cholera without quarantine, and there is no evidence that the disease was kept out of either by any such measure in 1875. The restrictions adopted at Dalhousie in particular were not such as could have had much influence on the result, for they amounted merely to ordering all new arrivals to report themselves at the hospital for two days after coming up. It was quite impossible to enforce any such order. I do not here refer to the measures taken with regard to the small isolated outburst of cholera in the outskirts of cantonment, but, before attributing any benefit to them, it must be remembered that the Chumba State, in which Dalhousie lies, has never suffered from an epidemic of cholera within the memory of those now living.

The case of Bhagsu also has been cited as a crucial illustration of the undoubted benefits of quarantine. The officer commanding at Dharmsala does not give an opinion to this effect; on the contrary, he says that, with all the supplies required for the British troops in that part of the station which goes by the name of Bhagsu, quarantine is an impossibility. But, when cholera appeared at Bhagsu on the 12th August, it was attributed to the fact that the quarantine had been taken off on the 8th. I enquired very carefully into the particulars during my late tour. As a matter of fact, the quarantine was not taken off. It was relaxed so far as to allow the men to go for a walk in the upper station. The quarantine was broken by a boy bringing in milk; he was seized with cholera on the road, and to this the outbreak is ascribed. But, long before cholera appeared in unmistakeable form, diarrhœa had been extremely prevalent among the men. In July and August, before the first case of cholera declared itself, there were 24 admissions into hospital from diarrhœa out of the small strength of 121 men. Some of these cases were very severe and attended with vomiting. One case nearly proved fatal. Besides the actual admissions from diarrhœa, many more received medicine for the same symptoms without being taken into hospital. This remarkable prevalence of diarrhœa at a place where the complaint is by no means common can only be accounted for on the supposition that the causes which produce cholera were at work in a milder form for some weeks before cholera actually appeared.

But it is urged that quarantine is valuable if it only postpone the outbreak of the disease for a few days. No doubt this would be a gain; but is there the smallest evidence that any such benefit accrued in 1875? The remark is made with reference to Lucknow, but the facts which have been recorded with regard to this station show perhaps more clearly than any others in the whole list how altogether useless the system is. Much stress has been laid on the results obtained in this cantonment,

and it is therefore important to examine the facts somewhat in detail. It is argued that the epidemic was most virulent in the surrounding districts, and that, in consequence of the quarantine arrangements, the cantonment was comparatively free from its ravages; and again, it is said that, "bearing in mind the fearful mortality in Oude, the comparative immunity from cholera in cantonments, and its late appearance among the British troops, it is hardly possible to attribute these results to mere chance." No doubt the district of Lucknow suffered heavily; yet of the 246 villages within 10 miles of the station only 48 return deaths from cholera; and, what is more remarkable, 26 of these return the date of the first case as later than the 20th April, the day on which the first case occurred in cantonments, leaving out of account the case in the 41st Native Infantry which was admitted into hospital so early, in the year as the 11th February. But did the quarantine confer any immunity on the cantonment which it had not enjoyed equally in former years when nothing of the kind was attempted? The statistics of cholera among the troops at Lucknow during April and May in each of the last 12 years show that during these months, of 1875, the time when quarantine was in force, the cantonment of Lucknow suffered really more than it had done in any of the previous 11 years without quarantine, and yet several of them were years of great epidemic prevalence in the Lucknow district and in Oude generally. The late appearance of cholera among the European troops in 1875 was merely the repetition of what has again and again occurred.

In order to prove that quarantine or any measure of this nature is really productive of good, it is necessary to shew—first, that, judging by former experience, a danger threatened; and, secondly, that this danger was averted; but in no instance has any such proof been afforded. On the contrary, there is the general and very significant fact that, within the area in which cholera prevailed, the places where no such measures were tried on the whole suffered much less than those where they were in force. It may be said that many of the places where the measures were not taken lie within or bordering on the endemic area, but cholera, even in the delta of the Ganges, is precisely the same disease as it is anywhere else.

In basing any opinion on the mere fact that a cantonment where restrictions were imposed was not attacked, regard must be had not only to the previous history of each place, to which attention has been already drawn, but also to the incidence of the disease in the neighbourhood. The partial distribution of cholera has been already illustrated by reference to the statistics of villages over whole districts. The same fact is borne out by the experience of the villages near cantonments. The proportions differ considerably, but all attest the same truth, that the few are attacked and the many escape.

The objections to the restrictions are many and great. The quarantine can be a quarantine only in name. Any one who really desires to avoid it can enter cantonments either by the aid of the darkness of night or the payment of a small bribe to the police; moreover, it is quite impossible to keep the arrivals of each day separate, and those who are freed at the end of their term of detention may have come from direct contact with those who have just commenced it. If there is any risk from intercourse with persons from affected localities, the unfortunates detained in quarantine are exposed to it and must often endure great hardships from want of proper shelter. The examination of railway trains and the forced separation from their friends of any persons found ill with symptoms resembling cholera are open to the most serious abuse. Even if carried out with the greatest care and consideration, any such measures must bear very hardly on the people. Entrusted as they necessarily are in practice to the native police, it is not easy to estimate the amount of oppression to which they may give rise. They could be justified only by showing that they are, beyond all question, beneficial; but no such evidence has been adduced. At present, it appears to be left to the individual judgment of the officer who happens to command a station whether the people are to be subjected to grave inconvenience and loss or not; and, if so, to what extent. The system cannot be limited in its application to the cantonments. In many places the high road passes through the station, and any restrictions imposed affect the traffic of the country. The measures have been tried, and no single case can be cited in which the smallest good has been effected by them. The evil done, on the other hand, is patent, though the full extent of that evil can never be known. In addition to the interference with trade and traffic, and the hardships and annoyance to which the people must be more or less exposed, there are other grave objections to the system. It exposes the troops or others employed on the duty to fatigue and night-work at the time when such exposure is calculated to prove most hurtful. It fills the mind of the community with needless fears, the depressing influences of which ought particularly to be avoided in time of cholera. If the authorities at many of the places where quarantine was enforced in 1875 had

appealed to the history of these places for a series of years, they would have done more to quiet the public mind and inspire confidence than by placing sentries in the hope of keeping out the disease. The system, moreover, diverts the attention of the authorities from the real evils to be dealt with—the sanitary defects of the cantonments; for, instead of endeavouring to discover what the defects are and what are the best means of rectifying them, they are taken up with the attempts to discover and arrest sources of contagion which, even if their existence be proved beyond all manner of doubt, can never be kept out by all the vigilance which can be exercised. Such endeavours, moreover, entirely mislead other countries, which are thus led to seek safety in quarantine, and to involve themselves and those who trade with them in all the miseries which quarantine entails, because, as will no doubt be asserted, the system has been adopted in India and has been found most beneficial, the real fact being that it has been productive only of evil. And what is perhaps most of all to be regretted, it must exercise the worst effect on the native mind, and retard most seriously that progress in sanitary reform which the Government is so anxious to encourage. What can the natives think of our faith in pure air and pure water, and good drainage and other improvements, the importance of which is so often urged on them, when they see that, on a great danger such as a cholera epidemic threatening the public health, we seek security not in these but in the protection of military guards or of the police?

It is not necessary, for the proper consideration of this question, to discuss whether cholera is a contagious disease, or whether it is spread by human intercourse. All this has but little bearing on the matter. The only point to be determined is, can cholera be kept out of a cantonment by means of guards? The views above advocated on the subject of quarantine entirely agree with those of English and other authorities, who, even although they believe in human intercourse as the great means by which cholera is disseminated, are still convinced that quarantine is impracticable. The late Vienna Cholera Conference came to the conclusion that “land quarantines are inexecutable and “useless, and that on this account, and on account of the serious damage they did to “commercial interests, they ought to be abolished.” Mr. Simon speaks of quarantine as “a mere irrational derangement of commerce;” and if quarantine at sea deserves this censure, what is to be said of any attempt at quarantine by land? No doubt much of what was attempted was not quarantine, but merely medical inspection to detect sick persons; but the experience of 1875 proves that even this cannot be carried out in practice, and that it altogether fails to afford any protection.

It is argued that by means of guards persons ill of cholera may be stopped outside cantonments, and that thus the troops and others inside may be protected from the disease. But the experience of 1875 shews that sick persons are not stopped, except in instances so rare that they merely prove the rule. In none of the many cantonments in the Bengal Presidency where restrictions were in force is it stated that persons suffering from cholera or other sickness resembling cholera were stopped except at Lucknow and Nagode. And from Lucknow the information on this point is very vague. It is said that “many infected persons, especially from the Alumbagh side, were stopped by “guards or sentries,” but no record was kept of their number or of the dates. At Nagode no sick were stopped, but it is stated that a traveller who, but for the cordon, would have gone on to cantonments died of cholera outside. Among those detained under observation at other places in this Presidency no mention is made even of any suspicious case having been detected.

In the preceding remarks no reference has been made to the precaution which was generally adopted of placing bazaars or towns and villages in which cholera was reported to exist out of bounds to the troops. This is quite in accordance with the rules prescribed by the Commander-in-Chief in 3rd August 1870. To visit a locality where cholera exists is to expose oneself to the causes producing the disease in that locality; and all such localities should therefore be avoided. This principle, the importance of locality, is enforced by all the facts of the epidemic.

If results are to be taken as evidence of the causes which produce them, then it follows that the causes of cholera, which are always more or less prevalent in the Lower Provinces of Bengal, were singularly dormant over other parts of the country in 1874; that in 1875 these causes were not only intensified in these Lower Provinces, but extended widely over the peninsula, generally diminishing in force as they neared the limits of the area which the epidemic covered; that these causes were not present in certain areas, notably in part of the Central Provinces and in the Upper Punjab; that the presence or absence of these causes was in no way dependent on the facilities or difficulties of communication; that even within the epidemic area these causes were in most parts localised in a small proportion of the villages of each district; that even where the disease was

most severe they left a large number of the villages unaffected by them; that removal from the locality where these causes were at work was attended with great benefit in many instances, while in others the benefit was doubtful, because apparently the movement had been made into another locality where these same causes existed; that these causes cannot be arrested by guards and cordons; and that attendance on the sick does not spread the disease. The whole history of the epidemic in fact points to the danger of locality, to a cause or causes which, though spread over a large area, become in some way localised in certain quarters within that area. What these local cholera and other disease-causes are must be the subject of further investigation, and their removal the aim of all practical sanitary action.

SECTION II.

EUROPEAN ARMY.

Sickness and mortality among European troops.

In spite of the cholera epidemic, the general results among European soldiers in India during 1875 were not unsatisfactory when compared with those of former years, as may be seen from the following statement:—

YEAR.	Average Strength.	RATIO PER 1,000.				TOTAL LOSS.
		Admissions into Hospital.	Daily Sick.	Deaths.	Invaliding.	
1871	56,806	1,449	57	17·53	43·62	61·15
1872	58,870	1,497	56	24·21	43·21	67·42
1873	58,769	1,328	55	15·30	44·58	59·88
1874	59,308	1,357	57	13·58	43·78	57·36
1875	58,409	1,337	56	17·48	40·25	57·73

The extent of sickness, as shown by the ratio of admissions into hospital, was under the average of the period 1871–74; the daily sick-rate and the mortality also were slightly less. Of the total death-rate in 1875—17·48 per 1,000—3·32 was due to cholera. In 1871 this proportion was 1·09; in 1872, 7·25; in 1873, ·80, and in 1874, ·18.

As usual, among causes of admission into hospital malarial fevers occupy by far the most prominent place; they account for 445 per 1,000 out of a total of 1,337. Next to them come venereal diseases with a proportion of 205. The two together make up 650 admissions per 1,000, or about one-half of the whole. The experience of 1875 merely repeats the experience of former years that malarial fevers and venereal diseases together contribute the great proportion of the sickness which affects the British soldier in India. Next to cholera, the chief causes of mortality were hepatitis, apoplexy, enteric fever, phthisis pulmonalis, malarial fevers, and heart diseases. Under none of them was there any very marked difference from the four previous years, except that the death-rate from hepatitis was lower than in any one of them, and that from apoplexy was above the average.

In the Bengal Presidency, taken separately, the results of 1875 as a whole also bear favourable comparison with those of former years. The admission-rate, 1,387 per 1,000, is lower than that of any one of them, excepting 1873, when it stood at 1,349. The daily sick-rate, 57 per 1,000, has been lower in only 4 out of the preceding 17 years; and the mortality, 17·32 per 1,000, is also less than in any of them, except 1873 and 1874, in both of which cholera affected the troops to a very trifling extent. As regards sickness, it is deserving of notice that malarial fevers were less prevalent than usual. The ratio for them, 499, is below the average, and is in marked contrast to 834, which it attained in 1870. Venereal diseases, on the other hand, show a somewhat larger proportion of admissions than in any year since 1866. Cases of venereal disease in 1866 equalled 217 per 1,000, and since then the rate has varied between 166 and 208; in 1875 it was 212. As regards mortality, the main point deserving of notice is that, next to cholera, the largest proportion of deaths was due to apoplexy, which was more fatal than in any year since 1869. Comparing 1875 with former years (beginning with

1860), the results, taken as a whole, are satisfactory, and all the more so because the improvement has been progressive. Under both admissions and deaths there has been a steady diminution.

In the Madras Presidency the admission-rate, 1,109 per 1,000, is lower than it was in any one of the previous 15 years. The daily sick-rate, 56, was also lower than in any one of them, except 1861, in which it stood exactly at the same figure, and 1863, when it was 55. The mortality, 14·85, is higher than in 1874, when it attained the minimum of 12·96; but lower than that of every other year in question. In 1875 fevers maintained the same low proportion of cases compared with the other Presidencies which they did in 1874. Venereal shows a considerable increase over 1874, from 188 to 208 per 1,000. The ratio for 1875 was, in fact, higher than it had been for several years. As regards mortality, enteric fever gives a lower death-rate than in any one of the five years in which this disease has been separately entered; but under other diseases there is no marked variation.

The admission-rate in the Bombay Presidency, 1,404 per 1,000, though higher than in either 1868, 1873, or 1874, is lower than that of any other of the previous 15 years. The daily sick-rate, 53 per 1,000, is also considerably below the average; but the death-rate, 20·92, exceeds that of any year since 1865. This result is mainly due to cholera, which contributed 5·30, or about one-fourth of the total mortality. Under the other heads there is no marked excess in the death-rate compared with the preceding four years with which exact comparison can be made.

In Bombay the daily sick-rate was lowest (53); in Bengal it was highest (57). Under the head of admissions into hospital, Bombay stands highest with a ratio of 1,404; next Bengal with 1,387; and then Madras with only 1,109. In respect to deaths, the Presidencies come in the same order. In Bombay the mortality was 20·92, in Bengal it was 17·32, and in Madras 14·85.

Taking the ten forms of sickness which give the largest ratios, and arranging them in order of prevalence, the results for each Presidency stand thus :—

BENGAL.	MADRAS.	BOMBAY.
1. Malarial fevers - 499	1. Venereal diseases - 208	1. Malarial fevers - 518
2. Venereal diseases - 212	2. Malarial fevers - 196	2. Venereal diseases - 174
3. Wounds and accidents - 94	3. Abscess and ulcer - 96	3. Wounds and accidents - 110
4. Abscess and ulcer - 80	4. Wounds and accidents - 93	4. Abscess and ulcer - 108
5. Respiratory diseases - 79	5. Hepatitis - 71	5. Diarrhœa - 70
6. Diarrhœa - 62	6. Dysentery - 68	6. Respiratory diseases - 69
7. Rheumatism - 59	7. Diarrhœa - 55	7. Rheumatism - 46
8. Hepatitis - 40	8. Respiratory diseases - 44	8. Hepatitis - 40
9. Dysentery - 27	9. Rheumatism - 31	9. Dysentery - 29
10. Eye diseases - 20	10. Eye diseases - 14	10. Eye diseases - 25
Total of the ten - 1,172	876	1,189
Total from all causes - 1,387	1,109	1,404

In all three Presidencies the ten forms of disease which prevailed to the greatest extent are the same; they preserve in the main a similar order, and in all they make up the great bulk of the sickness.

A similar statement may be given to illustrate the mortality per 1,000 from the principal diseases in each Presidency :—

BENGAL.	MADRAS.	BOMBAY.
1. Cholera - 3·66	Hepatitis - 3·17	Cholera - 5·30
2. Apoplexy - 1·91	Heart diseases - 1·99	Apoplexy - 2·16
3. Enteric fever - 1·59	Injuries - 1·99	Hepatitis - 1·77
4. Hepatitis - 1·48	Dysentery - 1·45	Enteric fever - 1·77
5. Phthisis pulmonalis - 1·24	Phthisis pulmonalis - 1·27	Phthisis pulmonalis - 1·28
6. Malarial fevers - 1·18	Apoplexy - ·72	Malarial fevers - 1·28
7. Injuries - 1·07	Suicide - ·72	Injuries - 1·08
8. Respiratory diseases - ·94	Enteric fever - ·63	Heart diseases - ·88
9. Heart diseases - ·78	Cholera - ·36	Dysentery - ·88
10. Dysentery - ·65	Malarial fevers - ·36	Respiratory diseases - ·79
Total of the ten - 14·50	12·66	17·19
Total from all causes - 17·32	14·85	20·92

The most noteworthy features in this statement are the high death-rates from cholera, apoplexy, enteric and malarial fevers in Bengal and Bombay as compared with Madras, and the high ratio due to hepatitis and heart diseases in Madras as compared with the other Presidencies.

Sickness and mortality in groups.

Having indicated in a general way the main points in the statistics of sickness and mortality in the European Army of India during 1875, and also in that of each Presidency taken separately, and having compared the results of the past year with those of former periods, the distribution of the sickness and death-rate in the provinces or groups of stations into which the Army has been divided for statistical purposes next claims attention.

Bengal proper.

In Bengal proper the results were very favourable. The admissions equalled only 1,047, the daily sick 45, and the mortality 11·63 per 1,000. Of cholera there was not a single case. These ratios are all the more satisfactory when compared with the experience of former years. During the ten years 1860–69 the admissions annually averaged 1,821 per 1,000, the daily sick 69, and the deaths 29·57. During the five years 1870–74 the admissions varied from 1,827 during the year of the dengue epidemic (1872) to 1,134 in 1874; the daily sick from 64 to 50; and the death-rate from 19·93 to 14·21. In no former year did the troops entirely escape cholera. The statistics of 1875 in Bengal proper are thus much more favourable than they have ever been previously. Of the three cantonments which form this first group, Fort William takes the first place. At Barrackpore both sickness and mortality were much in excess of what they were at either Fort William or Dum Dum. This result was due in the main to the continued unhealthiness of the two batteries of the 11th Brigade, R. A., which suffered so much in the previous year—the first of their Indian service.

Gangetic Provinces and Oude.

In the second group, which includes the Gangetic Provinces and Oude, the results were not so favourable as in Bengal proper, for here the admission-rate was 1,234, the sick-rate 65, and the death-rate 18·10, of which cholera contributed 5·65. In many of the ten stations forming this group sickness prevailed. At Benares the daily sick-rate reached 90 per 1,000. Here also was the heaviest death-rate, 27·40; at Lucknow it was 22·20, but in none of the others did it amount to 20 per 1,000. Among individual corps the greatest mortality was in the B. Battery, A. Brigade, R. H. A., at Lucknow, in which it equalled 70·42 per 1,000. But while the results during 1875 cannot be regarded as satisfactory, they show a marked improvement on those of other years. In the ten years 1860–69 the annual admission-rate equalled 1,614, the daily sick-rate 69, and the death-rate 28·59. During the five years 1870–74 the admissions were never under 1,276 per annum, the daily sick-rate varied between 58 and 71, and the death-rate between 18·34 and 25·81.

Meerut and Rohilkund.

The same cannot be said of Meerut and Rohilkund, where, owing mainly to the prevalence of fevers and cholera, there was much sickness and a high death-rate. The admissions in this group equalled 1,323, the daily sick-rate 54, and the mortality 21·62, of which 5·92 was due to cholera. It is to be observed, however, that during the ten-year period the annual ratios averaged for admissions 1,576, for daily sick 72, and for deaths 26·61. Between 1870 and 1874 the admissions varied between 1,730 and 1,229, the daily sick between 65 and 49, and the mortality between 33·98 and 14·75. Some of the stations in this group suffered much from sickness. At Meerut the cases equalled 1,855, and at Delhi 1,676 per 1,000. At this last station the death-rate was 31·12, and at Roorkee (chiefly on account of cholera, which alone equalled 10·80) it was 38·88. In individual corps the highest admission-rates were 2,277 in the 15th Hussars at Meerut, and 2,065 in the A. Battery, C. Brigade, Royal Horse Artillery at the same station. The unhealthiness of Meerut of late years was remarked on in last annual Report. Extensive drainage works are in progress for the improvement of the station. It is too early yet to form any estimate of the effect to be derived from them, but it may be noted that, high as the admission-rate at Meerut was in 1875 (1,855 per 1,000), there is considerable improvement on 1874, in which it equalled 2,439.

Agra and Central India.

The Agra and Central India group embraces seven cantonments. In point of sickness Jhansi suffered most, the admissions equalling 2,060 per 1,000; but the daily sick-rate was highest at Morar, where it averaged 69. As regards mortality, there are very marked fluctuations. At Saugor it was only 5·22 per 1,000, at Morar it was 27·28, and in the Gwalior Fortress 31·79. Of all the corps, the F. Battery of the 11th Brigade, Royal Artillery, shows the highest proportion of admissions, and the 11th Regiment at

Jubbulpore the lowest. The death-rate varied from 6·21 in the A. Battery, 19th Brigade, at Agra, to 29·38 in the 54th Regiment at Morar. Taking the group of stations as a whole, the cases of illness were in the proportion of 1,241 per 1,000, the sick-rate was 58, and the death-rate 16·71, of which 5·57 was caused by cholera. The figures for the ten-year period are, for admissions 2,169, daily sick 74, and deaths 38·48. Since 1870 only one year, 1873, shows a lower admission-rate. In three, the sick and death-rates were under those of 1875.

In the Upper Punjab fevers were very prevalent; and three of the stations suffered from cholera to some extent. The death-rate for the province, 18·34, is, however, affected by this disease only to the extent of 2·27. The admissions equalled 1,729 per 1,000, and the daily sick 58. In the ten years 1860–69 these rates were 1,740, 56, and 25·24. In 1870 the admissions equalled 2,323, the daily sick 69, and the deaths 24·48. In 1872 the death-rate was 32·43. With these exceptions, however, the results of 1875 are more unfavourable than those of any one of the previous five years. Several stations show great prevalence of sickness. In all but Ferozepore, the admission-rate exceeded 1,000; in four it exceeded 2,000, and at Peshawar it reached the very high figure of 3,312. In seven of them the death-rate was more than 20 per 1,000. At Attock it was 23·26, and at Umritsur and Govindgurh it attained the maximum of 39·22. Punjab.

The hill stations are eleven in number, varying greatly in elevation and geographical position. Excepting at Kangra, which is only 2,419 feet above the level of the sea, and cannot therefore properly be ranked as a hill station, the admission-rate was low. At Dharmasala there was a sharp outbreak of cholera, but here, and also at Jutogh, the comparatively high death-rate represents a few deaths in a very small body of men. Taken generally, the results at hill stations in 1875 were as usual favourable; the admissions equalled 996, the daily sick 42, and the deaths 8·31. For the ten-year period 1860–69 the ratios are 1,069, 49, and 14·78. Between 1870 and 1874 the admissions fluctuated between 1,114 and 846, the sick-rate between 51 and 40, and the death-rate between 18·06 and 9·04 per 1,000. Hill stations.

There was an increase in the number of European troops and their families quartered in the hills of the Bengal Presidency during the hot season and rains of 1875, and there has been a further increase during the present season. On the 1st June 1876 the proportion of men, women, and children in the hills to the total strength of each were, of men 24·75 per cent., of women 23·24, and of children 26·13.

The statistics of mortality in the convalescent depôts are somewhat disturbed by the severe outbreak of cholera at Kasauli. The death-rate at this station was 31·58. At the Darjeeling depôt, however, where there was no cholera, the occurrence of seven deaths in a comparatively small body of men yields even a higher ratio, 36·65. At the depôts generally the results of 1875 compare favourably with those of former years. The admissions into hospital, 1,167, are under those of the years 1860–69, in which they averaged 1,271. The rate is also lower than that of 1870. The daily sick-rate 89, although high, as may be expected because all the men sent to these depôts are more or less out of health, is the same as it was in 1874, and lower than that of any one of the previous four years, for which the statistics of convalescent depôts have been given separately. Convalescent depôts.

Among the groups of the Madras and Bombay Presidencies, British Burma shows, in every respect, the most favourable results. In this province the admissions into hospital equalled only 967 per 1,000, the daily sick 43, and the deaths 10·50. At Thyetmyo the admission-rate was only 786, the sick-rate 29, and the death-rate 7·36 per 1,000. In the Deccan and Nagpore group the admissions attained a maximum of 1,413; but the daily sick-rate was highest in Southern India, where it amounted to 58 per 1,000. But it was in the group which comprises Rajpootana, Malwa, and Sind that the mortality was heaviest. Here the ratio equalled 22·91, of which 6·62 was due to cholera. The excessive sickness at Bombay, represented by 2,442 cases per 1,000, is worthy of notice. Omitting all places occupied by very small garrisons, the next highest admission-rate was at Poona and Kirkee, where it was 1,781. In 14 other stations it exceeded 1,000. Discrepancies equally striking appear in the death-rates. At Cannanore it was only 4·85, and at Ahmednuggur 4·88. At Ahmedabad and Baroda, on the other hand, it was 44·26, and at Neemuch it attained a maximum of 57·60. These high ratios were due in great measure to cholera. Madras and Bombay Presidencies.

Small-pox.

In the whole European Army of India there were only 12 cases of small-pox, and of these only 2 were fatal. Eight of the cases occurred in Bengal, 3 in Madras, and 1 in Bombay. Of the whole number, 9 were admitted into hospital during the first four months of the year, 2 in July, and 1 in November. All the other months were blank. The entire absence of the disease in the autumn months repeats the experience of former years.

Malarial fever.

As a whole, malarial fevers were less prevalent than in any one of the previous four years. In 1872 the ratio attained a maximum of 603 per 1,000, and in 1874 the minimum of 465. For 1875 it stands at 445. The mortality ascribed to these fevers equalled 1.04, compared with 1.74 in 1871, and .86 in 1874; the ratios for 1872 and 1873 occupy an intermediate place; but the results varied much in the different Presidencies and groups. In Bengal the admission-rate from this cause equalled 499, in Madras it was only 196, and in Bombay 518; the death-rates being respectively 1.18, .36, and 1.18. In the Bengal Presidency these fevers were most prevalent in the Punjab, where the admissions from this cause alone equalled 854 per 1,000; in the Gangetic Provinces they were only 223. In the Rajpootana and Sind group again they were 475, and in British Burma only 117, the smallest proportion of all. In the Bengal Presidency the ratio fluctuates between a minimum of 85 at Shajahanpur to a maximum of 2,622 at Peshawur. In the Madras Presidency fevers were most prevalent at Kamptee, where the cases equalled 532 per 1,000, and least prevalent at Rangoon, where they equalled only 98. In the Bombay Presidency, Bombay itself gives a maximum of 1,212, and Ahmednuggur a minimum of 180. In the Bengal Presidency, fevers were most prevalent in November, in Madras in June, and in Bombay in November.

Enteric fever.

In the Army of India 166 cases of enteric fever were treated, of which 84 proved fatal. The admission-rate from this disease equalled 2.8 per 1,000, and the death-rate 1.44. Between 1871 and 1874 the mortality under this head fluctuated between 1.87 in 1872 and 1.34 in 1873. The cases occurred at 52 different stations; in Bengal the disease was most prevalent in the months of May and June; in Madras in April, June, July, and August; and in Bombay in April. It was not only less prevalent in Madras than in the other Presidencies, but the proportion of cases proving fatal was also smaller. In Bengal 51 per cent. of the cases were fatal; in Bombay the ratio was 64; whereas in Madras it was only 30.

In last annual Report the facts elicited by a special inquiry which had been instituted in regard to enteric fever were given for 1874 so far as concerned Bengal. The experience of 1875 is to much the same effect. Of 108 cases which have been analysed, 80 were in men under 25 years of age, and 96 were in men during their first four years of Indian service; of the latter, 37 cases were in the first year of Indian service, 67 within the first two years, and 80 within the first three years.

No reports on enteric fever have yet been received from either Madras or Bombay, but the evidence derived from Bengal fully supports the opinions which have been previously expressed regarding this disease. In the whole history of enteric fever in India there is nothing to lead to the belief that it is a disease which is new to this country, that it has been imported from England, or that it has been propagated by the sick. The only explanation of the facts is to be found in local insanitary conditions, and among these malaria seems to have an important place. As the Army Sanitary Commission remark, "the practical result of the entire series of facts is that "there should be strict local inquiry into the whole subject of enteric fever, and that, "in dealing with local causes, allowance must be made for the special exaggerating "effect of climate." The attention of the authorities in all three Presidencies has been directed by the Government of India to the remarks of the Commission, and also to the importance of a careful inquiry into all the facts connected with the appearance of the disease.

The special inquiry aimed at discovering, if possible, the local insanitary conditions by which enteric fever seemed to be caused. In many of the stations where cases occurred everything was said to be satisfactory, but in others defects have been noted which call for removal. The sanitary condition of stations will be referred to in a subsequent section, but in connexion with this special inquiry into enteric fever the following extracts from medical officers' reports may here be given. Surgeon-Major Hollingsworth, 62nd Regiment, Dum Dum, remarks:—

"The system (of burying the ordure in trenches) is bad for a place like Dum Dum during the rains, when the ground is water-logged; great difficulty in keeping "the ordure from spreading over the surface of the ground. Sudder Bazaar is

" very close to married quarters. It is tolerably clean on the surface, and that is all that can be said in its favour. Population over 5,000; about a third of their number have private latrines behind their houses, and cleaned at uncertain intervals. The remainder are supposed to go beyond the cantonment boundary, which is close to the bazaar, for the purposes of nature, but in reality nuisances are found everywhere in the vicinity. With the exception of the main street of the bazaar, the drains are in a very unsatisfactory state, merely dirty ditches."

The medical officers of the B.-A. Royal Horse Artillery and 40th Regiment, Lucknow, note no sanitary defects. Surgeon-Major Shipton, 13th Hussars, also at Lucknow, remarks:—

" The floors of the barracks in which the cases in that regiment occurred are very bad, they are irregular and full of holes, made of square flat bricks, about $2\frac{1}{2}$ inches thick, they are very soft and badly made, the corners break, and a depression soon occurs which enlarges. Consequently, in the rains it is impossible to keep the floors properly dry, and the holes and irregularities collect dirt and moisture. This is especially the condition in the hospital. Drainage is bad, could hardly be worse."

Surgeon-Major Barnwell, 1-18th Royal Irish, at Moradabad, describes the quarters in which the one case in that regiment occurred as "totally unfit." "It is an old building, and, owing to faulty construction, there are in some places six rows of cots, and never less than four rows. The floors are bad, and ventilation defective. The wells also are objectionably near the barracks."

Surgeon-Major Wilson, A.-C. Royal Horse Artillery, Meerut, observes that "the sanitary conditions of the barracks and their surroundings were, and are still, in a very unsatisfactory state." But Deputy Surgeon-General Tuson adds, with reference to this remark, that these conditions are dependent on the defective drainage, which is being remedied.

When the case in the 72nd Highlanders at Umritsur was taken into hospital, there were, writes Surgeon R. Smith, "a large number of admissions from malarial fever, and the subsoil water, which had risen unusually high, was again subsiding. The ground round the hospital and barracks was soaked during the rains, owing to inequalities in the ground and want of surface drainage. This defect has since been remedied. Offensive smells arise occasionally from the latrine-trenches. Neighbouring bazaar in an insanitary condition."

The sanitary condition of the barracks occupied by the 9th Lancers at Sialkot is described as good, but "in the bath-room of a married sergeant who was attacked the floor was found saturated with urine." Surface drainage generally defective.

The medical officer of the 4-13th Royal Artillery at Peshawur states that the surface drainage is "not good;" and a similar remark is made by the Surgeon of the 70th Regiment at this station. There was a very offensive smell in the bath-room of one of the men of this regiment who was attacked. This "arose from an iron pipe carrying off the dirty water from the bath-room above, which opened into the same small drain that carried off the water from his bath-room. The water from these bath-rooms, as well as from all the bath-rooms in the new barracks, is disposed of outside the barrack in close proximity by soakage."

The difficulty of distinguishing cases of enteric from ordinary malarial fevers in the early stage is generally admitted, and there is reason to believe that many escape detection. In not a few which prove fatal it is only the discovery of the characteristic lesion after death which puts the matter beyond all doubt. The medical officer of the E. Battery, 11th Brigade, Royal Artillery, at Allahabad, for example, remarks that "many of the simple continued fever cases were a very long time under treatment, and had more or less diarrhoea associated with them." Surgeon Jameson, C. Battery, of the same Brigade, expresses an opinion that "it is next to impossible to diagnose typhoid fever definitively during the first few days of the disease in this country;" and this opinion is shared by many medical officers. It is to this difficulty of diagnosis, and to the consequent necessity for changing the name of the disease during its course, that the apparent engrafting of enteric fever on ordinary cases of fever while in hospital is due.

Apoplexy, with a death-rate of 1·73, has been more fatal than in any year except Apoplexy. 1872; 240 cases were treated, of which 101 proved fatal. The admission-rate was highest in the Bombay Presidency, 6·3; next highest in Bengal, 4·1; and lowest in Madras, 2·1. The mortality observes the same order, having been 2·16 per 1,000 in Bombay, 1·91 in Bengal, and only ·72 in Madras. The disease was widely distributed,

and as usual occurred chiefly in the hot months. Of 153 cases in Bengal, 101 were admitted in June and July.

Bowel complaints. Dysentery and diarrhoea taken together account for 98 admissions per 1,000,—a proportion somewhat in excess of those of the two previous years, but under that of either 1871 or 1872. The death-rate, .98, is lower than that of any of the previous four years. In Bengal the admission-rate was 90, in Bombay 99, and in Madras it was 123. In Bengal the death-rate was .73, in Bombay 1.27, and in Madras 1.54. Omitting convalescent depôts, the admission-rate from dysentery taken alone exceeded 50 per 1,000 in six stations of the Bengal Presidency, the highest ratio being less than 90 per 1,000. In Bombay the admission-rate was 129, at Rangoon 93, and at Tonghoo 205 per 1,000.

Delirium tremens. Two hundred and one soldiers were admitted into hospital suffering from delirium tremens, and of these 8 died. The death-rate, .14 per 1,000, is exactly the same as it was in 1874, slightly over that of 1873, and less than that of either 1871 or 1872. In Bengal the ratios were, for admissions 2.4, and for deaths .03; in Madras the figures are 4.3 and .18; and in Bombay 6.2 and .49. In regard to delirium tremens, the results in Bombay are thus more unfavourable than in Bengal or Madras.

Hepatitis. In all three Presidencies hepatitis contributes a considerable portion of the total death-rate. In Bengal it stands fourth in the list of causes of mortality, contributing 1.48; in Bombay it is third, contributing 1.77; and in Madras it is first, with a ratio of 3.17. Since 1871 it has invariably headed the list in this Presidency. For the Army of India the total death-rate due to hepatitis, 1.85, is less than that of any of the preceding four years, in which it ranged between 2.16 and 2.73. The mortality from this cause in Bengal is less than it has ever been before. In Madras, high as it is, it is lower than that of any one of the previous four years; and in Bombay it is also lower than that of any one of these years except 1874.

Venereal diseases. The comparative prevalence of venereal diseases during the last five years is shown in the following statement:—

YEAR.	ADMISSIONS PER 1,000.			
	Bengal.	Madras.	Bombay.	India.
1871 - - -	208	180	174	196
1872 - - -	190	164	154	179
1873 - - -	167	152	181	166
1874 - - -	200	188	170	192
1875 - - -	212	208	174	205

In Bengal and Madras, as well as in the Army of India as a whole, venereal disease has been more prevalent in 1875 than in any one of the previous four years. In Bombay the ratio for 1875 is the same as it was in 1871, somewhat greater than it was in 1872 and 1874, and a little under what it was in 1873.

As to the proportion in which each station contributed to these results,—in the Bengal Presidency this varies from 32 per 1,000 during seven months at Landour, where there is no lock hospital, to 503 at Fyzabad. At only 9 station was the admission-rate under 100 per 1,000, and most of these were occupied for only a part of the year. At 19 stations it exceeded 200 per 1,000, and in many of these the excess was great. Of the Madras and Bombay stations there are six in which the ratio was under 100. Omitting small bodies of men among whom ratios for a single year have but small value, the greatest prevalence was at Kamptee, where the admission-rate equalled 261.

Taking the results in connexion with the working of the lock hospital system, the main facts may thus be briefly summarised. Of the 55 stations in the Bengal Presidency which were occupied by British troops in 1875, 12 were not under the rules for the prevention of venereal diseases. In all of these the European garrison is small, and the ratios are therefore subject to great fluctuations from year to year; 8 of the 12 show a decrease in venereal disease as compared with 1874, while in the other 4 there was an increase. At 17 of the 43 provided with lock hospitals, venereal disease

was in smaller proportion than it was in 1874; at one it was exactly the same in both years; at the other 25 it had increased. The reports of the Madras lock hospitals for 1875 have not yet been received, excepting those of the stations in British Burma here, of the three occupied by British troops, all of which have lock hospitals, Rangoon shows a large increase, and at Thyetmyo there is also an increase. At Tonghoo, on the other hand, there was a decided diminution of disease. Six of the other Madras stations under the rules show an increase. Of ten stations in the Bombay Presidency where lock hospitals were in operation, six give more favourable results in 1875 than in 1874; in the other four they were more unfavourable.

So far no distinction has been made between the various forms of venereal disease, but this information is important not only in itself, but also as affording a valuable test of the lock hospital system. The results in 1874 and 1875, as regards primary syphilis and gonorrhœa, stand thus:—

		Rates per 1,000 of Admissions into Hospital.			
		1874.		1875.	
		Primary Syphilis.	Gonorrhœa.	Primary Syphilis.	Gonorrhœa.
Army of Bengal	- -	66·3	99·0	71·3	94·1
„ Madras	- -	79·3	66·4	69·8	78·8
„ Bombay	- -	63·0	70·4	48·7	76·4

In Bengal the result was decidedly unsatisfactory; in 1873 the ratio for primary syphilis was only 49. While in Madras there was a considerable diminution of primary syphilis, there was an equally decided increase in gonorrhœa. For Bombay the return was more favourable than for either of the other Presidencies.

This is hardly the place to enter into a detailed discussion of the lock hospital question, or to explain the peculiar difficulties which attend its operation in India, and the measures which have been taken to overcome them. It is sufficient to point out that, in spite of a very general introduction of the rules for the prevention of venereal disease among European troops, the results hitherto have been a failure. In some cantonments, no doubt, little attempt has been made to attain success, but in others where the authorities have been most energetic and careful little result has attended their efforts. The statistics of different stations are no doubt more unfavourable than they would be if the cases due to these stations were alone considered; but to attempt any more minute record than that given in the tables would entail much extra labour with little corresponding benefit. In many instances it is almost impossible to say where or when disease was contracted. Moreover, as regards the inefficiency caused by venereal disease, it is immaterial whether it was contracted on the march or in cantonments. The practical question to be determined is, what effect have the lock hospitals in numerous stations over the country had in diminishing venereal disease among British soldiers in India, and the answer that must be given to this question is not favourable. The statistics which have been cited as to the comparative increase or decrease of venereal disease at individual stations in the last two years are important only in so far as they tend to show any progress. The real point at issue is not whether the results in 1875 are or are not more satisfactory than in 1874, but how far does venereal disease still prevail in each garrison; and it is only necessary to glance at the table to see how little has yet been accomplished. More detailed accounts would show that, in respect to the forms of disease prevailing, the results at many of them were most unsatisfactory. At Nowshera, for example, there were 127 admissions from primary syphilis in 1875, at Fyzabad 202, and at Lucknow 441. Nowhere has any permanent and decided impression been made on this class of diseases. In regard to many of them, years may be found before lock hospitals were established which show a lower proportion of venereal cases than other years in which the lock hospitals have been in operation. The stations with lock hospitals have established no decided superiority over those without them. It is argued that the disease is now of milder type than it used to be, but no facts have been adduced in support of this statement, nor does it appear how such a result could have been attained, unless it be admitted that the disease is contracted from the registered women,

for the others are under no surveillance, and cannot have been affected by the system. It is very disappointing to be obliged to acknowledge that the lock hospitals have failed. They were introduced at the recommendation of the Sanitary Department, and year by year their working has been carefully watched, and suggestions have been made by that department in the hopes that success would yet be attained, but so far these hopes have not been realized, and it is very evident either that the women who are the real source of evil still escape detection, or—and this is a danger which does not appear to be sufficiently appreciated—that registered women, though to all appearance healthy, are yet capable of propagating disease.

Invaliding.

The total loss by invaliding in the Army throughout India for 1875 equalled 40·25 per 1,000, and a comparison with the ratios of the previous four years shows that, although there has been but little fluctuation during the period, this loss is less than in any one of them. How much of it was due to invaliding for change of climate, and how much for discharge, is shown in the following statement, in which the ratios for the years 1871-74 are also entered:—

Year.	Total number invalided.	Ratio per 1,000.	Ratio per 1,000.	
			Number sent home for change.	Number sent home for discharge.
1871	2,381	43·62	31·00	12·62
1872	2,438	43·21	30·73	12·48
1873	2,434	44·58	33·68	10·90
1874	2,411	43·78	32·59	11·19
1875	2,371	40·25	31·19	9·07

Under both heads the results of 1875 compare favourably with those of the preceding years.

For Bengal taken separately, not only are the returns of 1875 favourable when compared with those of the years 1871-4, but the total invaliding is in smaller proportion than in any year since 1864, when it equalled 36·75 per 1,000; and the loss under the head of men sent home for discharge is less than in any one of the previous 15 years, with the single exception of 1870, in which it was only 8·37 per 1,000.

Although the results in Madras are not so favourable, as compared either with the total ratio or with the ratios of former years, it is to be remarked that the excess has been due to men having been sent home for change of climate. During the 15 years 1860-74 the annual loss by invaliding in Madras varied between 28 and 77 per 1,000. In 9 of these 15 years it exceeded 50 per 1,000.

Of the total loss of 40·57 per 1,000 in Bombay, only 5·27 was due to men sent home for discharge. In the 15 years 1860-74 the ratio of total invaliding in Bombay varied between 24 and 45.

The main causes to which invaliding is ascribed rank in the following order:—

1. General debility - 8·28 per 1,000
2. Hepatitis - 5·98 "
3. Diseases of heart and large vessels - 4·80 "
4. Phthisis pulmonalis - 2·77 "
5. Dysentery - 2·22 "
6. Intermittent and remittent fevers - 2·17 "
7. Rheumatism - 2·14 "

or a total of 28·36, out of the grand total of 40·25. These and other causes affected the results in each Presidency in very different degrees. From fevers, for example, the loss was in Bombay 4·58, in Bengal 1·87, and in Madras only ·99 per 1,000. From hepatitis, on the other hand, the loss in Madras was 8·06, in Bengal 5·76, and in Bombay 4·49. Dysentery had even more relative prominence as a cause of invaliding in Madras.

No returns have yet been received showing the ultimate disposal of the men invalided.

The following statement shows the ratio of mortality at different periods of life : —

Relation of mortality to age and length of service.

CAUSES OF DEATH.	RATIO PER 1,000 OF STRENGTH.					
	Under 20.	20 to 24.	25 to 29.	30 to 34.	35 to 39.	40 and upwards.
Cholera - - - - -	2·37	3·10	3·26	2·62	2·94	9·28
Remittent and continued fevers - - - - -	·79	1·10	1·20	·65	·71	2·06
Enteric fever - - - - -	2·37	2·35	1·49	·47	—	1·03
Apoplexy - - - - -	·79	·85	1·09	2·24	3·18	4·13
Delirium tremens - - - - -	—	—	·06	·09	·59	—
Dysentery and diarrhoea - - - - -	—	·40	1·09	1·03	1·77	4·13
Hepatitis - - - - -	—	1·05	1·49	1·68	3·18	7·74
Phthisis pulmonalis - - - - -	—	1·00	·57	·75	2·83	3·61
Heart disease - - - - -	—	·05	·63	1·59	3·06	1·55
All other causes - - - - -	1·58	2·85	4·00	4·96	7·65	17·02
All causes - - - - -	7·91	12·74	14·87	16·09	25·91	50·54
All causes, excluding cholera	5·54	9·64	11·61	13·47	22·96	41·26

The sickness and mortality in newly-arrived regiments, as compared with that in the Army generally, and also the death-rate due to a few of the principal climatic diseases in each class, are shown in the following statement, which has been prepared from the annual returns :—

Per 1,000.

	Admissions.	Daily sick.	Deaths.	CAUSES OF DEATH.			
				Enteric Fever.	Apo-plexy.	Dysentery.	Hepatitis.
Army generally - - - - -	1,307	55	17·25	1·43	1·68	0·87	1·78
Newly-arrived Regiments - - - - -	1,310	50	24·39	4·71	3·21	1·28	0·86

As in former years, the mortality among the newly arrived was considerably in excess of the general ratio, but the same remark does not hold good of the sickness. In forming any conclusion on this point, it is to be remembered that new regiments are quartered as far as possible at stations selected for their healthiness, and also that in the number for a single year fluctuations are apt to occur.

The influence of age and Indian service on the British soldier has been very ably discussed by Dr. Bryden in papers which appeared as appendices to the Sanitary Reports for 1871 and 1872, and which have since been collected in one of the volumes of his work on the vital statistics of the Bengal Presidency. The question is of so much practical importance, and has so direct a bearing on the future of the Army in India, that it will not be out of place to draw attention anew to some of the more important facts which have been given by him, and to add the results of further experience so far as they are yet available. As regards sickness, there are no statistics to show the relative proportion of admissions at different ages; but they would not be of much value as an index of the influence of climatic causes, as they would be largely affected by venereal disease.

The figures given in the Army Medical Reports fully bear out the views advanced by Dr. Bryden as to the marked influence of age, as may be seen from the following statement :—

Bodies of Men compared.	RATIO OF DEATHS PER 1,000.					
	Under 20.	20-24.	25-29.	30-34.	35-39.	40 and upwards.
Troops in the United Kingdom, 1863-72 - -	2·87	5·42	6·79	12·53	17·76	21·16
Civil male population, England and Wales -	7·41	8·42	9·21	10·23	11·63	13·55
Troops serving in India, 1863-72 - - - -	9·34	17·14	23·61	32·64	44·31	65·93

This statement brings out two facts in a striking manner: *first*, the high death-rate among troops in India as compared with those in England; and *secondly*, how much more rapidly the proportion here increases with age. For example, in the United Kingdom the mortality between the second and third quinquennial periods of life rises little more than 1 per 1,000, in India it rises nearly 7 per 1,000.

There can be no question then of the great general truth that as age advances the excess mortality among British soldiers in India over and above the English rate becomes more and more decided. There is, in other words, a marked deterioration among them as a body, and a much greater liability to death. It is not possible to fix any precise age at which the soldier is no longer fitted for Indian service; much depends on individual constitution and other concomitant circumstances; but it seems very clear that at or about 30 years of age, as a rule, service in India is attended with greatly enhanced risk.

The statistics of the eight years 1865-72 show that the number of young men invalided is greater than it ought to be, that it rapidly increases with age, and that the proportion is greatest in men over 30 years old:—

INVALIDING.	RATIO PER 1,000.		
	Under 24 years.	25-29.	30 and upwards.
1865-70 - - -	26·55	39·74	78·34
1871 - - -	25·97	40·42	68·14
1872 - - -	21·79	38·36	60·87

But how far are these results to be attributed to age, and how far to residence in India, for although the very young men are new to the country, many of the older men are new also? There are no general statistics of sickness, mortality, and invaliding according to Indian residence, but there are many striking examples to show that regiments during the first year of Indian service suffer very much more in all respects than they do afterwards.

In his first paper Dr. Bryden gives the experience of regiments during their first year of Indian service as compared with that of men of longer residence cantoned at the same station. The results are very striking, as may be seen from the following figures:—

Strength	-	-	-	{ New troops	-	3,777
				{ Old	-	3,878
Admission-rate per 1,000	-	-	-	{ New troops	-	2,026
				{ Old	-	1,219
Daily sick-rate per 1,000	-	-	-	{ New troops	-	84
				{ Old	-	52
Death-rate per 1,000	-	-	-	{ New troops	-	92
				{ Old	-	21

The difference is no doubt exaggerated owing to the fact that the period includes two unhealthy years, 1867 and 1869, in both of which cholera was epidemic; but cholera epidemics have an important bearing on the question, and there can be little doubt that new troops are much more liable to be attacked by cholera than those which have been acclimatized. The same truth is, however, illustrated in a remarkable manner by the case of the 11th Brigade, Royal Artillery, in 1874, which was a very healthy year and singularly free from cholera. This case is all the more instructive because the batteries were quartered at six separate stations. In all of these they differed from the other troops quartered beside them mainly in this one respect, that they were new to the country, and the result in each of the six stations was that the battery suffered excessively, and far more than the other troops. The results may no doubt have been exaggerated by the fact that the 11th Brigade arrived somewhat late in the season, that it was composed largely of young men, and that the duties of learning their drill were trying. But these causes, although due weight may be given them, seem insufficient of themselves to account for the striking contrasts which are presented. On the other hand, it is to be remembered that under the present system regiments on their first arrival are sent as far as possible to selected stations. If it should be necessary to send them on first arrival to stations without selection, much greater sickness and mortality might be anticipated, and if new arrivals had to take the field, the experience of 1858 would no doubt to a large extent be repeated.

When age and length of Indian service are taken together, it appears that the death-rate at the different periods of life maintains much the same relative proportions as in the standard, but that at all periods it is much increased during the first year, that it still remains high in the second, and that it sinks to a minimum in the third. As regards invaliding according to age and length of service, the main point is the general fact that the loss on this account, even during the first years of Indian service, is very heavy. How much men new to the country contribute to the invaliding may be gathered from the facts mentioned by Dr. Bryden: that of 1,800 invalids from new regiments 100 only had served more than three years in India; and, again, that of a total of 10,002 men invalided between 1865 and 1870, 3,122 had spent only from one to three years in India.

The importance of taking special care of regiments during the first years of their Indian service, which has long been recognised, is still further illustrated by these facts. The selection of the best stations for them, the removal of undeveloped youths to the hills for the hot weather and rains, and the most careful management of all those who remain in the plains, are all measures the value of which is fully understood, and renewed attention has been drawn to them by the case of the 11th Brigade, Royal Artillery.

The number of cases of drunkenness reported among British soldiers in Bengal during 1875 was 8,926, compared with 10,988 in the previous year. In 1873 the number was 8,976. The number of total abstainers was returned as 3,097. In Madras the cases amounted to 4,683; in 1874 the number was 5,346. The total number of abstainers in this Presidency was given as 612. In Bombay there was a considerable increase in the number of cases of drunkenness,—4,259, compared with 3,568 in 1874. The total abstainers were said to amount to 794. The returns from which these data are taken cannot be much depended on. The contrasts between different corps are so marked as to lead to the conclusion either that the statements have not been carefully compiled, or that they have not been prepared on the same principle in all.

As they now stand, it is very difficult to form any correct estimate of the extent to which alcohol is responsible for sickness and mortality among British soldiers in India, and the medical returns do not supply this deficiency.

The statistics of the women of European regiments throughout India were not so favourable as in some of the previous four years. In consequence of cholera, the death-rate was higher than in any one of them, except 1872, when also cholera was very prevalent.

Of the 164 deaths which occurred among the women throughout India, 34 were due to cholera, 21 to child-birth, 20 to malarial fevers, 14 to dysentery, 14 to phthisis, 10 to diarrhoea, 7 to enteric fever, and the same number to respiratory diseases.

Among children the death-rate was considerably higher than in either 1873 or 1874, a result due in some measure to cholera.

Of 862 children who died, 179 are returned as having died from diarrhoea, 137 from convulsions, 87 from anæmia, 86 from dentition, and 63 from cholera.

The ratio of mortality among the children at different ages, and also the ages at which the different diseases proved fatal, exhibit the same general truths as have been indicated in previous years, notably the enormous death-rate among very young children, and at the same time their comparative exemption from cholera.

Of a total of 1,990 officers of the British Army, 34 died in 1875, or a ratio of 17·09 per 1,000; of 1,799 officers of the Indian Army, 25 died, or a ratio of 13·90 per 1,000.

SECTION III.

NATIVE ARMY (BENGAL).

In the Regular Native Army the deaths, including those which occurred among men on leave, as well as those in the regimental hospitals, equalled 15·70 per 1,000. In 1874 the ratio was 13·50, but this was the minimum; in 1873 it equalled 17·01, and in 1872, 20·08. The total mortality of the Regular Native Army in 1875 was in fact much below the average. In the Central India Irregular Regiments the total deaths were in much smaller proportion than in the Regular Army, being only 9·68 per 1,000; but in the Punjab Frontier Field Force the reverse was the case, for here the death-rate amounted to 21·85 per 1,000. These figures are deserving of notice, but do not call for further comment, as, beyond the fact of death, nothing further is known. The

causes to which it was due are unrecorded, for in many instances the men died at their homes far removed from professional advice.

As a whole, the results of 1875 may be considered as favourable. In the Regular Native Army the admission-rate (1,233) was under that of 1874 (1,266) and also under the average of the preceding ten years (1,391); the daily sick-rate was 40, compared with 41 in 1874, and 43 the average of the ten years 1864-73; and the mortality 13·55, although in excess of that of 1874 (when it was only 10·94), was less than the average of the ten-year period (14·25). In the Central India Regiments the ratios for the two years are much the same, and both compare favourably with the ten-year standard. In the Punjab Frontier Field Force, however, the results are not favourable. Here the admission-rate, although high (1,662), was less than it was in 1874, when it equalled 1,712; but the death-rate (19·35) was much in excess of the ratio of the previous year (12·28), and was in fact above that of any one of the previous eleven years, excepting 1869 and 1872, in both of which a large proportion of the mortality was due to cholera. In 1875 only one death is ascribed to this disease.

The extent to which the ten chief forms of sickness contributed to make up the admission-rates of the different parts of the Native Army of this Presidency are shown in the annexed statement :—

Diseases.	Admissions per 1,000 of average strength.			
	Regular Native Army.	Central India Regiments.	Punjab Frontier Field Force.	Madras Regiments serving in Bengal.
1. Fevers - - -	598	298	915	470
2. Wounds and accidents - - -	131	108	143	67
3. Abscess and ulcer - - -	97	92	138	66
4. Dysentery - - -	72	34	68	15
5. Respiratory diseases - - -	51	42	96	23
6. Rheumatism - - -	46	43	53	43
7. Venereal diseases - - -	41	32	30	21
8. Diarrhoea - - -	35	24	41	14
9. Eye diseases - - -	28	84	31	76
10. Spleen disease - - -	11	2	14	4
Total of the ten -	1,110	759	1,529	799
Total from all causes -	1,233	884	1,662	888

In all cases the first nine diseases are the same and preserve much the same order, repeating in both respects the experience of former years. The tenth in none of them attains any prominence; in one, spleen disease, which occupies this position in the Regular Army, is replaced by small-pox, contributing, like it, a very small ratio. The ratios of both the Central India and Madras Regiments compare favourably with those of the other two divisions. Under eye diseases, however, the admission-rate in both was high. The excessive ratio for the Punjab Frontier Field Force was due chiefly to fevers and respiratory diseases. The fever ratio here exceeded the admission-rate from all causes in both the Madras and Central India Corps.

The ten principal causes of mortality stand in the following order :—

Diseases.	Died per 1,000 of average strength.			
	Regular Native Army.	Central India Regiments.	Punjab Frontier Field Force.	Madras Regiments serving in Bengal.
1. Respiratory diseases - - -	3·17	2·48	11·19	2·01
2. Fevers - - -	2·56	·68	3·13	3·16
3. Cholera - - -	1·69	1·81	·10	·29
4. Dysentery - - -	·92	·23	·91	·29
5. Diarrhoea - - -	·82	·68	·10	·29
6. Phthisis pulmonalis - - -	·77	·45	·60	·29
7. Spleen disease - - -	·56	—	·50	—
8. Atrophy and anæmia - - -	·36	·68	·20	·57
9. Apoplexy - - -	·33	—	—	·29
10. Wounds and accidents - - -	·28	·45	·40	·57
Total of the ten -	11·46	7·46	17·13	7·76
Total from all causes -	13·55	10·39	19·35	8·90

The ten diseases named are almost the same as those which have occupied the first places in former years. Taken as a whole, the Gangetic Provinces yield the most favourable return, for, although the admission-rate (896) and the sick-rate (31) were both higher than in the Meerut and Rohilkund group (835 and 28), the mortality was at the minimum of 5.05. The Punjab Frontier Field Force gives the highest admission-rate, but in Bengal proper and Assam both the daily sick-rate and the mortality were at the maximum.

The monthly variations in the daily sick-rates are chiefly remarkable from their being generally at a minimum during the hot months, rising considerably in the autumn, and remaining high during the early part of the cold season—a contrast to what is usually observed among European troops. The death-rate, in even a more marked manner than the sick-rate, bears heavily on the Native troops during the cold months. In the Regular Native Army, for example, the maximum mortality was in January, and the three cold-weather months, December, January, and February, all present comparatively high ratios. In the Punjab Frontier, where the cold is more severe and long continued, the contrast is very marked. Here during the six hot months, May to October, the deaths numbered 38; in the other, or cold half of the year, they numbered 154.

Standing fifth in order of prevalence, respiratory diseases occupy the most prominent place as a cause of mortality. In all parts of the Presidency individual stations present a high ratio of admissions from this cause. Two stations in Assam, Tezpur and Dibrugarh, give the maximum of 209 and 114 per 1,000, but it is in the Upper Provinces, and especially in the North-Western Frontier, that these diseases most generally prevailed. It was in this part of the country also that they were especially fatal. In the Regular Native Army, out of a strength of 15,355 quartered in the Punjab, there were 83 deaths from this cause, while the total in all the other provinces was 41. In the Punjab Frontier Field Force they account for more than one-half of the heavy death-rate. Lung affections have long been recognised as one of the most fruitful causes of mortality in the Native Army. Like fevers, they fluctuate greatly in different years, and the past year was one in which the troops in Upper India suffered from them in a very unusual degree.

Respiratory diseases.

The great importance of fevers as a cause of admissions into hospital is apparent from the figures already cited. These fevers are classed under two heads, "Intermittent" and "Remittent and continued;" a few cases have been entered as "Enteric," but the number is very small, only 10 among the whole of the Native troops of the Bengal Presidency. Whether these few cases represent a specific disease, or whether they merely developed enteric complications, the great mass of the fevers from which Natives as well as Europeans in India suffer are undoubtedly malarial.

Fever.

In the Regular Native Army, the groups show great variations in the prevalence of fevers. In the third group (Meerut and Rohilkund) the ratio of cases was only 323 per 1,000, whereas in the Punjab it equalled 800. In the Punjab Frontier Field Force it attained the maximum of 915. In nearly all the groups individual stations present very high admission-rates from fevers. In Bengal proper, for example, with an average of 681, Dum Dum and Berhampore each suffered to more than double that extent. In the second group (Dinapore, Benares &c.) only one station, Goruckpore, yields a ratio above 1,000. In the third group the highest is 912 at Delhi. In the fourth (Agra and Central India) none of the stations suffered from fevers in a marked degree. In most of the Punjab cantonments fevers were very prevalent. At Meean Meer the admission-rate from this cause was 1,204. Omitting small bodies of men, the maximum was 1,429 at Peshawur. At Kohat and Edwardesabad, also, the cases of fever were very numerous. No class of diseases presents more remarkable fluctuations than fevers. In the Punjab Frontier Field Force, for example, during the ten-year period 1864-73, the annual admission-rates due to them ranged between 437 and 1,478. In the Regular Army quartered in the Punjab it ranged between 469 and 1,200. It is apparent that the causes which produce a marked prevalence of such fevers over a large area in one year are comparatively dormant in another. What these general causes are is still very obscure. In a practical point of view the great object is to discover the local insanitary conditions of each place which act prejudicially at all times, and specially so when such general influences are at work. On this point more specific information is required in the annual sanitary reports from each cantonment.

SECTION IV.

JAILS (BENGAL).

Sickness and mortality in jails.

For the jails of the Bengal Presidency the results of the two past years stand thus as compared with those of the ten-year period 1864-73:—

Period.	Average annual strength.	Sickness per 1,000.		Deaths per 1,000.	
		Admissions.	Daily sick.	Cholera.	All causes.
1864-73	58,232	1,050	32	5·24	46·09
1874	72,060	1,027	34	2·48	39·90
1875	71,414	942	31	2·35	33·65

It is gratifying to find that under every head the statistics are in favour of 1875. In 1871 the admission-rate was only 927; in 1868 and 1871 the sick-rate was 29, and in 1870 it equalled 30; in 1868 the mortality was only 30·28; but with these exceptions the results of 1875 are more favourable in every respect than those of any of the preceding eleven years.

The ten forms of sickness which chiefly contributed to the admissions into hospital, as compared with 1874, were as follow:—

Diseases.	Admissions per 1,000 of average strength.	
	1874.	1875.
1. Fevers	445	398
2. Abscess and ulcer	106	99
3. Dysentery	101	95
4. Diarrhoea	96	90
5. Wounds and accidents	44	42
6. Respiratory diseases	45	37
7. Venereal diseases	15	20
8. Rheumatism	19	16
9. Atrophy and anæmia	14	16
10. Eye diseases	12	11
Total	897	824
Total admission-rate for the year	1,027	942

Under every head of importance the ratios of 1875 are less than those of 1874. For the ten-year period the average admissions due to all these diseases have not been separately compiled, but, taking those which are most prevalent, it appears that fever fluctuated between 379 and 514; dysentery and diarrhoea together between 168 and 221; respiratory diseases between 30 and 44; and atrophy and anæmia between 8 and 19 per 1,000.

The chief causes of mortality are represented in the following order:—

Diseases.	Deaths per 1,000 of strength.		
	Average for the 10 years 1864-73.	1874.	1875.
1. Dysentery and diarrhoea	18·20	16·38	12·38
2. Respiratory diseases	4·00	6·02	5·01
3. Fevers	7·96	3·72	4·20
4. Cholera	5·24	2·48	2·35
5. Phthisis pulmonalis	1·88	2·51	1·86
6. Atrophy and anæmia	2·52	2·37	1·65
7. Spleen disease	·37	·37	·77
8. Dropsy	·81	·85	·67
9. Wounds and accidents	·62	·69	·62
10. Apoplexy	·63	·31	·52
Total	42·23	35·70	30·03
Total annual death-rate	46·09	39·90	33·65

The diminution in the mortality as a whole is very satisfactory, and it appears all the more so when the statistics of the individual years which make up the ten-year period are examined. For example, the death-rate from dysentery and diarrhoea varied during that period between 24 and 12 per 1,000; in only one of the ten years was it lower, and then by only .36, than in 1875. Excepting 1871, when it was only 1.10, the cholera ratio varied between 12.10 and 2.48. Considering the wide-spread prevalence of the disease in 1875, the ratio of 2.35 is eminently satisfactory. In the whole sanitary history of the jails there is perhaps no fact more instructive and encouraging than the diminution in this disease.

In the first group, which comprises the jails of Bengal proper and Assam, the average strength (16,902) was much the same as it was in the previous year (16,922). During the ten years 1864-73 it increased from 14,441 to 16,147, but the increase was not gradual throughout the period. In 1866, the year of the famine, there was a sudden rise from 14,598 to 16,794. It may then be said to have gradually declined to a minimum of 14,026 in 1871, since which time it has again increased. The facts as to strength are of great importance, as they are intimately connected with the evil of overcrowding. The admissions in this province during 1875 equalled 1,334, compared with 1,412 in 1874, and an average of 1,386 during the ten-year period; the sick-rate shows no great difference, for it was 41, compared with 39 in 1874, and 41 in the ten years. The mortality, 49.88, is less than 52.24, the ratio for 1874, and still more favourable than 57.91, the average for the ten years 1864-73. Cholera, fever, dysentery and diarrhoea, phthisis pulmonalis, dropsy, and atrophy and anæmia, all contributed to the death-rate in excess of the average for the Presidency as a whole, and under the head of dysentery and diarrhoea the excess was great.

Sickness and mortality in groups: Bengal proper.

In many of the jails of this group both sickness and mortality were very great. In 23 out of the total of 45 the admissions into hospital were more than 1,000, and in 6 of these 23 they were more than 2,000 per 1,000. The maximum admission-rate was 3,854 at Dibrugarh, but the number of prisoners confined here was very small. Among the jails of any size, the Presidency jail gives the most unfavourable return—a ratio of 2,841 cases per 1,000. Of these, 834 were due to dysentery and diarrhoea. But high as was the proportion of sickness in this jail, the deaths were but few, for the total mortality equalled only 16.13 per 1,000. Only seven of the other jails in this province show a more favourable result. In many the mortality was very high. In 18 it exceeded 50 per 1,000; in five of these it exceeded 100 per 1,000; and at Julpigoree it attained a maximum of 255. Here, as in all the other jails where the death-rate was heavy, the main causes to which it is ascribed were dysentery and diarrhoea. In the Julpigoree jail, of 37 prisoners who died, 21 are returned as having died from these diseases. To them were due 354 out of the total of 843 deaths in this first group.

In many of the jails grave sanitary defects existed, the most common of which was overcrowding. At Maldah, for example, "during the months of November and December the overcrowding in the criminal ward was excessive." At Mymensing, it is said, "the jail buildings were condemned many years ago. The hospital is the worst building in the jail; it is low-roofed, therefore not well ventilated; it is low-floored, therefore damp; and altogether the place is quite unfitted for the purpose for which it is intended." The drainage is described as imperfect. Many of the prisoners suffered from scurvy. For nearly five months from 80 to 90 had lime-juice and limes given to them, and extra vegetables from the jail garden all the year round. Of the number in jail on the 1st January 1876 no less than 90 were found to be more or less scorbutic, and a large proportion of the cases of dysentery were associated with scorbutic cachexia. Many of the prisoners came into jail in a bad state of health. The Presidency jail was overcrowded during a portion of the year. During the rains the large surface drain in the *maidan* becomes tidal. As the drain passes through a very dirty and densely populated village before it reaches the jail, the inhabitants of which make a privy of it throughout the whole year, a large quantity of animal *débris* is carried up and deposited close to the jail walls. In the Alipore jail there was overcrowding during the latter half of the year. In October this was extreme; scurvy was prevalent, and the sickness and mortality were generally high. The Nuddea jail was "crowded throughout the year." The Moorshedabad jail was "crowded in January, September, and December." In the Rungpore jail there was "much overcrowding"; here scurvy was common among the prisoners: of 60 who died during the year from different diseases, 55 were more or less affected by it. At Bogra there was "overcrowding in July, August, and December." The Pubna jail was "generally more or less overcrowded."

In the Backergunge jail, "in consequence of the raised plinths being of earth, the floors are constantly damp. Damp ascends the walls to a height of six feet during the rains; ventilation is not satisfactory." At Sylhet "during the greater part of the year the capacity of the jail, the female ward excepted, was much below the demands upon it; * * * a constant urinous smell hangs about the ward privies." Thirteen per cent. of all the prisoners admitted into hospital were suffering from scurvy. It is common among the new prisoners; many lose their scorbutic symptoms in jail; extra vegetables seemed to have little effect in improving their condition. At Gowhatty "the mud floors of the sleeping wards are damp during the rains." At Balasore there "was overcrowding in the month of June in five of the wards; the drainage is not good; during the rains it is almost impossible to keep the workshed dry." At Purneah there was "a chronic state of overcrowding throughout the year."

The many and great defects which still exist in the jails of those Lower Provinces are not unknown to the authorities, and the remedying of them has been a matter of anxious consideration. The difficulties to be contended with are exceptionally great.

Gangetic
Provinces
and Oude.

In the second group the strength averaged 25,054, compared with 25,482 in 1874, and 18,684 for the ten preceding years. The admission-rate was 651 per 1,000, against 788 in 1874, and 817 in the ten-year period. In this group the admissions have very markedly diminished. In 1864 they equalled 930, and from that year to 1874 were never less than 727. The ratio for 1875 is thus lower than any previously recorded. The daily sick-rate, 22, also compares favourably with 26 in 1874. During the ten-year period 1864-73 it fluctuated between a minimum of 23 and a maximum of 31. The death-rate for 1875 (24·95) is markedly less than that of 1874 (37·05), and still more so than that of the ten-year period (45·61). During these ten years it never was less than 28·22, and in both 1864 and 1865 it exceeded 67 per 1,000. The results of 1875 in this group stand, therefore, in very favourable contrast to those of earlier years.

The jails of the second group present very marked extremes in the extent of both sickness and mortality. The admission-rate varies from a minimum of 155 per 1,000 in the Ghazee pore district jail, and 179 per 1,000 in the Allahabad central prison, to 2,227 at Gya. In 17 of the 41 jails the rate was under 500 per 1,000. In 12 it varied between 500 and 1,000, in 12 it exceeded 1,000, and in 2 of these 12 it was more than 2,000. The two jails where sickness was so prevalent were Chyebassa and Gya; at Gya the sickness was of a serious character. Of the total ratio, 1,195, or more than one-half, was due to dysentery and diarrhoea. In this jail also the mortality was very high, 118·34 per 1,000, 29 out of 40 deaths having been ascribed to these diseases. The death-rate at Gya far exceeds that of any of the other jails of this group, but there are 8 others in which it exceeded 50 per 1,000. On the other hand, many of the jails show excellent results; in 17 of them the mortality was less than 20 per 1,000, and in 7 of these it was under 10. The remarkably low death-rates of 2·99 at Roy Bareilly, 2·56 at Hardoi, and 5·91 in the large central prison at Allahabad, are deserving of notice. In the second as in the first group, dysentery and diarrhoea play a most important part; of the total of 625 deaths from all causes, 288 are returned as due to these diseases.

In this group also there are examples of sanitary defects, though the instances are rare compared with those in Bengal proper and Assam. At Ranchee it is noted that there was frequently an excess in the number of prisoners, and both at Patna and Shahabad there was at times some overcrowding; at Sultanpore the accommodation for male convicts was considerably below requirements for five months, this excess above capacity being at one time as great as from 100 to 119. The Unao jail was, "as usual, over-crowded."

Central
Provinces.

The number of prisoners in the third group is comparatively small. In 1875 it averaged only 2,434, in 1874 it was much the same (2,445), but during the ten-year period 1864-73 it stood at 4,445. The admission-rate, 1,046, was less than that of 1874, when it equalled 1,191; for the ten years it averaged 1,458, ranging from 1,012, the minimum in 1873, to 1,738, the maximum in 1869. The daily sick-rate in 1875 was 41; in 1874 it was 42, and in the ten-year period 48. The mortality of 1875 (36·15) somewhat exceeded that of 1874 (33·13); but for the ten-year period it averaged 52·31, reaching the minimum of 26·83 in 1873, and the enormous maximum of 104·77 in 1865. In 1875 there was no great mortality from any one cause. Of the 88 deaths, 17 were due to cholera, 16 to dysentery and diarrhoea, and 12 to respiratory diseases.

As regards the 16 jails which comprise the third group there are few points which require special notice. In most of them the population averaged only a small number; in only 7 out of the 16 did it exceed 100, and in only 2 jails was it over 200. Dealing with

such small numbers, apart from all other considerations, great fluctuations may be looked for. The admission-rate varies from 359 per 1,000 at Mandla, to 3,558, or ten times that rate, at Sehore, a result mainly due to the prevalence of intermittent fever in this last jail. In none of the jails was the mortality very heavy, except at Bilaspur, where cholera caused 12 out of the total of 19 deaths, or 171·17 per 1,000; at Chanda, where 7 fatal cases out of a small strength yield a high ratio, 101·45; and at Hoshungabad, where the death-rate, apparently due to no special disease, equalled 71·90 per 1,000.

At Bilaspur there was "overcrowding in the male convicts' barracks." At Nursingpore there "was overcrowding at times." In the Hoshungabad jail "crowding occurred on several occasions." At Bhandara "the average number of prisoners during the year has been in excess of the accommodation." The Inspector General of Prisons in his annual report notes that in some of the jails the supply of vegetables was defective, and the diet not according to orders. In some of them the prisoners suffered from spongy gums, and in others boils and ulcers were more common than usual.

The fourth group has been separated only since 1870. During the five years 1870-74 the admissions fluctuated between 704 and 955 per 1,000, the daily sick between 26 and 37, and the death-rate between 19·73 and 33·73. In 1875 the ratios were, for admissions 733, for daily sick 32, and for deaths 25·13; the year thus holds a medium place. The causes of death which were most active in this group were dysentery and respiratory diseases, which accounted respectively for 51 and 34 deaths.

In this group there are only 9 jails, but the average strength was much higher than that of the 16 jails of the third group. Among these 9 jails the admission-rate varied from 1,507 at Saugor to 338 at Jhansi; at Ajmere the ratio was 1,259. With the two exceptions named it did not equal 1,000 in any case. At Jhansi the mortality was highest, namely, 51·64 per 1,000; the next highest rate was 38·52 in the Agra district jail; then 28·89 at Jubbulpore; and 23·76 in the Agra central prison. In none of the others did it exceed 20; at Muttra it was at the minimum of 5·05.

At Jubbulpore no sanitary defect is mentioned, but the results were very unsatisfactory. At Saugor the female prisoners were overcrowded. At Muttra there was overcrowding from June to October. In the Agra central prison "the capacity in relation to population has been at times under the standard allowance;" in the Agra district jail the "drainage is not good."

In the fifth group, between 1870 and 1874 the admissions into hospital reached a maximum of 946 in 1872, and a minimum of 779 in 1870; in this last year the daily sick-rate was also at its lowest (24); in 1874 it attained to 43. During all these five years the mortality was very high, never under 46·40, and in one of them mounting up to 56·04. For 1875 the proportions are, for admissions 588, for daily sick 25, and for deaths 34·81; there has thus been a marked diminution in the sickness, and also in the mortality, though it was still high. Of the deaths the largest proportion (8·44) was from respiratory diseases; dysentery and diarrhoea contributed nearly as much (8·18); and fevers 6·33 per 1,000.

This group comprises 17 jails. Only in the Meerut district jail did the admission-rate exceed 1,000, and here it was 1,125. At Moradabad the ratio was only 328. In 1874 the admission-rate in the Meerut central prison was 1,699, and in the district jail 1,860. In respect to mortality also there has been considerable improvement. In 1874 in the Meerut central prison it equalled 128·37; in 1875 it was 54·05. This is the highest ratio of mortality among the jails of this group in 1875, but in the Bareilly central prison it was nearly as much (53·44); in none of the others did it equal 50. In four of them it was under 10; at Bijnour it was at the minimum of 5·03—omitting Dehra, where, in a very small body of prisoners, there was no death during the year.

At Etah "the accommodation was insufficient, but overcrowding was prevented by the use of one of the factory barracks and three small tents as dormitories." At Aligurh the excess prison population was "accommodated in worksheds." In the Bulandshuhr jail there was "constant overcrowding." In the Shahjahanpur jail there was "a good deal of overcrowding, particularly from July to October." The Budaon jail was "overcrowded throughout the year;" in the Bareilly central prison there was "unavoidable overcrowding." The Bareilly district jail also was overcrowded. In the Bijnour jail there was "partial overcrowding."

The sickness in the Punjab jails, 1,234 cases per 1,000, considerably exceeded the ratio of 1874 (1,096), and also the average of the ten-year period 1864-73; the daily

Agra and

Rohilkund.

Punjab.

sick-rate, 36, was also above that of 1874 (34), and that of the ten-year period (29). The death-rate, 31·71, on the contrary, was more favourable than either that of 1874 or the average of the previous ten years. Of these ten years several yielded results much better than those of 1875. In 1868, for example, the admissions equalled only 790, the daily sick 23, and the deaths 12·39 per 1,000. In 1875 fevers, bowel complaints, and respiratory diseases were all prevalent and fatal. The variations in respect to chief forms of sickness which are presented by different years are well seen by comparing the figures of 1875 with those of 1868. In 1875, for example, fevers caused 707 admissions, and 7·53 deaths per 1,000; in 1868 the ratios were 367 and 2·99. In 1875 dysentery and diarrhoea caused 139 admissions and 7·53 deaths; in 1868 the proportions were 88 and 3·08. Again, in 1875, respiratory diseases accounted for 56 cases and 7·81 deaths, whereas in 1868 they accounted for only 29 cases and 2·08 deaths per 1,000.

Many of the Punjab jails suffered much from sickness. In 16 out of the 30 the admission-rate exceeded 1,000; and in two of these, Rupar and the Lahore female jail, it was more than 2,000. At the first of these the maximum was attained of 2,487 cases per 1,000; in both fevers account for a large proportion of them. On the other hand, a few of the jails suffered little. At Umballa the admissions equalled only 373 per 1,000, and at Gujranwala there was the minimum of 329. Similar extremes are to be found in the death-rates; at Gujerat it was only 6·87, and at five others it was under 10. In the following jails the loss was very heavy. Lahore central jail 59·01; there were 130 deaths, of which 35 are returned as due to respiratory diseases. Lahore female jail 109·37; of 21 deaths, 12 were due to fevers. Bannu 140·35; but, of the 16 fatal cases, 6 were the result of wounds and accidents.

In the Punjab jails the chief insanitary condition which has been mentioned is overcrowding. This defect is noted at Delhi, Gurgaon, Jullundur, and Sialkot; at Gujerat the overcrowding was lessened by using the workshed for dormitories; an arrangement, however, which cannot be regarded as a remedy for this great evil. At Dharmasala and Mooltan there was some overcrowding in the female wards. At Kurnool there was "very great overcrowding." At Peshawur there was "considerable overcrowding." The Superintendent of Dera Ismail Khan jail estimates that there is room in it for 450 prisoners; the average number confined in 1875 was 628, and at one time there were as many as 719; the evil was diminished as far as circumstances would allow by placing some of the prisoners in the worksheds, some in tents, and allowing others to sleep in the open air; seven cases of typhus fever are reported to have occurred among them.

The details of the sanitary condition of certain jails have been taken from the reports of the medical officers, and reproduced generally in their own words. In regard to many of them more exact information is desirable than that which has been furnished. The very important question of sufficient space is sometimes unnoticed, in other cases it is said generally that there was "some overcrowding" or "slight overcrowding," without showing to what extent and for how long a time it existed. It not unfrequently happens that defects in drainage or other points are passed over with the remark that they need not be described because they have been noticed in previous reports. But this arrangement is unsatisfactory; so long as sanitary defects exist they should be carefully and fully brought to notice every year until they have been either altogether removed or remedied as far as they can be. Continually calling attention to the local insanitary conditions of the jails under their charge is in fact one of the most important duties devolving on medical officers. The fact that such conditions are not invariably associated with excessive sickness and mortality, a fact which is well known, and is again illustrated in the experience of 1875, is no evidence that they may be allowed to continue with impunity; wherever they exist they are a constant source of danger.

SECTION V.

GENERAL POPULATION.

Vital
statistics.

In many parts of the country the registration of deaths is as yet so imperfectly conducted that any detailed analysis of the results would be merely a waste of time and labour.

Although the defects in registration are very evident, the difficulties to be contended with also are great; among a simple and yet suspicious people, the successful introduc-

tion of any system requiring them to record deaths, and still more, births, must be the work of time. The enormous area and vast population of many of the provinces, the sparse and scattered distribution of the latter in many parts of the country, the want of educated medical practitioners, and the ignorance and apathy, not only of the people themselves, but also of the village officials by whom the reports are made, all offer obstacles to correct registration which are well known in India, but which are apt to be lost sight of elsewhere. But with all these difficulties the progress made in certain parts of the country is most encouraging. In the Central Provinces, as a whole, the greatest progress has been made, and the results generally bear evidence of very creditable accuracy. During last cold weather I marched through a portion of these provinces with the Sanitary Commissioner, Dr. Townsend, and was much struck by the attention which had been given to the registration of both births and deaths. The neatly kept police station, with its register of such events, even in remote villages, cannot fail to have a civilising effect, and already it appears that the people have adduced entries in these registers as evidence in the law courts. With all its defects, the information which registration has supplied regarding the distribution of disease, and especially epidemic disease, over India is most valuable.

In every province the mortality among males exceeded that among females; in the Punjab, however, the difference was very trifling.

In all of the provinces, except Berar and Bombay, the ratio in towns is in excess, and in several of them markedly in excess, of the ratio in the country; but there is reason to believe that much of this is due to imperfect registration in rural tracts.

The results attained in the larger towns of the Central Provinces and in the municipalities of the Punjab, where special attention has now for some time been devoted to the subject, show a very high death-rate. In the former the ratio is 31·60, and in the latter no less than 43·71. Many of the towns are still in a most insanitary condition, and urgently require improvement.

In most provinces the results of registration of deaths according to age are evidently incorrect, the infant mortality being much under-stated. In the Central Provinces the returns seem fairly to approximate the truth, all the more so because, although the ratios vary in different years, there is a remarkable correspondence between the results of 1875 and those of the previous three years. The results of 1875 are as follow:—

1 year	=	135·6	per 1,000.
1 and under 6	=	33·0	"
6	"	12	= 12·4 "
12	"	20	= 9·1 "
20	"	30	= 10·1 "
30	"	40	= 14·3 "
40	"	50	= 22·7 "
50	"	60	= 41·0 "
60 and upwards	=	124·4	"

The statistics generally afford ample evidence that the birth-rate in India is very much higher than it is in European countries.

In every part of the country where the registration seems to have been fairly successful there is a marked preponderance in the male over the female births.

The improvement of the registration both of births and deaths, and the extension of the birth registration to all parts of the country, is most desirable. The registration of births should not be limited to selected areas or to municipalities, still less should it be altogether omitted as it has been in Oude. The registration of births or deaths in towns or selected tracts of country, even when it attains a fair degree of accuracy, will in no way aid its introduction among the people generally. Its success depends not so much on the efficiency of the machinery employed (for without the assistance of the inhabitants no registering agency, however perfect, can effect much) as on accustoming the people themselves to record such domestic events, with the full confidence and conviction that the work is undertaken for no other end than their own benefit. And it must be remembered that it aims not so much at deducing facts of scientific value bearing on the chances of life as at endeavouring to rouse the people to understand the needless waste of life which now takes place and to adopt measures for its prevention.

In Bengal proper small-pox was present more or less in every district. In 11 of Small-pox. them it was more prevalent than in the previous year; in 33 it was less. It was generally more fatal in those towns and districts where inoculation was still practised. In the

North-West Provinces, it prevailed to a serious extent only in Lalitpur and Banda to the south, and in Bijnor, Moradabad, Saharanpur, and Muzaffernuggur to the north. The continued exemption of Kumaon and Gurhwal, where vaccination has been carried on with so much success, deserves special notice. In Kumaon the deaths due to this disease equalled only .01 per 1,000, in Gurhwal .05, whereas in Lalitpur they amounted to 16.12. In the Punjab, it was most fatal in Gurgaon, Umballa, Kurnool, and Peshawur. In Jullundur, Gurdaspur, and other districts, where the people have become more sensible of the advantages of vaccination, the mortality was trifling. Of the total of 13,611 who died from it, 13,008 were children under 10 years of age. In the Central Provinces small-pox was much more severe, and caused the death of more than 20,000 people. In Nursingpore it reached a maximum of 16.96 per 1,000 of the population. Among children in this district it proved fatal to 41.79 of every 1,000. In Betul, Chindwara, Seoni, and Sumbulpore it appeared evidently to be greatly held in check by vaccination. In Berar the disease was less prevalent than in any year since 1871; in 1875 there were 927 deaths, compared with more than 8,000 both in 1872 and in 1873. In Oude it was much less prevalent than in 1874. In British Burma it nowhere assumed an epidemic form.

Fevers.

The deaths ascribed to fevers account for by far the largest portion of the total mortality. In Bengal proper it is gratifying to find that the severe and fatal fever which prevailed in Burdwan and other neighbouring districts has continued to abate as regards both the area affected by it and the intensity of the disease. It continued epidemic in the Midnapore district, but even here it declined in severity and did not extend beyond its former limits. In the North-West Provinces the parts chiefly affected were the Terai, and the districts of the Northern and Central Doab, a result as regards these Doab districts which the Sanitary Commissioner ascribes to the changed condition of the country and climate due to canal irrigation with imperfect drainage. In the Punjab and the Central Provinces the fever death-rate was higher than in any other parts of the country.

Bowel complaints.

Excepting in Berar, where the mortality under this head continued as in former years at a very high figure compared with other provinces, bowel complaints do not call for special remark. Of this excessive death-rate in Berar no satisfactory explanation has yet been given.

Vaccination.

In the Madras and Bombay Presidencies, the Central Provinces, Berar, Oude, and British Burma, vaccination has been included among the duties of the Sanitary Department, but in Bengal proper and Assam the work is carried on under the orders of the Surgeon-General of the Indian Medical Department, and in both the North-West Provinces and the Punjab there is a separate Superintendent-General of Vaccination who is directly responsible to the Local Government.

The very large establishment which is employed in nothing else but vaccination, and which, owing to the difficulty of propagating the vaccine vesicle during the hot weather and rains, is idle during a great part of the year, is deserving of notice. In both the Madras and Bombay Presidencies vaccination has now been amalgamated with other sanitary work, and the same system is in force in the minor provinces of the Bengal Presidency. There can be no question that, with judicious management, the large staff of superintendents, native superintendents, and vaccinators may in time render very valuable service in general sanitary work.

The proportion of success varies from 78.5 per cent. in Berar to 98.43 in the Punjab. The figures are taken from the Vaccination Reports, and in regard to the latter there is a discrepancy which has not yet been explained. In several of them there is a want of information as to how far the results entered have been verified by inspection.

The number of children operated on bears in every instance but a very small proportion to the birth-rate, even if that be calculated on the most moderate estimate. Natives generally have a prejudice against having very young children vaccinated, but even in this respect some progress is being made.

SECTION VI.

SANITARY WORKS (BENGAL).

During the financial year 1875-76 a grand total of Rs. 82,42,085 was expended on works designed more or less to add to the health and comfort of the troops, and more particularly of the British troops, in the Bengal Presidency. Of the above, Rs. 34,19,649 were devoted to original works, Rs. 22,33,435 to repairs, and the balance to establishment, tools, and plant. As regards British troops, the following may be cited :—

Military
works.

Calcutta.—Construction of a new female garrison hospital; additions and alterations to the Ravelin Gateway quarters, Fort William. Improvements to Queen's Barracks.

Barrackpore.—Supplying Calcutta municipal water for cooking and drinking.

Hazareebagh.—Alterations and improvements to temporary barracks.

Darjeeling.—Building cottage barracks for single men, and barracks for married men at the depôt, with subsidiary buildings, and a female hospital; constructing cottage barrack for the battery of Royal Artillery, also a canteen and cook-houses.

Dinapore.—Improving family barracks; clearing and levelling ground round huts in Sudder Bazaar.

Allahabad.—Adding cook-houses and other subsidiary buildings required for the new Royal Artillery lines. Remodelling and completing their barracks with additional louvres. Building cook-houses for the family quarters of the British Infantry Regiment.

Pachmarhi.—Constructing subsidiary buildings for single men's barracks and a hospital.

Lucknow.—Wash-house and cook-house for military prison; remodelling and repairing barracks for Artillery, Cavalry, and Infantry.

Sitapur.—Sun-shades for barracks.

Fyzabad.—Improving and rebuilding barracks for Infantry.

Nowgong.—Improving the Dhorie Nullah.

Agra.—Louvres for barracks. Constructing family quarters for Infantry, with subsidiary buildings.

Meerut.—Clerestory windows to Royal Artillery barracks; bath-rooms for family quarters of Infantry; drainage works.

Roorkee.—Additional accommodation for married men of Sappers and Miners.

Chukrata.—Constructing hospitals; family quarters; barracks for single men.

Morar.—Cook-houses for family quarters. Louvres to verandah openings of barracks. Improvements to drainage.

Gwalior Fortress.—Cook-houses for family quarters; subsidiary buildings for hospitals; louvres to verandah openings.

Ranikhet.—Family quarters with subsidiary buildings; hospitals; huts for men on the Chowbuttia hill, with subsidiary buildings and reservoirs for water.

Umballa.—Improving the water-supply, and preliminary operations for a complete project.

Dagshai.—Improving barracks and constructing subsidiary buildings.

Kasauli.—Building school-rooms.

Subathu.—Building new barracks.

Jutogh.—Family quarters and subsidiary buildings.

Jullundur.—Ceiling to upper stories of barracks; cook-houses for barracks.

Dalhousie.—Water supply.

Ferozepore.—Constructing hospitals.

Mooltan.—New barracks for European Infantry.

Meean Meer.—Water-supply and drainage works.

Rawulpindee.—Sun-shades to clerestory windows; fireplaces in barracks; extension of gas for lighting.

Campbellpore.—Improving barracks.

Kalabagh.—Family quarters; lavatories; out-offices for hospital.

Chungla Gully.—Family quarters.

Peshawur.—Fireplaces in barracks; sun-shades over clerestory windows; improving drainage; water-supply project.

Among works designed to improve the accommodation for Native troops may be mentioned a new hospital at Alipore for the Infantry; a new hospital at Benares for the Infantry; enlarging the quarter-guard of the Infantry regiment at Cawnpore; a new hospital for the Infantry regiment at Saugor; a new hospital for the Goorkha regiment at Dehré Doon; sinking new wells in the Cavalry lines at Morar; additions and alterations to the

hospital of the Goorkha regiment at Bakloh ; a new barrack for the Goorkha detachment at Kangra ; enlarging and improving the Goorkha hospital at Dharmsala ; and constructing a new hospital for the Infantry at Nowshera.

In the above are not included other projects which are still in preparation, such as the drainage of Lucknow and Cawnpore, and a proper water-supply for Umballa. Measures are also being taken to improve the water-supply of all stations, so as to avoid all sources of contamination. Plans have been prepared of the arrangements for pumps and filter beds to be attached to wells at each station.

Canton-
ments.

The following is a summary of improvements effected during the year in cantonments. A few works are entered which have already appeared in the above summary of military works, but as a rule they are of a minor character.

Station.	Improvements.
Fort William	- New drain constructed on the south side of prison.
Dum Dum	- Latrine provided for Sudder Bazaar, and the drainage of this bazaar improved.
Hazareebagh	- The barracks occupied have been thoroughly repaired, and intermediate barracks dismantled to permit freer circulation of air.
Bhaugulpore	- Ground has been taken up, and latrines are being established for the regiment.
Darjeeling	- There have been built a new hospital for females, new cook-rooms and store-room for hospital, ten new family quarters with latrines and cook-rooms, three dry-earth sheds, and a new canteen. A saucer drain has been made round the hospital. No. 3 Barrack has been rebuilt in part and improved. Canteen improved, and a number of trees planted.
Buxa	- Latrine provided.
Cachar	- Barracks improved by plastering inside and out.
Shillong	- The water-course improved by the addition of an aqueduct to carry it over a marshy spot where it was formerly contaminated by drainage. Porches added to many of the huts. A few public latrines have been erected.
Benares	- A small building transferred from Infantry to Royal Artillery.
Cawnpore	- Additional surface drains made. Trees planted.
Lucknow	- Some improvements in drainage.
Sitapur	- A tank filled up, and trees planted.
Fyzabad	- New barracks in progress.
Goruckpore	- Some excavations filled in, and others dressed. Trees planted. Urinals erected.
Jubbulpore	- Drainage being improved.
Nowgong	- Sides of nullah which runs through Sudder Bazaar being dressed.
Morar	- Sudder Bazaar drains being improved. Holes in the course of Biswas Nullah filled up. Offensive tank in Fort emptied, and being thoroughly cleaned. New Commissariat lines built. New Native Cavalry lines being laid out.
Shahjahanpur	- Drainage improved.
Meerut	- Extensive drainage works in progress. Vaccination carried out to a much greater extent than ever done previously. Trees thinned ; high mud walls replaced by open masonry work, and tumble-down huts removed.
Roorkee	- Drainage has been much improved.
Chukrata	- Great improvements made in roads.
Agra	- Additional family quarters being constructed.
Muttra	- Drainage improved by masonry drains.
Kasauli	- Bazaar latrines improved.
Mooltan	- Market built.
Meean Meer	- Some masonry drains constructed.
Kangra	- A barrack in progress for Native detachment.
Rawulpindee	- Four pucca latrines built ; ravine improved.
Campbellpore	- Barracks being improved.
Attock	- Tank for water covered in and provided with a pump and taps ; water conveyed to tank in pipes.
Peshawur	- New waterworks in progress.

In forwarding the cantonment reports, the Quartermaster-General observes that "all deficiencies and defects brought to notice in them have received full consideration, and that remedial measures are being taken under the orders of His Excellency the Commander-in-Chief."

The supervision of villages in the neighbourhood of military cantonments, and the improvement of their sanitary condition, is a matter to which the attention of the local Sanitary Commissioners has been specially directed. At first it was proposed that an area of 30 miles round each cantonment should be selected for the purpose. But the labour involved would be enormous, and without a special establishment its accomplishment would be impossible. An area of 30 miles round each cantonment means an area of 3,600 square miles of country in each case with many hundreds of villages scattered over it. The area has accordingly been reduced to 5 miles round each cantonment. Even in this comparatively limited tract, however, the difficulties are great. A Sanitary Commissioner, single handed and with many other duties to attend to, cannot devote much time to the inspection of villages; but it is hoped that with the incorporation of the vaccination establishment as part of the Sanitary Department in each province, which has been already carried out in certain local Governments and Administrations, machinery may become available for pointing out defects in villages and for impressing on the inhabitants the great importance of remedying them. The improvement of these villages, and especially of those which lie on the outskirts of cantonments, is most desirable, all the more so because their removal, which has been urged in certain cases, would involve a very large expenditure, and their transfer to any distance would materially affect the comfort and convenience of the inhabitants, who are generally agriculturists living on the land they cultivate.

Sanitary supervision of villages round cantonments.

The advantages of having filter beds attached to wells seem to be great as compared with the present system of barrack filters. The water will be passed through a greater depth of filtering material, and will therefore be more thoroughly acted on; one filter bed requires less attention and is much more likely to be properly looked after than numerous barrack filters. Moreover, having the filter in the open air, and arranged so that the water passes into it direct from the well, and is drawn off from it only as required, is much to be preferred to a system under which the water before passing through the filter is exposed for hours, and it may be in part for days, to the impure gases and other impalpable matters which must more or less exist in the air of barracks, and even of barrack verandahs, and which there is no evidence that the filter can altogether remove.

Filtration of water.

The Macnamara barrack filters have been found to corrode very rapidly, especially at certain stations; so rapidly in fact that at some of them these filters in a few months were riddled with holes and became altogether unserviceable. In accordance with Dr. Macnamara's suggestion, certain experiments have been undertaken to test the protective power of modifications which he recommended in the hope of remedying this defect. In some of the filters the zinc of which the filter is constructed was connected by means of a piece of india-rubber tubing with the brass cock from which the water is drawn. Others were coated inside with naphtha varnish. The results of these experiments show that the india-rubber tubing exercises no influence in preventing the corrosion. On the other hand, when properly prepared and applied, and not rubbed off, as it is very apt to be, the naphtha varnish is a complete protection, but at times it taints the water and renders it unfit for drinking. Orders have accordingly been given for the issue of proper naphtha varnish, but, as stoneware presents many advantages over zinc, and is not likely to be more expensive, even if allowance be made for breakages, 50 Macnamara filters of this material have been ordered from England as an experiment. If barrack filters are to be retained, and the Macnamara filter permanently adopted, the stoneware will in all probability be found most suitable.

In all filters the filtering material is of great importance, and of all such materials animal charcoal seems to be the most valuable. It is worthy therefore of notice that Dr. Tulloh, of the 1-11th Regiment at Jubbulpore, has succeeded in manufacturing animal charcoal on the spot, which has been pronounced by the Chemical Examiner to be of good quality, and there seems no reason why this material should not be manufactured in like manner at every station for local use. The animal charcoal employed in the filters used formerly to be purified by means of certain chemical re-agents, but Surgeon-Major Davie, of the Army Medical Department, has shown that the same result can be obtained just as effectually and more economically by means of roasting, and the method he has recommended for this purpose has been generally introduced.

A new form of filter devised by Dr. Nicholson, of the Army Medical Department lately serving in the Madras Presidency, is now under trial, but no report has yet been received of its working, and it cannot therefore be said whether it possesses any advantages over the Macnamara filter, in place of which it was recommended.

**Water-
at hill
stations.**

At many of the hill stations the supply of water is short; at few does it equal the very moderate allowance of 10 gallons a head for European soldiers, and 5 for women and children. The best means of remedying this defect has lately been under consideration. The difficulties are peculiar; water has generally to be brought from a long distance down the hill, and the cost of carriage is great. There are very few hill stations where the surroundings admit of the water being led in from a neighbouring height, as has lately been done at Dalhousie, for in most cases the station occupies the highest point for many miles round. Under these circumstances, the only resource seems to be to construct tanks to collect rainfall, which at all hill stations is abundant, and there can be no doubt that in this way an ample supply might be obtained in every respect suitable for all purposes except drinking and cooking, for which the springs supply abundance.

**Conser-
vancy.**

Special reports on the dry-earth conservancy as used by British troops show that, after extended trial, the system has all the merits which were claimed for it. They bear remarkable testimony to its great value, and to its vast superiority over every other form of conservancy which has yet been tried in Upper India. Where carefully carried out, the results are admirable, and, as a rule, great pains are taken by the regimental authorities to see that it is properly looked after. The most common defect is the imperfect pounding of the earth, which, unless in fine division, loses much of its deodorizing power. The coarser the powder the more earth is needed, and the weight of the sewage is needlessly increased. To this point attention has been drawn, and also to the importance of cultivating the trenched ground where the sewage is deposited, and which, if properly managed in this respect, need be at no great distance from the barracks.

Further experience of the trench system of latrines for Native troops has also been on the whole satisfactory. Where well looked after it has been attended with considerable success, and the prejudices of the Native soldiers, who are averse to any form of latrine, seem to be diminishing. Certain proposals for rendering these places more private and more secure against storms and high wind have recently been sanctioned, and the importance of cultivating all such trenched ground has once more been impressed on the local authorities.

Civil works.

In reviewing the reports of the local Sanitary Commissioners under this head, attention can be drawn only to the more important points. Few great civil sanitary works have yet been undertaken, but much is being done to arouse the attention of the people to the necessity of taking measures for the improvement of the public health, and, as this education advances, the demand for such works must rapidly extend.

Bengal.

In Bengal proper the most noteworthy facts in the sanitary history of the year are the appointment of a Health Officer to superintend the sanitation and conservancy of the Port of Calcutta; the passing of certain Acts by the Bengal Council to improve the laws regarding municipalities, of which sanitary clauses form an important part; and the passing of the Bengal Irrigation Act, which provides for the carrying out of drainage works or removing obstructions to drainage, when such works are necessary for the public health. Other Acts providing for the conservancy and improvement of towns, and also for the prohibition of inoculation, have been extended to places where they were not previously in force. Rules for the conservancy of villages have been re-circulated in the vernacular, and considerable benefit is reported to have resulted from bringing home to the people in this simple manner a knowledge of the conditions which promote health and prevent disease. Arrangements have also been made for dealing on a definite system with the defects in towns which are brought to notice on the inspections of the Sanitary Commissioner.

At Dacca, works for the supply of water are in course of construction.

**North-West
Provinces.**

In the North-West Provinces the most important sanitary improvement was the further extension of the drainage of the canal-irrigated Doab. During the year this work was pushed on with great vigour. The total excavation in connexion with the Ganges and Eastern Jumna Canals amounted to 39,134,302 cubic feet. Besides these, schemes were also in progress for the drainage of the towns of Saharanpur, Meerut, and of Muzaffernuggur. In the Terai, also, drainage has been effected for the removal of swamps and marshes, especially near the town of Kashipur. At Sambhal, in the Moradabad district, a cutting has been in great part completed to prevent the flooding of the town. At Cawnpore, new surface drains of proper level have been made, and in several towns of the Hamirpur district drainage improvements have been effected. At Benares two new roadways have been made through the town which will aid in its better

ventilation and conservancy. Besides these more important measures, Dr. Planck reports "the steady continuance of minor improvements in towns. So general and so well established," he adds, "has this business of improvement become that I think, as one of the results of my inspections of the last two or three years, better results would ensue if I gave my entire attention for a time to the inspection of the smaller towns, say such as have a population of from 3,000 to 5,000 inhabitants;" and again: "I do not hesitate to say that improvement has made and is making good way in the towns in question from one end to the other of the country. The English officials who know these towns so well and visit them so often, and the superior class of native officials, are, as one result of perfect education and extended reading, very far advanced in knowledge of sanitary matters, and convinced of the advantage of sanitary improvements."

In the Punjab many minor improvements have been carried out, but any great civil sanitary works have yet to be commenced. Several of these, however, have been projected—a water-supply for the town of Delhi, a water-supply and sewerage scheme for Lahore, a water-supply for Rawulpindee, and a general scheme of sanitary improvement, including water-supply and sewerage, for Simla. The waterworks at Peshawur progress but slowly, and no definite orders appear to have yet been given regarding the city portion of the scheme. In the course of his tour, the Sanitary Commissioner held conferences with 18 district committees, to which he explained the elementary principles of hygiene, and illustrated his remarks on the effect of sewage on water by simple experiments. These meetings excited much interest. The simple address which the Sanitary Commissioner delivered at them has been embodied in a pamphlet and widely circulated among the village population. By directing the minds of the people to sanitary evils, of the existence of which they had no conception, there is reason to believe that much good will be done.

The Sanitary Commissioner of the Central Provinces observes: "No works of any magnitude have been undertaken during the year; but the improvement of the towns in respect to cleanliness, conservancy, and drainage has been carried on. The system of placing the conservancy arrangements in large towns under the control and inspection of the police, which was first adopted in Nagpur, has been extended to many towns in other districts, more especially in the Nerbudda and Jubbulpore Divisions, and the system is found to work very well." The Nagpur conservancy is very favourably reported on, and latrines of similar construction and managed in the same way have been erected in many other places. The water-supply is also being improved so far as funds will admit. The history of cholera in the town of Nagpur seems to show that decided benefit has attended the introduction of water from the Ambaghari reservoir. In 1866, during the months of July, August, and September, there were in this town 635 cases of cholera, of which 383 were fatal. In 1869, again, at the same season, there were 640 cases and 343 deaths. The new water-supply was let in on the 23rd July 1872, and in that year there were only 142 cases and 20 deaths. It is to be remarked, however, that in this year cholera was not prevalent in the district as it had been in 1869. But in 1875 the disease was severe in the district, and yet the cases were little over 60, and the deaths only 32. It is worthy of notice also, that the majority of the cases occurred in parts of the town not supplied with Ambaghari water. The people fully appreciate the benefits of the new water, and a scheme of drainage is much desired, but unfortunately it cannot be undertaken for want of money.

The Sanitary Commissioner reports that the civil stations have all been more or less improved during the year, and that in the general cleanliness of the villages much is being done; drainage is more attended to, and village refuse has been removed: although there are no large works of improvement to be recorded, progress seems to have been made, and Dr. Abbott states that he has no hesitation in saying that, from a sanitary point of view, Berar, as it is now, is incomparable with the Berar of five or six years since. Instructions have been issued empowering district officers to take up land for the extension of villages, which will materially aid in the disposal of refuse and also in stalling cattle outside.

The information given regarding sanitary progress in Oude is very meagre. It appears that throughout the province Rs. 90,285 were expended for sanitary purposes, of which Rs. 27,619 were devoted to original works, and the rest to repairs and general sanitary services; of the expenditure on new works, nearly the whole amount was spent by the Lucknow Municipality on new drains.

British
Burma.

In the report of British Burma it is noted that the town of Rangoon has been lighted with kerosine lamps; that the drainage is being improved; tanks have been deepened; the pumps put in good order; and the wells improved. At Moulmein are mentioned the cleaning of drains, the pulling down and the rebuilding of old and unsafe dwellings. At Akyab a considerable extent of drainage has been perfected in the heart of the town. At Bassein roads are being constructed. When wheeled vehicles can traverse the town in every direction, the removal of all refuse will be greatly facilitated. The Sanitary Commissioner expects that in future there will be much to record regarding sanitary improvements in municipal towns.

SECTION VII.

GENERAL REMARKS.

Researches
by Drs.
Lewis and
Cunningham:
Leprosy.

Drs. Lewis and Cunningham, as Special Assistants, have contributed two valuable papers to this Report,—the one on Leprosy in India, and the other on the Oriental sore. The paper on leprosy is in part preliminary, and in part embodies the result of their personal inquiries made in the district of Kumaon, where the disease is more than ordinarily prevalent. Their investigations support the belief that leprosy is not of a contagious nature, and that it is not spread by contagion. Hereditary influence seems to play a considerable part in its history; but it is extremely difficult, especially in this country, where people often live in the same place and till the same ground under much the same circumstances for many generations, to distinguish how far results are to be ascribed to hereditary influence, and how far to conditions of locality and mode of life. Several interesting reports on leprosy have been received from the local Sanitary Commissioners as the result of the general inquiry ordered by the Government of India, but as they are still incomplete, any attempt to summarise the facts they contain may be deferred for the present. So far as their researches have yet gone, Drs. Lewis and Cunningham have failed to discover any microscopic appearance diagnostic of leprosy, or to find evidence which would lead to the supposition that the disease is due to a special germ; but the microscopic part of the inquiry will be further prosecuted in Calcutta, where the Amherst Street Leper Hospital affords excellent opportunities for the purpose.

Delhi sore.

In the Delhi boil, or Oriental sore, after the most careful and complete search, there is no evidence of any specific germ. The opinions advanced some years ago, that these sores are due to parasites which are introduced into the system by means of water, and that they may be transferred man from man, find no support in the facts. The sores are due entirely to changes and developments in the tissues intrinsic to the organism affected. To all appearance the water is concerned in the production of these changes, and more particularly the salts to which it owes its extreme hardness. How they act in this way remains to be explained. The history of the Delhi sore is another illustration of the advantages of good pure water. The other sanitary improvements which have lately been made in the station, and especially in that part of it which is occupied by European troops, may be credited with some portion of the satisfactory results. In former years hundreds of men in a European regiment were affected, and some of them disfigured for life; now the disease is almost unknown.

Cholera.

Although Drs. Lewis and Cunningham have no paper on cholera in this Report, they have not lost sight of this most important part of their work. They have had continued opportunities of repeating former conclusions, and of extending their investigation into new channels. The results of their labours will appear when they have made further progress.

Plague in
Mesopotamia.

The prevalence of plague in Mesopotamia, and the possibility of its introduction into India, continued to engage attention during the year. No evidence has been adduced that the disease in question is contagious, or, even if it were, that any safety would be conferred on India by quarantine restrictions. Owing, however, to objections taken by the Egyptian authorities, and in order to prevent more serious detention in the Red Sea, it was considered expedient for the time to agree to a 15 days' quarantine at the ports of Kurrachee, Bombay, and Aden for all arrivals from the Persian Gulf, and rules to that

effect were accordingly promulgated. Fortunately, they were not passed till near the close of the plague season, and they could have been but partially acted on. Information on this and on other matters connected with the plague has been called for, in order to determine what steps should be taken in the event of the plague re-appearing in Mesopotamia, as is to be feared, in the coming spring.

ABSTRACT OF REPORT OF THE SANITARY COMMISSIONER FOR MADRAS FOR 1875.

(Surgeon-Major H. King.)

SECTION I.

EUROPEAN TROOPS.

Sickness and
mortality
among
European
troops.

The diseases which caused the greatest number of admissions were venereal, simple continued fever, intermittent fever, hepatic affections, and dysentery.

Deaths in the British Army proper numbered 163 (14·80 per 1,000 of strength). Of these, 150 occurred in stations, and 13 on march. Amongst the Veterans 10 deaths occurred; in Garrisons 4. The total number of deaths of European soldiers of all classes was, therefore, 177.

The principal causes of death amongst British soldiers, in stations and marching, were hepatitis (29), dysentery (16), drowning (14), aneurisms (14), phthisis (13), enteric fever (7.) Hepatic abscess caused 6 deaths, secondary syphilis 5, cholera 4, insolation 4, alcoholic poisoning 4, delirium tremens 3, remittent fever 2.

Of 150 deaths of British soldiers at stations, 51 (34 per cent.) were due to dysentery, hepatitis and hepatic abscess.

Venereal
diseases.

There were 2,152 admissions of British soldiers proper for venereal diseases—72·95 per 1,000 of strength for primary, and 39·22 for secondary syphilis; 88·31 for gonorrhœa. In 1875, as in previous years, Bellary suffered most severely of the larger stations from this cause, its admissions amounting to 310·15 per 1,000 of strength.

Fever.

Simple continued fever caused 120·36 per 1,000 admissions, in stations, of British troops. The highest sick-rates due to this cause were at Bellary (338·85) and Madras (267·96). Only two deaths are attributed to it.

Twenty-three cases of enteric fever were treated, all of British soldiers; 2·14 per 1,000. The ratio in 1874 was 3·12. Ten cases occurred at Secunderabad, four at Cannanore; two at each of the stations Bangalore, Kamptee, and Thyetmyo; one each at Madras, Port Blair, and Wellington.

Intermittent fever was the cause of 75·74 admissions per 1,000 of strength, but caused no death. It was most prevalent at Kamptee (407·37).

Hepatic
diseases.

Hepatic affections produced 70·60 admissions per 1,000 in the whole Army, and 71·46 in British troops proper. Arranging the ten largest stations in the order of frequency of admission for these diseases, the list would stand thus:—

Cannanore	-	-	-	116·01
Tonghoo	-	-	-	108·05
St. Thomas' Mount	-	-	-	92·39
Thyetmyo	-	-	-	79·52
Secunderabad	-	-	-	76·04
Trichinopoly	-	-	-	64·51
Madras	-	-	-	64·07
Bangalore	-	-	-	60·58
Rangoon	-	-	-	55·41
Kamptee	-	-	-	36·85

Dysentery.

A list for dysentery prepared as above would show the following order:—

Tonghoo	-	-	-	211·86
Rangoon	-	-	-	103·09
Secunderabad	-	-	-	88·28
Cannanore	-	-	-	78·43
Bangalore	-	-	-	56·98
St. Thomas' Mount	-	-	-	54·34
Thyetmyo	-	-	-	35·34
Madras	-	-	-	34·95
Trichinopoly	-	-	-	32·25
Kamptee	-	-	-	14·94

Three cases of cholera occurred at Trichinopoly ; four others at Madras, St. Thomas' Mount, Secunderabad, and Tonghoo. Cholera.

Only three cases of small-pox were admitted, two at Port Blair and one at Rangoon. Small-pox.

The other diseases to be briefly noticed, with admissions per 1,000 caused by them, are diarrhoea 54·49, respiratory diseases 38·38, rheumatism 31·30, heart diseases 21·42, phthisis 9·31, delirium tremens 4·19, remittent fever 2·98, insolation 1·30. Other diseases.

The numbers of men invalided in 1875 were very large, viz., 687 for change of climate and 177 for discharge. Invaliding.

Hepatitis was the most important cause of invaliding, 160 men being ordered for change of climate on account of this disease and 6 being discharged. Next comes debility, under which the numbers were 124 and 29. For dysentery the figures were 97 and 5 ; for phthisis 37 and 32 ; for secondary syphilis 50 and 7 ; for rheumatism 27 and 14.

Madras.

The average strength of British troops was 515 ; giving 613 admissions, 35·50 daily sick, and 6 deaths, of which 2 occurred out of hospital. Both sickness and mortality were considerably below the average. Stational statistics.

Simple continued fever caused 138 admissions, venereal diseases 136. There were 33 cases of hepatic diseases, 18 of dysentery, 1 of cholera (besides two of " diarrhoea with collapse and cramps "), and one of enteric fever (in a student from the Engineering College) .

The case of cholera was fatal. One man died of insolation and one of phthisis.

St. Thomas' Mount.

The average strength of Europeans was 368. 473 cases were treated ; daily sick were 25·25, and 9 deaths occurred, 3 out of hospital.

The greatest number of admissions (63) was for venereal diseases, 34 were due to hepatic affections, 29 to simple continued fever, 20 to dysentery, 19 to intermittents, and 18 to rheumatism.

A yearly diminution of venereal disease is observed. Much private prostitution prevails without a doubt. More vigilance on the part of the police, as detectives, would to some extent check this, and the British soldier should be made to assist in tracing out disease.

A sudden outbreak of cholera occurred amongst the European families in September. One woman and four children were attacked, all dying except one child. On the 13th October a non-commissioned officer was admitted for cholera, and died on the following night. The disease was prevalent among the civil population both before and after its attack on the military.

Hepatitis and dysentery caused, each, two deaths. One death, as before mentioned, was due to cholera.

Poonamallee.

The average strength of invalids and effectives together was 196 ; with 476 admissions, 50·11 daily sick, and 16 deaths. The severity of sickness and the rate of mortality were above the average.

There were 87 cases of hepatic diseases treated, 77 of dysentery, 73 of venereal diseases, 42 of continued fever, and 21 of phthisis. Cholera appeared in the town about the 20th October.

Five deaths were due to phthisis, three to secondary syphilis, three to hepatitis, two to dysentery, two to aneurisms.

Latrines for the civil population and a slaughter-house were built ; drainage and water-supply were improved.

Trichinopoly.

The strength was only 279 ; admissions were 309, daily sick 23·61, with 7 deaths. Venereal diseases caused most admissions, 49 ; 33 were due to simple continued fever, 18 to hepatic diseases, 17 to rheumatism, 9 to dysentery, 3 to cholera.

Two deaths were caused by cholera ; two by sun-stroke ; dysentery, diarrhoea, and phthisis each caused one death.

Wellington.

The average strength (chiefly of invalids) was 503; 377 cases were treated; 25·53 were daily sick; and 6 deaths occurred, 1 out of hospital. The year was a favourable one.

Venereal diseases caused the largest number of admissions, 90; 45 were due to simple continued fever, 29 to intermittent, 1 to remittent, and 1 to enteric. Dysentery caused 23, hepatic diseases 21, rheumatism 7, and phthisis 4.

Hepatic abscess caused 2 deaths, aneurisms 3, hepatitis 1.

Bangalore.

The strength of British soldiers proper was 1,667, with the same number of admissions, and 92·67 daily sick. There were 18 deaths, of which 5 occurred out of hospital.

The greatest number of admissions (304) were due to venereal diseases; 137 cases of intermittent, 8 of remittent, and 87 of simple continued fever were treated; 101 of hepatic affections, 95 of dysentery, 71 of rheumatism, 15 of heart diseases, 11 of phthisis, and 7 of delirium tremens. No case of cholera occurred amongst the men. There were 2 cases of enteric fever.

Venereal diseases are stated to have been both less prevalent and less virulent under the operation of the lock hospital rules. In May a serjeant of police and two or three constables were specially detailed for the supervision of the women who consort with European soldiers.

Cholera broke out in the cantonment bazaar and St. John's Hill in the beginning of November, and the epidemic continued until the 27th December; 584 cases were reported, with 360 deaths. 15 cases, with 4 deaths, occurred in Europeans or East Indians. The wife of a man of the 45th Regiment was attacked, but no other case occurred amongst the European troops.

Of 13 deaths in hospital, 5 were caused by hepatitis and 1 by dysentery.

The municipality completed 1,836 feet of box-drains and 11,480 of v-section drains during the year. The drainage of the cavalry and artillery barracks is proceeding. The works necessary for the conversion into dry land of the swampy ground at the tail of the Dumloor tank, a fertile source of malaria, have been sanctioned. The diversion of the sewage of the eastern side of the infantry barracks from the Ulsoor tank into the main sewer has also been sanctioned. The great water-supply scheme is progressing, and several new wells have been dug, and the old ones improved.

Cannanore.

The average strength of the European force was 612. There were 622 admissions, 33·88 daily sick, and 3 deaths. The mortality was very low in 1875.

Hepatic diseases caused most admissions, 78; venereal came next, 69; 65 were due to simple continued fever, 19 to intermittent, 4 to enteric. There were 53 cases of heart diseases, 48 of dysentery, and 11 of atrophy.

Two deaths were due to hepatitis, and the third to aneurism.

Bellary.

The strength of Europeans was 906, with 987 admissions, 48·56 daily sick, and 8 deaths, 3 of which were out of hospital. Both sickness and mortality were below the averages.

Continued fever caused 307 admissions, venereal diseases 281, hepatic 29, dysentery 13, intermittents 15, and rheumatism 12.

102 prostitutes are on the register; but the police arrangements are inefficient both in regard to bringing on the register women who practise clandestine prostitution and in compelling those already registered to attend the periodical inspections at the hospital. The arrangements are therefore incompetent to check venereal disease. The sanitary officer suggests the improvement of police supervision, compelling the women to live in one special quarter, and putting down the practice of solicitation in the roads.

Cholera prevailed amongst the civil population, and a few cases occurred among the Native troops. Railroads and ordinary roads were watched, and cholera cases when discovered were treated in special sheds.

Secunderabad.

The strength of the European portion of the Hyderabad Subsidiary Force, exclusive of "Garrison," was 2,288. There were 2,536 admissions, 115·95 daily sick, and 40 deaths. The year was a favourable one.

There were 498 admissions for venereal diseases, 235 for continued fever (not including 10 for enteric), 202 for dysentery, 174 for hepatic diseases, 70 for rheumatism, 20 for heart diseases, 12 for phthisis, 1 for cholera.

Venereal disease increased very considerably during 1875. In the year before admissions from this cause were 47 per 1,000, with 27 days in hospital per admission; in 1875 the corresponding figures were 182 and 32. The regiment was the same. The increase of this class of diseases is attributed to imperfect carrying out of the lock hospital rules.

Cholera appeared amongst the civil population of Secunderabad on the 24th August. From this date to 31st December there were 206 seizures registered, with 101 deaths. On the 14th September the disease appeared in the lines of the Sappers and Miners; then in those of the 29th, 3rd, and 40th N.I. Among sepoys, families, and followers there were 52 admissions for cholera, with 22 deaths. Of European troops and families only one man was attacked, who recovered.

Of the 40 deaths, 7 were due to dysentery and 10 to hepatitis (besides 3 from hepatic abscess). Enteric fever caused 3 deaths. One death was due to each of the following causes: remittent fever, phthisis, idiopathic tetanus, aortic aneurism, snake-bite, delirium tremens, and fracture of the spine.

Kamptee.

The European soldiers averaged 1,004, besides 12 of the "Garrison." The former gave 1,598 admissions, 62·06 daily sick, and 13 deaths. Both sickness and mortality were below the average.

There were 409 cases of intermittent fever, and 137 of continued. Venereal diseases contributed 262 cases, heart diseases and rheumatism 27 each, phthisis 17.

Eighty prostitutes are registered, of whom 25 per cent. appear to be under treatment throughout the year. The police are reported to have been more vigilant in the detection and apprehension of unregistered women, and venereal disease has proportionately decreased.

A case of cholera was reported from Nagpore on the 1st August, and, in all, 59 cases occurred in the city, with 32 deaths, up to the disappearance of the epidemic. On the 8th August a case occurred in Kamptee, in a pilgrim who had come from Nagpore. In Kamptee 84 cases were reported, with 53 deaths. Amongst the Native troops one man of the 35th Regiment was attacked and recovered.

Rangoon.

The average strength of British troops proper was 776, of "Garrison" 32. The former gave 782 admissions, 40·03 daily sick, and 9 deaths. The year's sickness and mortality compare favourably with the means.

There were 129 admissions for venereal diseases among British troops, 80 for dysentery, 43 for hepatic affections, 41 for intermittent, and 37 for continued fever, 24 for rheumatism, and 17 for delirium tremens.

At the end of the year 17 European and 375 Native prostitutes were on the register, and the average under treatment was 52. The rules are reported to act beneficially. In August and September there was a considerable increase of venereal disease amongst the troops, which was met by ordering weekly instead of fortnightly examinations of the women.

Dysentery, hepatitis, and hepatic abscess caused, each, one death, delirium tremens one.

Thyetmyo.

The strength of Europeans was 679, giving 538 admissions, 19·77 daily sick, and 5 deaths. The mortality was very high.

Of the admissions 91 were due to simple continued fever, 2 to enteric, 67 to venereal diseases, 54 to hepatic, 24 to dysentery.

Enteric and remittent fevers caused, each, one death. One is attributed to alcoholic poisoning, and one to delirium tremens.

Tonghoo.

The average strength was 472. There were 628 admissions, and 30·25 daily sick, with 6 deaths. Sickness was above the mean, but mortality below.

Dysentery caused 100 admissions, hepatic diseases 51, venereal 28, continued fever 25, intermittent 21, remittent 16, phthisis 10, cholera 1. This last case occurred in hospital, and no cause can be assigned for it.

There were 3 fatal cases of hepatitis; dysentery caused 1 death, "alcoholic poison" 1, and drowning 1.

SECTION II.

NATIVE TROOPS.

Sickness and
mortality in
Madras
Native
Army.

Malarial fevers were, as usual, the most important causes of sickness, 6,794 admissions being due to intermittent and 49 to remittent fever. The most malarious stations were Cuttack (where 1605·05 per 1,000 were treated for intermittent fever), Shoaygheen (991·94), Port Blair (949·83), Seroncha (677·85) and Hoshungabad (630·85); besides the Nicobars, where the small detachment of 56 men had 6,660·71 per 1,000 admissions from this cause. Secunderabad, which had been highly malarious in 1874, showed only 313·92 per 1,000 admissions in 1875. Rheumatism caused 1,065 admissions, Moulmein showing the highest proportion; Sumbulpore, Shoaygheen, Thyetmyo, and Cannanore also suffering from this disease. 797 admissions were due to diarrhœa, which was most prevalent at Madras, Tonghoo, Mercara, and Trichinopoly. 711 men were admitted for dysentery, mostly at Tonghoo, Secunderabad, and Madras. 456 cases of venereal disease were treated, 17 of variola, 61 of varicella, 53 of phthisis, 3 of delirium tremens. Cholera caused 93 admissions.

In the Madras Army 370 deaths occurred, 12·03 per 1,000 of mean strength (30,747). Stational returns gave 267 deaths, 10·59 per 1,000 of average strength (25,180). Forty deaths occurred out of hospital.

Of the deaths in hospital (227), 37 were due to cholera, 32 to respiratory diseases, 19 to intermittent and 11 to remittent fevers, 12 each to phthisis, dysentery and diarrhœa, 5 to hepatic, and 5 to venereal diseases, while delirium tremens caused 1 death.

1,212 men were invalided from the whole Army according to the Adjutant-General's returns—39·40 per 1,000.

Stational
statistics.

Madras.

The native portion of this large garrison showed an average strength of 1,927, with 1,275 admissions, 52·22 daily sick, and 22 deaths, of which 3 took place out of hospital. The sickness was about the average; the deaths 1·5 per 1,000 above it.

Intermittent fever caused 279 admissions, dysentery 73, diarrhœa 70, rheumatism 54, venereal 38. Two cases of cholera were treated.

Three deaths were caused by dysentery, 2 (one out of hospital) by cholera, 3 by fevers, 2 by diarrhœa, 2 by cardiac disease.

Palaveram.

The average strength of Native troops was 382; 417 cases were admitted; daily sick were 20·16; 14 deaths occurred, one out of hospital. The year was a favourable one.

The admissions included 51 cases of intermittent, and 1 of enteric fever, 20 of dysentery, 17 of rheumatism, 5 of phthisis, 1 of cholera.

Bronchitis caused 3 deaths, general debility 3; cholera, beri-beri, and leprosy caused, each, 1 death.

The case of cholera is attributed to eating stale fish. It appears, however, to have presented all the symptoms of true cholera.

Vellore.

The strength of the 14th Regiment was 587; 205 cases were admitted; daily sick were 5·58; 8 deaths occurred. The year was a very healthy one.

The principal diseases were intermittent fever (61), rheumatism (16), and venereal (14). One case of cholera was admitted.

Intermittent fever, cholera, phthisis, pneumonia, and diarrhoea caused, each, 1 death.

There were many cases of cholera amongst the population of the town, and some amongst the regimental followers. Peons were posted at the entrances to the town to prevent the entry of carts coming from infected villages. Sepoys returning from leave were not allowed to enter the lines until after medical inspection.

Vizagapatam.

The average strength of "Garrison" and Regiment combined was 733. There were 491 admissions, 31·44 daily sick, and 5 men died—1 out of hospital. The sickness of the year was average; the mortality very low.

Next to "skin diseases," which caused 102 admissions, the most important affections were continued fever (71), intermittent (56), and rheumatism (35).

Phthisis caused 1 death, and general dropsy 1. One death is attributed to dyspepsia.

Vizianagram.

The strength of the 12th Regiment was 645, giving 283 admissions, 16·96 daily sick, and 10 deaths, of which 2 occurred out of hospital. The mortality of the year was high.

Intermittent fever caused 64 admissions, skin diseases 49, rheumatism 9. There were two cases of remittent fever.

Two deaths were caused by malarious fevers: 2 out of hospital, by general debility. One death was due to bronchitis.

Berhampore.

The strength of the Head Quarters and Right Wing, 2nd N.I. was 362. Admissions were 229; daily sick 9·27; deaths 8, in hospital. The ratios of sickness were about the average, but the mortality was very high.

Intermittent fever caused most admissions, 54. There were 15 cases of rheumatism and 12 of cholera.

Of the 8 deaths 6 were due to cholera; the other 2 to beri-beri and bronchitis.

Cholera, not traced to importation, appeared in the lines on the 6th September. The epidemic lasted to the 30th, during which period 52 cases occurred and 17 were fatal. The disease re-appeared in the civil population on the 20th November, and continued up to the 25th December. At this time 67 cases were treated in the civil population, with 14 deaths; and 4 in the lines, with 2 deaths. An attempt was made to exclude Pooree pilgrims from the cantonment, but it was unsuccessful.

Cuttack.

The average strength of the 12th Regiment during the year was 633. There were 1,298 admissions and 57·71 daily sick. Only one death occurred. The sickness was three or four times greater than the average, but the death-rate was trifling.

Intermittent fever caused 1,016 admissions, rheumatism 30, dysentery 24.

The death was due to intermittent fever.

There were no cases of cholera amongst the troops. Three sporadic cases are reported amongst the civil population in October. The usual measures were taken to exclude from the cantonment pilgrims from Pooree.

Sumbulpore.

The strength of the Left Wing 2nd N.I. was 311; giving 317 admissions, and 8·70 daily sick, while 3 deaths occurred in hospital and 4 outside. The station is unhealthy and the mortality very high, but, on the whole, the year was a favourable one.

Of the admissions 173 were due to intermittent fever, 33 to rheumatism, 4 to cholera.

Cholera caused 2 deaths, out of hospital; intermittent fever 1, pneumonia 1, bronchitis 1.

Communication with localities infested with cholera was forbidden, and separation of residents within military limits from those without was maintained for nearly three months. The result was satisfactory. In the town closely adjoining the station 312 seizures with 111 deaths were recorded; but no epidemic broke out in the Wing. The deaths from cholera noticed above occurred out of cantonment.

Bangalore.

The average strength was 1,948. There were 1,127 admissions, 43.11 daily sick, and 10 deaths, all in hospital. The year was a healthy one.

The principal diseases were intermittent fever (208), continued fever (173), rheumatism (58), venereal diseases (51), diarrhoea (39). Fourteen cases of cholera were admitted.

Four of the cholera cases were fatal. Of the other deaths, 2 are attributed to simple continued fever, and one each to anæmia, tetanus, asthma, and fracture.

French Rocks.

The average strength of the Head-Quarters of the 30th N.I., which occupied the station during the year, was 602, giving 284 admissions, 7.69 daily sick, and 6 deaths, of which 1 occurred out of hospital. The sickness was greatly, and the mortality appreciably, below the means.

Intermittent fever and rheumatism were the most important diseases, the former causing 108 admissions, the latter 14.

Intermittent fever, apoplexy, bronchitis, colic, and general debility caused one death each. The case out of hospital was one of suicide.

No cholera in the cantonment, though present in Mysore 14 miles distant and in a village 7 miles away.

Mysore.

The average strength of the detachment from French Rocks, relieved monthly, was 63. The cases admitted numbered 29; daily sick were 0.65. Intermittent fever caused 12 admissions. One death occurred, from arsenical poisoning.

Cholera appeared in the town on 27th July, and continued to the 20th October, destroying about 550 persons, but none of the sepoys was attacked.

Mercara.

The strength of the 28th N.I. for the year was 609; admissions were 661, average daily sick 34.53; deaths 6, 1 out of hospital. The station continued unhealthy, though the mortality in 1875 was considerably below the mean.

Of the admissions, 284 were due to intermittent fever, 78 to diarrhoea, 34 to dysentery, and 15 to rheumatism. There was no cholera.

No case of fever was fatal. Dysentery, diarrhoea, bronchitis, and pneumonia caused each 1 death.

Walls are being built round the wells of drinking water. The medical officer says "it is hoped that the swamp below the lines will be drained this year."

Bellary.

The average strength was 1,355; 889 cases were admitted; daily sick were 44.24; and 12 deaths occurred, all in hospital. Comparison with the means shows sickness to have been much above the average, mortality very slightly.

296 cases of intermittent and 3 of remittent fever were admitted. Rheumatism caused 83 admissions, venereal 26, dysentery and diarrhoea 24 each, and cholera 2.

Dysentery caused 2 deaths, cholera 1; 1 death is attributed to each of the following diseases: intermittent fever, remittent, chronic rheumatism, pneumonia, diarrhoea, hepatitis, stricture of urethra, urinary fistula, and general debility.

Trichinopoly.

The strength of the Native force was 2,026 : admissions were 1,390, and daily sick 46·72. There were 33 deaths, 5 out of hospital. Both the sickness and mortality of the year were above the means.

There were 515 admissions for intermittent, and 3 for remittent fever, 74 for diarrhœa, 48 for dysentery, 64 for rheumatism, 24 for venereal diseases, and 34 for cholera.

Of the deaths 15 were due to cholera ; 3 cases of intermittent, and 2 of remittent fever were fatal ; 2 deaths arose from pneumonia ; and 2 from general debility.

Cholera was most severe and fatal in the 32nd Regiment, whose lines are notoriously unhealthy.

Quilon.

The strength of the 26th N.I. was 525 ; 258 cases were admitted ; daily sick were 13·82 ; 3 deaths occurred in hospital, and 4 outside. The mortality was nearly double the average.

Only 12 cases of intermittent fever were admitted ; 17 of rheumatism.

Phthisis, dropsy, and hepatitis caused, each, 1 death.

Palamcottah.

The strength of the 24th Regiment was 566 ; admissions were 292 ; daily sick 14·31 ; only 3 deaths occurred. The sickness in 1875 was about the average, and the mortality appreciably lower than the means.

Of the admissions, 46 were due to intermittent, and 4 to remittent fever, 38 to rheumatism, 13 to venereal, 10 to dysentery, 4 to phthisis, and 2 to cholera.

One death was due to cholera, one to congestive apoplexy, and one to phthisis.

Cholera appeared in Palamcottah in August, and disappeared in October. In the lines the first case occurred on the 5th September, the second on the 9th, the third (and last) on the 11th November. No distinct evidence of importation could be found. " When it was ascertained that the disease was in the vicinity, the troops were ordered " to remain in their lines, and guards posted and check roll-calls established to prevent " them infringing the order. The sanitary state of the cantonment, and particularly " the lines, was at the same time attended to, and every possible local cause of disease " removed."

Cannanore.

The average strength of the two regiments was 1,231, yielding 687 admissions and 27·13 daily sick. There were 9 deaths, of which 2 occurred out of hospital. The sickness was considerably above the average, without increase of mortality.

Rheumatism was the principal disease, causing 82 admissions ; 80 were due to intermittent, and 2 to remittent fevers ; 28 to venereal ; 18 to dysentery. No cholera in hospital.

A case of cholera proved fatal out of hospital. Two deaths were due to malarious fevers, one was caused by diarrhœa, and one by delirium tremens.

Mangalore.

In the 34th Regiment, with an average strength of 603, there were 269 admissions, 12·30 daily sick, and no deaths. A comparison with the means of nine years shows the sickness to have been about equal to the average.

Admissions for fever were 77, for dysentery 19, for diarrhœa 16, for rheumatism 14. There was no cholera.

Secunderabad.

The strength of natives in this garrison was 3,074 ; 2,491 cases were admitted to hospital ; daily sick were 102·30 ; and 31 died—3 out of hospital.

965 admissions were due to intermittent, and 14 to remittent fevers ; 129 to rheumatism, 84 to dysentery, 55 to venereal, and 19 to cholera.

Of the deaths 8 were caused by cholera, 5 by intermittent, and 2 by remittent fever; beri-beri caused 1, phthisis 4, respiratory diseases 4, and diarrhoea 1.

In the end of December cholera broke out amongst the Sappers. One sepoy and nine children were attacked; two children died. About the same time a man of the 3rd Regiment P.L.I., under treatment for ague, was seized with cholera, and 2 other sepoys and 1 woman were attacked. Subsequently 4 sepoys were attacked, of whom 2 died; and also a woman and child, the former making a good recovery. In the 40th N.I. cholera broke out in the ninth week of the fourth quarter. Three sepoys and 9 followers were seized; 3 of the latter died. In the following week 6 cases were admitted, 3 died, and 8 were discharged cured. In the eleventh week 3 sepoys died and 2 followers; and in the twelfth there was 1 death.

Kamptee.

The strength of the native part of the garrison was 1,173; there were 493 admissions, 22·71 daily sick, and 10 deaths, of which 1 occurred out of hospital. The year was a healthy one.

Intermittent fever produced most admissions, 206; 22 were due to rheumatism, 19 to dysentery, 10 to venereal disease. One case of cholera was treated.

Two deaths were due to beri-beri, phthisis, and valvular heart disease, each; 1 to dysentery, 1 to diarrhoea.

Seetabuldee.

The average strength of the 8th N.I. was 461, which gave 586 admissions, 16·94 daily sick, and 2 deaths. Sickness and mortality were below the mean.

Intermittent fever gave 212 admissions, remittent 3, rheumatism 28, venereal 18, and dysentery 12. There was no cholera.

Remittent fever and bronchitis were the causes of death.

Hoshungabad.

The average strength of the Head-Quarters and Left Wing, 22nd N.I., was 363; admissions were 411; daily sick 11·18. Three deaths occurred, one out of hospital. Sickness was above, but mortality below, the means.

229 cases of intermittent, and 6 of remittent fever were admitted; 13 of venereal disease; 11 of rheumatism. One case of cholera occurred.

One death is attributed to maltreated syphilis, and one to excessive use of opium. One man died, out of hospital, of cardiac disease.

Cholera was very prevalent on the Bhopal side of the Nerbudda; but, with the exception of a few sporadic cases among the civil population of town and cantonment, and one mild case in the regiment, which recovered, no epidemic, properly speaking, appeared. The civil authorities used every means to lessen intercourse between the civil population and those on the Bhopal side of the river.

Raipore.

The average strength of the 31st Regiment was 652. There were 561 admissions, and 14·15 daily sick. Four men died, one out of hospital. The health of the regiment was good. The greatest number of admissions (325) were due to intermittent fever; rheumatism caused 29; dysentery 7.

Intermittent fever, remittent, apoplexy, and pneumonia were the causes of death.

Cholera prevailed in the district from March to September and reached the town of Raipore in August. None occurred amongst the troops; and in cantonment only two cases, an officer's servants, one of whom recovered and the other died. No quarantine was attempted.

Rangoon.

The strength of the native portion of the garrison was 1,737. There were 908 admissions, 34·12 daily sick, and 17 deaths, of which 3 occurred out of hospital. Sickness and mortality were below the average.

There were only 140 cases of intermittent fever; 55 admissions were due to dysentery; 56 to diarrhoea; 43 to rheumatism. No cholera.

Two deaths are attributed to bronchitis, and one to pneumonia. "General debility" is reported to have caused 3 deaths.

Thyetmyo.

The average strength of natives at this garrison was 611, giving 471 admissions, 26·61 daily sick, and 10 deaths. The year was unhealthy, both sickness and mortality being nearly double the means.

Intermittent fever gave 139 admissions, rheumatism 45, dysentery 18, and diarrhoea 20. Sixteen admissions for dropsy—more than three times as many as occurred at any other station—seem to indicate insufficiency of food.

Three of the deaths are assigned to "general dropsy," and one to anæmia. Intermittent fever, bronchitis, hepatitis, and splenitis caused each one death.

Tonghoo.

The strength of the force detailed above averaged 653. Admissions were 682, daily sick 28·34. In this small force no less than 18 deaths occurred (7 out of hospital), nearly doubling the mortality, while the sickness did not rise above the average.

Diarrhoea caused 184 admissions; dysentery 95; intermittent fever 131; and rheumatism 19.

Six deaths were due to beri-beri, 2 to dysentery, 1 to diarrhoea, and 1 to phthisis.

Moulmein.

The strength of the garrison for the year was 295; giving 476 admissions, 14·36 daily sick, and 4 deaths. The sickness and mortality were about average.

115 cases of intermittent and 20 of continued (not enteric) fever were treated, 64 of rheumatism, 64 of dysentery. There was no cholera.

One death was due to beri-beri, two are attributed to "general debility."

SECTION III.

JAILS.

The average strength of prisoners, as given in the monthly medical returns, was 9,849. Admissions were $7,412 = 752 \cdot 56$ per 1,000; daily sick $289 \cdot 60 = 29 \cdot 40$ per 1,000; 381 deaths appear in the medical returns $= 38 \cdot 68$ per 1,000 of average strength. The Inspector-General's returns give 386 deaths, which would make the ratio $39 \cdot 19$ per 1,000. Sickness and mortality in jails.

Of 7,412 admissions, 1,350 were due to intermittent, and 651 to continued (not enteric) fevers. Remittent caused 20, diarrhoea 700, dysentery 662, dracunculus 294, venereal 251, rheumatism 195, cholera 95.

Cholera appeared in the central jails of Coimbatore (9) and Trichinopoly (5), in the Madras Penitentiary (2), and in the district jails of Madura (28), Cuddapah (24), Nellore (1), Coimbatore (2), Tanjore (14), Chittoor (1), Trichinopoly (3), Tranquebar (5), Kurnool (1). The number of cases was highest in July (21), August (22), and December (25).

Of the deaths, 76 were due to diarrhoea, 64 to dysentery, 35 to dropsies, 9 to atrophy and anæmia, 7 to phthisis. Neither scurvy nor dracunculus caused any. Cholera destroyed $40 = 4 \cdot 1$ per 1,000 of strength; 13 of the fatal cases occurring in August, and 13 in December.

In the subjoined table the sickness and mortality of 1875 are shown in comparison with the means of six years previous to the introduction of adequate dietaries and other Comparison with former years.

improvements, with the rates for 1867 and 1868 (the period of transition), and with the means of six years immediately preceding 1875 :—

Periods.	Ratio per 1,000.	
	Admissions.	Deaths.
Means of 1861-66	1371·1	107·0
1867	1012·4	53·9
1868	869·1	33·8
Means of 1869-74	719·2	27·2
1875	752·6	38·7

In the following table the mortality due to cholera and four jail-diseases in 1875 is compared with that of previous periods :—

Periods.	Deaths per 1,000.				
	Cholera.	Dysentery.	Diarrhœa.	Dropsies.	Anæmia.
Means of 1861-66	23·6	12·9	22·5	—	—
1867	0·8	8·8	10·5	5·3	12·1
1868	0·2	5·5	7·3	1·9	5·7
Means of 1869-74	1·3	4·7	5·0	1·9	1·1
1875	4·1	6·4	7·7	3·5	0·9

Comparison
of central
and district
jails.

The following table shows the superiority of central over district jails in point of healthiness during 1875 :—

Jails.	Strength.	Ratio per 1,000.		
		Admissions.	Daily Sick.	Deaths.
Central	5,009	541·22	24·15	35·13
District	4,813	972·57	34·50	42·59

Central Jails.

The following table gives the mortality of the six central jails in 1875, and the means for the eight years 1867-74 :—

Central Jails.	Ratio per 1,000.	
	Mean of 8 years 1867-74.	1875.
Cannanore	45·71	30·56
Coimbatore	24·94	38·18
Rajahmundry	12·71	24·21
Salem	16·93	24·76
Trichinopoly	33·05	54·79
Vellore	14·69	32·29

Cannanore.

The average strength of prisoners was 687. Admissions were 296, chiefly for intermittent fever (69), dysentery (52), rheumatism (28), scurvy (10), and atrophy (10).

No cholera. Deaths were 21, of which 4 were attributed to rheumatism, 1 each to atrophy, dysentery, and diarrhoea. An extra allowance of mutton was recommended and sanctioned during the monsoon and afterwards.

Coimbatore.

Average strength 969. Admissions 331, of which diarrhoea caused 52, dysentery 41, intermittent fever 39, dracunculus 34, dropsies 24, and cholera 9. The latter disease appeared twice in the jail. One fatal case occurred in August. From 20th to 29th November 7 cases were admitted, of which 2 were fatal. The first of these occurred in a prisoner who had been over five years in jail; no importation could be traced. Three deaths were due to cholera, 11 to dropsies, 5 to diarrhoea, and 4 to dysentery.

Rajahmundry.

Average strength 950, with a very high number of admissions, 813. Of these, 119 are attributed to continued, 56 to intermittent, and 2 to remittent fevers, 101 to dysentery, 69 to diarrhoea, 32 to rheumatism, 28 to dropsies, and 20 to atrophy. There was no cholera. Though the sick-rate was highest in this among central jails, the death-rate was lowest. Twenty-three deaths occurred: 1 by remittent fever, 7 by dropsies, 6 by dysentery, and 1 by diarrhoea.

Salem.

Average strength 525, with 224 admissions, chiefly for intermittent fever (51), dracunculus (23), venereal diseases (12), and dysentery (11). The mortality was almost as low as at Rajahmundry. Of 13 deaths, 3 were due to respiratory diseases; 1 each to phthisis, dropsy, dysentery, diarrhoea, and venereal.

Trichinopoly.

Strength 949, giving 423 admissions, among the causes of which were intermittent fever (96), diarrhoea (79), dysentery (29), atrophy (14), dropsies (7). Cholera contributed 5 cases, none of which were fatal. Two of the cases occurred on the 16th and 17th June, two in July, and the last on the 4th September. The death-rate was very much higher than that of any other central jail. Of 52 deaths, 27 were caused by diarrhoea, 3 by dysentery, 5 by atrophy, 3 by dropsies, 4 by intermittent fever. The jail accommodation was increased during the year by the addition of two wards.

Vellore.

Average strength 929; admissions 624, chiefly for continued fever (186), intermittent (9), diarrhoea (82), dysentery (35), and rheumatism (13). Deaths 30; 11 caused by diarrhoea, 7 by dysentery, 1 by intermittent fever, and 1 by atrophy. Accommodation is being increased and drainage improved.

Ootacamund.

The European Prison at Ootacamund may be conveniently classed as a central jail. Its average strength was 27, giving 20 admissions, but no death. There were 3 cases of diarrhoea, 2 of continued, and 1 of remittent fever. The want of a hospital, which was much felt, has been supplied by the conversion of the office, which is capable of accommodating three patients.

District Jails.

In the following table the rates of mortality in district jails during 1875 will be found. More detailed remarks upon each will be made afterwards, the arrangement of stations being alphabetical.

District Jails.	Death-rate per 1,000 of Strength.
Bellary	19·07
Berhampore	43·24
Calicut	25·77
Chingleput	12·73
Chittoor	36·58
Coimbatore	117·94
Cuddalore	16·30
Cuddapah	97·67
Guindy	15·38
Guntoor	9·90
Kurnool	25·86
Madras (Penitentiary)	6·71
Do. (Her Majesty's Jail)	—
Madura	69·14
Mangalore	83·33
Masulipatam	27·77
Nellore	10·20
Ootacamund (Native)	19·10
Palamcottah	51·79
Rajahmundry	40·40
Russelcondah	17·85
Tanjore	136·09
Tellicherry	23·52
Tranquebar	50·72
Trichinopoly	47·61
Vizagapatam	57·57

Bellary.

Of 252 admissions, 39 were due to dracunculus, 27 to venereal diseases, 12 to continued and 9 to intermittent fevers, 8 to diarrhoea, 5 to dysentery. Of 7 deaths, 2 were from diarrhoea, 1 from intermittent fever. Eleven old wards were demolished during the year, and two new ones occupied.

Berhampore.

129 admissions: 45 for intermittent fever, 26 for diarrhoea, 14 for dysentery, and 7 for rheumatism. Eight died; 2 of intermittent fever; 1 each of dropsy, diarrhoea, and dysentery. Night-latrines communicating with the wards have been constructed.

Calicut.

111 admissions; of which dysentery contributed 23, continued fever 22, intermittent 7, remittent 2, diarrhoea 15; no cholera. Of 5 deaths, dysentery caused 2, and diarrhoea 1. Some sleeping pials were asphalted during the year, and a new well was sunk.

Chingleput.

Of 291 admissions, 137 were due to intermittent fever, 20 to diarrhoea, 9 to venereal, 8 to dysentery, and 4 to atrophy. Only 2 deaths occurred, 1 from diarrhoea, so that an exceedingly high sick-rate is combined with very low mortality. The large number of admissions for ague is attributed partly to prolonged drought and its effect upon the tank and fort-ditch, and partly to the railway works having converted the inner moat into a chain of stagnant pools. Cases began to increase in July.

Chittoor.

There were 327 admissions, giving a very high sick-rate; but 127 were cases of skin disease. 50 cases of intermittent fever, and 24 of remittent were treated, 18 of

dysentery, 13 of diarrhoea, 12 of venereal, 8 of rheumatism. Two deaths were due to dysentery, and one to diarrhoea. There was one fatal case of cholera. Death occurred within 24 hours of admission to the jail; and the disease did not spread.

Coimbatore.

273 admissions, chiefly for dysentery (28), dracunculus (67), diarrhoea (12), and varicella (21). There were 2 cases of cholera, of which 1 was fatal. The mortality was very high, 23 deaths having occurred; 4 from diarrhoea, 3 from dysentery, 2 from dropsies.

Cuddalore.

341 admissions: 48 for continued, 8 for intermittent, and 2 for remittent fevers, 41 for diarrhoea, 17 for dysentery, 15 for rheumatism. Respiratory diseases (39) contributed a large proportion of admissions. Only 6 deaths: 2 from diarrhoea, and 1 from dropsy. The superintendent remarks that extramural employment is necessary to the health of prisoners confined in Cuddalore Jail. In December, when many of the police force were withdrawn from the district, extramural labour became impossible for want of guards; and the result was a considerable number of serious cases of anasarca, anæmia, and jail diarrhoea.

Cuddapah.

The sickness in this jail was very great, and the mortality high. There were 550 admissions: 352 for intermittent fever, 36 for dysentery, 17 for diarrhoea, 23 for dracunculus. There were 24 cases of cholera, with 12 deaths. The first case occurred on the 17th July, the last on the 22d August. The disease had prevailed in the town since the beginning of July, and lasted up to the middle of September. On the 14th August the prisoners were removed to a camp three miles distant, and brought back on the 14th September.

Guindy.

In this small jail there were but 50 admissions; 20 for intermittent fever, 4 for dysentery; the only death being due to the latter disease.

Guntoor.

63 admissions; 9 of which were for guinea-worm, and 8 for intermittent fever. Only one death, attributed to "general debility."

Kurnool.

Admissions 129: 18 for intermittent fever, 24 for diarrhoea, 20 for dracunculus, 6 for dysentery. One prisoner was attacked by cholera, and recovered. Only three deaths one of which was caused by dysentery, and one by dropsy.

Madras Penitentiary.

377 admissions: 35 for continued, 31 for intermittent fevers, 52 for diarrhoea, 29 for venereal. Two cases of cholera were admitted, and recovered. Deaths three only; two from phthisis.

Madras Civil Jail.

In this Debtors' Jail the sick-rate was exceedingly high, though no deaths occurred. Rheumatism caused most admissions (7); dysentery and diarrhoea 1 each. The prisoners feed and clothe themselves.

Madura.

233 admissions; chiefly for diarrhoea (48), cholera (28), dysentery (22), intermittent fever (26), and varicella (15). There were 8 cases of venereal and 9 of dracun-

culus. 28 cases of cholera were admitted, and 15 were fatal. The first case occurred on the 11th September, and none followed until the 25th. The last attack was on the 19th December. Four deaths were caused by diarrhoea, and one by dysentery.

Mangalore.

Intermittent fever caused 25, remittent 8, and dysentery 21, of the 123 admissions. The mortality was very high, and 6 of the 10 deaths were due to remittent fever. One died of atrophy, 1 of dysentery, 1 of diarrhoea.

Masulipatam.

Only 45 admissions in this small jail, of which intermittent fever caused 14, and dysentery 5. One death, from atrophy.

Nellore.

162 admissions: 23 for continued, and 23 for intermittent fevers, 10 for dysentery, 9 for diarrhoea, 16 for venereal diseases, and 20 for guinea-worm. One fatal case of cholera. The man attacked had been over five months in jail. He died in 7½ hours. As soon as the symptoms of cholera appeared he was removed to a shed in the jail-garden; and a quarantine shed, in which new prisoners were to be kept for 15 days, was erected outside the jail and used until October. One other death occurred, from dropsy.

Ootacamund.

Of 96 admissions, 26 were caused by continued, and 6 by intermittent fevers. There were 14 cases of diarrhoea, 14 of dysentery, and 4 of rheumatism. Three deaths occurred, all from dysentery. Water-supply improved during the year.

Palamcottah.

282 admissions; of which 70 were for dysentery, 49 for intermittent fever, 22 for diarrhoea, 15 for rheumatism, 15 for venereal diseases, and 10 for dracunculus. Of 13 deaths, 7 were due to dysentery, 3 to dropsies, 2 to fevers, and 1 to diarrhoea. Cholera prevailed outside, but none of the prisoners were attacked.

Rajahmundry.

Of 111 admissions, venereal diseases caused 14, intermittent fever 11, dysentery 10. Four deaths occurred, 1 from dysentery, 1 from dropsy, 1 from "general debility."

Russelcondah.

163 admissions, chiefly for intermittent fever (37), dysentery (10), and diarrhoea (6). Only 2 deaths, from dysentery and dropsy.

Tanjore.

108 admissions; of which fevers (continued 6, intermittent 16, and remittent 3) caused 25, dysentery 20, diarrhoea 15, and cholera 14. Of these last only 3 were fatal. 10 deaths were due to dysentery, 3 to diarrhoea, 2 to dropsies.

Tellicherry.

48 admissions: 9 for intermittent fever, 8 for dysentery, 7 for diarrhoea 5 for rheumatism. Only 2 deaths, from heart disease and diarrhoea.

Tranquebar.

Of 68 admissions, 13 were caused by intermittent fever, 12 by dysentery, and 5 by cholera. Cholera lasted from 26th to 28th December. The first two cases occurred in new arrivals from Negapatam and Nannilam, where cholera was epidemic at the time. Sheds were prepared for the camping out of all the prisoners, but there was no occasion to use them, the disease having been restricted to the five cases mentioned. Three of the five were fatal. There were four other deaths, from small-pox, continued fever, dysentery, and diarrhoea.

Trichinipoly.

157 admissions: 78 for intermittent fever, 30 for diarrhoea, 3 for cholera. One each of these last occurred in June, July, and August; and one was fatal. There were 6 other deaths: 5 from diarrhoea, and 1 from intermittent fever.

Vizagapatam.

Of 150 admissions, 26 were caused by intermittent and 18 by continued fevers. There were 14 cases of dysentery, 7 of diarrhoea, 10 of venereal diseases. Of 19 deaths, 5 were from dysentery, 4 from intermittent fever. The jail is a temporary one, in camp.

SECTION IV.**GENERAL POPULATION.**

In this Presidency 638,771 births were registered during 1875, being 21·09 per 1,000 of the population of 1871. Of these, 327,754 were male, and 311,017 female births, or in the proportion of 100 to 94·89. Vital statistics.

There were registered 641,260 deaths, namely, 335,388 of males and 305,872 of females; the proportion being 100 to 91·20. The death-rate would be 21·1 per 1,000, or 4 per 1,000 higher than that of 1874. The extensive prevalence of cholera accounts in some degree for the higher mortality of 1875; let us hope that improved registration counts for something also.

The following table shows the numbers dying at different periods of life:—

Ages.	Population.	Deaths.	Death-rate per 1,000.
Under 6 years - -	6,580,599	201,497	30·6
6 to 12 do. - -	4,812,372	47,341	9·8
12 to 20 do. - -	4,851,742	41,879	8·6
20 to 30 do. - -	5,702,078	67,208	11·7
30 to 40 do. - -	3,778,993	60,163	15·3
40 to 50 do. - -	2,527,838	56,604	22·3
50 to 60 do. - -	1,593,982	58,477	36·6
Above 60 do. - -	983,749	108,091	109·8
Unknown ages - -	449,824	—	—

The subjoined table shows the total mortality, and that due to each of the principal causes of death, for four years past* :—

—	Total Deaths.	Cholera.	Small-pox.	Fevers.	Bowel Complaints.	Other Causes.
1872 - - -	508,182	13,247	39,074	214,148	39,387	202,326
1873 - - -	513,232	840	51,782	222,843	36,392	201,375
1874 - - -	521,329	313	48,343	226,220	37,993	208,460
1875 - - -	641,260	94,546	24,775	252,042	37,484	232,4 3

* For comparison with years previous to 1872, see table in Vol. VIII, p. 101.—Ed.

The registered mortality exceeded 40 per 1,000 in Madura (60·36), Tinnevely (55·07), Tuticorin (57·16), Cuddapah (68·26), Adoni (53·55), Cumbum (73·80), Vellore (52·02), and Coonoor (40·54). All these towns except the last three suffered severely from cholera, and the fever mortality in Vellore and Cumbum was very high.

In the capital, although the year 1875 was not free from epidemic cholera, the death-rate was more favourable than that of the previous year. It was 35·6 per 1,000 of census population; that of 1874 had been 37·1. The average mortality of the 16 years 1859-74 was 31·8; the population of 1871 being taken as the basis of calculation. Mahomedan mortality was, as usual, highest, 42·3 per 1,000. The European rate, 32·1, was lowest.

Cholera.

Cholera carried off 94,657 persons (including Europeans and Eurasians) during the year; the ratio being 147·3 per 1,000 of total deaths, and 3·1 per 1,000 of census population.

The first registered case of cholera in the capital occurred on the 7th August. Up to the close of the year 935 deaths had taken place. Eight Europeans (2·2 per 1,000) died of it.

The disease first became epidemic in the south-eastern part of the Presidency in April, and spread gradually into every district but two. Another wave from the north had reached the northern district by the close of the year; and at that time the Vizagapatam and greater part of the Kistna districts remained unaffected by either epidemic.

In January two deaths in the Tanjore district were reported, one from the Nannilam taluq on the 12th, and one from the Combaconum taluq on the 15th. From the 16th January no death is reported until the 9th February, when one occurred in the Negapatam taluq, followed by two others on the 13th and 15th. There were seven deaths in February, the last occurring in the Nannilam taluq on the 28th. From this date until the 22d March no deaths were returned. On the latter day a death occurred in Negapatam taluq, followed by another on the 31st. These were the only cholera deaths reported during March. In April the disease became epidemic, and 65 deaths occurred, of which 46 were in the Negapatam taluq, 17 in Nannilam, and 1 in each of the taluqs of Combaconum and Tanjore. The first death was reported on the 5th. In May the deaths were 1,589; chiefly in the taluqs of Negapatam (783), Nannilam (373), and in Negapatam town (169). In June every taluq and town suffered, and the total deaths were 4,972. In July the mortality reached its maximum, 7,184; and the numbers for the succeeding months of the year were 1,733, 945, 822, 348, and 454.

Tinnevely is not conterminous with Tanjore, and did not receive cholera from the latter district. The disease made its first appearance at a seaport on the 14th April. No case had occurred previously in any part of the district. Up to the end of April 9 deaths had occurred, all in the seaboard taluq of Tenkarai. In May the number rose to 30, still in one taluq. In June the deaths were 59, 44 in Tenkarai taluq, and 15 in another (Ambasamudram), which is separated from it by the Tinnevely taluq, in which no deaths were reported until August. In July the deaths were 227, 215 in Tenkarai taluq, and 12 in Tenkasi, which adjoins Ambasamudram on the north. Henceforward deaths were reported in every taluq and municipal town; and the totals for August and subsequent months were 541, 1,343, 1,150, 1,085, and 2,073. It seems clear that in this district the disease spread from a seaport.

Madura district touches Tinnevely on the south, but cholera did not appear in its southern taluq until after its explosion in eastern taluqs. One death is reported from Melur taluq, between which and the Tanjore district a large zemindary (from which we have no information) intervenes, on the 10th June. In July the disease appeared simultaneously in this taluq and in Madura which lies on its west. On the 11th the first cases occurred in Dindigul taluq north of Madura; and on the 17th in the southern taluq adjacent to Tinnevely. The total deaths in July were 113. In August the disease was everywhere; 412 deaths were reported. The numbers for subsequent months were 915, 2,783, 4,074, and 3,303.

In South Arcot, conterminous with Tanjore on the south, sporadic deaths occurred in January (3), February (6), April (3) and May (3); but the epidemic did not begin until June. All the April cases had been reported from the taluq of Chedambaram, which takes its name from a very filthy municipal town, with a famous temple, a favourite place of pilgrimage. The taluq lies on the seaboard and touches the northern part of the Tanjore district. In May a death occurred in the same taluq, and on the 6th June another. During the latter month 171 deaths in the taluq and 30 in the town were reported. From July onward the disease spread in every part of the district, the

monthly mortality fluctuating. The totals for July to December were 2,342, 2,339, 906, 695, 659, 1,167.

The district of Trichinopoly lies west of South Arcot and Tanjore. An isolated death was reported on the 17th March in a taluq bordering on the former district; but the epidemic began in Trichinopoly town (connected with infected districts by road and rail) on the 18th May; and 9 deaths, all in the town, occurred. In June it spread into the Trichinopoly taluq, in which 133 died, and in the town itself there were 255 deaths. The total of the month was 555. The mortality reached its maximum, 2,854, in July, and thenceforward fell through 2,008, 780, and 458, to 260 in November. In December the deaths were 360.

The first reported death in the Coimbatore district occurred in the Sathiamungalum taluq on the 8th June. Two deaths are reported from the Erode taluq on the 16th, and three from Bhowani on the 28th. The total for the month was 60. The numbers increased (383, 427, 1,239, 2,741, and 4,680) up to November, and fell to 3,402 in December.

In August the disease crept up to the Nilgherries, one death being reported from the district and two from Coonoor in that month. Another death occurred in the district in October, and 7 (besides one in Ootacamund) in December.

The first death in Cuddapah district occurred on the 3rd June in the Cuddapah taluq, and 27 deaths were reported in the month. In July the epidemic spread through all the eleven taluqs but two, and the town of Cuddapah suffered severely: the total was 773. In August the mortality reached its maximum, 1,513; falling to 1,394 in September, and thence declining through 492 and 245 to 213 in December. The taluq of Madanapully suffered very little during 1875, reporting only 3 deaths in August and 24 in October.

The Salem district lies between South Arcot and Trichinopoly on the east, and Coimbatore and Mysore on the west. Cholera appeared first in the end of June, the first death being reported on the 1st July, in the Namacul taluq on the confines of the Trichinopoly district. Trichingode was next attacked, bordering both on Trichinopoly and Namacul, and then Ahtoor west of Namacul. The deaths in July were 134, in August 520, in September 1,553, the highest total of the year. In the following months the deaths were 1,527, 1,511, 1,360.

Nellore is a sea-board district, having Kurnool and Cuddapah on its west, and touching Chingleput and North Arcot on the south. The first death was reported on the 15th July, in a taluq (Atmakur) bordering on Cuddapah district. The next taluq attacked was Nellore, adjacent to Atmakur on the east. In July 151 deaths occurred, almost all in these two taluqs. In August deaths were reported from all taluqs, except Ongole and Kanigeri in the extreme north, which enjoyed almost complete immunity up to the end of the year. After August, in which 1,072 deaths occurred, the total decreased in September (910), October (353), and November (173); rising to 358 in December.

Two deaths, on the 7th and 9th, were reported from the Conjeveram taluq, in the middle of the Chingleput district, in June; and one occurred on the 22nd in the Madrantakum taluq bordering on South Arcot; but the disease did not take hold. The only deaths in July were in the latter taluq also—one each on the 5th, 9th, 14th, and 31st. In August there were 215 deaths, some in each taluq; 92 in the town of Conjeveram (a favourite resort of pilgrims) and 56 in the taluq, 18 in Madrantakum taluq, 27 in Sydapet adjacent to the city of Madras. In September (295), October (350), and November (318), the epidemic was present in all the taluqs; and in December (327) in all but Trivellore.

Five deaths were reported from North Arcot, from parts bordering on the Mysore country, in July. In August cholera was present in every taluq except Wandewash, and 1,341 persons died. In September (1,754), October (937), and November (624), Palmanair was the only exempted taluq. It broke out here in the middle of December, and in that month the deaths were 1,194.

Cholera made its first appearance in Bellary district, in the taluq of Ghooty, in July. On the 21st and 25th deaths occurred, and subsequently in the adjacent taluq of Tadputri. Both taluqs are connected by railway with localities previously infected. In August 569 deaths were reported, in September 657, and in October the greatest number, 672. There were 345 and 134 in the following months.

The outbreak was somewhat later in the Kurnool district bounding Bellary on the north. On the 4th August the first death occurred in a taluq (Kovilkuntla) adjacent to Tadputri taluq, in which the disease was prevalent. On the 14th deaths began in

the Pattikondah taluq conterminous with Ghooty. In September, October, and November only two of the eight taluqs were free from the disease. These were Cumbum and Markapoor, cut off by a range of hills from the western parts of the district. In December, however, 5 deaths were reported from the Cumbum taluq. The epidemic reached its height (in the western taluqs) in September, when 447 deaths were recorded. In the closing months of the year the totals were 262, 118, and 19.

Cholera made its first appearance in Mysore in July, in the Gundlapet and Mysore taluqs. The former adjoins the Coimbatore district (where the epidemic began in June and was fully established in July), and the first death occurred on the 14th July; the latter lies next the Gundlapet taluq, and there the epidemic began on the 29th of the month. In August the disease was almost confined to the same two taluqs, though a few deaths occurred in four others, and some cases in the Toomkoor, Colar, and Bangalore districts, which appear to have been unconnected with the northward course of the disease. In September the deaths in the Mysore district rose to 738, from which they declined monthly to the close of the year; Toomkoor also reported its maximum 95; and the epidemic had spread into the Hassan district, probably from the south. In October deaths were reported from every district except Chitteldroog; and in the following months from every one. The total deaths in the province were 3,220; and the highest monthly mortality, 1,029, was registered in September.

Coorg escaped with 5 deaths in the year, of which 1 occurred in April and 4 in October.

Except July no month was altogether free from cholera in the district of Malabar. In January 1 death was reported from the town of Cochin, and 2 deaths in February from an unconnected taluq, Valavañad. In March, April, and May, 4 deaths occurred in Palghaut taluq, and 1 death in the Wynaad; a solitary death occurred in Ponani taluq in June. In August the epidemic began, first appearing in Ernad and Palghaut taluqs, the latter of which borders on Coimbatore. The deaths this month were 26; in the following months 146, 579, 1,227, 1,575.

South Canara remained free from cholera until November, in which month 8 deaths were reported. The disease did not come from Malabar on the south, the northern taluq of which was unaffected all through the year, but from Mysore on the east. The first deaths occurred in the Upinangadi taluq on the 7th, the Mangalore taluq on the 13th, and that of Udupi on the 17th. The disease seems to have got no hold on the district at this time, as no deaths were reported in December.

North of Nellore, on the sea-board, lies the Kistna district, on which up to the end of the year cholera had made little impression. It appeared in the taluq of Narsarowpett (or Rajapett) on the 9th September, causing 5 deaths. In the same month, but earlier (on the 2nd), a death had occurred in the Ongole taluq of the Nellore district, which bounds Narsarowpett on the south. Only 3 deaths were reported from the Ongole taluq in that month, and none subsequently; nor did the disease spread immediately in Narsarowpett, 6 deaths only occurring in October, and these in the latter half of the month. On the 1st November the last death in this taluq was reported. On the 24th of the same month the disease made a fresh start in the sea-board taluq of Masulipatam, and caused 3 deaths in November and 15 in December.

A strip of zemindary territory, from which but little sanitary information is obtained, separates the Kistna district on the south from the Ellore taluq of the Godavery district on the north. In this taluq only did any cholera occur; and only in the end of December 5 deaths were reported from the taluq and 7 from the town of Ellore.

Thus far the course has been described of an epidemic starting from the maritime southern districts of the Presidency and gradually advancing westward, north-westward, and northward. At the end of the year it had reached, in this last direction the southern part of the Kistna district. All above the Ellore taluq was free. Between this district and Ganjam the Vizagapatam district is interposed, and in it no cholera appeared in 1875. It is certain, therefore, that the Ganjam epidemic is unconnected with that of the south, and was imported from the north. In February a solitary death is reported from the zemindaries which seem to surround the Berhampore and Goomsoor taluqs on all sides, and in March another. In April 4 deaths occurred in the Goomsoor taluq; in May, 1 in the zemindaries. In June no death was reported. In July the disease became epidemic; 10 deaths occurred in the Goomsoor taluq, 1 in that of Berhampore, 4 in the zemindaries. In August the latter reported 9, and the town of Berhampore 6. In September 19 out of 20 deaths occurred in the town; in October only 5 deaths were reported. In November the total was 178: 100 in Berhampore taluq and 23 in the

town. 53 in zemindaries. In December the total fell to 114,—63 in the taluq and 15 in the town.

The number of deaths from small-pox was less in 1875 than in any year since 1871. Small-pox. It was 24,787, 0·8 per 1,000 of census population. No district escaped altogether. In Ganjam the mortality from this cause rose to 1·5 per 1,000; in South Arcot and Kurnool to 1·3; in Malabar to 2·8.

The mortality attributed to “fevers” has been increasing year by year since 1868. Fevers. The total in 1875 was 252,131, 8·3 per 1,000 of population. Fever mortality rose to or exceeded 10 per 1,000 in Ganjam, Vizagapatam, Godavery, Kurnool, Cuddapah, North Arcot, Salem, and Nilgherries.

Under bowel complaints 37,613 deaths were registered, a mortality of 1·2 per 1,000. Bowel complaints. Of the districts, Chingleput, Tinnevely, Nilgherries, South Canara, and Malabar suffered most severely from this cause.

A table of unnatural deaths is given below. Deaths by snake-bite were reported from every district except the Nilgherries. Wild beasts were destructive to human life in every district except the Nilgherries and Tanjore. Violent deaths.

Suicides	-	-	-	1,816
Wounding	-	-	-	880
Accidents	-	-	-	7,188
Snake-bite	-	-	-	2,306
Wild beasts	-	-	-	247
Total				12,437

SECTION V.

VACCINATION.

Vaccination having been transferred from the Medical to the Sanitary Department from the 1st April 1875, it becomes necessary to introduce the subject into this Report. I think it would be desirable, in future years, to include the Annual Report of the Inspector of Vaccination in that of the Sanitary Commissioner, altering the period of the former from the official to the calendar year. The confusion inseparable from so great a change as the transfer of control of the vaccinating staff from Government to Local Bodies has prevented my receiving complete returns of the work done in 1875; while the prevalence of cholera in most of the districts, and the utilization of vaccinators by the local authorities as distributors of cholera medicines, interfered seriously with the progress of vaccination.

So far as the papers in this office show, the total number of successful vaccinations performed in 1875 was 242,804. This is exclusive of operations performed in the districts of Tinnevely, Canara, Vizagapatam, Ganjam, and the town of Cumbum. The number of births registered (with the same exclusion) was 533,251. The ratio per cent. of the former total to the latter is 45·5.

In October 1874 Surgeon-General Balfour suggested to Government the plan of working the vaccinators of districts in bodies moving from village to village. “Confident of success,” he said, “I would like it tried in every district.” The Governor in Council had “great doubts whether the system would answer in rural districts,” but suggested that the subject might be considered by the several Local Fund Boards. The views of 20 Boards were laid before Government, and ordered to be recorded, with the remark that “the replies received from the Presidents of Local Fund Boards appear to be generally unfavourable to the proposal made by the Surgeon-General.” I do not think the system likely to yield satisfactory results in any case; but the disapproval of the Boards, whose hearty co-operation is indispensable to the progress of vaccination, is an insurmountable objection to the experiment.

SECTION VI.

SANITARY WORKS.

The following are some items of sanitary operations in municipal towns :—

Madras.

Waterworks ; new latrines ; new drains ; sanitary repairs.

Trichinopoly.

Three new latrines built, others repaired ; drainage and water-supply improved.

Tanjore.

295 yards of drain constructed ; market drainage improved ; latrines built ; two water conduits constructed ; wells improved ; tank improved ; drains repaired.

Negapatam.

Tanks improved ; wells cleaned ; latrines repaired.

Coimbatore.

Poudrette sheds erected ; 16 culverts built, and drains, &c., cleansed ; narrow lanes of parcherry widened ; wells improved and dug ; 3 new latrines built ; others repaired.

Vizagapatam.

A large well improved and utilised ; dhobies excluded from other wells ; 6 public latrines built ; 197 yards of surface drains constructed.

Nellore.

Water-supply improved.

Kurnool.

Water-supply channel completed ; 5 surface drains constructed ; cess-pools closed ; new latrines built.

Palamcottah.

One new latrine built ; a new tank excavated and another improved ; 3 wells improved.

Manargoody.

Water-supply improved.

Wallajahpett.

New spring-water pond opened ; wells improved ; drainage improved.

Bimlipatam.

1,004 yards of drains made ; tank deepened.

Ghooty.

Water-supply and drainage improved.

Coonoor.

Underwood cut away ; drains cleared and repaired ; latrines and slaughter-houses much improved ; water-supply channels repaired and constructed.

For all municipal towns together the proportion of total income expended on conservancy was 18·6 per cent. In individual towns (omitting Madras) it varied from 44·1 in Ghooty to 6·6 in Palghaut.

It occurred to me to inquire, so far as the imperfect data in our possession afford the means, whether sanitary expenditure has any apparent effect upon health, estimated by mortality. Accordingly I calculated the mean death-rate of the 13 towns whose expenditure on conservancy exceeded 30 per cent., on the one hand, and of those towns, also 13 (excluding Madras), on the other hand, whose expenditure was less than 20 per cent. I had no notion as to the result of the calculation; but, naturally, I hoped that it would be favourable to the cause of sanitary effort. And so it proved. The registered death-rate of 13 towns whose mean expenditure on conservancy was 34·8 per cent. of income was 27·7 per 1,000; that of 13 whose mean expenditure was 15·5 per cent. was 33·8, or 6·1 per 1,000 higher. To eliminate from the comparison the possible effect of freedom from cholera, I struck out from both lists those towns—3 in the former, 5 in the latter series—in which no cholera mortality had occurred. I then found the death-rate of 10 towns, expending 34·9 per cent. of income on conservancy, to be 29·2; and that of 8 towns, expending 14·3 per cent., to be 34·6. The difference is 5·4 per 1,000, apparently in favour of sanitary expenditure.

The necessity for some organization by which the Sanitary Commissioner may be made and kept acquainted with the condition and requirements of non-municipal towns and villages is, I think, very obvious. I have submitted for the consideration of Government suggestions for an organization of an inexpensive, but (as appears to me) tolerably efficient, reporting Sanitary Department, and I am anxiously awaiting orders on the subject.

ABSTRACT OF REPORT OF THE SANITARY COMMISSIONER FOR BOMBAY FOR 1875.

(*Surgeon-Major J. Lumsdaine.*)

SECTION I.

VITAL STATISTICS.

Births.

In a population of 16,228,774, the number of births registered during 1875 was 340,829, of which 178,892 were male and 161,937 female. This is the highest total yet recorded, and it exceeds that of last year by 8,021. The ratio per 1,000 for the year is 21.01. For every 100 male births the females were 90.52, so their respective percentages were 52.49 and 47.81; and taking the proportion of boys to girls *living*, the respective percentages were 52.80 and 47.20.

I said in last year's Report that the rate of births should be 40 per 1,000 instead of the 18 per 1,000 shown, and that, instead of our annual total of 285,670 (the mean of four years), it should be 664,705. We have not reached this figure yet, but already it looms in the future. When registration was introduced in 1871 the numbers for that year were 252,609; in the next year the increase was 14,334; in the next it was 23,376; in the next 42,489; and in the year under notice it is only 8,021. But notwithstanding the falling off for 1875, the numbers then recorded exceed those for 1871 by no less than 88,220, and the *annual average* increase for the five years has been 22,055.

Turning to Mr. Hewlett's Bombay City Census Report, we find the females are there classified as (1) single; (2) married; (3) widows; (4) women whose civil condition was not stated. Taking the ordinary limits of childbearing to be between 15 and 40 years, and dealing only with the married, they are thus shown:—

Between 15 and 20 years	-	-	-	-	22,024
" 20 " 30 "	-	-	-	-	50,478
" 30 " 40 "	-	-	-	-	28,379
					100,881

or say, in round numbers, 100,000.

The majority of these 100,000 may be supposed to be living with their husbands; but let us assume that 25 per cent. are not. Of the 75,000 who live with their husbands, will it be too much to assume that the child expectancy for each may be once in 30 months? If this be assumed it gives 30,000 births per year; and if to this we add the births amongst the unmarried and the widows, the total would not be far short of 35,000. The total returned is between 16,000 and 17,000.

Deaths.

The deaths from all causes, exclusive of *born dead*, were returned as 375,718. Of the numbers for the ten years from 1865 this was the maximum. This is partly owing to the high mortality from cholera, but some of the increase is, no doubt, due to what may be termed recoveries by improved registration. The rate per 1,000 was 23.15.

Last year the births recorded exceeded the deaths by 54,156; but this year (1875) the deaths are more numerous by 34,889.

Of the 375,718 deaths registered, there were 199,712 of males, and 176,006 of females; a proportion of 53.15 of the former to 46.85 of the latter: similar proportions for the living are respectively 52.27 and 47.73. Of males dying to males living, the ratio per 1,000 was 23.54, and of females dying to females living it was 22.72; for both sexes it was 23.15. For every 100 males dying there died 83.13 females, and for every 100 males living there should now be alive 91.32 females.

In 1875 the rural and urban rates of mortality were respectively 23.63 and 19.37 per 1,000, whilst in 1874 they were 16.3 and 23.5. At home the urban rate exceeds the rural by about 25 per cent., and *cæteris paribus* the balance should here be against the towns. In the Report for 1874 I said that a truer general rate would be something like 35 per 1,000, and now, after again going carefully over the whole question, I see no reason to change the opinion then expressed.

The maximum mortality for the year was in Khandesh (31,051), and the minimum (711) was in the Upper Sind Frontier. In 1874 the maximum and minimum were respectively in Dharwar and the Upper Sind Frontier. For this year the deaths in Dharwar were 30,538, and in Belgaum they were 30,064.

The monthly maximum death-rate was 2·67 in July, and the minimum was 1·36 in February.

By quarters the death-rate was lowest in the first, and highest in the third. For the first and last quarters the results nearly agree with those for last year, but the second and third quarters have changed places. The comparatively low death-rate in these quarters in 1874 is partly due to the absence of cholera. The contrasting figures are here shown :—

Quarters.	Total Number of Deaths.		Ratio per 1,000 on Total Population.	
	1874.	1875.	1874.	1875.
1st Quarter ending March	67,384	71,849	4·15	4·43
2nd do. do. June	63,440	94,731	3·91	5·84
3rd do. do. September	69,394	117,564	4·28	7·24
4th do. do. December	78,434	91,574	4·83	5·64

Taking the deaths from 1870 to 1875 inclusive, it is found that in the cold season the mortality was highest in 1872, and lowest in 1870; in each of the other seasons the maximum was in 1875, and the minimum in 1870. The subjoined table gives the total mortality in each season from 1870 to 1875, inclusive :—

Seasons.	1870.	1871.	1872.	1873.	1874.	1875.
Cold	70,875	88,880	111,484	100,661	43,588	101,304
Hot and Dry	29,944	45,337	56,383	44,238	41,985	57,869
Rainy	72,184	96,054	136,443	92,592	90,849	154,426
Hot and Damp	46,724	49,455	62,747	53,481	52,230	62,119
Total	219,727	279,726	367,057	290,972	278,652	375,718

Comparing 1874 with 1875, the deaths from each specified cause, except small-pox, were higher in the latter year, thus :—

	1874.	1875.
Cholera	37	47,555
Small-pox	3,903	3,461
Fevers	183,717	219,156
Bowel complaints	26,990	33,650
Accident or violence	6,165	6,217
All other causes	57,840	65,679
	278,665	375,718

In noticing the Report for 1874, Government suggested that perhaps it would be advisable “to establish in the great cities, and in a smaller number of representative towns and villages in each collectorate, a real system of registration, properly supervised, and draw the conclusions from these only.” Now a real system of registration, to be thoroughly effective, would necessarily entail a separate and special agency, and it would involve considerable expenditure. But if the scheme of improved sanitary organization be sanctioned by the Government of India, I think we may safely predict an increased value for the registers, and there will then be a very fair amount of supervision. It can hardly be meant that births and deaths in places other than those specified were not to be registered, so I take it they were to be returned, as at present, from all the units which make up the Presidency, but were only to be compiled for the selected areas. If no use were to be made of what may here be termed the outside returns, there would be little use in transmitting them to a central office, but seeing that we have them for the past ten years, it would be a pity to give up the ground already gained, more especially as the prospect is more promising. If, again, in these outside areas it were known that the deaths, though registered, were not returned to an office in which they are so closely scrutinised, they would gradually become less and less accurate. I cannot but think it will be better to lighten the mass, and let it work—no matter how slowly.

SECTION II.

HISTORY OF THE CHIEF DISEASES.

Cholera.

For the districts as they now stand our complete records only go back to 1866, so that the close of 1875 ends the decade; and in this period the total of deaths from cholera has been 158,960, the annual mean is 15,896, and the rate per 1,000 is 1.11.

Commencing with 1866, the deaths in that year numbered 23,037, and the rate per 1,000 was 1.85.

In the two following years (1867-68) there was marked immunity, but in the third year (1869) there was a return, and this time a heavier one. In that year the deaths were 52,380, and the rate per 1,000 was 3.77.

Again for two years (1870-71) there was a comparative freedom, and again in the third year (1872) it came back; but this time with less severity. The deaths were 15,642, and the rate per 1,000 was 1.03.

For the third time there were two years of very marked immunity (1873-74), and for the third time it has returned in the fatal third year. During this last recurrence the deaths have been 47,555, and the rate per 1,000 is 2.93.

These details are best seen when tabulated thus:—

	Deaths.
1866	23,037
1867	5,143
1868	6,447
1869	52,380
1870	2,666
1871	5,821
1872	15,642
1873	232
1874	37
1875	47,555

There is here the record of a fact that on four successive occasions there was a visitation, or recurrence, or revival, every third year. But then there is also the fact that in 1865, the year before our complete tables commence, the total of deaths reached a maximum of 83,148. Whatever were the conditions which in 1865 brought about this terrible mortality, we may assume that in degree there were similar conditions in 1866, 1869, 1872, and 1875.

96,012 persons were attacked with cholera during the year, of whom 47,555 died. Of these 25,397 were males, and 22,158 females, or in the proportion of 87 females to every 100 males.

By seasons the greatest number of deaths (35,382) occurred during the rains, whilst in the preceding year the greatest number was in the hot and dry season.

Seasons.	1873.	1874.	1875.
Cold	198	6	831
Hot and dry	58	21	6,154
Rainy	22	8	35,382
Hot and damp	5	2	5,188
Total	283	37	47,555

In January 1875 there was one death in Bombay city, and in February there was another, but with these exceptions the year commenced without any reported cholera anywhere.

On the 22d March there was a case in the town of Nassick, and from this date to the end of the month there were 10 others, which all ended fatally; in all there were 29 attacks. The first case was that of a Gosain, who had come from Dwarka. At first it was thought he must have brought the disease with him, more especially as it is said he had had diarrhœa for some days before he arrived; but neither at Dwarka, nor at any intermediate place, had there been a sign of cholera; and after due inquiry on the

spot, Dr. Cody (who was at Nassick during the whole of the outbreak) inclines to the belief that it originated in the exposure, the irregularities, and the excesses of the Holi festival, which commenced on the 22d.

During April there were 959 attacks at Nassick, and 481 deaths, and it now appeared in other districts. In Khandesh there were 26 deaths, in Ahmednuggur 65, in Poona 43, in Sholapur 1, in Rutnagherry 8, in Tanna city 3, in Bombay city 31, in Kaira 95, in the Punch Mehals 41, and in Ahmedabad 1. Amongst the civil population there were 796 deaths, in cantonments 8, and 1 in a jail; so the total for the month was 805. In native territory there was an outbreak at Baroda, but there is no record of the particulars.

Taking Nassick as the centre of infection, or revival, it would be extremely interesting to trace the course of the disease through the several districts in which it appeared, but the means are not forthcoming. Very excellent reports have been received from Nassick, Kaira, the Punch Mehals, and Ahmedabad; but in these even there is not the requisite precision as to dates. When the outbreak first occurred there were taking place numbers of caste dinners, wedding feasts, &c., and then came the Holi with all its excesses; so here were causes for the bad form of diarrhoea which was said to be prevalent.

The following relates to the agency of human intercourse. In the Kaira districts there was no cholera, but it was at Baroda. One of the Municipal Commissioners of Nariad went to Baroda, was attacked immediately after his return home, and died, and the disease then spread through the town. In the Borsad taluka a man was attacked after visiting Nariad; six others of his household were attacked, and all seven died. There was no other case in the village, nor was there anything in the condition of the house or its surroundings different from other houses. From the Nariad and Borsad talukas it spread over the entire district, and appeared erratically in village after village. The one fatal case in Ahmedabad was brought by railway on the 29th April from Anund in the Kaira district. On the 17th it appeared in the Punch Mehals, in the Kalol taluka, and here it is said to have been imported from Baroda and Kaira.

During May it was in all the districts named except Sholapur, and it also appeared in the Colaba and Surat districts. On the 25th May it broke out in the city of Broach, and is said to have been brought there by persons returning from the usual fair at Dakor.

In June it re-appeared in Sholapur, and spread to the Satara district. It was also reported from Thar and Parkar in Sind, where none had occurred since 1869. On the 21st June a case occurred at Pandharpur. It was that of a Brahmin woman who had arrived on the 19th from Baroda. She was then reported as suffering from diarrhoea, and died two days after her arrival. Three days afterwards (on the 24th) a man living some 12 yards off in the same court-yard was attacked, and died within 12 hours. From this time cases occurred in different quarters of the town, and there were from two to four deaths daily up to the 14th July, the time of the Jutra.

During July it was at all the places named, and three cases were reported from the Ghizri sanitarium near Kurrachee. It now appeared in the Belgaum and Kaladgi districts (on the 5th at Indi), having been brought, it is said, by pilgrims returned from Pandharpur. The Jutra at Pandharpur lasted from July 14th to 24th, and during this time there were 193 admissions in the civil dispensary, and of these cases 85 (44 per cent.) were fatal. By the police returns there were 380 attacks, and 242 deaths (40 on the Kala day). There were 28 deaths amongst the resident inhabitants, and 182 amongst the pilgrims. From the 19th June to the 6th July, when the pilgrims began to assemble, there were 26 deaths, and 216 after. There were 50 cases before, and 330 after.

In August it was in every district of the Deccan except Dharwar. In the Konkan only Kanara was exempt up to the 30th. In Guzerat it was in every district. Sind was free. At Pandharpur the last case was on the 18th August.

In September it was in every Deccan district, having broken out in the first week of the month at Byabhuti, in the Hubli rural circle. In the Konkan Kanara was still exempt, and in Guzerat the Punch Mehals and Broach were free. There was none in Sind.

In October it was still in every district of the Deccan. In Guzerat it disappeared from Kaira, nor was there any in the Punch Mehals or Broach, or in Sind.

In November it disappeared from the Khandesh and Poona districts. Ahmedabad, Broach, and the Punch Mehals were free, but it re-appeared in Kaira. Sind was free.

In December it had left five out of the nine Deccan districts, remaining in Sholapur, Belgaum, Dharwar, and Kaladgi. With the exception of Colaba, it was in every district of the Konkan. In Guzerat it was only in the Surat and Kaira districts. Sind remained free.

In the reports from Kaira and Dharwar it is recorded that the disease advanced against the wind, which was then blowing steadily and strong from the south-west.

Small-pox.

In 1875, 3,461 deaths from small-pox were recorded, 442 less than in the preceding year. The number of fatal cases in 1875 is the least recorded since the commencement of the registration of deaths. Of the 3,461 deaths, 1,708 were males, and 1,753 females, or in the proportion of 103 females to 100 males. Out of every 4,689 persons living, and out of every 109 deaths from "all causes," there was one from small-pox.

The ratio of deaths from this disease per 1,000 of population for the year was 0·21, 0·20 of males and 0·23 of females. The following statement shows the number of deaths from small-pox and the ratio to population in each of the previous 9 years :—

Years.	Deaths from Small-pox.	Ratio per 1,000.
1866	3,846	0·31
1867	8,802	0·66
1868	15,183	1·19
1869	12,606	0·91
1870	4,609	0·34
1871	9,443	0·66
1872	26,699	1·76
1873	9,935	0·61
1874	3,903	0·24
1875	3,461	0·21

In 1875, in only 5 of the 85 Registration Circles the death-rate from small-pox exceeded one per 1,000 of total population.

The highest number of deaths recorded from this disease in 1875 occurred in Belgaum Collectorate, where 693 fatal cases are reported to have taken place. 600 deaths were reported from the Kaira Collectorate. Only one death is returned in the Shikarpur Collectorate, and the Upper Sind Frontier district was entirely free.

The maximum mortality occurred in April, when 577 deaths were recorded, and the minimum in October, when 91 fatal cases took place.

Fever.

By far the greatest number of deaths is, as usual, attributed to fever. In the year under report 219,156 persons are said to have died from fever, against 183,717 in the preceding year.

The mortality from this cause and the ratio per 1,000 for 1875, as compared with the 9 previous years, were as under :—

Years.	Deaths from Fever.	Ratio per 1,000.
1866	94,456	7·60
1867	89,841	6·78
1868	97,665	7·63
1869	129,117	9·29
1870	131,035	9·69
1871	167,677	11·85
1872	206,747	13·60
1873	188,201	11·59
1874	183,717	11·32
1875	219,156	13·54

From the foregoing table it will be seen that, though the rate is somewhat less than that for 1872, yet it is far above the average. The aggregate number of deaths from this cause exceeds any of the past years.

Of the 219,156 deaths from fever, 116,157 were of males, and 102,999 of females, being in the proportion of 89 females to 100 males.

The numbers of deaths in the different seasons were as follow :—

Months.	Seasons.	Deaths from Fever.	
		1874.	1875.
December, January, February, March -	Cold - - -	64,590	68,801
April, May - - -	Hot and dry - - -	27,245	34,260
June, July, August, September -	Rainy - - -	55,381	76,465
October, November - - -	Hot and damp - - -	36,501	39,630
	Total -	183,717	219,156

The registered deaths from diarrhæa and dysentery are shown in the following table since 1866 :—

Bowel complaints.

Years.	Deaths from Bowel Complaints.	Ratio per 1,000.
1866 - - -	20,239	1·63
1867 - - -	17,373	1·31
1868 - - -	19,361	1·51
1869 - - -	30,128	2·15
1870 - - -	25,836	1·91
1871 - - -	30,422	2·15
1872 - - -	33,664	2·22
1873 - - -	26,259	1·62
1874 - - -	26,990	1·66
1875 - - -	33,650	2·07

The total deaths from this cause reported were 33,650; 18,761 were males, and 14,889 females, being in the proportion of 79 females to every 100 males. It was most prevalent in the Dharwar Collectorate, where 4,686 deaths were recorded. In the Upper Sind Frontier only 14 deaths are said to have taken place from this cause.

The maximum mortality was in August, and the minimum in February.

Deaths from accident or violence are arranged as follows :—

Injuries.

Suicide - - -	821
Wounding - - -	425
Accident - - -	2,376
Snake-bite - - -	1,207
Wild beasts - - -	80
Otherwise - - -	1,308
	<u>6,217</u>

SECTION III.

RECORD OF PERSONAL PROCEEDINGS.

It has been proposed by the Irrigation Department to establish a sewage farm on a selected site near Poona, and to utilise upon it the excretal matters from the different regimental latrines. The removal is to be by water-carriage, and the power will be provided from the Kurrukwasla Canal, which is now the source of supply for the cantonment and city. The present system of removal by hand is carefully worked, but, with all the attention that can be paid to it, there must always be the drawback of delay in removal. It is hoped that the new scheme may be introduced during the current year, so that its details and working may be explained in the next Report. The success of the sewage farm at Madras augurs well for the one proposed for Poona, and, should it succeed, its benefits can be extended to the cantonment bazaar, and eventually to the city and other places.

Sewage Farm at Poona.

In compliance with orders, the following memorandum was drafted and circulated for general guidance, and it was also asked that civil surgeons would furnish reports on the topography and condition of such towns as were within their immediate reach, and make such recommendations for improvements as might suggest themselves :—

(*Memorandum.*)

"It is almost impossible to lay down *seriatim* the duties of the Health Officers appointed by the above Resolution,* nor can they be defined satisfactorily by quoting from manuals written for places where Sanitary and other Acts are in force. In this Presidency for very many years to come none but the simplest measures will be required, and perhaps it will be sufficient to mention some of the chief points to which attention should be directed.

"*Registration of Births and Deaths.*

"The registration system has been described in the Sanitary Commissioner's Report for 1873, and until such time as there can be found for it a separate and special agency, it will perhaps be more expedient to work it under the orders of the Collector.

* * * *

"Seeing that the village is the primary unit, the initial register must begin there, and there would be no difficulty if in each village there was a qualified resident subordinate to note down births and deaths as they occurred, together with the cause of death. But many patels can neither read nor write, and when the registering *kulkarni* comes round they have to tax their memories as to when this or that child was born, or when such and such a person died, and from what cause. No opportunity should be lost of urging upon the people the importance of themselves reporting all domestic occurrences to the head of their village, and he, if unable to write or to keep a score, will always find some one ready to write or keep it for him. The larger the village the more probable is it that in it some one will be found, and in the smallest even there is generally one Buniah who can write, and whose entries would be available for the *kulkarni* when he paid his visit. In ordinary times the entries for an ordinary village would be very few, and would give very little trouble if made at the time. The new Village Register will be a book with a number of blank forms.

* * * *

"The form itself will be sent to the Mamlutdar, but its counterfoil will remain in the village, and a glance will show if it has been properly kept and posted up to date. The *born dead* are not to be included amongst the total of births or deaths, for, never having had an independent life, it cannot be said they died. At the same time it will be well to know how many there are, and in what localities they are most frequent.

"Ages are now to be registered under four heads, thus:—1. Infants unable to walk ; 2. Boys and Girls ; 3. Adults ; 4. Old People. It is suggested that infants are those under 1 year, that boys and girls are those from 1 to 12 (that being the limit fixed by the Statistical Committee), that adults are those from 12 to 50, and that old people are those from 50 upwards.

"The registers will be kept for the calendar year.

"*Conservancy.*

"By surface conservancy is meant the removal of surface refuse from public and private houses, and outhouses, enclosures, streets, &c., the ordinary dirt and refuse always and everywhere collecting above the surface. Of this nothing should remain either within the house or its enclosure, and, where no receptacles are provided for its deposit, it is far better that it be thrown out on to the street at those times when the streets are being cleaned, or that it be carried to the common heap. This common heap or lay-stall should be on the N. or S. of the village, or at both points if more convenient, or between N. and N. by E. or S. and S. by E. It should never be on the other side of the circle, that is, the half circle from N. through W. to S. It might be enclosed by mud or dry stone walls, and the bulk of material can always be kept down by burning. There is probably no village which could not, on its own lands, use up its own collected refuse, nor is there one in which it should not be collected. There is one season or time when the people themselves will voluntarily co-operate. As each Dewali festival approaches there is a general cleansing and whitewashing, and at this time, if at no other, each village may be fairly cleaned. The opportunity should never be lost.

"Other refuse is the liquid house waste ; the water brought to the house for domestic or manufacturing purposes, and not actually consumed. This should always be led out of the house and its enclosure, and from the point of escape it should be led in as straight a line as possible to the nearest drain.

"There should be no cesspools, for as holes outside village huts they are objectionable and offensive, and as underground chambers to houses in towns they are positively dangerous. They exist in their worst form in Kurrachee and Surat, and every opportunity should be taken to get rid of them.

"Other refuse is the night-soil, and wherever there is a house privy the owner of the house or the occupier should be responsible for its condition and cleanliness. The people generally use the fields outside the village, and, under the circumstances, it is about the best thing they could do, but then it should be done under a system. The filthy habit of fouling the lanes, streets, and open places *within* the village should be put down unhesitatingly. Places of resort for both sexes should be carefully selected ; near enough for use, but as far as possible from dwellings, present and future, and from tanks and wells, and all sources of water-supply. On the score of decency these places should be screened, and there is no better enclosure than a milk bush hedge

* See Vol. VII, p. 22.

(Euphorbium), so trimmed as to let the breeze blow over the ground surface. The prickly-pear (*Opuntia Dillenii*) should never be planted, and huge embankments and walls are almost as objectionable. The making of trench latrines can generally be managed, but less easy is it to provide for their maintenance, and to get for them the indispensable establishment. Unless this is to be had it is better to do without them—far better not to have them than have them and neglect them. When they are made they should be from one to one and a half foot deep; earth should be thrown into them at the time of using them, and each day's deposit should every day be well covered over; in this way alternate sites can be used over and over again. If no trenches can be opened, or if for those opened the establishment to attend to them be too small, a pit can always be made, and into this pit should be thrown the ordure swept up daily from the places of resort. The pit may be of any shape, and if it be a long one the people can use it as they would an ordinary trench. Although shallow trenches are to be preferred, all things being equal, deep ones, or pits even may be used without the slightest risk, provided they are managed properly. They must never be near any source of water-supply, nor must their position be forgotten and built over. The fæces and earth should be well mixed, and, as the demand for the compost will have to be created, it will be safer not to touch it for two or three years. At the end of this time, if the pits be re-opened, it will be seen that there is nothing in them but a rich mould, free from smell, and valuable as a manure.

“ Drainage.

“ Ordinary surface drainage here means the providing for the removal or escape of such water as would otherwise lodge. It may be from a cook-room or a bathing-place or a privy; and it may lie within a courtyard, or just outside, or in the street, or there may be some excavation filled by rainfall. In many instances a few baskets of earth will suffice, or a cutting will lead to a natural channel. It should always be led away from dwellings as quickly as possible. Open segmental drains are the best; indeed no *square* drains should ever be made. The sides should be smooth and impervious, the object being to carry off quickly whatever is to be carried off, without polluting the subsoil. Where nothing better is to be had, much may be effected with well-cut trenches lined with common ridge and roof tiles, and in Sind the natural soil will puddle into excellent channels. In this Presidency, with good surface drainage, there are few town or village sites where much will be required in the way of subsoil drainage. Regular sewerage and drainage must, of course, be for engineers to carry out.

“ Water Supply.

“ When the supply is from tanks, neither bathing nor washing of any kind should be permitted within them, or on any spot which drains into them. Wells should be protected from acquired impurities, such as leaves, &c. They should have parapet walls, and on these no washing or scouring of pots should be permitted. The ground immediately around them, and that round the cattle-troughs, should always be drained. When the supply is from running streams, it should be drawn from a point above the village, and all fords and operations entailing the use of water should be below the village. Periodical cleaning of tanks and wells should be attended to.

“ Epidemics.

“ The special peculiarities of an epidemic can best be noted by the curative agency which combats it, but the reported characteristics may always be inquired into, and its course through a locality laid down very fairly. It is at these times that measures may be carried to which a deaf ear has long been turned, and with tact the opportunity may always be turned to advantage.

“ It is not intended that Health Officers shall have executive powers, and obviously the assumption of powers which have not been delegated to them must bring them into conflict with the civil authority; they are the constituted advisers of the authority, but not the authority itself. The more they can gain the confidence of the people the stronger will be their position. In their relations to the Sanitary Commissioner there is nothing whatever to interfere with their duties in their own department, and those duties will always be their first care. Vaccination is carried on in districts to which the system of registration has not been extended (in Kattywar for instance), but although in those districts there will be no village returns to examine, none the less can local sanitary defects be pointed out, and advice given as to how they may best be remedied.

“ It is only by the cordial working together of all concerned that an effective sanitary system may be developed.

“ JOHN LUMSDAINE,

“ Sanitary Commissioner.”

“ 2d April 1875.

There can be no doubt that a scheme such as that proposed would eventually develop into a real and active sanitary organization. At the time of writing the matter is still with the Government of India, and very probably it will be sanctioned. If so, a very short time should see it in working order, and then in all directions there will be constantly moving over the face of the country a set of more or less trained observers, whose special duties it will be to inspect, advise, and report; and, whilst they look to local conditions, they will also turn their attention to the details of registration; so the outcome of the work cannot but be satisfactory.

And when the Sanitary Commissioner is more released from statistical routine, he can devote almost all his time to those important duties of inspection and topography, by which alone it will be possible to try and establish a connexion between the death-rate of an area and its physical conditions.

Drainage of
Government
buildings in
Bombay.

To discharge the waste from the Secretariat and from all the public buildings on the Esplanade, there is the choice between an *eastern* outfall through the Fort system of sewers, and a *western* into Back Bay, dead to windward. For the Secretariat the eastern outfall was first selected, and, as I understand it, a house drain ran round the building, collected the house-waste and rainfall, and carried them to the nearest Fort drain some 200 yards off. It having been found that sewer gases entered the building (there being nothing to prevent it), the connexion with the Fort drain was abandoned. A new brick-drain, some 1,500 yards long, was made, and carried dead to windward to a point in Back Bay professedly below low-water mark, where it discharges on to a rocky, broken shore line.

The resident Under Secretary having reported that the drainage was still defective, a committee was appointed to inquire into it, and on that committee I first learnt how matters stood. The points to be seen to were obviously—

1. The waste pipes.
2. The house drain.
3. The outfall sewer.

The waste pipes are those for rain water, and those from kitchen, bath-rooms, lavatories, and urinals; but there is no plan to show their numbers, their size, the traps, the connexions with the house drain, and the method of ventilation. There are no waterclosets, the pans being removed by hand when necessary.

With the exception of the pipes for rain water, all the others are *within* the building, and except a shallow water seal, by itself almost useless, there is no safeguard whatever against the return escape of gases from the house drain and the outfall sewer.

Not only in the Secretariat, but in all Government buildings, all pipes should invariably be *outside*; they should be specially ventilated, and entirely disconnected with the house drains. The ventilating pipes should be taken to the ridge, and there fitted with Latham's spiral charcoal ventilators. The drain pipes should discharge into Mansergh's gully traps, and if these be used the discharge can be below the ground line. Another method is that shown in Baldwin Latham's *Sanitary Engineering*, p. 320, fig. 106. The existing house drain may be kept for subsoil drainage, but for that only.

For house drainage it would be better to lay down egg-shaped glass or salt glazed pipes, every tenth an access pipe. At every 100 yards have a spiral charcoal ventilator, and at the junction with the Fort sewer have a proper junction block laid within the water line. At each gully there should be special ventilating pipes, and the rain-water pipes should not be used for this purpose.

As regards the new outfall drain, I cannot but protest, and most strongly, against any sewage being discharged into Back Bay, at a point so close to the Fort, and so dead to windward. It is said that at the outlet the discharge is inoffensive; but, if this be so, it only proves that the sewage impurities never reach the outlet. The gases which now escape at the heads of the rain-water pipes are convincing proof that the contents of the drain are highly offensive, so that clearly they should not be discharged to windward; and if they are inoffensive, why take them 1,500 yards, and by a tide-locked brick drain, when at 200 yards they can be run into a Fort drain? Unfortunately the longer drain has been made, but it can be used to drain the whole of the oval in front of the public offices south of the General Post Office.

I would ask that the drainage principles here advocated may be adopted in degree, and adapted to all Government buildings completed, under construction, or yet to be constructed. I ask this very earnestly, because it is my firm belief that, unless something be done, it is a mere question of time as to when typhoid fever will make its appearance.

The Boree Bunder lines are now occupied by the 20th Regiment N. I., and the following is the strength:—

Boree
Bunder
Sepoy Lines.

Native Officers with their families	...	...	62
Rank and file	...	...	639
Women	...	...	241
Children	...	...	248
Authorised Followers with their families	...	...	57
Followers	...	...	45

Total.....1,292

In addition there are the lines for details, merely separated by a railing. In all there are some 40 blocks of huts in parallel rows, running east and west. Each has 20 rooms, back to back, and each room is 10' $\times$ 10' with an enclosed verandah 10' $\times$ 3'. The height to the ridge is 13', the front wall is 7' 6", and that of the verandah 6'. In each verandah is a small bathing place, which now discharges its waste anywhere. The plinths are from 9" to 1' high, the roofs are single-tiled, the floors are mud, and the walls are lath, mud-plastered. Since the lines were first occupied no urinals have been provided for them, nor was there any latrine accommodation until very lately. Nor has there ever been any drainage proper; but along the west and windward front there is an old square, dry-laid drain, some 4' deep, which during the monsoon carries off the storm waters: at other times it is almost dry. It joins one of the foulest city sewers, but there are no precautions of any sort at the point of junction.

Such is the condition of these lines within their boundary; but without there are other and great drawbacks. At the N.E. corner is the nightsoil depot, where the daily collection averages over 100 tons solid and liquid. At the S.E. angle is the siding where the surface sweepings and house refuse are shot into railway trucks for removal to the municipal lay-stall at Coorla: here, too, the daily collection is very many tons.

With a view to the general improvement of the lines it has been proposed by the military authorities to rebuild the huts, to raise the plinths, to face the bathing places with stone, and to discharge their waste on to open cut stone segmental carriers; these again are to join similar longitudinal channels running between the blocks, and parallel to them, and ultimately they are to join the old drain already mentioned.

Although the carrier system is the best for removing the waste from huts which are themselves too rude in construction to admit of their being connected with sewers, it will be advisable to alter the arrangement by which the waste is to reach the sewers. If the levels will permit of it, I would suggest that the longer channels be given a slope from W. to E. with the wind, instead of from E. to W. against it. If this can be done, a pipe drain of suitable diameter could be laid across the east front, and properly connected with the sewers. The old drain on the west would still serve to carry off the storm waters; but, under any circumstances, it must be properly connected.

With regard to the bathing places within the huts, I may here mention that when the drainage of the Marine Battalion lines was under consideration, I recommended that *detached* lavatories should be put up,—mere screened platforms, to which Vehar water might easily have been laid on, and which, together with such urinaries as would suffice, could all have been drained from a single pipe. There were many assertions that the proposal was impracticable, but not one argument to show that it was so; and so convinced am I that in a very short time detached lavatories would be fully appreciated that I have asked for a trial of one or more in the Boree Bunder lines, together with urinaries. At present sepoys, women, and children may be seen at all hours of the day washing themselves and their clothes at the various wells on the esplanade,—not a pleasing sight, and in direct contravention of the Municipal Act.

It has been proposed by the Brigadier-General that, except on their west front, the lines should be enclosed by a masonry wall 14' high, and there I join issue. It is said that the wall will lessen the nuisance of the night-soil depôt and sweepings siding, and prevent dirt being thrown into the lines from lines occupied by the municipal halalcores. Now these halalcores occupy a line frontage of some 230', whilst the proposed wall is to run 625', and if dirt is thrown over it can be easily prevented by a close-set railing of the necessary height. The east front in 675', and the sweepings siding is to be removed bodily, so no wall will be wanted there; nor would it have been of much use, for the tipping platform is 16' above the rails, whilst the wall would have been 14'. As regards the night-soil depôt, without a doubt it is a horrible nuisance: indeed, so bad is it that the wonder is it has been tolerated so long, when it might at any time have been closed by an injunction of the High Court. But though it is a nuisance, little good would have come from screening it as proposed, and far more effective measures have already been taken. In place of the old uncovered enclosure there is now a masonry building, roofed in, and well ventilated. There are powerful engines for emptying the tanks and flushing them, and they can now be emptied and flushed in from 30 to 40 minutes, and still further improvements are contemplated. The Municipality are doing their best to mend matters, and time alone can show how far they will succeed. At the same time, when all is done that can be done, the working upon a point so close to one of the busiest thoroughfares must always be objectionable, and nothing can be done here that will not be merely palliative. The only real remedy is the closing of the depôt, but this involves a solution of the general drainage question.

The north frontage is 720, and seeing that in Bombay the most frequent winds are from points between W. and N.N.W., the effect of a wall on this side would be to exclude more and more every shift of wind to the north of west. According to the proposal the lines would be converted into a *cul de sac*, with an untrapped drain across the open and windward front.

I have proposed that the followers' huts be shifted over to the east side, and that certain of the sepoys' blocks be moved to other sites, so as to widen the approach to the Carnac over-bridge, and, at the same time, to open out, and, as it were, isolate the lines. In exchange for the ground taken on this side, the eastern boundary can be advanced to the railway limit, so as to take in a plot measuring 3,320 square yards.

Pandharpur
Temple.

I am glad to say that at last most of my proposed alterations to the temple have been accepted by its guardians, and they are now being carried out. The outside arrangements are in the hands of the Municipality, and there will be no difficulty in dealing with these; so, on the whole, the question has been settled very satisfactorily.

European
General
Hospital.

In October last I received from the Secretary to Government in the Public Works Department (Major-General Kennedy) plans and estimates connected with the proposed arrangements for removing the European General Hospital from the buildings now occupied to others within Fort George. It was stated that the removal was necessary in order to provide better accommodation for the European sick, and also on account of the engagement Government is under with the Great Indian Peninsula Railway Company to clear the site occupied by the present hospital. It was urged that the proposed buildings would afford suitable accommodation, at all events for some time to come, because

- (1.) The position they occupy is held to be one well suited for a European General Hospital.
- (2.) The buildings it is proposed to alter and adapt are substantially constructed and well raised.
- (3.) They have a good aspect, being in this respect similarly situated to the existing buildings.

It was further stated that the project provides for such additional subsidiary accommodation as has been considered requisite by the medical authorities, whose approval of the plans has been obtained. It was referred to me in order that I might point out any omissions which might occur to me in regard to sanitary arrangements, and which might have escaped the notice of those officers through whose hands it had already passed.

To understand the position, it must be remembered that, when Fort George was occupied by Artillery, their hospital was a mere enclosed shed, in no way suitable; but such as it was, it was used. When the troops were withdrawn, this shed was made over for the accommodation of the general European sick of the place, and there they have been treated ever since, upwards of ten years. Within the Fort there were also long upper-storied ranges of officers' quarters, of which some were pulled down to make room for a railway which never came. Of the remaining blocks the smaller is occupied by the resident Surgeon, and the upper floor of the larger has been divided into wards for those sick who cannot be accommodated in the hospital proper. I should add that, although Fort George is still so spoken of, it is not a Fort now.

It is unnecessary to describe in detail the several alterations which were proposed, but the existing hospital was to be given up, and in place of it the old ranges of officers' quarters were to be taken over, altered, adapted, and added to.

In reporting upon the project, I said that, in addition to the question as to whether the buildings when altered, and those to be added, will be suitable for hospital purposes, the proposal necessarily involves a consideration of the relative positions of the main structures and their out-houses, and the condition of the general surroundings, present and prospective.

The total area proposed to be given over is about 11 acres, but from this there must be deducted, as unavailable in its present state, and undesirable, to say the least of it, the blind railway cutting on the west and the low-lying marshy ground on the south. The extent of these two portions is together some 5 acres, and, though both would be valuable acquisitions if filled in and reclaimed to a common level, they cannot, as they now are, be deemed desirable even though drained. Not only are they physically undesirable, but they reduce the available area by nearly one half; indeed, looking at other useless patches, it may be said that out of 11 acres no less than 7 are now unavailable by reason of their condition.

The ground to the east, and in the rear of the main buildings, is also very low-lying; so much so that foot bridges lead to the out-houses. Here, too, it would require to be filled in to a common level.

On the north is a crumbling remnant of what was once Fort George, and the future of this must decide whether or not the hospital is to be in this locality. If the Fort is to be restored, the hospital cannot be placed outside, and immediately under its guns. If it is not to be restored, the air space and the ground space it occupies are, perhaps, the strongest arguments in favour of its removal. Its retention will not only deprive the hospital of the full benefit of the site, but in many ways it is objectionable. Its ruins are necessarily foul, its stables and store-sheds are sources of dirt, and the passage of workpeople to and fro across the hospital frontage would be singularly inopportune and unadvisable.

Here, then, are the more prominent outlying disadvantages immediate and present. On the south the low-lying marshy ground, on the west the blind railway cutting, on the east the low-lying ground between the main buildings and their out-houses, on the north the mass of ruins covering some two acres. These are one and all too serious to be ignored, but they are all of them removable, and if removed there would then be a clear site of some 13 acres.

The prospective surroundings are the proposed terminal goods and passenger stations of the Great Indian Peninsula Railway. The present hospital is rather more than 200 yards from the present station, and the value of the site is fully realised by its having a clear frontage of about half a mile; in fact practically there is nothing in front of it. The proposed buildings will be little more than 100 yards from the proposed station, and to leeward of it. It is impossible to say how far the future railway buildings will be intercepting, but, assuming that most of them will be open sheds, there need be little apprehension about them. More grave objections are the incessant noise of a terminal station a little more than 100 yards to windward, and the dust incident to railway working. It may be said that in London Guy's Hospital is alongside of a far larger station, but in London there can be used double windows and other appliances which in Bombay are inadmissible.

The Boree Bunder night-soil depôt is felt to be a gross and palpable nuisance at the present hospital, and its influence would not be less at the proposed buildings, but this I regard as a minor point, because before long the depôt itself *must* be given up. In the same way the foreshore in Mody Bay is broken and foul, but here again its improvement is a certainty; so beyond noticing these points nothing more need be said about them.

I now come to the buildings themselves; and, speaking in a general way, I would observe that, although the proposed alterations may be the best obtainable under the circumstances, they will fail utterly in making the place suitable for hospital purposes, except for a very limited occupancy. I say this with great reluctance and deference, because it is so directly opposed to General Kennedy's expressed opinion that the arrangements "will be so good, or can be made so good, by a little additional outlay" that they need not be regarded as temporary." If this implies that they are to be permanent, it entirely changes the light in which they should be viewed, for it cannot be urged that hospital accommodation which could be accepted as a matter of temporary expediency would also serve for a permanency.

The present is a notable instance of how a place may have the theoretical qualifications of cubic and floor space and may yet be wanting in the essentials of a fitting hospital. In my opinion the disadvantages enumerated are so fatal a bar to the adoption of the project that it is unnecessary to discuss in detail the minor alterations which suggest themselves. There appears to be a misapprehension as to the scheme having met with the approval of the medical authorities, for I learn from the Surgeon-General and Deputy Surgeon-General that they not only do not approve of it, but condemn it.

(The remainder of this section consists of reports from Surgeon-Major T. G. Hewlett, Acting Sanitary Commissioner, of which the following are abstracts):—

On the 28th May I went to Tanna, as I had heard that cholera had broken out in the town. I made my official inspection of it in company with Dr. Hojel, the Acting Civil Surgeon. Sanitary inspection of Tanna.

On the 20th May Dr. Hojel heard that cholera had broken out in the neighbouring districts, and was anxious to take timely measures to put the town in a proper state of cleanliness; but I regret to notice that his endeavours to get the municipal authority to do their duty did not meet with immediate success, although from the commencement

he had received the cordial aid of Mr. Cumine, the Assistant Collector. Dr. Hojel acknowledges the assistance he received at once from the police authorities, who placed sepoy to watch the principal roads leading to the town, so as to prevent people who might be suffering from cholera, or who were coming from villages known to be infected, from entering the town.

The municipal authorities appear to have taken alarm at the occurrence of these cases, and Dr. Hojel was able, after disinfection of their contents, to have all the drains in the neighbourhood of the two houses cleaned out. He established fires in the neighbourhood, and burnt sulphur and dammer; but he reports that even "the aid of the municipal authorities was, considering the circumstances, given in a most niggardly way."

Up to the date of my visit 18 cases of cholera had occurred, 4 of which—equal to 22·3 per cent. of those attacked—had proved fatal. Three of these deaths had taken place in the house to which the original case was brought. It had been emptied of its inmates before my arrival, and, whilst I was there, instructions were given by Mr. Robertson, the Collector, to remove the tiles from the roof, and to dig up the floors and to pull down and burn the tattie partitions. Such action has always been found effectual in Bombay, where we have learnt from experience that cholera cannot live in plenty of air and light.

The town is situated on the west side of Tanna Creek, and is only a few feet above its level. At the time of the census it had a population of 14,299 persons.

There are 2,086 houses, but in the great majority of them there is no privy attached, as only 406 houses had privies; whilst the occupants of the remaining 1,680 houses, numbering about 11,340 persons, have to go outside their domiciles to obey the calls of nature. There are, I believe, only two public latrines which have been built on the side of the creek, but, as Dr. Hojel truly says, they are so far from the houses that the people will not go to them, and they are therefore practically useless; and, besides, they have been erected far above the low-water line, and would prove a nuisance if much used, as the excreta would be every day exposed for several hours until the tide reached them. The people consequently defæcate in any *sequestered* place they can find, too often in *the streets*, and in house gullies, which are not paved, into which the trap-doors of the house privies open, and on to which the urine, ablution water, and house sullage are allowed to find their way, soaking into the ground or slowly trickling down into cesspools, which are numerous, and which emit the most noxious vapours, and are in many instances in very close proximity to surface wells from which the people draw their drinking-water supply.

There is no regular system of sewerage in Tanna. On each side of the streets are unpaved earth trenches formed on one side by the rubble masonry plinth of the houses and on the other by that of the road-way. These so-called drains have not been laid with any proper gradient, so that whatever sullage finds its way into them will not flow, but remains until pushed along into one of the two outlet drains, which, instead of being continued down the edge of the creek, below low-water mark, end in simple earth trenches, in which I saw sullage festering and bubbling from the escape of sulphuretted hydrogen gas, where it remains until absorbed or dried up. These outlets are in the close vicinity of the town.

The water-supply of Tanna is on a par with the drainage. The people are solely dependent on surface wells and a large tank. I saw people washing their clothes, their persons, cleaning their mouths by taking mouthfuls of water and spitting it back into the tank, whilst others close by were filling mussucks and water lotas which they carried off for domestic use. There was a green scum on the water and on the exposed mud-banks. The wells were nearly all dry, and I was told that into one near the market, which was also close to a drain, a few lotas full of water percolated during the night which was eagerly collected by the people very early in the morning. This well at the time of my visit had no water in it, though I could see that it had been recently removed. The bottoms of most of the other wells that I saw were foul, being full of refuse of all kinds.

That the town has suffered from the abominable state of filth it has been allowed to lie in for so many years may be gathered from a study of the mortuary reports. I find, for example, in the Report of the Sanitary Commissioner for 1873 that in that year the annual death-rate at Tanna was 33·22 per 1,000. It must be remembered that 1873 was a healthy year, and not a single death from cholera was registered during it in the entire Tanna Collectorate, but in the town the fever death-rate attained the very high point of 21·19 per 1,000. In Bombay city during the same year it was 9·31. Again, 4·75 persons per 1,000 died from bowel complaints, whilst in Bombay only 2·42 deaths per 1,000 took place from this cause.

Although I am not in a position to state exactly what the annual income of the town is, yet I believe I am right in saying that the municipal expenditure on sanitation during 1874-75 amounted only to between Rs. 7,000 and Rs. 8,000, whereas during that year they had an income of Rs. 31,000. I think, however, enough has been said to show that there is an urgent necessity for pressure to be brought to bear upon the Municipality to make it do its duty in a more efficient manner.

I have made an inspection of the city of Poona with the view of becoming acquainted with its sanitary condition, and instituting a comparison between its present state and that detailed in Dr. Leith's valuable and well-known report dated 8th October 1863. Sanitary inspection of Poona.

The city is divided into eighteen sections or wards called peth, which vary in size and density of population.

As regards the density of the population, I am enabled to show that the inhabited areas of the city are overcrowded.

The principal water-supply is drawn from a reservoir constructed by the Peishwa among the Katruj Hills, at a distance of about five miles from the city, from which it is brought in by an aqueduct and distributed to nearly every section of it, the exceptions being Ghorpade's peth, part of Shukarwar and part of Vetāl peths, which are of too high a level to admit of its reaching them. Water from Karakwasla Canal has also lately been laid on to part of Shukarwar, Vetāl, Ganj, Bhowani, Nana, and Rastia's peths, and there are also ancient wells, made during native rule by the heads of some of the old families, such as the Chaudri, Rastia, and Nana Furnavis, which are situated at distances varying from 5 to 7 miles outside the city, and from which water is brought into it by means of stone and lime masonry aqueducts. At present the number of pipes laid into private houses is something under 100, but the water is generally distributed by means of dipping cisterns which, besides being objectionable in principle, are of faulty construction, as they have generally a low ledge running round the top, on which the drawers of water rest their chatty pots or iron and copper vessels, the consequence being that much dirty water finds its way back into the cisterns, which being exposed to the air get also fouled by dust and other impurities being blown, and by leaves, flowers, &c., being wantonly thrown into them. I saw several cisterns in which there were these objectionable matters. With the present daily supply there are only 10 gallons per head of population; but in some of the peths, as for example in Bhowani, the supply from the Katruj aqueduct is miserably low, as it is stated that not quite three-quarters of a gallon are available for each individual living in it; but when the Karakwasla water is laid on there will be an ample one, and instead of 900,000 gallons per diem, the quantity, if the population is to have the moderate amount of 20 gallons per head, will be at least doubled.

When the Katruj Bund was made by the Peishwa, means were provided for carrying off the water fouled in domestic use; and though the sewers were not constructed on modern principles, yet one cannot but admire the foresight and prudence that recognised the danger of introducing a large volume of water into the place without providing channels for getting rid of it after it had served its purpose.

Nine peths of the city, viz., those west of the Nagjheri, with a present population of 63,569 persons, were thus provided with sewers, but the remaining nine peths, with a present population of 26,867 persons, are entirely without proper means for carrying off the sullage, which either finds its way through channels cut in the ground into the two nullahs, the Nagjheri and the Manik, or else too frequently remains to soak into the surface near the houses of their inhabitants. Some slight, but very inefficient, means have been taken, since the date of Dr. Leith's report, to improve the flow in these nullahs, and they have been, since the introduction of the Karakwasla water, occasionally flushed with it; but the surface of their beds is so uneven that in many places the water stagnates, and the foul matters in it emit the most offensive smell, which however does not prevent the people living in the vicinity from washing their persons and clothes in it. Cattle, too, are habitually taken down to drink the water in these nullahs. The main sewer, which is laid along the right bank of the river and intercepts the sewerage from the peths adjacent to it, discharges its contents into the river immediately below the old bund, within a few feet of the bank. At the time of my visit to it, a black, semi-consistent sludge of half putrid matter had collected opposite to it, and was floating on the surface of the water close along the bank, extending, I should think, for about 200 yards; I saw, however, persons bathing in the river close to the outlet, and washing their mouths out with the water.

Of the entire population (90,436) only about 63,140 persons have any privies to go to; and the serious question forces itself very earnestly upon me,—Where did the remaining 27,000 persons resort for natural purposes? The answer is not difficult, as from the quantity of night-soil I saw lying about the lanes, the nullahs, the back court-yards, &c., it was evident that the people, having no proper accommodation provided for their wants, had resorted to such places.

The provisions of the Municipal Act regarding the employment of municipal halalcotes have not as yet been enforced in Poona, and the owners of the 7,000 privies are entirely at the mercy of private sweepers, of whom there are estimated to be about 300. The condition of the privies is consequently not one whit improved since Dr. Leith described them; I saw many of them in an indescribable state of filth.

The surface of the roads in the city is well swept, and appears clean; but there is an immense quantity of rubbish lying in the back yards of the houses which is never removed.

As regards the disposal of the sewage in England and on the Continent, the truth of Mr. Ward's axiom—"the rain to the river, the sewage to the soil"—is every day becoming more and more acknowledged. Every year the Army Sanitary Commission, which has done so much for the cause of sanitary reform all over the world, urges that this action should be taken in India. In Poona the natural drainage is excellent; and its advantages in having pure drinking water at hand in unlimited quantity, whilst the present supply from the Katruj Reservoir could be utilized for flushing the sewers, would place it on a par with any city in Europe, before many in England, and before all in India.

The preparation of such a scheme is, of course, beyond my powers and beyond my duty; but I am informed by high authority that it is believed to be practicable, and that there is suitable land available for the purpose. If efficiently supervised, it should prove financially profitable; and, although the first outlay would be heavy, it would, I am confident, be cheaper for the Municipality to raise a loan and carry it out than to sustain, year after year, the dead loss entailed by the maintenance of the large establishments I have above shown to be necessary, to which must be added the cost of breaking up and cleaning the present inefficient drains. I have, from information supplied me by the Secretary, roughly estimated that the annual expenditure on all these operations would come to something like Rs. 89,000.

Sanitary
inspection of
Ahmedabad.

On the 30th June I proceeded to Ahmedabad for the purpose of making an inspection of that city:

A halalcote cess has been imposed in the city, and 450 halalcotes are employed in cleaning the house and *panch* privies, and 59 work at the public necessities. These persons collect wood-ashes from the houses in the town, and apply them through a small trap-door opening on to the street to the night-soil, which falls down on to a chunamed platform placed below the privy seat. No basket or receptacle for the night-soil to fall into is ever used in Ahmedabad.

The surface of the roads is, as a rule, well swept, but within the boundaries of private enclosures there are too often collections of rubbish which are not removed. Ruinous houses also afford a ready site for the collection of filth of all sorts, and open spaces and the lanes in the city are sometimes during the night fouled with night-soil, whilst the sides of the dead walls are used as urinals from which a very offensive odour arises. Until quite lately, as there was no magistrate, the municipal officers were unable to take any action whatever to compel cleanliness on the part of private owners, or to punish offenders against the sanitary clauses of the Act.

The bodies of Hindus are for the most part carried out of the town as far up the river as the ford near the temple of Dudeswar, about a mile above the city, and about $\frac{1}{4}$ mile below the Shahi Bagh, where the railway bridge crosses the river. They are burnt on the sand on the edge of the water, and the ashes are thrown into the running stream. At the same place in the very centre of the dry bed of the river and within 40 yards of the stream, Kolis, Marwaries, and Khumars are in the habit of burying their dead in the sand. The graves are dug for a depth of about 3 feet, and the bodies are said to be not unfrequently scratched out by jackals and other animals. There were about 300 or 400 mounds of sand, each indicating a grave, to be seen at the time of my visit. The bodies of the Shrawak inhabitants of the city are burnt on the bank of the river near the Shahpur Gate, and their ashes are thrown into the stream. Mussulmans are buried in the numerous places of sepulture all round the outside of the town.

I must also notice that there are many objectionable hollows near the city, and the right of excavating the ground below the walls on the north-west side has been sold by

Government to potters ; and, as the hollows thus made afford convenient shelter, the place is used as a public necessary.

There is not a single made drain or sewer in Ahmedabad ; the storm-water runs off through the streets and through four nullahs, and the household refuse water with privy water and urine is allowed to flow into closed pits from the bottom of which the fluid escapes into the surrounding soil. We know that for a mixed population it is safe to assume that 40 oz. of urine are voided per head per diem. Thus in Ahmedabad every day there are produced about 124 tons of urine, equal to 45,260 tons per annum, and this amount contains about 1,855 tons of solid putrescent matter, which during every minute of the day is giving off the deadly gases of decomposition, and which by constant infiltration through the soil finds its way into the water-bearing stratum. In the 2,752 "deep" privies, besides the urine, the night-soil of about 9,200 persons is retained every day at the bottom, so that, at 2·5 oz. per head per day, there must every year be about 235 tons of solid night-soil deposited within the inhabited area of the city.

It will be thus seen how impure the sub-soil has been rendered by the accumulated filth of generations upon generations, the consequence being that the water in the wells throughout the town has become brackish and totally unfit for drinking purposes. The well-water is so bad that it cannot be used for gardens, as flowers watered with it die. I am informed that water drawn from wells situated immediately outside the walls, although much less so, is still brackish, but is drunk by some of the poorer classes, whilst a few hundred yards distant from the city the water in the wells becomes sweet and potable. Such facts are instructive ; and that this contamination of the water-bearing stratum in the town has been going on for centuries may be learnt from the fact that the people have from time immemorial been in the habit of constructing beneath their court-yards reservoirs lined with hydraulic cement, into which the rain-water falling on the roofs during the monsoon is stored for the year's consumption. This is at the present time the principal source of drinking water in the town ; whilst those persons who cannot afford the cost of their construction, or who have not space enough within their enclosures, procure their drinking water from the river. About 40 years ago, I am informed, water-works were constructed at the south-western extremity of the city. The water is raised up to a height of 52 feet on to a tower, is filtered through vegetable charcoal and gravel, and is brought into the heart of the town through an earthen pipe, 8" in diameter, which is enclosed in very thick masonry. It is distributed by means of iron stand pipes, of which there are 16, and from 6 covered masonry reservoirs, on each side of which there are ten brass cocks and on each end 3, so that 26 people can draw water at once. This supply is excessively limited and does not exceed 1 gallon per head of population, and the place whence it is drawn is obviously, from a sanitary point of view, the worst that by any possibility could have been chosen, as it is at the furthest point *below* the town, and the river before reaching it has been polluted in numerous ways.

The registration of births and deaths is conducted under the management of the police, who collect the returns ; and perhaps I may express an opinion that the number of deaths, as far as the city itself is concerned, is as nearly accurate as possible, for at each gate a police sepoy is stationed, and no corpse can pass out of the town without being stopped, while a further check is kept by the secretary, who has informed me that only a very trifling difference exists between the figures he has collected and those furnished by the police.

The different causes of death during the years 1871-74 are shown in the following table, and the rates are compared with that of Bombay for 1874 :—

		Ratio of Deaths per 1,000 of Population.						
		Cholera.	Small-pox.	Fever.	Bowel Complaints.	Injuries.	Other Causes.	All Causes.
1871	- -	—	3·2	29·2	5·1	—	8·58	46·8
1872	- -	—	0·1	27·2	0·7	0·3	15·71	44·0
1873	- -	—	0·04	28·06	1·33	0·33	17·01	46·83
1874	- -	—	0·01	26·33	0·98	0·19	17·89	45·39
Mean, 1871-4	-	—	0·84	27·70	2·27	0·21	14·80	45·76
Bombay, 1874	-	0·03	0·40	8·29	2·49	0·35	11·91	23·48

The above is a most instructive table. The average death-rate from fever is more than three times larger in Ahmedabad than in Bombay, in fact it is more than the Bombay rate from all causes; and the total death-rate is nearly double that of Bombay. It is almost the highest to be found in any town in the Presidency. Can there be any reason, but the persistent neglect of the first principles of sanitation?

I think that ample cause has been shown above why the principal city of Guzerat should no longer be left in its present eminently dangerous state, and I earnestly trust that Government will insist upon immediate steps being taken to improve its sanitary condition.

Sanitary
inspection of
Ahmednug-
gur.

I have to report that, having received a communication from the Collector of Ahmednuggur relative to the establishment of a main drainage scheme in that city, I considered it my duty to proceed to the place, and to make a sanitary inspection of the town with reference to the question on which my opinion had been asked.

It is stated there are 2,000 privies in the town. These are sometimes situated inside the walled enclosure, but are too often built into the wall of the house, and are in these cases cleaned through a trap-door opening on to the public street; whilst, in many instances, the owner of a house has erected a private privy on the ground outside the wall of his house, and between it and the curbstone of the adjacent street. From all these privies, as well as from the bathing-places, urine and ablution water find their way by means of a drain or trench cut in the earth, and sometimes are discharged into the roadside gutter or an absorbent cesspit, or frequently into a small earthen vessel, which soon gets choked up when its liquid contents are thrown over the surface of the compound or road.

The night-soil is collected in the town by 70 municipal halalcores, who mix ashes or earth with it, carry it in covered baskets, and deposit it in a closed iron cart, if there is one near at hand; if not, it is thrown into a wooden box placed during the morning in the public streets, from which the cartmen remove it and convey it to a place about half a mile to the south of the town, where the Municipality rent about 30 acres of ground immediately to the east of the Walki road. It is then deposited in pits 24' long $\times$ 4' broad and $4\frac{1}{2}'$ to 5' deep. This trench is filled in to within about one foot of the surface, when about 10 cart-loads of sweepings are thrown over it, and the earth dug out of the pit is heaped on the top. About 30 cart-loads of night-soil are brought here every day, and generally one pit holds the day's supply. There are on the ground 350 pits, which are left undisturbed for about a year and a half or two years. The contents are then taken out and sold to cultivators. Last year the contents of 60 pits were sold for Rs. 400.

There are about 1,000 head of milch cattle in the town, which are housed in about 80 yards, containing on an average about 12 beasts in each. The stables are necessarily dirty, and the ground is saturated with the urine of these animals, the smell arising from it being very obnoxious. The same remark applies to the tattoo stables.

The water-supply is derived from wells constructed during Mahommedan rule, situated at distances varying from five to six miles from the city, and brought into it by three conduits consisting of earthen pipes laid in masonry, two of which are situated on the north-east near a village called Kapurwadi.

I was much pleased at the general cleanliness of the surface inside the city; in fact, I have never seen greater attention paid to this most important duty. The roads and bye-lanes were well swept, and every privy served by municipal halalcores that I inspected was more than fairly clean. It appeared to me that the Municipality do all in their power to keep the place as clean as the present faulty arrangements permit.

As before stated, the household liquid refuse, including urine, privy ablution water, and water used in bathing or for domestic purposes, either is received into an absorbent cesspit, or is thrown over the surface of the ground, or finds its way into the roadside unmade gutters, where after running for a short distance it is, generally speaking, absorbed. There are in the city about 8 miles of such open roadside gutters, while there are about $3\frac{1}{2}$ miles of covered drains, which are, however, not paved at the bottom. There are four main drains in the town.

The establishment of a main drainage scheme, as desired by the Municipality, is in all respects to be commended, and would prove an inestimable blessing to the town; but there is no map available showing the contour lines of levels in the city, so that the preparation of this should be the first thing undertaken.

Ahmednuggur possesses great natural facilities for sewerage. It is impossible for me to state what would be the cost of any such scheme; but information on this point could be readily ascertained by a competent engineer, and there is no reason why, if it is found too costly to undertake all at once, certain sections of the city should not be sewered independently.

SECTION IV.

SANITARY PROGRESS.

Bombay.

Cantonment
reports.

The general health of the garrison during the year has been fully maintained.

The prevailing diseases have been in the following order: ague 209, diseases of the respiratory system 119, diarrhoea and dysentery 97, rheumatism 79, and syphilis 75. Syphilis of a bad type has been unusually prevalent since the last quarter of the year.

Sixteen deaths have occurred, being one in excess of last year.

The lines of the 20th Regiment Native Infantry have been for the most part rebuilt during the year.

Colaba.

The general health of the troops has been indifferent, more particularly since the month of September, or the end of the rainy season.

The system of conservancy for the troops is very good indeed, and the latrines are always clean and in good order. McDougall's powder is used instead of dry earth, and if more expensive, answers the purpose better.

The latrines for the natives answer very well now.

The Colaba Board of Health have brought to notice that the foreshores on the prongs south and west are defiled daily by the evacuations of 300 lunatics. Also that this establishment, always short of water, and being to windward of the troops, was, during an epidemic therein of cholera, a source of great anxiety.

Poona.

The general health of the troops may be pronounced to have been good, notwithstanding the prevalence of cholera, which attacked the troops at Wanowrie, but which fortunately subsided after a fatal result in ten instances. It is remarkable that the 27th Regiment at Ghorpoorie, though with indifferent health at the time, and consequently more susceptible to the influence of the plague, escaped it altogether.

Malarial fevers and bowel complaints were the prevalent diseases, attributable to climatic causes and local influences.

The water supply from the Kurruckwasla is good, both as to quantity and quality, and will greatly improve when it has undergone the process of filtration, the works for which are nearly completed; but the committee are of opinion that, the canal being open, and passing through or by certain insanitary localities, the water is liable to pollution, while its purity is further endangered by the rapid growth of vegetation on the banks of the canal and surface washings.

The ground near the Cantonment Magistrate's Court, which was being levelled up, has now been turned into a garden, and affords ground for recreation to a large number of residents of all classes.

Kirkee.

Fever was prevalent among the Royal Artillery; 266 cases were treated in 1875, against 158 in 1874, though the average strength during the latter year was much greater than in 1875. Cholera prevailed to a considerable extent over the country surrounding Kirkee. The cantonment remained comparatively free from this disease.

The supply of water for the Artillery was good and abundant. For the Sappers and Miners the only supply since they went to their new lines in June has been that of the river, which, though stated by the Government Analyser in 1874 to be fairly potable, cannot be as good as it should be, as it is subject to all sorts of pollution from men and animals on the banks for a large part of the year. It is almost stagnant just above the place where the men have to draw it; it receives during the rains the drainage of a large field used as a trench latrine by the men, and on the opposite side is a large sand-bank, which was let out to a native for the cultivation of melons, and the manure for which, as the man owned himself, was human excrement from the station cesspits. The station committee promised to stop this in future.

Ahmednuggur.

Health of the European Corps good. The principal admissions have been from ague, simple continued fever, and diarrhoea, none of them attributable to special causes. Two deaths only occurred—one from cholera, the other from apoplexy, caused by exposure to the sun when drunk.

The health of the 13th Regiment Native Infantry was reported good throughout the year.

The water-supply has been ample and good.

Both barrack and hospital accommodation for the European and Native troops has been ample throughout the year.

Conservancy on the dry-earth system has been continued in the European Corps, and contents of latrines removed in carts daily, as also are the urinals and soiled water from bathing-rooms. In the Native Infantry Regiment the tank-cart system is used.

The station is kept clean in every respect.

A cook-house and bath-room have been built at the Lock Hospital for the accommodation of the hospital assistants.

A bathing pavement has been constructed for the use of the low-caste people residing in the Sudder Bazaar.

Extra bathing accommodation has been made for the men of the Native Infantry Regiment located in cantonments.

The conservancy of the town of Bhingar has been thoroughly supervised.

A number of houses have been removed in the Munoodavi Bazaar. The ground is now more open.

Asseerghur.

The health of the troops, European and Native, has been good, and the general sanitary state is as satisfactory, considering the many local deficiencies and drawbacks, as can be expected.

Water-supply still most inadequate and insufficient both as to quality and quantity.

In the latrines and urinals used by both Europeans and Natives dry earth was used, and all were reported clean and in a good sanitary state during the year.

The cleanliness and sanitary condition of the station generally, private compounds, and native bazaars have been satisfactory.

Belgaum.

The health of the European troops has been very good, and there were only 9·85 admissions to 10·18 of the preceding year. Ague was the chief prevailing disease among the men of the Infantry Regiment, and there were 123 admissions under that head. Most of the men, however, had suffered previously from the disease in Sind where they contracted it, so that its prevalence cannot fairly be attributed to the climate of Belgaum.

The water-supply is very satisfactory; the wells are numerous; the water is abundant, found pure and good, uncontaminated, and agreeable in taste. The supply is exclusively from wells.

The conservancy for the European troops has been satisfactory, the dry-earth system being efficiently carried out at the station; and the latrines have been kept in a good sanitary condition by limewashing when required, and by frequent dammering of the pans and urinals.

The accommodation for European troops is ample and good. That for the Native regiments is also very good. There is no such thing as overcrowding either in the lines or hospitals.

Ahmedabad.

Cholera prevailed pretty extensively in the city of Ahmedabad during May, June, July, and August, and this cantonment also suffered to a certain extent. Every possible precaution was taken to prevent its spreading.

Measles appeared in the lines of the 3rd Native Light Infantry in April, and continued till June, attacking adults as well as infants. The total number of cases among the men was 17, of which one proved fatal. Among the women and children of the regiment there were about 200 cases.

The general sanitary condition of the cantonment was good. The station continued to be kept clean.

The defective drainage mentioned in last year's report continues, but an estimate for its improvement has been sanctioned, and the work is about to be commenced. The latrine arrangements in connexion with the European troops have worked satisfactorily.

The water-supply for the troops continues in sufficient quantity, and is of fair quality.

The European Barracks were clean and in good order. A project for new barracks with subsidiary buildings has been sanctioned by Government. Two barracks for the artillery are in progress, and one for the infantry is about to be commenced. A school-room is also in progress. The Artillery Quarter Guard has been completed.

Bhuj.

The health of the troops during the year has been good.

The supply of water is drawn exclusively from wells. It has been sufficient for all purposes, and that obtained from the drinking wells was clear and good.

The trench system of latrines has been continued during the year, and, so far as used, answers well enough; but as a matter of fact the men prefer, when practicable, resorting to the open country, as they do not like the scanty and somewhat dirty accommodation afforded by the trenches when much frequented.

No offensive smell has been observed from the filled-in trenches, and those in use are not at any time so offensive as the old system was apt to be.

The dry-earth system in a modified form has been carried out in the hospital latrine and answered well.

The roads have been kept in a good state of repair and cleanliness. Attention has been paid to promoting the growth of trees; but under hand-watering, and in the face of difficulties connected with soil and atmosphere, their progress is very slow.

Baroda.

The general health of the garrison was good.

There is no overcrowding in either barracks or hospitals. The European troops are quartered in barracks which were previously condemned but have lately been repaired and put in order for their accommodation. New temporary lines have been built for the 9th Native Infantry, at a cost of about Rs. 25,000.

The bund of the Pensionpoora tank has been repaired, and a project for deepening the tank and so storing an enlarged supply of water has now been sanctioned.

Sanction having been obtained to the expenditure of Rs. 342 for the repair of some of the roads in the Sudder Bazaar, the work is about to be carried out by the Public Works Department.

Mhow.

The health of the garrison in its several branches may be judged from the following tabular statement:—

	Ratio per 1,000.	
	1874.	1875.
Royal Horse Artillery:		
Admissions - - -	1,781·30	1,800·62
Deaths - - -	—	6·75
Royal Artillery:		
Admissions - - -	1,790·82	1,063·13
Deaths - - -	12·43	38·40
Hussars:		
Admissions - - -	1,790·75	1,182·92
Deaths - - -	10·01	7·31
Infantry:		
Admissions - - -	1,112·37	1,457·23
Deaths - - -	4·88	29·60

The table shows a slightly improved state of things in the health of the Royal Horse Artillery, and exactly an opposite one in the case of the 2-6th Royal Artillery. With respect to the 3rd Hussars, the table shows a notable improvement in the health of the

corps during 1875 as compared with 1874, when it was very unhealthy from enteric fever. It is hoped that this marked improvement was due in a great measure to the abandonment of all the cavalry wells for drinking water and exclusive use of a rather purer water from the one Library well; also to exclusion from the bed of the nullah of numerous natives who resorted there in the preceding year, and to improvement in the drainage.

The health of the Native regiments was considered generally good.

There was an unusually prolonged outbreak of cholera at Mhow; in ordinary seasons it is over by August.

The drainage of the bazaar, which until 1873 was very defective, has been greatly improved by the new drainage scheme, which has already been finished in the main streets and is in progress throughout the bazaar generally.

The monsoon has been ample, but still the water-supply for this large cantonment is very deficient, and great privation by the bazaar people is felt. There is a talk of a scheme for bunding up a portion of a valley in the hills about six miles from here, and bringing the water into the cantonment by pipes. This, if carried out, will be the only means of meeting the existing very deficient water-supply of Mhow. The Executive Engineer tells me that the scheme is in progress, and plans and estimates are being prepared.

The medical officers report that there has been no overcrowding in either hospital or barracks during the year.

Trees have been planted, drains cut, wells cleaned out, and hollows filled up.

Neemuch.

There have been about one-third less of fever cases this year; the rain-fall was less than last year and commenced nearly a month later. Cholera raged during the monsoon, but the average daily number of sick has been considerably less than last year.

The chief storm-water drain, which still opened into the little river (south-west) *above* the temporary bund, was provided with a new outfall. This had silted up and required further opening out and deepening, which has been done.

Nusseerabad.

The health of the European troops during the past year has been unexceptionally good.

The committee are devoting their earnest consideration to the preservation of the sources of the existing water-supply from risk of pollution or contamination.

The dry-earth system of trenching is carried out with very fair success and will, it is hoped, eventually prove a source of revenue to the cantonment funds. The medical officer of the Native troops remarks that the system does not answer fully in the wet weather. This might be remedied by temporarily opening the permanent latrines of the regiment, and the matter will receive consideration during the approaching monsoon.

The surface drains of the European lines and station have been greatly improved and extended, and there is now an abundant supply of fresh water available in all the European barrack ablution-rooms. Several wells have been dug, and cultivation and the supply of vegetables have been improved thereby.

Mehidpur.

The health of the corps has seriously suffered from malarious influences.

In 1874 the lines were thoroughly drained, and a marked improvement was the result in the comfort and health of the men and families. Since then the system of drainage has been extended to the cantonment generally, but sanction for this work was received too late last year for any benefit to be derived from the plan last monsoon; there is no doubt however that the cantonment will be very much drier in future.

Drainage throughout the cantonment was completed; covered latrines were provided for the men and families during the monsoon months; and jungle was to a considerable extent cleared.

Kurrachee.

The health of the Royal Artillery was indifferent, but that of the 56th Foot and the 2nd Beloochees was fairly good.

During the year the drainage in the Napier lines was very much improved, and is now in good working order.

Hyderabad.

The health of the corps forming the garrison during the year has been good.

The sanitation of the fort and the latrines is under consideration.

A water scheme for supplying the cantonment and town from the Indus is being constructed.

Jacobabad.

Health of garrison unsatisfactory ; percentage of sick to strength 163·3, percentage of mortality to strength, 1·5. Chief cause of mortality, malarious diseases of the respiratory system, caused by vicissitudes of climate and malaria. Health unsatisfactory in all regiments ; families in the same condition. That of the native community indifferent.

Trees and branches have been greatly thinned out to admit of the free circulation of air.

During the past year an embankment has been made to the west of the cantonment. Two canals inside of the Jumabinah bund have been closed. All cultivation inside the Jumali bund to the south of cantonment has been put a stop to. The large Kusmore and Begari embankment has been nearly completed, and owing to the foregoing measures percolation water has greatly disappeared ; the water in the well in the Political Superintendent's bungalow was in October 15 to 18 inches less than at the same period in 1874, a fact showing that, if the floods are kept from Jacobabad, the cantonment will right itself by degrees in another two or three years.

ABSTRACT OF REPORT OF THE CALCUTTA MUNICIPALITY FOR 1875.

(*Mr. Stuart Hogg.*)

Drainage.

In the last Report it was stated that detailed estimates for the completion of Mr. Clark's drainage scheme were under preparation, and that the necessary surveys were being made under the directions of the engineer, Mr. Bradford Leslie.

In May 1875 a report was furnished by Mr. Leslie, with detailed estimates for the completion of the works for the whole town, except a small portion at the extreme north. Mr. Leslie concludes his report with the following remarks: "Calcutta, as must be patent to all who have a knowledge of it, is a most difficult city to improve; buildings have been dropped down, so to speak, in a very peculiar fashion, and without regard to regularity or possible future improvement, and with a scarcity of roads where most wanted; therefore, in laying out the 3rd class sewers, it has been necessary to deal with the materials at hand, and to make the best of them."

On receipt of this report, the Justices applied to Government for a loan of Rs. 3,39,400, which was granted.

The sanction of this loan brought to a termination the borrowing powers of the Justices under Act I. (B.C.) of 1872. However, by the new Municipal Consolidation Act just passed, which will come into force on the 1st July next, the Corporation is empowered, and indeed required, to carry on to completion, from borrowed capital, the drainage works which have for so many years been in the course of construction.

The drainage scheme now in progress provides for 39 miles of brick sewers and 136½ miles of pipe sewers. Of the former 37¾ miles, and of the latter 37 miles, have been completed.

The cost of the drainage works up to date has been about 67 lacs, and, at the present cost of labour and materials, the drainage of the whole town south of Baug Bazaar can be completed by a further expenditure of about 22 lacs.

The following is the Engineer's report on the completed drainage works:—

"The sewers are in a very satisfactory condition, and have received closer attention possibly than will be necessary when the entire town is sewered, and the sewage passes through finer gratings than it has been deemed advisable to provide at present at the junctions of the open ditches. As regards road grit, it will always be necessary to employ manual labour to remove the heavier particles, which cannot be flushed down to the silt-pits, and which should not be permitted to pass through the pumps.

"The 1st and 2nd class sewers of the drainage system having been completed, they now receive the entire sewage and night-soil of the city, though not exactly in the form it could be desired, or in a manner conducing to the effectual working of the sewers. This can only be expected when an augmented water-supply is available, when the pipe sewers are generally introduced, and every public and private privy connected, and the open ditches as far as possible abolished."

Water-supply.

The water-works were designed for the supply of six million gallons daily, or about 13 gallons per head on the population taken at 450,000; and since the works have been started, the Justices have constantly had in view schemes for increasing the supply, and extending the works as much as the means at their disposal would admit of.

In connexion with the unfiltered supply, 25¼ miles of pipes were laid through 33 of the public thoroughfares. This unfiltered supply has of course been of great benefit as tending to diminish the waste of the filtered water, though the want of a more copious supply of filtered water is still much felt. The Justices therefore caused estimates to be prepared for two alternative schemes, viz.: (1) for doubling the filtered supply; (2) extending the unfiltered supply throughout the whole town.

The first scheme is the only really efficient one, but it would involve the construction of works the cost of which would amount to about 24 lacs; and as the debt on account of water-supply works now aggregates Rs. 56,11,000 involving an annual charge of Rs. 3,38,715 on account of interest and sinking fund, the Justices were reluctantly compelled to abandon the idea of doubling the works, as a scheme at present quite beyond the means at their disposal.

The alternative scheme was rejected on the ground that the object to be kept in view was to double the filtered supply, and that, the more money spent on the unfiltered supply, the greater would be the financial difficulty of doubling the filtered supply.

As the supply is most deficient during the rains, owing to the filters becoming clogged, it was decided to apply to Government for permission to construct four new filters at a cost of Rs. 1,45,000, as that would facilitate the delivery of filtered water during the rains, and would at the same time be a step towards doubling the filtered supply.

The Engineer makes the following remarks relative to the waste of water in the town :

" The habitual waste of water by nearly all classes of the community continues almost unabated. There seems to be no sense of mutual responsibility, and each inhabitant appears to aim only at appropriating and wasting as much as possible. * * * *

" The general use of meters cannot be recommended, as, in addition to the prime cost, they are a constant source of expense for repairs, and, if the bulk of the water was to be pumped through meters, the friction to be overcome would reduce the pressure, and add to the cost of pumping."

In the new Municipal Act just passed by the Bengal Legislative Council, many useful checks to the waste of water have been introduced.

The total number of houses now connected with the water-works is 8,970 ; 820 were so connected during the year.

Many applications were received for the extension of the water-pipes through various lanes of the town, but, in consideration of the supply being now deficient, it was not deemed expedient to extend it.

The 75 H.P. engine has worked well throughout the year, and has required no extensive repairs beyond the usual periodical over-haul.

The following is an extract from the report of the Analyst to the Corporation on the quality of the water during 1875 :—

" During the past year the water supply of Calcutta has been in a satisfactory condition.

" A comparison of the quality of the water with that of the previous year has shown that during 1875 the water has been rather purer than usual.

" During 1874 the amounts of saline impurity and of chlorine were considerably in excess of those found in 1875. This is quite what might be expected, when it is remembered that in the former year there was a great deficiency in the rainfall. The amount of organic matter, as measured by the 'total ammonia test,' was almost equal in the two years, and this is satisfactory, for it perhaps might have been feared that with the scarcity of water the amount of organic matter would have increased. The organic matter which is measured by the 'total ammonia test' does not represent the absolute quantity of organic matter present in the water, but it (so far as our present knowledge goes) gives a fairly accurate estimate of the amount of contamination by *animal organic matter* of the water ; the amount of *vegetable* organic matter is not estimated by this test."

The streets have been regularly cleaned, and the refuse deposited on them removed by about 300 carts to the depôts along the Circular Road ; from whence it was removed, as in previous years, to the Salt Water Lake, where it is utilised for raising and reclaiming the embanked square mile acquired by the Justices in 1865. Conservancy.

In 1863, when this Municipality was created, and for some years afterwards, the night-soil was collected by mehters, and at night thrown into the river at a ghat set apart for the purpose. This system, it need hardly be stated, created a fearful nuisance, both along the river bank, and also at night in the streets through which the filth carts passed.

As soon as the new main drainage scheme was sufficiently advanced, the Justices put a stop to the polluting of the river, and caused the filth to be collected from private houses and discharged into the main sewers at depôts specially established for the purpose. As the drainage scheme progressed, the latrines attached to private houses along the sewered streets were connected with the sewers and water laid on. In streets not sewered the filth had to be collected as before stated.

As constant complaints were received of mehters failing to do the work for which they were paid, the Justices organised an establishment for removing filth, and, subject to the payment of certain monthly fees, undertook the work for private parties. This was the origin of the Nuisance Department. The system has, on the whole, worked fairly, but, as the plan was not authorised in the Municipal Acts, it was not possible to organise an establishment for the work on a thoroughly satisfactory basis. Now however, by the new Municipal Act, the Municipality has power to cause the

duties in question to be performed by an establishment under its own control in such districts of the town as it may think proper, and it has also power to levy fees for the work done; all difficulties in the way of perfecting the scheme are, therefore, now removed.

The net profits from filth depôts aggregate the very large sum of Rs. 29,750 for the year. These fees are collected from mehters for the use of the depôts provided by the Municipality, and are regulated by the quantity of filth deposited for discharge in the depôts.

Improvement
of native
villages.

During last year, owing to the remarks made by the Army Sanitary Commission regarding the state of bustees in Calcutta, the Government of Bengal urged prompt measures being adopted by the Justices.

In deference to the wishes of Government, a Special Committee was appointed to inspect and report on a number of bustees. The Lieutenant-Governor also took a direct personal interest in the inquiries which he had set on foot by visiting some of the worst bustees, about which so much has been written, and he is therefore now in a position to judge of the correctness, or otherwise, of the description of their foul state given in the following extract from a report of the Special Committee:—

“ We have inspected the six villages situated in the Northern Division of the town, and regret much to have to report that we found them all in a filthy state, and we have reason to believe that there are other villages in town in an equally bad condition.

“ The villages are all, or nearly all, after one type, consisting of a collection of huts of different sizes, which have been constructed from time to time without any plan or arrangement, generally surrounded by filthy drains, and having only tortuous narrow footpaths for access to the interior; and many of them having slimy stagnant ponds, full of putrid vegetable and animal matter in a state of decomposition. It should also be stated that many villages are intersected by deep public ditches or drains, which receive the drainage and sewage of the surrounding area, and are in a most filthy state. The improvement of these ditches is the proper work of the Municipality.

“ The remedies proposed by both Dr. Tonnerre and Mr. Clark are roads, ventilation, drainage, improved huts, and a better system of conservancy, coupled with the construction of suitable public latrines for the use of all residents in the villages. That these are the radical reforms required is a point on which there is not likely to be much difference of opinion. All these measures should doubtless be carried out, if practicable, but to do so thoroughly would involve the demolition of nearly all existing huts and their reconstruction on a proper and regular plan.

“ The question then arises, who is to pay for this costly reform?

“ According to the present land system in Calcutta, the land on which each village is built belongs to proprietors who lease out plots of land to tenants, and the tenants construct their own huts, according to their own ideas of convenience and comfort; the owners of the land exercising no sort of efficient control over the disposition of the huts.

“ To attempt a system of improved drainage without, in the first instance, remodelling to a certain extent the arrangement of the villages may be in many cases impossible, as not only are the huts indiscriminately scattered over the land, but the area is on no uniform level, some spots being high and others low. Conservancy arrangements of an efficient character are not possible in most villages, owing to the absence of proper roads and latrines.

“ It is therefore obvious that the cost of improving the villages must involve a very large expenditure, and, as the Municipality can hardly be expected to expend any very large amount on improving private property, the owners must bear the chief burden of the cost; as to impose on tenants, who live from hand to mouth, much pecuniary responsibility would simply be impossible. Moreover, it must be borne in mind that the owners of the land have not disconnected themselves from the direct management, and consequent responsibility, of their property; they let out their lands at a very high rate of rent, and must therefore be held responsible for the state in which it is kept. * * * *

“ We consider—

“ 1stly. That owners should provide private roads of reasonable width, say about nine feet, through their villages for the use of their tenants and for conservancy purposes, the proprietary right in the land occupied by the roads remaining with the owner.

“ 2ndly. That these said roads should be cheaply but efficiently drained.

" 3rdly. That all the waste lands, not let to tenants, should, when reasonably practicable, be raised, drained, and brought to a proper level.

" 4thly. That low marshy lands and small stagnant ponds should, when reasonably practicable, be filled up.

" 5thly. That filthy unwholesome tanks should, when reasonably practicable, be filled up or improved.

" 6thly. That the landlords should be made to understand that they are personally responsible for keeping all waste unlet lands in a proper state of cleanliness.

" As regards the tenants, for the present we would merely require that they should collectively, or separately for each household, provide proper latrines for their own use, that they should drain their own private premises into the drains provided by their landlords, and should place in a proper state the land held by them on lease.

* * * *

" We would here notice that, next to the nuisance of waste lands in villages being made use of as latrines, the most fertile source of filth arises from the absence of all arrangements for the keeping of cows and bullocks. The present practice is for the *gowallas* (milkmen) to stable their cattle in huts with mud-floors, and to store the stable manure in the immediate vicinity of the huts. The nuisance caused by this is very great, and can only be met by prohibiting by legislative enactment the keeping of cattle in town, except in buildings duly licensed. It would then devolve on the Municipality to see that only buildings provided with proper drainage arrangements should be used for the keeping of cows.

" The same observations, but in a modified degree, apply to stables for hackney carriages, horses, and ponies; these should also be licensed and brought under strict supervision, as at present many of them are in a very unsatisfactory state."

The new Corporation will have full power to carry out the sanitary reforms so often recommended, but the cost of the reforms required in each bustee will, the Chairman fears, be so great that too much progress must not be expected.

Much progress will never be made unless the executive authorities are fortunate enough to secure the co-operation of the leading owners of property. Baboo Soobuldas Mullick, a wealthy landowner of the city, has made a beginning by undertaking to remodel his Mirzapore bustee according to a plan furnished from this office. At an expenditure of about Rs. 7,000, he has constructed metalled roads of reasonable width through the bustee, and he has also provided good surface-drains on the sides of the roads, and now the framework for the construction of a good bustee is ready. But much more remains to be done, as the huts have to be arranged with some sort of regularity; latrines have also to be constructed, and the low lands filled up. The works of improvement in the Mirzapore bustee have now long been at a standstill, owing to the property being under partition, but it is to be hoped that Baboo Soobuldas Mullick will fully accomplish his purpose, so that the municipal authorities may have one bustee in town to point to as fulfilling their wishes in all sanitary details.

Most persons will admit that it would be conducive to the interests of the public if all markets belonged to the Municipality and were under its direct control. However, to carry out this plan would involve such a large capital expenditure, which would have to be raised by loan, that the plan can only be carried out, if at all, by degrees. Public markets.

A step towards attaining this end has been taken by the establishment of a first-class slaughter-house for the whole town, as also by the acquisition of the chief market in the town, viz., the Dhurumtollah Bazaar, and the construction of a fine spacious new market.

The slaughter-houses cost the town Rs. 2,28,308; they were completed in 1870, but it was not until 1872, after much trouble and expense, that they were placed on their present satisfactory footing. The Health Officer is responsible for the immediate control of the slaughter-houses, and it is his duty to see that only wholesome meat is supplied from them to the markets in town.

It is alleged by some persons that the establishment of the Municipal Market has been followed by a considerable general rise of the price of supplies, especially meat and fish. The Chairman is unable to accept the accuracy of this statement; but even if it were correct, the result is in no wise owing to the action of the Municipality, as the rents levied are not in excess of those charged in the old Dhurumtollah Market. It is true that during the first quarter the supply of mutton was dear, and not up to the mark, owing to the late famine in Behar, as nearly the whole of the sheep sent to Calcutta for public consumption came from that province. With that exception the supply of every article of food has, on the whole, been abundant and good throughout the year.

Health of
Calcutta.

The following is an extract from Dr. Tonnerre's Health Report for 1875:—

“ During the year under review 15,072 persons died in Calcutta, against 12,651 in the year preceding. The death-rate, therefore, to a total population of 447,601 as

“ per census of 1872, amounted to 33·6 per 1,000.
“ Deaths are ascribable to the under-mentioned classes of diseases as shown against each:—

		Deaths.		Ratio per cent. of Deaths to Population.	
		1874.	1875.	1874.	1875.
From Zymotic diseases	- - -	8,384	10,386	1·87	2·32
„ Constitutional ditto	- - -	486	580	0·10	0·12
„ Local ditto	- - -	2,002	2,093	0·44	0·46
„ Developmental ditto	- - -	697	804	0·15	0·18
Violence	- - -	179	190	0·03	0·04
Diseases not specified	- - -	903	1,019	0·20	0·23

“ The bulk of the mortality from zymotic diseases resulted from the specific causes shown in the annexed statement in the order of their virulence:—

	Deaths.	Ratio per 1,000 of Deaths to Population.
Fevers - - - - -	5,444	12·16
Cholera - - - - -	1,726	3·85
Dysentery - - - - -	1,274	2·84
Diarrhœa - - - - -	821	1·83
Small-pox - - - - -	775	1·73

“ The highest number of fatal cases from constitutional diseases occurred from phthisis, viz., 355; under local diseases, the largest number was from spleen disease, or 564; and from developmental diseases, joint diseases, &c., 340.

“ The following table exhibits the total mortality during the decennial period 1866–75 from four of the principal diseases of the zymotic class:—

Diseases.	Number of Deaths during the Decennial Period 1866–1875.	Ratio per cent. of Mortality to Total Population during ditto.	Average Mortality of the Decennial Period.
Fevers - - - - -	44,591	9·96	·99
Cholera - - - - -	24,589	5·49	·54
Dysentery - - - - -	14,536	3·24	·32
Diarrhœa - - - - -	6,891	1·53	·15

“ The mortality in relation to sex was as follows:—

	Deaths.	Population as per Census.	Ratio per cent. of Deaths to Population.
Males - - - - -	8,821	299,857	2·94
Females - - - - -	6,251	147,744	4·23

“ showing a higher proportion of deaths amongst females than amongst males.

“ The highest number of deaths from fevers, dysentery, diarrhœa, cholera, and small-pox occurred in the Northern Division of the town, viz., 7,403, against 2,637 in the Southern.

“ Fevers prevailed with the greatest virulence in December, as in the year preceding, a mortality of 19·07 per 1,000 of population having occurred during that month; the next highest death-rate took place in November. There was a rise in the rate of mortality from August of the past year.

“Dysentery was most fatal in December, and so was diarrhoea; and they were at the lowest in May.

“Cholera was also most virulent in November, causing a mortality of 19·75 per 1,000 of population; the next highest death-rate from the disease occurred in April; and it was at its lowest figure in July.

“From small-pox the highest number of deaths, 243, occurred in March, *i.e.*, 6·52 per 1,000 of population; the next highest was in June, when 162 persons succumbed to it. It gradually subsided, till it entirely disappeared in December.

“With the exception of small-pox, nearly all diseases stood at their highest in November and December, and the lowest in May and June, which months and also July are invariably the most healthy during the year.”

That the death-rate should have been as high as 33·6 per 1,000 cannot be accounted for by any known causes. It must, however, be borne in mind that from the composition of the town population Calcutta, in respect to its aggregate mortality, is not comparable with the cities of other countries. Here we have a great number of migratory classes, and what proportion those migratory classes bear to the settled classes cannot be accurately ascertained, but doubtless it is large. It is well known that among the migratory class the first thought in illness is to hasten away to their homes, and that from this there arises an effect on the vital statistics of the place much the same as that of invaliding on the death-rate of the Army; owing to the above causes, and to the uncertain movements of the migratory classes, a comparison of the death-rate of different years forms the basis of no sound conclusions. But remembering the special conditions of the population of this town, the mortuary figures become more serious, as they represent a death-rate which must be most largely derived from one section of the people, *viz.*, the fixed residents.

During the last 10 years Calcutta has made rapid strides in sanitary reforms, but it must not be lost sight of that, whilst to the casual observer the chief streets of this city are provided with good drainage arrangements, and have a supply of pure water laid along them, and represent generally a tidy and well cared-for appearance, yet, if an inquisitive enquirer did but leave the public thoroughfares, he would at once be introduced into the home life of the natives, would be brought face to face with the great sanitary reform question of the day, *viz.*, improvement of the native villages, and would be convinced of the urgent need of wide-spread change if human life is not to continue to be sacrificed to the neglect of common cleanliness.

ABSTRACT OF REPORT OF THE MADRAS MUNICIPALITY FOR 1875-6.

(*Mr. L. R. Burrows.*)

Drainage.

One of the chief causes of complaint during the year was the mode of cleaning the drains. The removal of slush is attended with a very powerful stench, which is not perceptible so long as the slush is undisturbed. "It is a choice between two evils, and in cleaning the drains and removing the slush the lesser evil has undoubtedly been chosen. The prevalence of this nuisance is entirely due to the bad form and the ruinous condition of the drains in general.

The work of flushing the drains has been carried on throughout the year with good effect. A great improvement was brought about in the large open drain which traverses Triplicane from the Grand Mosque to the Wallajah Road, by repairing the floor and side walls and connecting it with the water mains. From being a source of danger and a constant offence to the neighbourhood, it has been rendered efficient as a drain and inoffensive. So long as the quantity of water used for washing and other domestic purposes continues to be so limited, the house drainage received into the street gutters, impregnated as it is to so large an extent with urine, will necessarily be of an offensive character, and flushing must be carried on as extensively as possible. But the full benefit of flushing is obtained only where the gutters are of good construction and in good repair.

The expenditure on new drains was Rs. 1,889, and on repairs to drains Rs. 4,863. Compared with the requirements of the town, the work done during the year was but a drop in the ocean.

The allotment to drains was, as usual, restricted, in the expectation that the new drainage scheme would shortly be put in hand. It will not be out of place here to review the history of the new drainage project, and to mark the position in which it stood at the close of the year.

During the year 1874-75 the Government repeatedly pressed the drainage question on the attention of the Commissioners, and called for a report from them on the general features of any scheme they might be in favour of. Owing to a press of work in connexion with the pipe laying and erection of fountains, there was some delay in the preparation of the report by the Municipality. Meanwhile arrangements were entered into by the Government with Mr. W. Clark, the Engineer who had executed the Calcutta drainage works, to draw up a detailed scheme and estimate for the drainage of Madras. Mr. Clark commenced work towards the close of the year 1874-75, and in April 1875 his report was submitted to Government. On the 14th of May Government passed a Resolution of which the following is an extract:—

"Mr. Clark alludes to Major Tulloch's report as being so full and complete as to the nature of the district to be drained as to dispense with description from him.

"He concurs with Major Tulloch in excluding provision for carrying off rain water from his scheme; in the position of his main drainage out-fall, viz., into the sea two miles north of the Railway Station; and as to the necessity of lifting the sewage at some one point. He has simplified and cheapened the project as a whole, by dealing with Saint Thomé separately. This has enabled him to lay his sewers at much less depth and cost; but it would seem that Saint Thomé will be exposed in a minor degree to the evils inseparable from having two out-fall sewers, one north and one south, similar to the two out-falls of Black Town drain.

*

* . . . *

*

*

*

*

"Mr. Clark proposes to carry off all fluid filth or house-drainage, subsoil water near the surface, and excreta, by a system of main and out-fall sewers of brick or laterite in mortar plastered with cement inside, and laid in concrete, or of concrete blocks cast to the required shapes; and of subsidiary stone-ware drain pipes, laid in concrete; all concentrating at a pumping station near the Elephant Gate Bridge, where a couple of engines of 35 horse power each will lift the discharge of the main sewers a height of 19½ feet, to gravitate through the out-fall sewer into the sea, if no arrangements can be made to utilise the sewage for the irrigation of land. To facilitate such use it is proposed to leave open 1,300 yards in length of the out-fall sewer. Including Rs. 1,08,325 on account of the separate Saint Thomé project, the total cost of the drainage scheme is set down at Rs. 23,48,000, Major Tulloch's estimate having been 33½ lacs.

" His Excellency the Governor in Council cannot but accept the scheme, elaborated during four months' continued devotion to the subject on the spot by an Engineer of Mr. Clark's extensive practical Indian experience, as the most satisfactory solution of the problem of draining Madras that is likely to be attained. He observes, however, that Mr. Clark bases the details of his proposals in a great measure on the local water-supply, and considers that their efficiency is likely to be commensurate with the development of the latter. The Government as well as the Municipality being financially and otherwise interested in its complete development, which is now retarded owing as much to want of engineering knowledge and experience as to lack of funds, it would appear desirable that arrangements should be entered into for placing both the water-supply and drainage in the hands of a competent Engineer-in-Chief, such as Mr. Clark.

" It is remitted to the Financial Department to arrange with the Municipality the manner in which the interest of the loans and the working expenses of both schemes can best be met; the cost of draining the Fort and Black Town only, with pumping station and out-fall complete, and that of the separate Saint Thomé project being raised in the first instance."

In communicating this order to the Municipality the Government desired that the Commissioners would express their views at an early date. The Commissioners referred the matter to a Committee for report, and subsequently adopted a resolution of that Committee which was as follows:—

" Resolved, that this Committee is of opinion that the cost of the maintenance and extension of the water-works should be met from the proceeds of the water rate which it is in contemplation to levy on houses and lands.

" That, considering that the proposed drainage works are more of an imperial than a local character, the Committee assume that the Government will be disposed to incur the greater portion of the cost of the scheme. Any share of the burden which the Municipality may be called upon to defray should be met from the ordinary revenues, if that becomes possible, by the expenditure being spread over a number of years, or by raising, if necessary, a loan, the interest on which should be payable from those revenues."

The orders of Government on this communication from the Commissioners had not been received at the close of the year, but a bill, having for its principal object the increase of the municipal revenue, was introduced in the Legislative Council in February, and was referred to a Select Committee.

Beyond maintaining the works in good order very little has been done in connection with the water-supply of the town. 1,559 yards of pipes were laid down in extension of the municipal pipe-system; ten public fountains and three stand-pipes for drain flushing were erected; in addition to the 140 house connections in existence at the end of 1874-75, 36 new connexions were made during the year; and the large estimate for supplying the Government buildings at Chepauk was successfully executed. Twenty tanks for bathing and washing have been supplied with water from time to time as occasion required. Water-supply.

In June the water at several of the public fountains commenced to give off a very offensive smell when fresh-drawn. It was found that the bad smell disappeared after the water had been exposed a short time to the air. The water received into the pipes was found to be heavily charged with solid matters, including some forms of animal and vegetable life. These latter dying and decomposing in the pipes were doubtless the cause of the bad smell. Whenever there was a good circulation in the pipes, the water was perfectly inoffensive. It was also observed that, the lower the water sank in the Red Hills reservoir, the more it showed a tendency to become offensive in the pipes.

When it becomes necessary to remove the weeds, the water is run off for the purpose, and not re-admitted into the pipes until it has cleared. Great inconvenience is caused to the public by these interruptions, which occur about once in six weeks, but there is no other means of avoiding the introduction of a large quantity of silt into the pipe system. It was discovered during the year that the 42-inch main contained nine inches of silt.

Notwithstanding its imperfections the Red Hills water-supply is an incalculable blessing to the town. The addition of settling tanks, or means of filtration, is needed, and it is hoped that these improvements will shortly be put in hand.

Every effort was made to ensure the proper working of the large force employed in conservancy operations. Notwithstanding a reduction of the supervising staff, the streets Conser-
vancy.

were kept pretty clean, and some improvement was effected in the attendance at the public latrines. The use of road dust as a deodorant has also been introduced with good effect.

Besides 22,597 cartloads of night-soil removed from the public latrines, an enormous quantity is taken away every day in the open rubbish carts. It may be said, in fact, without exaggeration, that the whole of the night-soil from all the private houses in the urban portions of the Municipality is thus removed. The privy in an ordinary Madras house is so constructed that the urine flows off by a gutter into the street drain along with the other slops of the house, and the solid deposit alone remains to be removed by the scavenger, who attends once a day or oftener for that purpose. These house-to-house scavengers are generally at work very early in the morning. Their collections are more or less deodorized by the addition of ashes and dust, and thrown into the first municipal cart which offers itself. This practice has always prevailed in spite of the opposition of the Conservancy Department, and it is obvious that, unless some adequate means for the separate removal of night-soil be provided, any attempt to stop the practice must either prove abortive or mischievous. Any scheme involving a large additional expenditure being out of the question, the following arrangements were decided upon. House scavengers were to be allowed to throw night-soil into the open carts, but the more plentiful use of ashes and dry earth was to be insisted upon. They were also to be allowed to deposit night-soil at any public latrine. By these arrangements the practice of dropping night-soil surreptitiously into dust-bins and other convenient nooks and corners has been checked to a great extent, and a considerable improvement has been effected.

Health of
Madras.

Including 389 still-born, the number of births registered in 1875-6 was 10,473, but there is no doubt that a large number was not reported.

The deaths numbered 14,415; few, if any, deaths escape registration. On a population of 397,552, the death-rate per 1,000 was 36·2. A very large proportion of the deaths occurred amongst children under six years old; the percentage was not less than 41·48, of which 21·65 were boys and 19·83 girls. In order of salubrity June stood first and January last. Taking the deaths for the six years from 1870-71 to 1875-6, January is shown as the unhealthiest month, while April stands first, and June second.

Of the total deaths cholera caused 1,450, or about 10 per cent. Its intensity was as variable as its course was capricious; and its fatal work was accomplished in 238 days. Every precautionary measure suggested by the medical authorities both to ward off the epidemic and to arrest its progress was adopted, but in vain.

Fevers, diarrhœa, and dysentery prevailed throughout the year. The two former contrasted favourably with the previous five years, but dysentery exceeded the average.

ABSTRACT OF REPORT OF THE BOMBAY MUNICIPALITY FOR 1875

(*Mr. W. G. Pedder.*)

The much complained of night-soil depôt at Carnac Bunder has been much altered and greatly improved. The building itself has been rebuilt and roofed so as to diminish the stench and conceal the operations from public view. The pipe to the sea, which was constantly choking, and gave much trouble, has been entirely relaid. And engines and pumps have been erected to flush the depôt with abundant sea-water, thus saving a great waste of Vehar water, and to force all the contents of the tanks, into which the ordure collected in the city is emptied, into the sea under water in only half an hour or forty minutes immediately after ebb tide begins, so that the stuff is carried rapidly out to sea. The new arrangements are now working most successfully; the improvement is immense, and greater than was anticipated, and I think that the present system may now well be permitted to continue till it can be superseded by a complete system of sewerage. Drainage.

A machine for the experimental desiccation of night-soil was ordered from England, but it has not been erected, as a part of the machinery was lost in landing, and we have not yet been able to replace it.

As stated in my last Report, the Pumping Machinery at Love Grove gave a great deal of trouble in 1874. It has since been very thoroughly overhauled and placed under the direct control of the Superintendent of Workshops, and is working satisfactorily. We are now, however, obliged to work the engines and pumps much more nearly up to their full power than was formerly the case, and this involves very heavy expenditure in coals and in repairs. The reason of this is simply that the quantity of sewage to be lifted has very largely increased, and of this increase there are two causes. The greater the quantity of Vehar water used in the town, and the more the sewers are improved or extended, the greater is the quantity of sewage conveyed from the city to Love Grove; and the increase arising from this cause is, of course, highly satisfactory. But, besides this, there can be no doubt that the sea-water at high tides now percolates through the Vellard, and, soaking the lower portion of the Flats, finds its way into the high-level sewer, so that we are really at times pumping against the sea. It is hoped that the new project lately sanctioned for surface drainage of the Flats will remedy this.

The number of connections with the water-works increased by 230, and this increase would doubtless have been larger had it not been for the insufficiency of the Vehar supply. Water-supply.

The only extension of water-supply was to a street in Kamateepoora, and the principal work carried out in connection with the Vehar works was the complete reconstruction of a portion of the Waste Weir, which had fallen out of repair. I am glad to say that there have been no serious bursts of the Vehar Main during the year.

The Vehar Lake was again quite full at the close of the monsoon, and we cannot be too thankful that the Tulsi works have been so far completed as to permit the diversion of the rainfall of the Tulsi Valley into Vehar since 1872. Had this not been done, as the lake was not nearly full at the end of the rains of 1871, it would by this time have been half empty, pressure would have been very bad, and great part of the city would have been entirely unable to obtain Vehar water. As it is, complaints of scarcity of water have been and are loud and almost universal, and will doubtless increase till the Tulsi water can be brought direct into the city.

No progress was made during the year with the Tulsi works, the main dam having been raised to its full height, and it being impossible to go on with the rest of the work till the question of the manner in which the project should be completed was decided. I am glad to be able to add that this is now the case. After long and careful discussion, Mr. Walton's original designs for the work have been fully approved by the Government of Bombay and the Government of India: the latter Government has agreed to advance the necessary funds on very liberal terms, which have been accepted by the Corporation; the work will now be pushed on as rapidly as possible; and I hope there is a chance that it will be completed, and the Tulsi water brought into the city, by the end of the hot weather of 1878.

The long delay and vigorous criticism of a project finally accepted without modification has caused a loss of time which cannot but be regretted, as it has delayed by at least a year the much needed improvement of the water-supply; but, on the other hand, the advantage has been gained that the Corporation and the public will be fully convinced that the project adopted is a thoroughly sound one.

Public
markets.

The new markets at Mazagon have for many years been promised to the inhabitants of that quarter, and will be a great convenience to them. They were nearly finished during the year, and will now be opened almost immediately. They consist of three separate markets—for vegetables and fruit, &c., for mutton and fish, and for beef. They are very well built, convenient, and ornamental. The Corporation will this year be asked to sanction a sum to complete them by the addition of proper latrines, as at the Crawford Market, and by enclosing and laying out the municipal ground on which they stand. I have no doubt that they will be fully occupied and will prove popular, and hope that they will be remunerative to the Municipality.

Town im-
provements.

Among other new works may be mentioned the construction or reconstruction of three important sewers, of three new or improved roads, and of seven municipal buildings.

In 58 localities the streets have been widened by the addition of 1,788 square yards of land.

The roads have been kept in very fair order throughout the year at a diminished cost, the area repaired having been about 790,000 square yards against 765,000 last year, and the cost Rs. 2,49,000 against Rs. 2,65,000 in 1874. The cost includes the construction of a number of footways, and also the reconstruction of a large portion of the Parell Road.

Health of
Bombay.

Last year I pointed out that the Health Department had done more work at a smaller cost than ever before; a still higher degree of efficiency has been attained in 1875.

The year was not a healthy one. The death-rate rose from 24·04 per 1,000 in 1874 to 29·07 in 1875. It must, however, be remembered that in all probability the population, partly from the extension of manufactories and partly from the exceptional cause of the Prince's visit, was a good deal larger, on an average, in 1875 than in 1874, and that the increase in the death-rate is therefore in fact apparent only. That there was a real increase in the death-rate, however, though probably not so large a one as appears, is shown by the unusual number of deaths from cholera and measles, which unfortunately visited the city in an epidemic form. These diseases carried off 2,333 people, or six times as many as in the previous year.

Until 1875 Bombay had been free from cholera in an epidemic form for several years, and the number of sporadic cases had greatly diminished each year of the preceding three. We cannot expect perpetual immunity, and the outbreak of 1875 was a serious one, especially as it was not local, but extended with great violence all over Western India. But it is satisfactory to notice that, notwithstanding this, the deaths from cholera in Bombay were only 847, or nearly one-third less than the average annual mortality from cholera (1,220) in the ten years 1862–1872. I think it is due in no small measure to the vigorous efforts of the Health Department in stamping out the disease that so formidable an epidemic caused a mortality comparatively so small.

ABSTRACT OF REPORT OF THE HEALTH OFFICER OF BOMBAY FOR 1875.

(*Surgeon T. S. Weir.*)

There has been a great increase in the efficiency of the Health Department, and the amount of work accomplished is much in excess of that of former years. Indications of greater activity and usefulness are perceptible in every branch of the establishment. The tests which should be applied at the end of the year to the Health Department, and by which its efficiency should be judged, are the amount of night-soil and garbage collected and removed, and the extent of drains opened and cleaned. Sanitary work.

The greatest quantity of night-soil ever collected by the Health Department was collected in 1875, viz., 65,915·3 tons, equal to 180·5 tons a day. While the amount collected cannot much exceed 180 tons a day, it ought never to fall much below it. The total weight of garbage and refuse collected amounted to 118,407 tons. 166·8 miles of covered drains were opened and cleaned. Conservancy.

For the purpose of conservancy there were, on an average, every day at work 2,481 men and women. This is an immense establishment, scattered all over the city; and unless a constant and personal supervision were exercised over every branch of the establishment, and firm discipline maintained, the department would soon become disorganised and fall to pieces. The only punishment which I can inflict on those who are lazy, careless, or negligent is a fine or dismissal. And although I am extremely reluctant to reduce the small pay the bigarries and halalcores receive, still, in the public interest and in the interest of the department, I have had to inflict a great many fines. The total amount of fines recovered from the establishment amounted to Rs. 4,074. The amount seems large, but it ought to be remembered that the work which the Health Department has to do is of such importance that any systematic or repeated neglect in its performance would seriously injure and endanger the health and welfare of the community.

While 4,924 notices were issued, in only 3,342 cases was it necessary to proceed to the extremity of serving summonses. I have always been opposed to the dragging of people into the police courts for trifling and unimportant offences. I believe that there is nothing that tends to cast more discredit on sanitation, or to bring sanitary efforts into greater ridicule and contempt, than the indiscriminate prosecution of people for petty offences which affect in no way the public health. But while I am opposed to prosecutions for slight offences, on the other hand I think that there are certain violations of sanitary rules—such as the building of privies inside houses, or the buildings of rooms over privies—which should be very severely punished, and in the prosecution of which no effort should be spared to bring the delinquent to punishment, and no attempt to spare him should be in any way countenanced. Sanitary prosecutions.

The question as to whether the flats should be a swamp or a garden has been finally settled. At a meeting of the Town Council held on the 7th May 1875 it was resolved: “That the Council consider that the proposal of the Municipal Commissioner and Health Officer for the gradual reclamation of the flats with town-sweepings, with due sanitary precautions as now adopted, instead of transporting the sweepings by railway to Coorla, would be an important sanitary improvement, and they approve the same generally.” Disposal of town-sweepings.

The night-soil pipe from the Carnac Bunder dépôt, which was getting continually choked and gave so much trouble in the previous year, became so blocked in May that the night-soil would not flow through it. The obstruction was so great that it could not be removed with the assistance of the steam fire-engine. There was no other resource left but to take up the pipe, which was done. When the night-soil pipe was examined, it was found that more than half the sectional area of the greater portion of the pipe was filled with sand and dirt, and that the pipe itself was out of gradient. The causes of the obstruction in the pipe were now evident. The obstructions in the outlet pipe are generally due to the sand in the night-soil sticking to the sides of the pipe when the night-soil is flowing slowly; and if any deposit occurs, other deposits Sewerage.

quickly collect around it, and it is extremely difficult to overcome the obstruction caused by deposits of night-soil and sand glued together. The settling of the night-soil in the tanks also often leads to stoppages in the pipe. The sand sinks to the bottom and gets glued into masses, which are slowly washed into the night-soil pipe and stick there. Of course if the pipe is out of gradient the night-soil is still more likely to clog it.

The quicker discharge of the night-soil by the pumping of it into the sea will have the effect of abating the nuisance at the Carnac Bunder, and of lessening the chance of stoppages occurring in the pipe. Nevertheless our whole system of disposing of the night-soil of this city is a false one. If it was not possible to utilize the night-soil, then it ought never to have been separated from its natural carriers, the urine and waste water. To incur the expense, trouble, and nuisance of carting the pressed fœcal matter to the Carnac Bunder merely to cast it into the sea is monstrous and opposed to all common sense. The pipe is now being relaid, and in the meantime the night-soil is discharged through the Port Trust drain. The night-soil depôt is to be domed over, and a steam fire-engine to pump the night-soil through the pipe has arrived. Salt water will be used to flush the pipe, and consequently less Vehar water will be required at the depôt.

The drainage of most of the island is so defective that steps to improve it cannot much longer be deferred.

The European inhabitants of Bombay can scarcely form any adequate idea of the sufferings the people in the town endure from the halalcore system, and of the disgusting nuisances that are nakedly exposed to their view every day. Early in the morning, long before the light of day has arisen, they are disturbed by the cries of the sweepers and the rattle of the filth-carts. Picture to yourself the life of a Hindu gentleman in the heart of the city. Disturbed in the early morning, long before sunrise, by the sweepers at work, he gets up and goes to the verandah in front of his house to breathe the cool and refreshing air of the morning; but even that comfort is denied him, for he is driven from the verandah by the sweepers passing to and fro in front of his dwelling, and the horrid odours that taint the morning breeze. From the gullies on either side shoot in and out mehters and mehtranees busy at their ghastly work. And perhaps even the end of his verandah may be fouled by the basket of the unholy and vile bhungy. He may remonstrate, he may threaten, but the sweeper cares not, for he knows too well that the kind-hearted and too merciful Settia will never report him. Such are the scenes that go on every morning in most of the streets in the capital of India, and I would ask, Would Europeans submit to this system? To a stranger passing through our streets the narrow and grimy channels filled with a foul and stagnant mire,—the passing to and fro of wretched and degraded beings carrying on their heads and in their hands baskets of human ordure, and whose clothes and persons exhale a pestiferous odour and reek with the products of their noisome occupation,—offer food for reflection, if not amazement. That a city which advances pretensions to be the first in India should have so long submitted to such intolerable and loathsome nuisances is incredible. It can only be explained on the supposition that, never having known anything better, the people wish for no change, desire no amelioration of their lot, and care not to be freed from nuisances which every hour of the day interfere with their comfort and hamper their enjoyment of life. I am therefore opposed—until the city is more amply supplied with water, and a new system of sewers constructed—to the admission of night-soil directly into the sewers from the houses; and I am convinced that, did the masses of the people once realize that the sweepers could be dispensed with, they would never allow them near their houses again.

From time to time different schemes having for their object the improvement of the drainage and the disposal of the night-soil have been brought to the notice of the public, and they have been discussed at great length, and severely criticized in all their bearings. But these schemes have never advanced beyond the region of discussion. The drainage and sewage scheme that has secured most favour as well as attention, and which has been prepared with the greatest care, is Mr. Pedder's. Mr. Pedder has had, in the compilation of his scheme, the great advantage of being able to impartially consider the other schemes that have been advanced, to select what in them was good, and to exclude what was bad.

Mr. Pedder proposes that—

- (1) The sewage and storm water be separated.
- (2) The storm water be removed by gravitation.
- (3) Major Tulloch's system of street and house sewerage by pipe drains leading into four main branch sewers be adopted as far as Bellasis Bridge.
- (4) Night-soil be removed as now from the privies by hand; but, instead of being carried in carts to the Carnac Bunder, that it be emptied into the sewers at different central collecting depôts.

- (5) From Bellasis Bridge the main sewer be carried across the Flats to a spot on the foreshore about half a mile north of the Love Grove pumping-station, and to the west of Worlee Hill.
- (6) The sewage be pumped up to a dépôt on the side of the Worlee Hill and defæcated ; the effluent water to be either pumped into the sea, or to be used for irrigation ; the solid matter to be utilized.

It is generally granted that the separation of the storm water from the sewage is necessary in Bombay. Owing to the heavy rainfall, sewers to be sufficiently large to carry off the greatest rainfall and at the same time to carry sewage would require to be, according to Major Tulloch, forty times as large as they need be for sewage only, and they would not have to act to their full capacity except, on an average, once in six months ; supposing, then, that sewers were built large enough to carry both sewage and storm water, the consequence would be that in the dry season the sewage would scarcely flow at all, and in the monsoon the volume of sewage would be so great that the pumps would not be able to lift it. But it is well known and recognised that, so long as sewage is rapidly removed and not allowed to stagnate, the danger of gases being generated is reduced to a minimum ; it is, therefore, in order that the flow of the sewage may be retarded as little as possible, and that the chances of sewer gases being formed may be rendered highly remote, and that the pumps may be able to work in the monsoon, that it is advisable in Bombay to have sewers sufficiently large to carry only sewage.

It is proposed to remove the storm water by the existing drains, the Fort and Elphinstone quarter to be drained in the direction of their fall into the harbour, and Girgaum and Sonapore into Back Bay. The sluices at Dharavee, Worlee, and Love Grove are to be widened, in order to facilitate the exit of water from the rest of the island in the monsoon.

The widening of the sluices at Dharavee, Worlee, and Love Grove will be a most important sanitary step, and there is every reason to believe that it will contribute in no small degree to diminish the amount and alter the type of fever prevalent in this city. Dr. Cook has drawn particular attention to the necessity, on sanitary grounds, of a wider outlet being provided for the surface drainage.

The Flats possess most of the conditions generally believed to favour the production of malaria :—

- (1) The soil is moist, and periodically flooded.
- (2) The soil contains a large quantity of organic matter.
- (3) The surface of the ground is below mean sea-level.
- (4) The soil is stiff, clayey, and more or less impervious to air.

To take away the moisture is to remove one important factor in the list.

Mr. Pedder adopts Major Tulloch's system of branch sewers and pipes, but proposes to adopt in addition a system of house connections designed by Mr. Walton, Executive Engineer, which I shall now give a short description of.

Leading from the *nanees*, cook-rooms, and privies are pipes called down-takes, which break off about nine inches above the top of catch-basins ; leading from these catch-basins are pipes which will run horizontally along the sides of the houses, and which will discharge into open cast-iron tanks, fitted with diaphragms, at the entrance to the gullies ; these tanks communicate with the street sewers by means of earthenware pipes, which will be both trapped and syphoned ; between the down-take pipe and catch-basin, and also between the catch-pipe and iron tank, there is an air-space, so that ventilation is provided for not only by two air-spaces, but, besides, the pipe leading to the drain is trapped and syphoned. Therefore, sewer gases, before they could find their way from the sewers into the houses, would have to pass through, not only a syphon-trapped pipe, but also two air-chambers. With these provisions it seems to me impossible that sewer gases could ever gain admission to the houses through the pipes. To put it shortly. The house connections which Mr. Pedder proposes to adopt, and which I have now described, are easily cleaned, difficult to put out of order, and moreover so ventilated that they cannot possibly be the carriers of sewer air from the sewers to the houses ; and if they are adopted, the sewage and sullage will be discharged through a series of well-ventilated pipes, instead of being allowed to trickle along the sweepers' gullies to taint the air, and to soak into the earth to foul the well-water.

This system of house connections is the first and greatest advance made towards scientific sanitation in Bombay. For more than two years I have watched the system at work in Sonapore. The improvement which it has effected in that neighbourhood has been as marked as it has been remarkable. There is but one fault which I have to

find with it, and that is, that I think the catch-pipes instead of being closed should be open along the top. To modify the house connections I have just described so as to enable them to carry night-soil is not an impossibility. Mr. Walton has given the question much attention, and he assures me that he has designed a system of house connections, based on the same principles, to carry night-soil.

The present system of collecting the night-soil by hand will be continued. The night-soil will be carried to dépôts, but there, instead of its being pitched into carts and sent to the Carnac Bunder, it will be directly put into the sewers. The dépôts are to be connected with the sewers. There are nine now, and the number will be increased to sixteen. The dépôts will be domed over. They will be ventilated by shafts 30 feet high or upwards. The erection of small furnaces over the hoppers into which the night-soil will be emptied is also contemplated.

It will be observed that the points at which the night-soil will be emptied into the sewers will be away from dwellings, and in the open air. Therefore any exhalations that may be given off from the night-soil, or any gases that may come from the sewers, will be conducted directly into the open air. The objections that are urged against the admission of night-soil direct into sewers from houses cannot possibly be applied to the emptying of night-soil into sewers at dépôts such as I have described; for these dépôts will not be connected with dwellings, they will be in the open with air all around them. That the dépôts will be a nuisance is beside the question. There are nine dépôts now; but these dépôts, so called, are merely enclosed spaces into which, and over which, people passing by can see. Moreover, nothing whatever has been attempted in the way of mitigating the offensiveness of the existing night-soil dépôts. It is now proposed to substitute for these rudely devised rallying-places for the sweepers domed over and well ventilated dépôts, or, in other words, to substitute for dépôts that are a nuisance dépôts which will be neither an eyesore nor a nuisance. The sewers will be ventilated by manholes at intervals of two hundred yards. Over the manholes will be charcoal trays. The ventilation of the sewers will be on the most approved principles, and will leave little to be desired in that direction. I cannot conceive greater precautions than those provided in Mr. Pedder's scheme to render the pollution of the air of dwellings by sewer air impossible.

Mr. Pedder proposes to carry the sewage to a point about half a mile north of the present pumping-station, and to pump it up to a dépôt on the western side of the Worlee Hill. There the sewage is to be defæcated. The effluent water is either to be pumped into the sea or to be used for irrigation. It is proposed to utilize the solid matter. As I have said, the outfall is to be on the west side of the Worlee Hill; there will, therefore, be between the dépôt and the city the Worlee Hill, which rises to nearly a hundred feet. The side of the hill on which the outfall will be projects as a sort of tongue into the sea. Four objections have been raised to the Worlee outfall, which I may shortly state as follows:—

- (1.) That it is to the windward of the town, and will therefore taint the sea-breeze.
- (2.) That, if the sewage is pumped into the sea at Worlee, it will be driven back on the foreshore, where it will form beds of festering, decomposing sewage slush.
- (3.) That it will be a nuisance as offensive to the neighbourhood as it will be dangerous to the public health.
- (4.) That, if the effluent water is pumped into the sea, a valuable fertilizing agent will be lost; and that, even if it was contemplated utilizing the sewage, there is no land on which it could be utilized.

It is true that the outfall will be in a quarter from which the wind sets towards the town for more than fifty days every year. No doubt, objection may be taken to this, and if a site for the outfall could be found from which the wind would never set towards the town I should prefer it. But where can such a site be found?

As regards the second objection, the sewage is not likely to collect along the coast, for, although sewage has been pumped from the Love Grove station into the sea for many years, yet it is a much-vexed question whether any has ever been deposited on the foreshore. I have repeatedly examined the foreshore with reference to this question, and I have no hesitation in saying that the rocks south of the Love Grove outfall are as clean as those to the northward. That offensive smells come at times from the foreshore I do not deny, but that they are due to festering sewage on the foreshore I entirely deny.

The third objection is more specious. As to the nuisance the Worlee outfall will cause, it is true that an action was brought and gained against the Municipality on

account of the Love Grove pumping-station by a neighbouring householder, but that only one action was filed is, I conceive, the best proof that the nuisance was not general. I have never believed that the Love Grove outfall is as great a nuisance as it is generally represented to be. And it is only a reasonable inference that, if the Love Grove outfall has not injured the health of the city, a better situated and more isolated outfall will not.

Lastly, as to the utilization of the sewage. Sewage irrigation is more likely to be successful, both from a sanitary and financial point of view, on this side of India than in England. The advantages on our side are many. But, on the other hand, there are some disadvantages, more particularly near Bombay, which must not be overlooked. Although I am an advocate for the utilization of the sewage on land, and although I believe that sewage irrigation, if conducted on proper principles and with care, will pay, still I cannot overlook the fact that there are very great difficulties to be met and overcome before it can be carried out successfully anywhere near Bombay. The two great difficulties to be surmounted with regard to sewage irrigation near Bombay are the low-lying position of the land, and the heavy monsoon rains. Sewage irrigation has been spoken of in Bombay as if all that was necessary was to run sewage, no matter how great the volume, over any land, even on to a salt marsh, and crops would spring up, and the problem how to dispose successfully of the sewage of this city would thus be solved. But experience has taught us that irrigation of any kind, unless conducted with great judgment and care, will not pay, and that to discharge immense volumes of sewage or water on to any low-lying undrained ground is to swamp it, to create a nuisance, and to injure the public health. Any farmer knows that too much water is as bad as too little for his land. The land of this island is not favourably situated for irrigation. Its low-lying position enhances immensely the difficulty. In the first place the area to be irrigated must be raised, and thoroughly under-drained, so as to secure for the sewage a fall; and if any quantity of sewage was run on to the ground, it would be necessary, in order to prevent the soil from becoming waterlogged, to resort to the expense of pumping to carry off the effluent water. In the rains, anywhere near Bombay, irrigation is out of the question. To irrigate any land would be to swamp it. Under one condition only can sewage irrigation be successful near Bombay, namely, when the cultivator can take as much sewage as he wants, and as much as is good for his ground.

Under such circumstances sewage irrigation can be carried out from the outfall on the Worlee Hill; as much of the sewage as is good for the land will be given to it, and the rest will be run into the ocean. To the north-east and east of the Worlee Hill stretches a great expanse of land which is partly flooded in the monsoon, and during the dry season, for want of water, is left uncultivated. There are no dwellings on it, and but few places of habitation near. On this land sewage irrigation could be conducted under comparatively favourable conditions. It will here be objected that sewage irrigation so near the town would create a nuisance, if it did not endanger the public health. But to these objections I would reply that sewage irrigation has been practised, and is now being carried out, much nearer to the thickly inhabited parts of the town, and as it were in the heart of the city, without causing a nuisance. I have never received complaints regarding the fields irrigated with sewage in Bombay, and if they had caused any nuisance it would have been speedily brought to my notice. We may, I think, safely conclude that, if sewage irrigation is practised so close to the centre of population as the race-course, and does not create a nuisance or affect the health of those living near it, it will neither be a nuisance nor be attended with risk to the public health at a spot much further off.

It has been proposed to carry the sewage to, and to utilize it on a portion of, the salt marsh at Coorla, which had been shut off from the sea by an embankment. If this marsh was filled in and made sweet first, and if afterwards it was irrigated with the proper quantity of sewage, it would be highly productive. But to discharge sewage on to it before it had been filled in would be to convert it merely into a cesspool. Again, suppose that it had been reclaimed with sweepings. Land reclaimed with sweepings requires to be opened up and exposed to the atmosphere for some time, and to be thoroughly drained, before sewage can be run on to it; and even after all that had been done, so boggy is ground reclaimed with sweepings that no large amount of sewage could be used without swamping and flooding it. In the monsoon what is to be done with the sewage, supposing that it was carried to Coorla? It cannot be used on the land. Is it to be discharged into the harbour? It is absurd to institute any comparison between the land which it has been proposed to irrigate with sewage at Coorla and the plain to the east and north-east of Worlee to which I propose to apply the sewage. One is a salt marsh, the other is a firm, comparatively sweet soil.

The outfall at Worlee has these great advantages over every other outfall that has been proposed, that the sea is just behind it; as much of the sewage as is wanted for irrigation can be supplied, and what is not wanted can be pumped into the sea. While I yield to no one in a desire to preserve the sea-breeze from being tainted, and while I am fully alive to the importance of having a pure and plentiful supply of water, I fail to see that any of the schemes that have been proposed for the disposal of the night-soil and sewage of this city are not open to as grave objections on the score of pollution of the sea-breeze as Mr. Pedder's, and I am, moreover, convinced that none hold out such prospects for the successful utilization of the sewage as Mr. Pedder's scheme.

Water-supply. Notwithstanding that our water is not what it might be, we may congratulate ourselves that we have a much purer supply than Madras. The Red Hills water, to judge from the analysis, must be a villainous supply. The Calcutta water, however, is delivered in a much purer state than the Vehar water.

Milch cattle stables. Although the milch cattle stables have been very much improved within the last five years, they are not what I would wish them to be. They are better ventilated, and perhaps a little less overcrowded, and they are certainly much cleaner than they were two years ago. As stated in my last Report, the prosecution of the owners of the milch cattle has done comparatively little good, for it is impossible for them, with the means at their disposal, to comply with strict sanitary regulations.

Visit of the Prince of Wales. The visit of the Prince of Wales put to a severe test the resources and organization of the Health Department. Notwithstanding the magnitude and importance of the occasion, I had every confidence in the officers and men of the department, and the expectations which I formed of them were fully realized. The results of our labours more than surpassed my most sanguine anticipations.

Health of Bombay. Although the health of Bombay in 1875 was not so good as in either of the previous two years, the mortality was less than in 1872. The year 1875 appears to have been a season of unhealthiness in most parts of India. Bombay, however, fared better than either of the sister Presidency towns.

Exclusive of still-born, 18,734 deaths were registered. In the previous year, which was an unusually healthy season, only 15,496 were recorded. But in 1875 Bombay was visited by an epidemic of measles, and by an outbreak of cholera. These two diseases carried off 2,333 people; had the city escaped them, the mortality would have been only 25.45 per 1,000.

Altogether 1,362 cases of cholera came to my knowledge, and of these 847 terminated fatally.

1,486 deaths were registered from measles, against 351 in the preceding year, and 127 in 1873. The disease gradually increased in intensity and fatality up to March 1875, in which month 362 deaths were registered. In April the deaths fell to 278, in May to 127, and in June they still further declined to 52.

Measles were more fatal between one and two years of age than at any other period of life; 451 deaths among children between one and two years old occurred. The next most fatal period was between seven and twelve months, when 357 deaths were registered.

The number of deaths from fever was less than the number registered in 1874 by 159, and below the average of the previous five years by 787.

The decrease in the mortality from fevers may have been partly due to the prevalence of cholera and measles. I am convinced, however, that fever has not been so prevalent in Bombay of late years as it was formerly, and that the type of fever has also much altered. The reclamation of the foreshore has done much towards this, but the great agencies which have been at work are sanitary measures in the shape of better ventilated and improved dwellings, privies detached from the houses, regular conservancy, widening of streets and freer admission of the breeze into the densely inhabited portions of the city, and the filling in of low-lying places and gradual raising of the surface of the city. The scarcity or prevalence of fevers may be looked on as the measure of the efficiency or inefficiency of our sanitary measures.

There has been a great increase in the number of deaths from phthisis; 2,364 were registered from this cause.

As would be expected in a year in which cholera was prevalent, there has been an increase in the mortality from diarrhoea and dysentery. 876 deaths were referred to the former, 231.3 more than the average of 10 years; and 1,389 to the latter, 502 in

excess of the decennial average. 501 deaths were due to all the other diseases of the digestive system.

The first quarter was the most unhealthy period of the year. The mortality rose to 32·95 per 1,000. The enhanced mortality was chiefly due to the prevalence of measles. Deducting 982 deaths from this cause, the annual death-rate would be equal to 26·85 per 1,000. Fevers were also more than usually fatal, and dysentery was prevalent.

In the second quarter the death-rate fell to 30·6 per 1,000. This diminution in the mortality was due to the decrease in the number of deaths from measles and fever. Cholera was prevalent in this quarter, and became more fatal towards the end of the season.

The mortality underwent a still further decline in the third quarter, and fell to 27·12 per 1,000. The deaths from fever were 421 less than the mean of five years. This diminution in the fatality of fevers is remarkable, considering that cholera was prevalent and 501 deaths were registered from it. This zymotic acquired its maximum of intensity in the first month of the quarter, and gradually fell off towards the end of the season.

The death-rate in the fourth quarter fell to 26·15. Fevers were prevalent in this season, 1,332 deaths being attributed to them, which was, however, 259 less than the mean of five years. Towards the end of the quarter small-pox showed some indications of awakened vitality.

There has been a great improvement in the registration of births this year. The birth-rate was equal to 22·45 per 1,000 of population. Of 13,391 children born living, 6,894 were males and 6,497 females.

APPENDIX.

No. 1.

MEMORANDUM of the ARMY SANITARY COMMISSION on the REPORT of the SANITARY COMMISSIONER with the GOVERNMENT OF INDIA for 1875.

The first section of Dr. Cuningham's Report for 1875 is devoted to the cholera epidemic of that year. As this section has been issued separately, a special Memorandum on it has been sent to the India Office by the Army Sanitary Commission.

Section 2 is devoted to the meteorology of Northern India, a matter of great importance, but not as yet in so forward a state as to enable it to be applied satisfactorily to the solution of sanitary problems.

The 3rd section relates to the sanitary history of the European Army in India; and the 4th section to that of the Native Army in the Bengal Presidency.

The next section, No. 5, gives an account of the sanitary statistics of Bengal Jails. This is followed by the vital statistics of the general population, together with an account (in sections 6, 7, and 8) of the chief diseases and of vaccination.

Sections 9 and 10 are devoted to a brief but important statement of military and civil sanitary works in Bengal Presidency, followed in section 11 by a few general remarks on other matters of sanitary history.

The appendix contains two very important contributions to the history and pathology of Oriental sore and leprosy in India by Dr. Lewis and Dr. Cunningham; and the volume is concluded by the usual annual statistics of European and Native Armies, and of jails in Bengal Presidency, for 1875.

The Report, as a whole, is one of considerable importance to the public service, and on some points it contains more information than the Sanitary Commissioner has been able to give in preceding years.

It is proposed in the following paragraphs to select for remark the more prominent practical points in each section, beginning with the sanitary history of European troops during 1875.

(*European Troops.*)

1. The year under review was marked by a great epidemic of cholera, during which there were 384,421 cholera deaths registered among the civil population, a mortality in all probability considerably under the truth. The civil population furnishing these deaths is not accurately known, but it may be estimated approximately at $182\frac{1}{4}$ millions. The corresponding mortality from cholera among European troops was 194 deaths out of an average strength of 58,409. It is necessary to keep this fact in view in order to account for the increased mortality among British troops during the year. The total number of deaths among British troops was 1,021, equal to a death-rate of 17·48 per 1,000 in and out of hospital in India; deducting the death-rate from cholera (3·32 per 1,000), the rate (including 48 from suicide) would be 14·16 per 1,000; and the actual death-rate from all diseases and accidents incident to the service, excluding suicides, would be exactly 17 per 1,000. If suicides, however, are to be considered as final results of insanity, of which about 80 cases a year are invalided to England, then the 17·48 per 1,000 will represent the total loss from disease and accident of the year.

2. The corresponding death-rates for five previous years have been as follow :

					Ratio per 1,000.
1871	-	-	-	-	17·53
1872	-	-	-	-	24·21 (cholera epidemic).
1873	-	-	-	-	15·30
1874	-	-	-	-	13·58
1875	-	-	-	-	17·48 (cholera epidemic).

The mortality of the epidemic year 1875 was thus nearly 7 per 1,000 less than that of the preceding epidemic year 1872.

3. The number of men sent home for change in 1875 was 1,837, and for discharge 534. The total loss from death and invaliding was thus—

Deaths	-	-	-	-	1,021
Invalids	-	-	-	-	2,371
Together	-	-	-	-	3,392

The comparative results of the last five years are given by Dr. Cuningham in the following abstract :—

Period.	Average Strength.	Ratio per 1,000 Strength.						
		Admissions.	Daily Sick.	Deaths.			Invaliding.	Total Loss.
				Cholera.	All others.	Total.		
1871—1874 -	58,438	1,408	57	2·34	15·31	17·65	41	59
1875 - -	58,409	1,337	56	3·32	14·16	17·48	40	57

It will be seen that in all the elements of efficiency, even including the loss from cholera, the year 1875 shows improvement over the preceding four years average.

4. The next abstract gives the inefficiency statistics of each Presidency separately for 1875 :—

	Average Strength.	Ratio per 1,000 Strength.						
		Admissions.	Daily Sick.	Deaths.			Invaliding.	Total Loss.
				Cholera.	All others.	Total.		
Bengal - -	37,184	1,387	57	3·66	13·66	17·32	39	56
Madras - -	11,041	1,109	56	0·36	14·49	14·85	45	60
Bombay - -	10,184	1,404	53	5·30	15·62	20·92	41	62

This table shows that in each Presidency the increased death-rate was mainly due to cholera ; that except in Bombay the total death-rate was not very high ; that the amount of invaliding was high ; and suggests inquiry into the reasons of this fact.

5. The following were the chief admission causes in each Presidency :—

Ratio per 1,000 strength.

Bengal.	Madras.	Bombay.
1. Malarial fevers - 499	1. Venereal diseases - 208	1. Malarial fevers - 518
2. Venereal diseases - 212	2. Malarial fevers - 196	2. Venereal diseases - 174
3. Wounds and accidents - 94	3. Abscess and ulcer - 96	3. Wounds and accidents - 110
4. Abscess and ulcer - 80	4. Wounds and accidents - 93	4. Abscess and ulcer - 108
5. Respiratory diseases - 79	5. Hepatitis - 71	5. Diarrhœa - 70
6. Diarrhœa - 62	6. Dysentery - 68	6. Respiratory diseases - 69
7. Rheumatism - 59	7. Diarrhœa - 55	7. Rheumatism - 46
8. Hepatitis - 40	8. Respiratory diseases - 44	8. Hepatitis - 40
9. Dysentery - 27	9. Rheumatism - 31	9. Dysentery - 29
10. Eye diseases - 20	10. Eye disease - 14	10. Eye diseases - 25
Total of 10 causes - 1,172	- - - - - 876	- - - - - 1,189
Total of all causes - 1,387	- - - - - 1,109	- - - - - 1,404

There are several obvious practical questions raised by this table of admission-rates. For instance, what are the local, climatic, and personal causes of the greater prevalence of malarial fevers in Bombay and Bengal than in Madras Presidency? Again, with so great a prevalence of venereal diseases (greater in Madras than even malarial fevers), is much good being done by lock hospitals? Should not some inquiry be made into the causes of the following conjoined admission-rates from dysentery and hepatitis?—

Bengal - - - - - 67 per 1,000
 Madras - - - - - 139 "
 Bombay - - - - - 69 "

There must be some reason for the persistent excess of these admissions in Madras.

To show the importance of these questions, it may be sufficient to state the following total admissions from these diseases in 1875 for the Indian Army :—

Fevers (intermittent, remittent, continued) - 26,026
 Venereal disease - 11,978*
 Dysentery and hepatitis - 4,803

6. Table XXI. in the appendix to the Report enables these high fever admission-rates to be localized, as the following examples will show, and hence the ground is already prepared for local investigation.

* This is the number in the tables, but the aggregates of three abstracts at pp. 75 and 76 of this Report give 13,173 admissions in 1875.

Leaving out fractions, the fever admission-rates per 1,000 strength have been as follow :—

Peshawur	-	-	-	-	-	2,622
Meean Meer	-	-	-	-	-	1,489
Bombay	-	-	-	-	-	1,212
Poona and Kirkee	-	-	-	-	-	795
Mhow	-	-	-	-	-	521
Sealkot	-	-	-	-	-	638
Dum Dum	-	-	-	-	-	202
Fort William	-	-	-	-	-	187

Rangoon	-	-	-	-	-	98
Shahjehanpore	-	-	-	-	-	85

The numbers of troops at each of these stations were sufficient for the comparison instituted between them.

In our Memorandum on Dr. Cuninghame's Report for 1874 attention was called to the high fever admission-rate at Meerut, viz., 1,475 per 1,000. In the Report under consideration the fever-rate at Meerut is given as 839 per 1,000. There have been large drainage works in progress in the district, and it will be important to watch the fever statistics of Meerut in future years.

It may be that this great diminution of fever may be connected with these works, but it is necessary at the same time to state that the fever-rate at Meerut has been less than the present one in previous years. The importance of the Meerut case is that it may be used as a test in future years, in any inquiry into fever causes, such as has been suggested above, and if the fever-rate is permanently reduced by drainage works, as it ought to be, it will point the way to remedial measures for other stations.

7. The next abstract shows the death-rates in each Presidency from ten leading death causes :—

Ratio per 1,000 strength.

Bengal.	Madras.	Bombay.
1. Cholera - - - - 3·66	Hepatitis - - - - 3·17	Cholera - - - - 5·30
2. Apoplexy - - - - 1·91	Heart disease - - - 1·99	Apoplexy - - - - 2·16
3. Enteric fever - - - 1·59	Injuries - - - - 1·99	Hepatitis - - - - 1·77
4. Hepatitis - - - - 1·48	Dysentery - - - - 1·45	Enteric fever - - - 1·77
5. Phthisis pulm. - - - 1·24	Phthisis pulm. - - - 1·27	Phthisis pulm. - - - 1·28
6. Malarial fevers - - - 1·18	Apoplexy - - - - 72	Malarial fevers - - - 1·28
7. Injuries - - - - 1·07	Suicide - - - - 72	Injuries - - - - 1·08
8. Respiratory diseases - - 94	Enteric fever - - - - 63	Heart disease - - - 88
9. Heart disease - - - - 78	Cholera - - - - 36	Dysentery - - - - 88
10. Dysentery - - - - 65	Malarial fevers - - - 36	Respiratory diseases - - 79
Total of 10 causes - 14·50	- - - - 12·66	- - - - 17·19
Total all causes - 17·32	- - - - 14·85	- - - - 20·92

The more important differences between these ratios and those of the preceding year, 1874, are briefly as follow.

In 1874 cholera mortality was scarcely appreciable statistically. In 1875 it heads the list in Bombay and Bengal. In Bombay there is a slight increase of mortality from enteric fever. In Bengal and Madras there is a marked diminution. Hepatitis was the chief death cause in Madras Presidency, as was the case the year before. But, except in Bombay, this disease was less fatal in 1875. A similar comparison holds good as regards dysentery.

There was an increased mortality under the head of malarial fever in all the Presidencies.

In 1875 the death-rate from phthisis pulmonalis was nearly equal in each Presidency, and showed a slight augmentation in Bombay over the corresponding rate of 1874. This fact appears to point anew to the probable existence of latent phthisis in recruits.

8. As is usually the case, there were considerable differences in the health of British troops in different parts of Bengal Presidency.

In Bengal proper, a hotbed of disease, especially during epidemic seasons, and where upwards of 100,000 people died of cholera in 1875, there was not a single admission from cholera among British troops. The admissions from all causes were only 1,047 per 1,000 strength, the daily sick 45, and the mortality 11·63 per 1,000. During the 10 years 1860 to 1869 the annual admissions averaged 1,821 per 1,000, the daily sick 69, and the deaths 29·57 per 1,000. The rates in 1875 would have been even lower had it not been for the unhealthiness of the two batteries of the 11th Brigade, Royal Artillery, at Barrackpore, the causes of which have been discussed by the Commission on other papers. As they stand, the statistics for 1875 are much more favourable than they have ever been, and in no former year have troops entirely escaped cholera as they did during the epidemic of 1875.

9. In the Gangetic Provinces and Oude the year's experience was not so satisfactory. The admission-rate was 1,234 per 1,000, the sick-rate 65, and the death-rate 18·10 per 1,000, of which cholera contributed 5·65 per 1,000. The chief sufferers were at Benares and Lucknow.

But, withal, the rates were favourable when compared with those of the years 1860—1869, during which the admission-rate was 1,614 per 1,000, the daily sick-rate 69, and the death-rate 28·59 per 1,000.

10. In Meerut and Rohilkund the death-rate was 21·62 per 1,000, of which 5·92 was due to cholera.

The admission-rate was 1,323 per 1,000, and the daily sick 54 per 1,000. But even these rates compare favourably with those from 1860 to 1869, which were as follow: admissions 1,576, daily sick 72, deaths 26·61 per 1,000. As already stated, extensive drainage works are proceeding at Meerut, and may be expected to reduce the fever statistics in time to come.

11. In Agra and Central India the rates for the 10 years 1860—1869 were: admissions 2,169, daily sick 74, deaths 38·48 per 1,000. During 1875 they were: admissions 1,241, daily sick 58, deaths 16·71 per 1,000, of which 5·57 per 1,000 were due to cholera.

12. The Punjab showed a high admission-rate as usual, namely, 1,729 per 1,000. The daily sick-rate was 58, and the death-rate, including 2·27 from cholera, was 18·34 per 1,000. For the 10 years 1860—1869 the admission-rate was 1,740, the sick-rate 56, and the death-rate 25·24 per 1,000.

Seeing that 1875 was a cholera-epidemic year, it is right that attention should be directed to the remarkable improvement in health and efficiency which these statistics show to have taken place in Northern India since 1860, when the great improvements in stations of British troops may be said to have been commenced.

13. The hill stations, 11 in number, give an admission-rate of 996 per 1,000, the daily sick were 42, and the deaths 8·31 per 1,000. During the 10 years 1860—1869 the ratios were: admissions 1,096, daily sick 49, and deaths 14·78 per 1,000.

In 1875 there were 9,058 men, 813 women, and 1,690 children at hill stations. And on 1st June 1876, 24·7 per cent. of the Bengal troops were stationed at them.

14. During the hot season of 1875 the average strength at Bengal convalescent depôts was 2,094, among whom 33 died in seven months. The chief death causes were,—

	Deaths.
Cholera - - - - -	9
Enteric fever - - - - -	2
Remittent and continued fever - - - - -	4
Hepatitis - - - - -	7

15. The health statistics of troops in other Indian Governments have been dealt with on separate papers, and do not require further comment, except to call attention to the continued comparative healthiness of Burma stations, at which the admission-rates were 967, the daily sick 43, and the deaths 10·50 per 1,000. At Rangoon, where there is the largest number of troops, there was no cholera, and the fever admission-rate was only 98½ per 1,000. The suggestion has been made on former occasions that probably some part of this favourable result may be due to the raised barrack rooms with free ventilation between the soil and the room floor common in Burma.

16. *Chief Diseases.*—Under this head attention may be directed to the abstract already given, showing the great diversity of prevalence of fever at different stations.

This fact affords a far better ground of proceeding in dealing with the local causes of malarial fever than their average prevalence all over India. It may be, however, noted that, while the admissions from malarial fevers in Northern India were 603 per 1,000 in 1872, and 465 per 1,000 in 1874, the ratio in 1875 was 445 per 1,000.

17. *Enteric Fever.*—In the whole Indian Army there were 166 cases of enteric fever treated, of which 84 proved fatal. The numbers for the preceding year (1874) were 243 cases and 101 deaths, showing in 1875 a large reduction in the amount of this disease.

In the Memorandum of the Commission on Dr. Cunningham's Report for last year attention was called to the question of diagnosis with reference to the alleged frequency of enteric fever in the Indian Army, and it may be useful to introduce here the following abstract of fever deaths during the two years in the whole Indian European Army:—

—	Strength.	Total Deaths.				
		Enteric Fever.	Intermittent Fever.	Remittent Fever.	Continued Fever.	Total Fever Deaths.
1874 - - -	59,308	101	6	32	13	152
1875 - - -	58,409	84	1	38	22	145

The deaths from enteric fever were fewer by 17 in 1875. In the same year the deaths from intermittent fever were 5 fewer. But the remittent fever deaths had increased by 6, and the continued fever deaths by 9, in 1875.

Leaving out the intermittent fever deaths, the case would stand thus:—

Enteric fever - - - - -	17 deaths.
Remittent and continued - - - - -	+ 15 „

The object of these comparisons is not to call the accuracy of the diagnosis in question, but simply to suggest caution in the classification where diagnosis is often very difficult. We may here state that in one Memorandum of the Commission of the present year a statement is given from a report by a Medical Officer, in which he says that at his station enteric fever is merely an aggravated result of malaria. In the preceding abstract there is one satisfactory point, namely, the diminution of the total fever deaths, and it must be hoped that the diminution extends to enteric fever.

The following facts regarding the incidence of enteric fever in 1875 are given by Dr. Cunningham. Out of 108 cases which have been analysed,—

- 80 were in men under 25 years of age;
- 37 were in the first year of Indian service;
- 67 within the first two years;
- 80 within the first three years.

There was, he states, no evidence of importation from England, and no evidence to show that the disease was propagated either directly or indirectly by sick.

Last year the Commission suggested that special local examinations should be made into the sanitary state of stations where enteric fever cases took place, and we are glad to learn from the Report under review that the attention of the authorities in all the three Presidencies has been directed to this very important subject.

In the meantime, a few facts regarding local conditions have been made out which, so far as they go, lead to the conclusion that enteric fever, like everything else, has a cause.

18. *Dum Dum* had 2 cases of enteric fever. Latrine matter is buried in trenches in a water-logged subsoil; "great difficulty in keeping the ordure from spreading over the surface of the "ground" (and, it may be added, from polluting the subsoil water). Conservancy of bazaar of 5,000 people unsatisfactory; nuisances found everywhere in this vicinity.

19. *Lucknow*.—The Medical Officers of the B Battery, A Brigade, Royal Horse Artillery, and 40th Regiment, note no sanitary defects. But Surgeon-Major Shipton, 13th Hussars, reports the floors of barracks where the cases occurred as "very bad, irregular, and full of holes;" "in the rains it is impossible to keep the floors properly dry, and the holes and irregularities "collect dirt and moisture. This is especially the condition in the hospital. Drainage is bad, "could hardly be worse."

This last defect extends, no doubt, more or less over the station. There were no fewer than 11 cases of enteric fever and 4 deaths at this station, out of a strength of 2,342 men.

20. *Moradabad* had a fatal case of enteric fever out of a strength of 202 men. The Medical Officer says that the quarters of the 1st Battalion, 18th Royal Irish, where the case took place, are "totally unfit." It is an old building of faulty construction. "There are in some places "six rows of cots, and never less than four rows. The floors are bad, and ventilation defective. "The wells also are objectionably near the barracks."

21. *Meerut*.—Out of a strength of 1,498 men at this station, there were 5 cases and 3 deaths from enteric fever. The Medical Officer of the A Battery, C Brigade, Royal Horse Artillery, says: "The sanitary conditions of the barracks and their surroundings were, and are still, in a "very unsatisfactory state." This remark refers to conditions arising out of defective drainage, which the Deputy Surgeon-General says is being remedied.

22. There were 6 cases and 2 deaths from enteric fever among 1,096 men at *Sealkot*. The barracks are stated to be in good sanitary condition, but the "surface drainage generally defective." The bath room floor of a sergeant who was attacked "was found saturated with "urine."

23. There was a fatal case of enteric fever among 306 men at *Umritsur* and *Govindghur*. There was nuisance from latrines, and the bazaar was in an insanitary state. At the time the ground was saturated with water from defective drainage, since remedied.

24. *Peshawur*.—The drainage arrangements at this station appear to be very defective. The bath room drainages give rise to offensive odours, and the water from all the bath rooms and from those in the new barracks "is disposed of outside the barracks, and in close proximity, by "soakage." Out of 1,591 men at Peshawur, there were 18 cases and 10 deaths from enteric fever in 1875.

25. Referring to the sanitary reports on enteric fever received from different parts of India, the Commissioner sums up the evidence as follows:—"The only explanation of the facts is to be found in local insanitary conditions, and among these malaria seems to have an important place."

As every case of enteric fever will, it is hoped, be reported, and the local and personal conditions under which it has taken place noted at the same time, we shall, no doubt, obtain a sufficient account of the removable local conditions accompanying this fatal disease.

26. Up to the present time, it appears that the evidence leads to the conclusion that enteric fever in India shows itself frequently in the course of ordinary periodic fever, the result of malaria; that foul dampness arising from dirty undrained subsoil under and around the barracks and hospitals, emanations from latrine matter, and from nuisances generally, as also the use of suspicious water, must be enumerated among removable conditions attending on this disease. And wherever these are found to exist at stations, especially at such as have had cases of this fever, they should be at once dealt with.

27. Allusion has already been made to the influence of age in predisposing to attacks of enteric fever.

The following abstract shows the seasonal prevalence of the disease in the different Presidencies for 1875:—

	Number of Admissions to Hospital.											
	Jan.	Feb.	Mar.	April.	May.	June.	July.	Aug.	Sept.	Oct.	Nov.	Dec.
Army of Bengal -	6	7	5	15	21	18	4	3	9	7	13	7
" Madras -	4	-	-	4	-	4	3	4	2	-	1	1
" Bombay	2	-	2	7	4	2	1	4	4	-	-	2
Army of India -	12	7	7	26	25	24	8	11	15	7	14	10

Enteric fever appeared at 33 stations of Bengal troops out of 59; at 8 stations of Bombay troops out of 15; and at 9 stations of Madras troops out of 19. Hence, out of 93 stations included in the returns, no fewer than 50 had enteric fever cases. Nothing can show more clearly the extent of the sanitary problem connected with this disease.

28. *Dysentery and Hepatitis*.—As already stated, there were 4,803 admissions from these formidable diseases in 1875, of which 2,089 were due to dysentery, and 2,714 to hepatitis. The former disease was fatal in 49 cases, and the latter in 108 cases. Not much appears to have been done hitherto in elucidating the causes of either disease, or in pointing out practical remedies. Reference must therefore be made to long past experience, which shows the distinct causative relation to these diseases of intemperate habits, chills, especially at night while sleeping in air currents after hot days, want of flannel underclothing, too free use of animal diet, and drinking impure water.

These are all simple enough matters to deal with, at least there is nothing mysterious about them, and we would beg to suggest, as we have done in the case of enteric fever, whether inquiry might not be made at stations where these diseases prevail into the presumed causes enumerated above, and the results included in the annual reports. It appears to be time that more attention should be devoted to these important causes of sickness, mortality, and invaliding, to see whether their frequency may not be diminished.

29. Take again two other diseases, which no doubt have a practical relation to each other in India, viz., *delirium tremens* and *apoplexy*. In 1875, no fewer than 201 soldiers were admitted to hospital suffering under delirium tremens, of whom 8 died. The ratios of frequency of this disease for similar strengths were,—for Bengal 2, Madras 4, Bombay 6; figures which may be taken as approximately showing the relative amount of drunken excesses in each of the three Armies. They are introduced here in order that the attention of those concerned may be again called to the subject.

The other disease, apoplexy, which it is to be feared is a not unfrequent result of drunkenness caused 240 admissions to hospital, and 101 deaths. The proportions of admissions in each Presidency were represented by—Madras 2, Bengal 4, Bombay 6. In Bengal there were 101 admissions in June and July, out of 153, showing the influence of higher temperature. But it is doubtful whether heat alone would have destroyed so many valuable lives from this one disease.

The facts regarding hepatitis, dysentery, delirium tremens, and apoplexy have been reproduced year after year. It may be safely stated that among British soldiers in India they are all more or less connected with dram drinking. These four diseases destroyed 266 soldiers in 1875, a fact which ought not to be accepted simply as of necessity, or as a matter of course, but as indicating an evil to be combated.

30. *Venereal diseases* form another cause of inefficiency, allied with intemperate habits. Their annual prevalence in the Army of India since 1871 has been as follows:—

Admissions per 1,000 strength.				
1871.	1872.	1873.	1874.	1875.
196	179	166	192	205

The total admissions to hospital for syphilis during the last two years has been:—

	Primary.		Secondary.		Total Syphilis.	
	1874.	1875.	1874.	1875.	1874.	1875.
Bengal - - -	2,466	2,696	860	787	3,326	3,483
Madras - - -	917	786	348	428	1,265	1,214
Bombay - - -	662	502	285	273	947	775
Army of India	4,045	3,984	1,493	1,488	5,538	5,472

The strengths differed somewhat in the two years, but the figures show how small an effect lock hospitals have had on syphilis among troops.

The general results of these hospitals up to the present time may be stated in the words of the Sanitary Commissioner with the Government of India, as follows :—

“The stations with lock hospitals have established no decided superiority over those without them.

“Nowhere has any permanent and decided impression been made in this class of diseases.

“In many instances it is almost impossible to say where or when disease was contracted.

“In some cantonments, no doubt, little attempt has been made to attain success, but in others again, where the authorities have been most energetic and careful, little result has attended their efforts.

“It is very disappointing to be obliged to acknowledge that the lock hospitals have failed. . . .

“It is very evident, either that the women who are the real source of evil still escape detection, or—and this is a danger which does not appear to be sufficiently appreciated—that registered women, though to all appearance healthy, are yet capable of propagating disease.”

Whatever explanation may be given of the results, it is certain that no preventive agency can be considered a success under which the admissions to hospital from syphilis, gonorrhoea and their many secondary results, were 13,173 in one year (1875) out of a strength of 59,368 men, and it is not easy to see what hope there is for the future in the face of these facts for consecutive years, and of the statement made in the Report that year by year the working of the protective agencies “has been carefully watched,” and suggestions made for improving the service.

31. *Invaliding.*—In 1875 there were 1,837 men sent home for change, and 534 for discharge.

The total loss from these causes was 40·25 per 1,000 strength. The losses from death and invaliding amounted to 57 per 1,000. In our Memorandum on last year's Report of the Sanitary Commissioner with the Government of India the whole subject was fully discussed, and the necessity shown for reducing the numbers invalided so far as it might be practicable to do so. We also gave a table showing how invalids had been disposed of after arriving in this country for the preceding five years.

We have been enabled by the aid of the Director-General of the Army Medical Department to continue the details down to the end of last year, premising that the numbers in the following table do not correspond with those in Dr. Cuninghame's Report:

Years.	Number embarked in India.	Deaths on the Voyage.	Admitted to Netley.	Transferred thence to Lunatic Asylum.	Admitted direct to Lunatic Asylum.	Died at Netley.	Invalided to Pension, &c.
1875	2,513	26	1,755	10	91	28*	779†
1876	2,446	19	2,144	3	78	24	1,261‡

* Including one lunatic.

† Including 90 lunatics.

‡ Including 79 lunatics.

This table enables the total loss of the Indian Army for 1875 to be deduced as follows :—

Average Indian strength	-	-	-	-	58,409
Deaths in India	-	-	-	-	1,021
“ on voyage	-	-	-	-	26
“ at Netley	-	-	-	-	28
Total deaths	-	-	-	-	1,075
Deaths per 1,000	-	-	-	-	18·4
Discharged invalids	-	-	-	-	779
“ “ per 1,000	-	-	-	-	13·3
Total loss by death and invaliding per 1,000	-	-	-	-	31·7

The corresponding ratio for 1874 was 23·9 per 1,000. The excess in 1875 was due to cholera in India, to 11 more deaths among invalids, and to final discharges of 206 more invalids.

A note appended to the return states that, of invalids shipped in India 2,513 in number,—

50 went direct to Cavalry Depôt.
321 Royal Artillery to Woolwich.
270 to Infantry Depôts.

It is possible, therefore, that the total losses of the year were higher than those in the Netley returns.

It is important to remark that, of the 779 discharges to pension, &c., at Netley, 188 were due to phthisis, 152 to heart disease, none of them peculiarly the results of Indian service; and that, of Indian diseases, liver affections contributed only 36, and general debility 51 discharges. Of the 54 deaths among invalids, 22 arose from phthisis. The facts are sufficient to prove anew how important an element ordinary home diseases are to the efficiency of the Indian Army, and they suggest again the existence of latent diseases of the class among recruits.

32. *Influence of Age and Length of Service on Mortality and Invaliding.*—On this important subject Dr. Cunningham has entered into considerable detail, and his facts are worthy of careful consideration. It can scarcely be said that they contain anything not already known, but the subject is of so much importance that it is necessary to call attention to it from time to time. The main points of comparison, so far as regards the influence of age on mortality, are given in the following abstract :—

Bodies of Men compared.	Ratio of Deaths per 1,000.					
	Under 20	20 to 24	25 to 29	30 to 34	35 to 39	40 and upwards.
Troops in the United Kingdom, 1863—1872	2·97	5·42	6·79	12·53	17·76	21·16
Civil Male Population, England and Wales	7·41	8·42	9·21	10·23	11·63	13·55
Troops serving in India, 1863—1872	9·34	17·41	23·61	32·64	44·31	65·93

This table shows that, irrespective of length of service, Indian climates and conditions of life occasion high and increasing death-rates with increased ages. The next abstract shows the general results of Indian conditions of climate and service on troops :—

		Ratio per 1,000 Strength.						
		Admissions.	Daily Sick.	Total Deaths.	Causes of Death.			
					Enteric Fever.	Apoplexy.	Dysentery.	Hepatitis.
Army generally	- - -	1,307	55	17·25	1·43	1·68	0·87	1·78
Newly arrived Regiments	- - -	1,310	50	24·39	4·71	3·21	1·28	0·86

This table shows that newly arrived troops, irrespective of ages, have a somewhat less sick-rate than the Army generally, due, Dr. Cunningham thinks, to their being as far as possible quartered on arrival at healthy stations, but that they furnish a higher death-rate from enteric fever and other diseases, until possibly the weakest constitutions are cleared off. What, then, are the practical lessons from the whole death and invaliding statistics? Do they not point in the direction, (1) of special selection of recruits rather than sending all kinds and classes to India, (2) of avoiding unhealthy stations for newly arrived regiments, as is done as far as possible at present, (3) as Dr. Cunningham proposes, of sending undeveloped youths to the hills for the hot weather and rains, and bestowing the most careful management on those who remain on the plains? And, we would add, pressing forward with the drainage and other improvements of stations.

Lastly, can nothing be done to check intemperate habits? In 1875 there were 8,926 cases of drunkenness reported in the Bengal Army, 4,683 in the Madras Army, and 4,259 in the Bombay Army. Were there no other disease cause in India, this one and the sun would account for many avoidable casualties.

33. *Women and Children.*—The death-rate among 6,335 women of the Army of India was 25·89 per 1,000, of which cholera occasioned 5·37 per 1,000.

There were 12,359 children, who yielded a death-rate of 69·75 per 1,000, including 5·1 from cholera.

The rates both among women and children were considerably higher than in the two preceding years.

The causes of death among children were mainly diarrhœa, convulsions, anæmia, and dentition, the usual children's diseases, aggravated by Indian climatic conditions. There were seven deaths from enteric fever among women and one among children. Half of the whole children's mortality took place under 18 months of age in 1874. In 1875 nearly half the deaths took place at and under 12 months of age.

The facts show great need of more care and intelligence in rearing children in Indian climates. Some years ago the Army Medical Department issued instructions on this subject, and attention might again be called to their contents.

The comparative immunity of children of British soldiers in India from scarlet fever has often been referred to, and it may be useful to introduce the following statistics for children, all over India, for six years, 1870—1875, in comparison with corresponding statistics for soldiers children at Aldershot for six years, 1859—1864, given in the report of the Army Sanitary Committee on the Aldershot scarlet fever epidemic, leaving out the epidemic months of 1865 :—

		Aggregate No. of Children in 6 years.	Total Deaths of Children in 6 years.	Total Deaths from Scarlet Fever in 6 years.
India :				
1870—1875	- -	69,647	4,979	27
Aldershot :				
1859—1864	- -	9,256	331	51

The following are the ratios deduced from these facts :—

—			Total Mortality per 1,000 Children.	Mortality per 1,000 Children from Scarlet Fever.	Percentage of Scarlet Fever Deaths to Total Deaths.
India	-	-	71·5	0·39	0·54
Aldershot	-	-	35·7	5·51	15·40

It hence appears that, while the mortality from all causes among children was double in India what it was at Aldershot, the ratio of scarlet fever mortality was fourteenfold at Aldershot what it was in India, and the proportion of deaths from scarlet fever to all deaths was $28\frac{1}{2}$ times at Aldershot what it was in India. The class of children was the same in both cases.

It may be added that the deaths from all other "children's epidemics" among the aggregate population, 69,647, of children in India during six years were as follows :—

Small-pox	-	-	14
Measles	-	-	163
Hooping cough	-	-	42
			219

The most fatal disease of the class was hence measles.

34. *Officers.*—In 1875 there were in India 1,721 Officers of the British service, among whom there were 24 deaths, and 1,364 Officers of the Indian service, among whom were 18 deaths. The Indian death-rate in both classes was 13·6 per 1,000. Four of the deaths arose from cholera, and one from enteric fever. During the year there were 704 Officers of both branches on leave beyond sea, among whom there were 17 deaths, a death-rate of 24·1 per 1,000.

It may be useful again to call attention to the comparative death-rates of Officers and men serving at the same stations in India, with the view of pointing out that there must be some assignable reason for the differences :—

—		Death Rates per 1,000 Strength.		
		All causes.	Cholera.	Enteric Fever.
Officers	-	13·6	1·3	0·32
Men	-	17·48	3·32	1·72

(*Native Army of Bengal.*)

35. As the Report on the Bengal Native Army is usually referred separately to the Army Sanitary Commission, it appears to be unnecessary to deal with the statistical points in Dr. Cunningham's Report, which, moreover, contains no account of the stations.

(*Jails in Bengal Presidency.*)

36. In 1875 the average annual strength of prisoners in these jails was 71,414. The admissions to hospital were 942 per 1,000, the daily sick 31 per 1,000, and the death-rate 33·65 per 1,000, of which 2·35 was due to cholera, 12·38 to dysentery and diarrhoea, and 4·20 to fevers. The average death-rate taken over the entire jail population for the years 1864—1873 was 46·09 per 1,000. For 1874 the rate was 39·90 per 1,000, and for 1875, as already stated, 33·65 per 1,000. This at first sight appears to be a satisfactory result, but on turning to the jail statistics we again encounter the anomaly of an apparently moderate, or even declining, general death-rate co-existing with such rates as the following,—Alipore 6 per cent., Baraset $12\frac{1}{4}$ per cent., Rungpore $12\frac{1}{4}$ per cent., Backergunge 12 per cent. Some of the smaller jails give even higher rates than these, such as Julpigoree, which returns a death-rate of $25\frac{1}{2}$ per cent., and Bilaspur, 17 per cent. There cannot be a doubt that rates such as these ought never to be shown by any jail population. Even without cholera the rates are excessive. Dr. Cunningham gives a few facts from the jail reports to show what is their sanitary condition. The most common defect appears to be great overcrowding, damp subsoil, as in the case of Backergunge, with its 12 per cent. death-rate, where, "in consequence of the raised plinths being of earth, the floors are constantly damp, damp ascends the walls to a height of 6 feet during the rains, ventilation is not satisfactory." Scurvy is prevalent in some of the jails, in others the drainage is bad. What appears to be wanted in most of them is an exhaustive inquiry and report on sanitary defects, and the removal of these as soon as possible.

(*Vital Statistics and Chief Diseases of the General Population.*)

37. The practical questions relating to these sections of the Report having been already considered by the Commission on other papers, it appears to be unnecessary to refer to them at present, except to call attention to the fact that in 1875 there were registered throughout India no fewer than 22,428 deaths by wild beasts and snake-bites, and to repeat the suggestion formerly made that better inducements held out for destroying poisonous snakes might possibly lead to considerable reduction of deaths under this head.

(Military Sanitary Works in Bengal Presidency.)

38. During the financial year 1875-76 the sum of 824,208*l.* was expended on works more or less designed to add to the health and comfort of the troops, mostly in the Bengal Presidency. Thirty-three stations are named at which works of various classes, including new barracks and hospitals, water-supply and drainage works, have been carried out.

New barracks have been built at Mooltan, Subathoo, Fyzabad, Darjeeling, and Chukrata.

Existing barracks have been remodelled and improved at Campbellpore, Jullundur, Dugshai, Meerut, Agra, Sitapur, Lucknow, Allahabad, Hazareebagh, Calcutta.

Various kinds of subsidiary accommodation have been provided at several of these stations, and at Peshawur, Rawul Pindie, Gwalior Fortress, Pachmarlai, Morar. Family quarters have been provided or improved at Chungla Gully, Jutogh, Raneekhet, Chukrata, Roorkee, Dinapore, and other stations.

Hospital accommodation has been provided at Ferozepore, Chukrata, and Calcutta.

Water-supply has been extended and improved at Meean Meer, Dalhousy, Umballa, Raneekhet, and Barrackpore.

Drainage and surface improvements are reported from Peshawur, Meean Meer, Morar, Meerut, and Dinapore.

Similar improvements have been carried out at a number of Native stations, and projects are in preparation for drainage and water-supply at several stations of British troops. Plans have also been prepared for pumps and filter beds to be attached to wells at each station.

The dry-earth system of conservancy is found to answer completely when carefully worked, and improved modes of dealing with the saturated earth have been advised for British stations. The trench latrines are in use at Native stations.

An important item of improvement has been brought to the notice of the Sanitary Commissioner, viz., the supervision of villages in the neighbourhood of cantonments.

The necessity for action in this matter was shown in the Report of the Royal Commission on the Sanitary State of the Indian Army in 1863, and detailed instructions for carrying out this duty were given by this Commission in their Suggestions for the Sanitary Improvement of Indian Stations. There are difficulties in the work, arising from its great extent, and perhaps the best way would be to concentrate effort in the first instance on villages and towns immediately adjoining stations, and to extend the work outwards. In this way the most dangerous nuisances would be first dealt with, and the example would facilitate progress.

(Civil Sanitary Works in Bengal Presidency.)

39. The chief points under this head have been noticed by the Commission on the Reports of the Sanitary Commissioners of districts; it is hence unnecessary to recur to them at present, except to state generally that progress is being made all over the country, not so rapidly as could be desired, but, considering the short period of time which has elapsed since these improvements were initiated, the wonder is that so much has been done in the way of improved conservancy, better drainage and water-supply, opening up and improving towns and villages, and the general spread of information and of interest in the subject which these reports show.

40. Under the head of *General Remarks*, Dr. Cuninghame has introduced extracts from 52 cantonment reports, showing the "sanitary defects noted," together with the improvements effected during the year. In forwarding the reports, the Quartermaster-General observes that "all deficiencies and defects brought to notice in them have received full consideration, and that remedial measures are being taken under the orders of His Excellency the Commander-in-Chief." The great defect at many stations is one long ago pointed out, namely, bad surface and subsoil drainage, and until this serious cause of disease is remedied, it will be in vain to look for a diminution of epidemic diseases. The "notes" do not afford all the information required, and Dr. Cuninghame has issued a code of instructions, which, if fully complied with, will go far to supply the deficiencies in the sanitary history of stations which we have more than once pointed out in its reference to cholera.

Lastly. In summing up the results of the Sanitary Commissioner's Report for 1875, the following practical results present themselves:—

1. That, whether tested by comparative death-rates with or without cholera, the report shows steady advance in improved health of British troops at Indian stations.
2. That improved health has accompanied the progress of sanitary works and measures at these stations.
3. That the general adoption of the dry-earth conservancy has enabled the sewage produced at stations to be removed away, without injury, to a distance, and has put a stop to the pollution of the subsoil and water sources at many stations.
4. That the widespread prevalence of enteric fever nevertheless points to the presence of local causes at many stations, probably connected with old conservancy defects, and other sources of foul damp in barracks and hospitals, resulting from want of proper drainage, nuisances in the vicinity, &c., as in the case of Peshawur (where such defects as those stated in the Report ought not to have existed after having been so often brought to notice), and that the inquiries already suggested by the Army Sanitary Commission into the local and personal conditions accompanying every case of enteric fever should be carried out and reported.
5. That the chief inefficiency cause at most stations is malaria and its results, indicating the necessity for surface and subsoil drainage, a fact which is moreover shown by the condition of stations described in the present Report.
6. That the proposed improvements in the water-supply from station wells, by introducing filter beds and pumps, will, when carried into effect, be an important advance towards

protecting and purifying the water sources for the use of troops (*vide* the following note on water filtration, in which a statement of principles it may be useful to keep in view is given).

7. That the proposal to supervise the sanitary condition of villages near stations is one of great importance, but it would be more advantageous to concentrate efforts at improvement on the nearest groups of population, rather than to undertake more work of the kind than can be efficiently done.
8. That intemperate habits are a very serious cause of inefficiency not to be met by sanitary measures, and the Commission desires that the attention of the authorities in India should be again called to the subject, and that some attempt should be made to deal with hepatic and dysenteric diseases, in so far as it may be practicable to diminish their frequency. They would further call attention to the fact that, notwithstanding the existence of lock hospitals and police measures for many years, venereal affections are, next to Indian fevers, the most important causes of admission to hospital in India. Diseases the result of intemperate and immoral habits show no decrease.
9. That the sanitary state of the jail population shows that great improvements are required in the Bengal jails.
10. The Commission would again call attention to the high death-rate (22,428 deaths) from snake-bite and wild animals, and would suggest the expediency of taking measures for preventing this, as far as practicable, by increasing the rewards for destroying poisonous snakes.

(APPENDIX A.)

This Appendix contains the results of a very important inquiry into the pathology and causes of the Delhi sore, which appears to have gone far to settle practically the questions connected with this disease. Many years ago the Army Sanitary Commission advised that a special investigation should be undertaken into the subject at Delhi, and the resulting reports clearly showed that the disease was localised in Delhi, and did not exist outside.

The special causes incident to troops sent into the city, besides the general bad sanitary state of it, were connected with the well water-supply used for drinking and ablution by the troops. Analyses made at the time showed that an ablution well water contained 358 grains of impurity per gallon, of which $65\frac{1}{2}$ grains were organic matter. From some of the wells remains of dead bodies were taken after the mutiny. Troops using purer water away from the polluted subsoil of the city suffered very little, and the result was a recommendation that the sanitary state of Delhi should be improved and Jumna water introduced for use. The whole subject has been exhaustively treated in this Appendix by Drs. Lewis and D. Cunningham, and proof has been adduced to show that the quantity of salts in the water was in all probability the primary cause of the mischief. When bad water was given up and good water used instead, the disease declined, and when the use of bad water was resumed the disease reappeared.

Formerly, in 1864, from 40 to 70 per cent. of European troops were affected, and now, with sanitary improvements and better water, the reporters are able to state: "At the time of our visit to Delhi, in the early part of 1876, Delhi boil was, and had for some time been, 'practically unknown among British troops.'" It still exists among the civil population, although it is diminishing as improvement advances. It is scarcely necessary to dwell on the practical importance of this experience, but up to the present time we have no means of knowing how the water acts in causing the disease. The worst water was that applied direct to the skin in the process of ablution, and the most frequent seats of the sore were the forehead, the cheek, the wrist, the back of the hands and feet, the points of the elbows and knees, and not unfrequently the side of the nose, all subject to friction in the process of ablution. There is nothing new to add to the recommendations formerly made on this subject by the Commission: This new inquiry shows their necessity.

(APPENDIX B.)

by the same investigators, contains a first instalment of an inquiry, partly advised by this Commission, into leprosy in India. It is chiefly of a statistical and topographical nature, and contains a general account also of the nosology of the disease, but the pathological part of the inquiry is still in hand.

The practical conclusions at which the reporters have arrived up to the present time appear to be that compulsory segregation of lepers would be of no use, and that leper asylums "are beyond doubt calculated to do very great good, and deserve all support and encouragement, so long as such support does not relieve the relatives of the diseased from the performance of their duties to the sick."

26th May 1877.

(Note on the Principles of Water Filtration for Indian Stations supplied by Wells.)

As Dr. Cunningham's Report contains proposals for filtering the water-supply of stations, the Commission has thought it might be useful to give, in the form of an appendix to their Memorandum on the Report, the following brief statement of principles bearing on this subject.

1. Wells for supplying drinking and culinary water should be selected after careful examination of the surroundings of the well, to see that there are no sources from which the subsoil water can be polluted by sewage of men or animals.

2. The water should be analysed and its sanitary condition estimated,

3. The selected wells should be capable of yielding the amount of water required.

4. Supposing that these three requirements are found to be favourably fulfilled, the tube of the well should, as a precaution against future risk, be coated outside with a layer of concrete of sufficient thickness, and to such depth as would cut off the immediate subsoil water from the well, leaving the well to be supplied by the deeper water-bearing strata. But if in any case it happens that cesspits have been dug down to water-bearing strata, the only safe course to take is not to use the well.

5. The tube of the well should be raised two or three feet above the ground level, the platform round the well should be concreted or paved, and the ground sloped away from the well, and means provided for draining away all waste water.

6. It is not necessary to arch the well over, but some permanent cover is required to prevent dust or dead leaves from falling into the well.

7. Suppose that these points have been all arranged satisfactorily, the next question refers to the filtration of the water, and, first, it may be found that after taking these precautions no filtration is required. In a good well the best possible filtration is that obtained by means of the natural stratification. Second, all wells in time contract impurities from accidental and unforeseen causes, but the remedy in such cases ought never to be sought by filtration. The well should be examined and cleaned out.

8. When well water will clearly be benefited by filtration, the following principles should be kept in view:—

First, to save outlay and current expenditure, the amount of water filtered should be no more than is required for drinking and cooking, probably 3 gallons per head per day. Ablution and bath water does not require to be filtered, and provision should be made for supplying drinking and cooking water in such a way that the water carriers cannot draw unfiltered water for these purposes. Where wells are the source, it will probably be better to use different wells for the two purposes. This will render it less easy for the carriers to draw unfiltered water for drinking or cooking.

Second, the object of filtering is to remove suspended matter by straining, and to oxidize dissolved organic matter by oxygen supplied by the filtering medium. In performing these functions the filter may become clogged by suspended matter, and the dissolved organic matter may pass through the filter unoxidized, because the amount of water previously passed may have deprived the filtering medium of its available oxygen. Hence it is necessary to provide for removing all impurities deposited in the superficial layer of the material, and to allow the whole filtering medium to be drained of its contained water from time to time, so as to renew its supply of oxygen from the atmosphere.

A filter constructed for downward filtration can be cleansed and aerated with the greatest facility.

9. According to the proposed plans all the water for cooking, drinking, lavatories, and baths, amounting to about 12 gallons per head per day for healthy men, and from 30 to 35 gallons per head for sick, besides water required for horses and for water carts when in use, would have to be pumped and stored, while only 3 gallons per head would require filtration; it is hence evident that a storage tank would be required sufficient to hold a day's supply for the station, or for that division of the station for which each well is set apart.

10. The proposed use of a capstan to raise the water involves machinery which may be necessary for deep wells and large pumps, but not for ordinary hand pumps. In the new dépôt barracks in England water is raised from the well by a small steam engine to a tank placed on some convenient locality or building, from which the water is conducted in pipes for distribution to the barrack buildings. Such an arrangement in India could be combined with means of filtering the quantity required for drinking and cooking, care being taken that unfiltered water was laid on solely to the baths and lavatories.

11. For 1,000 men with 5 per cent. sick, the water required would be as follows:—

	Gallons.
Lavatories and baths, unfiltered	10,000
Drinking and cooking, filtered	3,000
	13,000

The filtering area would have to be increased fourfold if the whole water were filtered.

If the day's supply were to be raised at one pumping, a barrack for 1,000 men would require a storage tank to hold 13,000 gallons for the men alone. If the labour were available twice a day, a tank of half the dimensions would be required. Much also will depend on the rate within a given time at which water is drawn for bath and lavatory purposes.

12. The construction of water tanks and filters (together with a large amount of information on the general question of water-supply) was given in detail in our "Suggestions for the Sanitary Improvement of Indian Stations," to which reference may be made for present purposes.

A properly constructed filter, on the principle shown in Plate VII. of the Suggestions, will filter from $1\frac{1}{2}$ to $3\frac{1}{2}$ gallons per square foot per hour, according as the water contains more or less suspended matter.

At the former rate for a barrack of 1,000 men a filtering surface of 84 square feet for each filter would be required, and at the latter rate a surface of 38 square feet would answer. Allowance, however, would have to be made for the amount of water drawn from the filter within a given time, for this amount might possibly exceed the quantity the filter was capable of passing within the time. It would hence be necessary to take into account the customary manner of supplying the

barracks, hospitals, and cook-houses with water, *i.e.*, the manner of distribution must determine to a certain extent the amount of tank capacity and filtering area to be provided.

The amount of water to be supplied from the storage tank to the filters could easily be regulated by a common ball valve.

13. Suppose that the most economical way of providing pumping power requires that the day's supply be raised within an hour or two, it is obvious that for 1,000 men storage tank capacity would be required for 13,000 gallons, and suppose that the filtered water distribution was to be made within, say, half an hour, in order to save expense, a distributing tank to hold 3,000 gallons would be required for a barrack of 1,000 men. If, as already suggested, the best well were to be used for yielding drinking and cooking water, and an inferior well for supplying the lavatories and baths, the filtering arrangements would be as follow :—

For drinking and cooking water for 1,000 men,—

1. A storage tank of 3,000 gallons capacity.
2. Filters to be used alternately.
3. A storage tank for filtered water to hold 3,000 gallons, and then for the bath and lavatory well simply a storage tank to hold 10,000 gallons.

14. In all cases there should be three filters, each capable of filtering the volume of water required, to allow one for filtering, one for cleansing, and one for oxidation. One filter would be of little use, it would soon become clogged, and the filtration would be stopped. In a recent case this event took place, and the filter was abandoned as useless. It would be a mistake to construct filters under the idea that they are self-acting and require no attention. On the contrary, wherever filters are introduced, provision would have to be made for intelligent superintendence of the apparatus, to keep it in constant working condition. If this precaution be neglected, great risk to health of troops may arise, from the well known experience that, when a filter or a filtering medium becomes foul, the water passing through it is certain to dissolve and carry with it a dangerous amount of organic impurity, in addition to the quantity brought with it from the well.

15. In winter the surface of the sand may probably need to be scraped once in each month, in summer once a week. At each scraping from half an inch to an inch of sand with the deposited mud should be removed from the surface of the filter, and the quantity replaced by clean sand. Twelve inches of sand would allow of six scrapings, taking off 1 inch each time, after which 6 inches of clean sand would have to be added. The dirty sand can be washed clean for future use. If vegetation shows itself on the surface it had better be removed at once.

The bottom drains of each filter should be so arranged as to admit of the freest ventilation when the filter is empty, in order to ensure the complete aëration and oxidation of the filtering media before the filter is again brought into use.

16. If it be considered necessary in any case to ventilate the well itself, a wooden tube should not be used, as it is liable to decay and to become a receptacle for animal or vegetable life ; an iron tube would be better, and it should be carried to a sufficient height above the top of the well to have an air current formed in it by the rarefying action of the sun.

17. The tanks should be regularly cleaned out, and, together with the filters, should be protected from sun heat as far as possible.

18. Filtered water should only be drawn by a water tap, never by dipping. The filtered water tank should be covered and secured, so as to render this hurtful practice impossible.

19. Filtered water should be carried for use in metal pails, never in mussocks, and it should be stored in barracks and cook-houses in covered earthenware vessels, kept scrupulously clean. But for large stations it would be far safer to have the water properly laid on.

(Memorandum on the Report on the Cholera Epidemic of 1875.)

This Report, which forms the first section of the general Report of the Sanitary Commissioner with the Government of India, has been issued separately, and is confined to a discussion of facts regarding the great epidemic of 1875. There are points of a controversial nature raised in the report which scarcely come within the province of the Army Sanitary Commission, except in so far as they may help to forward real practical work. It is not proposed in the following remarks to give any decided opinion on the controverted points at issue, and the object of these remarks will perhaps be best served by stating the facts as a contribution to the Indian Cholera Inquiry, and taking from the experience any points of practical importance that may present themselves.

1. The following abstract given by Dr. Cuninghame shows the cholera mortality all over India for 1875, contrasted with that of 1874 :—

Province.	Population.	Total Deaths from Cholera in 1875.	Total Deaths from Cholera in 1874.
Bengal Proper and Assam	63,787,577	116,606	73,354
North-West Provinces	30,769,056	41,106	6,396
Oude	11,174,785	23,321	68
Punjab	17,487,125	6,246	78
Central Provinces	7,427,608	14,643	14
Berar	2,184,945	22,465	2
British Burma	2,738,358	761	960
Madras and Mysore	30,360,211*	97,051	313
Bombay	18,228,774	47,573	37
Rajpootana, Hyderabad, and Central India	Not known	14,649	4†

* Population of Mysore not known.

† In Western Malwa.

The total cholera deaths amounted to 384,421 in 1875, as contrasted with a mortality of 81,226 during the preceding year 1874.

The table shows that the same variations in intensity existed all over India. The facts are indeed reproduced year after year, and it appears not unwarrantable to deduce from all this past experience that, whatever may be the cause of cholera, its action in districts where it appears periodically is very variable in degree, and that this is a law of cholera, not amenable as yet to any theory; that it must be accepted as a law, the practical result of which is that the immunity of one year or more cannot be accepted as any reason for relaxing our efforts; and that, in the meantime, we must test our success in mitigating the ravages of cholera by comparing death-rates over considerable periods of time. It is satisfactory to know that when such a test is applied it appears to show a falling off in cholera mortality in different districts of India.

2. Just as epidemic deaths vary in numbers year by year, so they vary in numbers in different districts of India. The map attached to the Report shows that the epidemic of 1875 covered nearly the whole of Southern India, where the disease had an apparent relation to the epidemic cholera of Ceylon. The north-east part of Madras Presidency suffered little. The Central Provinces escaped in great part. It covered the whole of Bengal proper, the North-West Provinces, and Oude. The upper Punjab also escaped the disease, which in this province was confined chiefly to the sub-Himalayan districts.

Over the whole of this vast area cholera deaths were registered in the earlier months of 1875. The disease appeared in detached cases in regions where it afterwards became epidemic, except in Bengal, where it passed over in considerable force from the latter months of 1874 to the earlier months of 1875.

Referring to the distribution of cholera, Dr. Cunningham says:—"These areas of prevalence, it is to be observed, are not the areas through which the great highways of traffic lead, nor are the exempted tracts those which are removed from the great lines of communication. Over great part of the country in which cholera was most severe there are no railways, and the roads are often indifferent. Through part of the Central Provinces which escaped one of the great trunk lines of railway, on which there is much and constant traffic, runs. In the Upper Provinces the extension of the disease was not along the high road, but over an area where the means of communication are comparatively difficult and little used."

Facts regarding the same epidemic contained in the reports of Sanitary Commissioners of different Governments show, locally, the absence of relation between traffic movements and the movements of epidemic cholera.

Up to the present time, therefore, this part of the inquiry has resulted in showing that no practical good can be effected by interfering with the internal communications of India with the view of limiting the sphere of epidemic movement or delaying its progress.

3. The present Report contains some very important information regarding the distribution of cholera within the registration districts of India, obtained in conformity with our instructions for the Cholera Inquiry.

The information is given in a tabular form, showing the number of registration districts, the number of these in which cholera appeared, together with number of villages in each district, and the proportion of these which yielded cases of cholera in Bengal proper, Oude, Punjab, Central Provinces, and Berar. The following are the totals of these tables:—

	Registration Circles.		Villages.	
	Total Number.	Number attacked by Cholera.	Total Number.	Number attacked by Cholera.
Bengal Proper	548	466	154,194	17,699
Oude	134	120	24,702	4,210
Punjab	487	162	22,986	797
Central Provinces	189	89	24,257	1,881
Berar	131	98	5,427	2,431
Total	1,489	935	231,566	27,018

The data in this abstract prove that 63 per cent. of the registration districts included in it suffered from cholera in 1875, showing that the disease was extensively diffused over the country; but when the proportion of groups of population attacked is taken into account, it is found that little more than $11\frac{1}{2}$ per cent. of these groups suffered, while $88\frac{1}{2}$ per cent. escaped.

This fact of the comparatively small number of groups of population on which the epidemic falls has been confirmed all over India, and must be received as another ascertained law of cholera diffusion, in reference to which Dr. Cunningham says:—"The popular impression with regard to cholera seems to be that, when once it attacks a district, it spreads from village to village, until all have more or less suffered. But this idea is altogether a mistake. In most of the districts where cholera prevailed, the villages attacked were the exception, and even in those parts where it was most prevalent, and where it beyond all question attained the proportions of a very severe epidemic, many towns and villages escaped."

The same law holds good within the endemic area in Lower Bengal. Thus in Burdwan district, with a population of 2,034,754, there are 5,191 villages, and there were 2,127 cholera deaths in 1875 in 198 of these groups of population. In Hazareebagh district, with a population of 771,875, 270 deaths took place in 38 villages, out of a total of 6,073 villages. In Nuddea district, with a population of 1,812,795, there were 9,948 cholera deaths registered in 1,001

villages, out of a total number of 3,691 villages. Similar facts could be produced in detail all over India, and they appear to point in the direction of another law of cholera, viz., that it attacks and remains in special localities until the force of the epidemic is spent.

4. Up to the present time, we have no account from India of the manner in which cholera comports itself in attacked towns and villages when it is once there. This important point in cholera history has yet to be made out. But in the west it has been observed that in successive cholera epidemics the same houses have been attacked, often in the same order of time, and it has happened that the first cholera case has taken place in the same house in which the first cholera case of the preceding epidemic had appeared. It may be suggested whether the history of cholera might not be advantageously followed up in this direction in a few suitable localities in India.

As this part of the Report is devoted mainly to a history of cholera diffusion among the civil population, there is no information regarding attacked localities and their sanitary condition; points which are left to the local Sanitary Commissioners.

5. Those sections of the Report which refer to cholera in the Army contain much interesting information.

Among British troops the prevalence of cholera during 1875 was as follows:—

	Cases.	Deaths.	Ratio per 1,000.
Bengal - - - -	201	136	3·66
Madras - - - -	7	4	·86
Bombay - - - -	80	54	5·30
Total - - - -	288	194	3·32

Although 1875 was a severe epidemic year, it is satisfactory to learn that the proportionate mortality among British troops serving in Bengal was much less than during previous great epidemics.

The following are the facts as given by the Sanitary Commissioner:—

	Deaths from Cholera per 1,000 Strength.
1861 - - - -	23·73
1867 - - - -	13·84
1869 - - - -	16·46
1872 - - - -	10·66
1875 - - - -	3·66

In any comparison between these figures, they must be accepted as showing a great reduction in the cholera death-rate in the Bengal Army within the last ten years, and the question may fairly be asked whether the reduction is not, in part at least, due to progressive sanitary improvement, especially in barracks, hospitals, water-supply, and conservancy?

The results are of course quite irrespective of the influence of invaliding, and the argument from them is decidedly in favour of pressing forward in the way of improvement. So far as cholera is concerned, the test of improved health must be applied during epidemic years, and if, during a series of these years, the mortality in the British Army from cholera continues to decrease, the conclusion is allowable that sanitary work is telling on the epidemic mortality.

6. Among Native troops in Bengal there were 142 cases and 69 deaths from cholera in 1874.

7. There are notes appended to the Report giving the local details of cholera at 40 different stations in Bengal, the North-West Provinces, Oude, Lower Punjab, and Central India, including information regarding the disease as it showed itself in 37 European and 26 Native corps, besides the outbreak at Simla, &c. Much of the detail relates to the diffusion of cholera, and the connection between attacks among troops and among the adjacent population in relation to the question of contagion. As on other similar occasions, it is proposed not to enter into the discussion, but simply to see whether from the facts themselves any additional rules for guidance can be deduced.

8. There are no additional facts to show the relation of meteorological elements to epidemic cholera, and we must echo Dr. Cunningham's wish that "what peculiar features characterise a cholera epidemic year as contradistinguished from a non-epidemic year, the Meteorological Department of India, which has been recently reorganized, may, it is hoped, in time be able to explain." Hitherto the only observed element of this class, and not always a constant one, has been the co-existence of easterly winds in Northern India with the progress of cholera towards the north-west.

9. Appendix C gives some important information of a terrestrial and local character, namely, the possible relation between attacks of cholera in the vicinity of stations and the disease in the station itself. It is a table showing the number of villages within a radius of 10 miles of 26 stations of British troops, together with the number of these villages which were the seats of cholera. To make such a table complete would require the dates to be appended of the first appearance of cholera within the 10-mile radius, and the date of its appearance within the station. This point, the date of events, was strongly insisted on in our instructions for the Cholera Inquiry.

An instance or two will show the nature of the evidence in this table. Round Sealkot there are 648 villages, of which one was attacked by cholera. There was a single case of cholera among troops. There was no cholera among a Native population of 13,400 in cantonments, and

only two deaths in the city of 25,337 inhabitants. Sitapur has 583 villages within a 10-mile radius, of which 17 were attacked by cholera. There was one fatal case among troops, and another among a cantonment population of 3,675, both in April. The town itself had 41 cholera deaths, of which all, except one in April, took place in and after September.

A few examples, including districts within which some of the chief military stations are situated, will illustrate this point further:—

Stations.	Number of Villages within a Radius of 10 Miles.	Number of these Villages attacked by Cholera in 1875.
Allahabad - - - -	379	23
Cawnpore - - - -	148	12
Lucknow - - - -	246	48
Fyzabad - - - -	229	35
Meerut - - - -	236	24
Delhi - - - -	130	10
Umballa - - - -	139	10
Meean Meer - - - -	224	3
Jullundur - - - -	215	1

The total number of villages within a 10-mile radius of the 26 cantonments amounted to 6,941, and of this number 370, or 5·3 per cent., were attacked by cholera. The proportion of villages within 10 miles of military stations attacked by cholera was thus one half of the proportion of villages attacked in the country generally. Here a question suggests itself, viz., whether villages near military stations have been undergoing more active sanitary improvement than others?

It might be worth while to include this element in any subsequent report. As the case stands, it appears that cholera selected its localities in the vicinity of stations, as it did all over the country, without reference to communications and on local grounds.

10. Connected with this same subject is the very important question of the relation of cholera in villages to the appearance of cholera in cantonments, and whether there is any sufficient evidence to prove importation of the latter?

The facts under this head are contained in reports of Medical Officers attached to 64 corps of British and Native troops, at 41 separate stations, besides the jail at Fyzabad, the central prison at Meerut, and the Thomason College at Roorkee, 67 communities in all. In not one instance is there evidence such as is required by our instructions to show that cholera was due to importation. In one case only was cholera imported (into Agar) by a sepoy, but the imported case was the only one at the station. There are, however, a few instances in which, in the absence of histories and dates, opinions were entertained that the disease might have been imported. The opinions by themselves cannot of course be admitted as evidence, but if opinions are to be admitted, it must be stated that in the great majority of cases there was no apparent ground even to form opinions in favour of importations, for none are given.

Dr. Cuninghame has given an analysis of the facts in the more prominent instances, which may be resumed as follows. At Cawnpore Native servants were supposed to be means of communication, from their presence at a Native festival where cholera broke out, but no dates or facts are given. It is simply an opinion. The actual dates show that the first case of cholera took place in the 35th Regiment, Native Infantry, on March 26th (there were 5 cases in all). The cantonment (52 cases) was attacked next day, March 27th; the 73rd Foot (6 cases), April 2nd. It will be seen that the whole station suffered at the same time.

At Moradabad it was believed that cholera was imported by punka coolies, but there are neither facts nor dates given.

There were three corps at the station, one of which, the 1st Battalion, 18th Foot, had six cases of cholera, the first on September 5th. But on August 26th cholera had broken out in the jail. There was none in cantonments or in the other corps.

At Meerut it was thought that cholera had been imported from a stricken village by work-people employed in the Artillery barracks. There were five corps at the station, besides the cantonment and jail population. The dates of attack were as follow:—

		Total Cases.
Royal Artillery	- First case, 26th August	- 15
15th Hussars	- " " 24th September	- 2
85th Regiment	- " " 11th "	- 1
Jail	- " " 7th "	- 23
Cantonment	- " " 5th "	- 46
City of Meerut	- " death, 14th August	- 80 fatal.

As already stated, there were 24 villages (out of 236) attacked by cholera within 10 miles of Meerut. In the absence of any trace of communication admissible as evidence, it seems justifiable to conclude that the Meerut attack was part of the epidemic, and came under the law of locality already stated. At Dharmasala the fact of the arrival of travellers was assumed as proof of importation, and one of the cases had eaten pork and drunk milk brought by a boy who was taken ill with cholera on the road. This case took place on August 12th, in a soldier of the 81st. There were five cases in this regiment. But cholera actually broke out at the station on July 2nd (1st Goorkha Regiment, 97 cases), and in cantonments (42 cases) on July 3rd. Moreover, in Dharmasala and Kangra, out of 89 villages within 10 miles, 11 were attacked with cholera.

The usual assumption in these and similar cases appears to have been that, without reference to facts, dates, and circumstances, the presence of cholera in a country was a *prima facie* reason

for accounting for its appearance in cantonments by importation. The truth will never be arrived at by this proceeding, and we must again direct attention to the rules laid down for investigating these cases in our instructions for the Indian Cholera Inquiry.

11. It cannot be said that the practical results of experience during the cholera of 1875 are in favour of quarantine, but they are not opposed to the more rigid application of another measure, far more in accordance with what we really do know about cholera, viz., to prevent troops from going into localities where cholera exists. The great danger appears to be in *places*, not in *persons*.

12. This last proposition, so far as persons are concerned, receives a large amount of confirmation from the manner in which cholera restricted its influence within hospital wards to the sick. Dr. Cunningham has abstracted the particulars from Medical Officers' reports for 67 attacked bodies of people, 64 of which were regimental corps.

Amongst these were treated 611 cholera cases, or, including the Simla cases, 894. In 8 cases of 67, attendants were attacked. The following is an abstract of the facts. Among 8 bodies of people, from among whom 220 cases of cholera were treated, 22 attendants were attacked. In several instances the attacks were in members of the same family in attendance on the sick, and in the same locality. The only instance in which the proportion of attendants attacked can be given is in the 1st Goorkha Regiment at Dharmasala. In this instance there were 97 cases of cholera treated. The hospital establishment contained 127 persons, of whom 11 were seized with cholera. But Dr. Cunningham has shown that the proportion of attendants on sick attacked during this severe outbreak was 8.66 per cent., while the proportion of attacks among persons not in contact with sick was 8.01 per cent., nearly the same. Of seven sweepers employed in removing excreta, not one suffered. Of the other attendants, who carefully avoided the excreta, eight were attacked. In this instance the Commanding Officer was attacked, "and is supposed to have contracted the disease during his visit to the hospital."

Among the other affected bodies of people, 59 in number, 674 cholera cases were treated, and not one attendant suffered. Unfortunately, the number of attendants in each instance is not given, but, estimated on the scale of the 1st Goorkha Regiment, they must have been very numerous.

13. In our remarks on the great cholera epidemic of 1872 attention was called to the propriety of limiting quarantine restrictions solely to cantonments, in the event of a further trial of this method of protecting communities from cholera being deemed advisable. Since then further experience has been obtained, and in the present Report we have a great number of facts bearing on the subject, but none, unfortunately, which hold out any hope of arresting cholera, either in the country or outside cantonments, by this measure. There are, in fact, no data on which to rest proceedings of this class. The history of cholera since 1872 shows no steady progress in the epidemic in time and space. The fundamental condition on which restriction of intercourse must be based is hence non-existent. There is an apparent movement in the maxima, but already the disease is far ahead of the maxima, and beyond the line of any practicable quarantine cordon.

Like an invading army, an epidemic of cholera is preceded by an indefinite number of advanced guards, which the more careful observations of late years have shown to have established positions a long way, perhaps many hundred miles, in front of the main body. Hence the disease, and all that may follow from its presence, must already exist in localities before any protective steps can be taken, for it is only after realizing its presence and the course it is taking that any rational measures can be adopted for establishing either quarantines or cordons.

14. In the Report under consideration the facts as already epitomized point to the same conclusion as a matter of history. But the old question of the practicability of station cordons has again come forward.

This is the only point with which the Army Sanitary Commission can deal. Restrictions have been tried with regard to a number of stations, with the result, as stated by Dr. Cunningham, that "no single case can be cited in which the smallest good has been effected by them." This result is fully borne out by the statistics. Even with persons actually suffering from choleraic symptoms there have been similar difficulties, for "the experience of 1875," Dr. Cunningham says, "shows that sick persons are not stopped." There is no evidence of sick having been stopped, except as regards Lucknow and Nagode. The first suffered, Nagode escaped; but there are reasons why this fact should be considered on wider grounds.

It may be well, however, while stating the Sanitary Commissioner's estimate of the results of station cordons, to give his facts briefly.

In many cantonments no restrictions were imposed. In three of them pilgrims only were diverted. In others cordons were drawn round the stations to keep out affected persons, and generally to stop communication with affected localities. At six stations quarantine in its more extended sense was introduced, but it was found to be impossible to stop supplies or the post. In a few places, where there was no cholera near, restrictions were imposed, but as there was no cholera to keep out, the resulting immunity can scarcely be ranked as a success.

Leaving out stations within the endemic area, there were 25 places in the Bengal Presidency which were unprotected. None of them suffered to any great extent, and some escaped.

Within the endemic area of 1875 there were 29 cantonments "where restrictions more or less stringent were imposed," and yet 20 of these suffered from cholera, many of them suffered much. Of the remaining nine stations, several have hitherto been more or less exempt from cholera without quarantine; several are hill stations, which rarely suffer; and in one case, "Kasauli, with quarantine, suffered heavily, while Subathu, Dagshai, and Jutogh with it escaped, but so did Solun, which lies in the midst of them," although unprotected. In one instance, Bagsu, the protection afforded by quarantine was considered complete, but it turned out on inquiry that in some very essential points quarantine could not be carried out, and, notwithstanding the restrictions, severe diarrhoea (24 cases out of 121 men) broke out.

These facts show how necessary it is to investigate all similar cases with great care and minuteness, and at the time, if the truth is ever to become known.

15. The experience of 1875, taken in its broad features, and apart from all theoretical discussions, is unfavourable to the idea of placing any faith in cordons for protecting the health of troops during cholera epidemics, even although the restrictions may be rendered as complete as possible.

It follows that we must look mainly to sanitary improvements for protection, and, as any information on these points is of importance, it may be well that attention be called to the following facts:—

Cachar, 3rd Native Infantry.—"Drainage very imperfect."

Chunar.—"The bungalow used as a barrack by Europeans is deficient in ventilation, especially when the end rooms are occupied, as they sometimes are, by married men. Washings of cook-houses, &c., drain into the lower ground which surrounds the bungalow. The water-supply from the Ganges is liable to pollution. The beer was reported sour."

Fyzabad.—"Too abundant vegetation on the west side of cantonments. . . . A mango grove obstructing ventilation opposite No. 6 barrack, and keeping the ground damp." (N.B. This may be remedied probably without cutting down trees.) "Two large excavations on the north and south-east, and several cesspools near the hospital and barracks," 1st Battalion, 25th Regiment. "Sanitary condition of the lines at the time not so good as it might have been." Defects not stated.

Lucknow, Royal Artillery.—"Sanitary condition of lines satisfactory, and conservancy arrangements carefully looked after. Water was boiled and filtered. Disease could not be connected with water from any particular well." (This has an important bearing on the cholera water theory, for the Artillery had 24 cases of cholera). "The drainage is fairly good." 13th Hussars.—"Barracks old . . . but fairly water-tight. . . . In family quarters ventilation not so good as in barracks, from subdivision into rooms. . . . Walls appeared damp during heavy rains. . . . Drainage on surface, and fairly good, but from the ground being level, and the soil so impermeable, the whole surface is more or less under water for a considerable time after heavy rain. Around the hospital the drainage is not so good as round the barracks." (This simply means that the whole station requires to be drained.) Roof ventilation in male wards "somewhat deficient." 40th Regiment.—"The sanitary condition of the lines was most satisfactory. No facts whatever to connect the disease with water polluted by cholera discharges." 65th Regiment.—"The drainage of the lines is indifferent; no evidence to connect the disease with polluted water." 6th Native Infantry.—"In the Fort the quarters are dark, badly ventilated, and afford too little superficial space. Conservancy also reported to be defective there." 41st Native Infantry.—"In the Fort there is no drinkable water." The nearest is half a mile away, and the men drink the bad water.

Bareilly, 11th Native Infantry.—"The barracks overcrowded."

Roorkee, 55th Foot.—The fire buckets are hung in the verandahs of the bungalows. The water had not been changed for weeks, and smelt "most objectionably" in one bungalow where two children and one woman contracted the disease. *Thomason C. E. College.*—Imperfect drainage, unsatisfactory state of Native students' latrines. Some overcrowding in class room and want of proper protection to the well. (Some of these defects had been remedied.)

Meerut, Royal Artillery.—Syces and grass-cutters' lines badly constructed, in many instances 12 and 15 inches below level of ground. 85th Regiment.—"The ground around the hospital, in which the only case occurred, was water-logged owing to unusual heavy rain."

Muttra.—"Large sudder bazaar close by, objected to. Its conservancy defective. Slaughter-house also objected to."

Morar.—Quarters of Bombardiers first attacked were in an insanitary condition (defects not stated). 54th Regiment.—Biswas Nullah, near barracks, "may have been prejudicial to health." An unsatisfactory native latrine near regimental bazaar. *Fort Gwalior.*—"There are eight large tanks of stagnant water in the fortress, some of which in the early morning and evening give off unpleasant effluvia."

Nowgong, 63rd Regiment.—Black cotton soil. Becomes very swampy in the rains. Numerous family houses bring many Natives constantly near the quarters, harbouring refuse and encouraging flies. Drainage from these quarters at times offensive.

Sirdarpore.—Bed of river fouler than usual from want of flushing.

Umballa, Rifle Brigade.—"Drainage is imperfect."

Kasauli.—No. 16 family barrack appears to have been built on old foul ground, and the floor was damp.

Simla.—As this hill station suffered greatly during the epidemic of 1875, it may be useful to call special attention to the facts. The population consisted of 1,434 Europeans and Eurasians and 13,414 Natives. The first case of cholera occurred on June 26th, and the last on August 25th. There were in all 341 seizures and 184 deaths. The epidemic began by a single case, and ended in the same way. It reached its maximum period between July 18th and August 3rd, between which dates there were 212 cases. Of the total attacks 25 were in Europeans and Eurasians, and 316 in Natives; 308 were adults, and 33 children. The incidence of cholera according to locality was as follows:—

Main bazaar	-	-	-	-	89 cases.
Lukkur bazaar	-	-	-	-	14 "
Boileau Gunge	-	-	-	-	7 "
Chota Simla	-	-	-	-	2 "
Khyutoo	-	-	-	-	6 "
Detachment of Goorkha Regiment	-	-	-	-	4 "
Jail	-	-	-	-	2 "
Private compounds	-	-	-	-	217 "

The Viceroy's household, comprehending 620 persons, entirely escaped. For weeks before cholera appeared the public health was bad, and many deaths from fever took place. During the cholera outbreak diarrhœa was very prevalent. The following general account of the sanitary state of Simla is given in the notes:—"Sanitary Defects.—These are many and great. The water-supply, drawn as it is from many independent and unprotected sources, is scanty, and open to all kinds of contamination; the conservancy both of bazaars and private houses is defective. The houses in which the Natives and even some of the Europeans live are overcrowded, ill ventilated, and damp during the rains. Many of the huts occupied by Native servants in particular are not fit to live in. The sanitary condition of the settlement has been reported on by a special Committee, and recommendations have been made for dealing with all these evils."

At Simla, as in many other instances, the fatality of cholera was quite unnecessarily augmented by erroneous ideas regarding the advantages of removal and isolation of the sick. During the epidemic of 1848-49 in this country it was proved as a fact that the mere removal often destroyed all chance of recovery. At Simla, out of 58 cases dealt with in this way, 47, or 81 per cent., died, some of them on the road.

Ferozepore, Royal Artillery.—To the east of the lines, at the distance of nearly half a mile, there is some low ground where the water lies for some days after a heavy fall of rain.

Dharmasala, 1st Goorkhas.—State of the lines was very bad; huts overcrowded together. New lines are in course of construction. Water-supply open to contamination. A watercourse which passes through the lines flows past the jail, where there had been cases of cholera some days before, and a portion of the drainage of the jail is liable in heavy rain to be washed into it. (But the springs which supply drinking water are above the flood level of the stream, and 300 or 400 yards from the jail.)

Umritsur and Govindgurh, 1st Battalion, 6th Foot.—"A large quantity of rain was lying on the ground, and the ground was thoroughly soaked."

Meeran Meer, 2nd Battalion, 1st Foot.—"Two of the men attacked worked in a barrack, where for some time previously a bad smell had been noticed as emanating from the brick floor. This building has since been abandoned."

16. These are all the facts respecting the sanitary condition of stations contained in the notes sent to the Sanitary Commissioner. It can scarcely be said that they afford any other than very general indications of the class of remedies required. But as local improvements afford the only practicable means of diminishing the liability of troops and civil population near stations to epidemic outbreaks, it seems necessary to call attention to the defective character of the information, such as it is. Indeed, from Dr. Cunningham's Report, judged as a whole, he appears to have found it necessary for progress to deal mainly with opinions on the spread of cholera by contagion, and he calls pointed attention to the dangers of admitting such a supposition as a basis of action, because it excites alarm (a known cause of cholera attacks), it leads to exposing troops and others employed on cordon duty to fatigue and night work, and, worse than all, it lulls people into fatal security by trusting to cordons for protection which can only come from active sanitary work.

It would be most advisable that in future reports from stations the local authorities should pay special attention to the sanitary state of the subsoil, wells, buildings, bazaars, and Native towns, and of the vicinity generally; we want much more information on all these matters than we have yet had.

17. The information in the notes points chiefly to fundamental drainage defects at stations, and in some instances to suspicious water supply and defective accommodation. In this respect it confirms all past reports, and might very well be assumed as a basis of more extended local inquiry.

18. The evidence regarding the epidemic, as a whole, points directly to the influence of locality on the severity of cholera, and thus the experience of stations is in harmony with the statistical facts of the epidemic among the civil population. But besides this, evidence of another kind is furnished by the effect of movement of troops, the facts regarding which are as follow:—

At Chunar the barracks were vacated, and "no cases occurred in camp."

At Lucknow the Royal Artillery had eight cases in camp after removal. The 13th Hussars, 40th Regiment, 65th Regiment, and 19th Bengal Cavalry were all attacked with cholera, which disappeared, except a few cases of diarrhœa, on removal into camp.

At Cawnpore there were no more cholera cases after the barracks were vacated.

At Allahabad the same result followed removal.

At Moradabad a woman was seized with cholera after removal, but no other case followed; "returned all well."

At Roorkee, whenever disease appeared in a barrack, troops and families were removed out; only one case took place afterwards, in a family. The native pupils of the College, 40 strong, were moved into camp, and yielded three cases afterwards.

At Meerut the A/C and E/F, Royal Horse Artillery, and the B/8 and F/8, Royal Artillery, were moved out of barracks into tents within cantonments. The last corps had three cases.

At Delhi the E Company, 55th foot, had two cases in barracks; it was then put under canvas, when another case took place. It was then moved away, and the disease was arrested. A half battery of Royal Artillery was sent directly away, and remained free of disease.

At Muttra the movement was made partly into camp, partly into buildings at a distance, and no disease followed.

The following were the results of movement at *Morar*. The Royal Artillery were moved into tents, and no further attack took place. The right wing, 54th Regiment, was moved away four miles; there it had four cases; it was moved again, and one case followed. The head-quarters sick, among whom the largest proportion of cases had taken place, were moved, and only one suspicious case followed. This regiment had, in all, 26 cases of cholera, only 5 of which took place in camp. The disease at Fort Gwalior was arrested by removal into camp. One woman was seized in a tent on the parade ground.

Nougong.—"Several parties from affected barracks were moved into tents at distances from " 1,000 yards to two miles from barracks, and all with complete success. No further case " occurred in any of them."

Umballa.—300 men out of 560 were moved into four camps and a rest-house in wet weather. In two camps there were 11 cases, 7 of which were in men who had come from attacked barracks.

At Kasauli the outbreak was sudden and severe, and 215 men, 61 women, and 121 children were moved on to a ridge. Twelve cases occurred, "but they were chiefly among those who had " recently left barracks."

Ferozepore.—Removal of men of Royal Artillery and 2nd Battalion, 12th Foot, was quite successful. No cases occurred in camp after they had been 24 hours in it.

Dharmasala.—The 81st Regiment was marched into camp. One man was attacked on the road, but no one else. The Goorkha Regiment was moved to a lower position and had 10 cases, and 8 others on another site. It had altogether 97 cases, 79 in quarters and 18 in camp.

Kangra.—Movement into tents inside the fort; no further cases.

Umritsur and Govindghur.—No further cases after movement.

Meean Meer.—Some of the married people were placed in camp, and no further cases took place.

19. It cannot be denied that this expedient of moving the troops out of affected buildings, or even away from the locality, has been a success. The apparent exceptions might be due to well known causes, such, for example, as delaying removal too long,—for in such cases there is nothing to prevent the disease becoming developed subsequently,—or fatigue, or movement in bad weather to moist ground.

The measure, as a rule, had been so successful that the real point for investigation is the reason of the exceptions.

In conclusion, the facts in the present Report of a great cholera epidemic appear to the Commission to point to the following practical conclusions:—

- 1st. That facts regarding the movement of cholera show that, whether or not cordons be drawn round stations, no dependence can be placed on them as a protection against cholera, while the employment of troops on cordon duty may be a direct means of augmenting the mortality.
- 2nd. That evidence afforded by the epidemic, whether derived from the facts of its distribution, or from the results of movement of troops, points to the great importance of locality as an element in the fatality of cholera.
- 3rd. That in future reports the sanitary condition of stations, especially as connected with the drainage of the subsoil, water-supply, conservancy, state of bazaar and Native towns, should have a much more prominent place assigned to it than has hitherto been the case in reports on cholera, and that the facts regarding locality in the notes appended to the present Report should be taken into consideration with the view to further inquiry being made and defects remedied.
- 4th. That the most important of all means of protecting troops from outbreaks of cholera is timely removal from infected and threatened cantonments, and that, while this measure is rigidly carried out, means should be adopted for preventing troops frequenting places where cholera has already appeared.
- 5th. That the entire chain of facts connected with the epidemic of 1875 shows the necessity of coping with the causes of disease in the localities themselves, for upon the continued progress of sanitary improvement, especially in the purity of drinking water and of the atmosphere, cleanliness, surface drainage, &c., in the towns and villages of India, it depends whether the intensity of each succeeding epidemic is to be less or greater than that which has preceded it, so far at least as past experience enables us to judge.

26th May 1877.

No. 2.

MEMORANDUM of the ARMY SANITARY COMMISSION on the REPORT of the SANITARY COMMISSIONER for MADRAS for 1875.

The present Report, prepared by Dr. King, Acting Sanitary Commissioner, although chiefly devoted to sanitary statistics, like the Report of last year, nevertheless contains references to work done of more than usual interest, which it is hoped may be the means of throwing more light on local disease causes, especially those to which malarial fevers owe their prevalence.

The Report is divided as usual into separate sections for British and Native troops, civil population, and jails. It is followed by an interesting appendix of local reports on leprosy in different parts of Madras Presidency; and the volume is concluded by tabular vital statistics of the civil population.

(British Troops.)

1. There are several accounts given of the strength of British troops during the year.

The mean of the Adjutant-General's returns for the commencement and end of 1875 gives the strength at 11,333.

The mean strength of troops quartered at 20 stations as deduced from weekly stational reports was 10,734, but including troops in movement the mean strength was 11,005.

2. From among troops at stations the admissions to hospital were 12,015 = 1,119·34 per 1,000 strength. Troops on march had 50 admissions = 184·5 per 1,000. The average admissions for the whole British force were 1,096·31 per 1,000.

The average daily sick at stations were 57·84 per 1,000 (621 men), among troops on march 25·83 per 1,000 (7 men), and for the whole Army 57·05 per 1,000 (628 men).

The deaths in the British Army proper numbered 163 = 14·8 per 1,000 strength; of these deaths 150 took place at stations, and 13 on the march. Including veterans and troops in garrisons the total deaths were 177.

3. The first point regarding admissions to hospital is a very unsatisfactory one, viz., that *venereal diseases* were by far the most prevalent admission causes, as will be seen from the following statement:—

	Admissions.
Venereal diseases	2,153
Simple continued fever	1,300
Intermittent fever	825
Hepatic affections	778
Dysentery	738

The admissions per 1,000 from different classes of venereal affections were—

	Per 1,000.
Primary syphilis	72·95
Secondary syphilis	39·22
Gonorrhœa	88·31

Total 204·84 per 1,000 strength.

The highest admission rate from venereal diseases where the strengths admit of comparison was 310 per 1,000 at Bellary, with a force of 906 men. At Secunderabad (2,288 men) the admission rate was 217·65 per 1,000. At Madras (515 men) the rate was 264 per 1,000. At Kamptee (1,004 men) it was 261 per 1,000. At Bangalore (1,667 men) the rate was 182·36 per 1,000. The lowest rate, 59·32 per 1,000, was at Tonghoo (472 men).

The most important venereal affection, primary syphilis, gave rise to 17 per 1,000 admissions at Tonghoo, the lowest rate. From this point the numbers were from 6 to 8 and 9 per cent. of the strength; the highest rate, about 14 per cent., was at Bellary.

Whatever may be alleged as the causes of these very various admission rates, one thing appears to be self-evident, viz., that lock hospitals and police regulations have hitherto failed to check this serious cause of inefficiency in the Madras Army.

4. Admissions from *simple continued fever* were 120·36 per 1,000 strength. The highest rates were at Bellary (338·85 per 1,000), and Madras (268 per 1,000). Only two deaths were attributed to this form of fever.

Intermittent fever was most prevalent at Kamptee (407·37 per 1,000 strength). For the whole Army the admissions were 75·74 per 1,000, and no deaths.

5. *Hepatic diseases* gave rise to 70·6 admissions per 1,000 of the whole Army. Cannanore had 116, and Tonghoo 108 admissions per 1,000 from this class of diseases.

6. *Dysentery* gave rise to 68·75 admissions per 1,000 for the whole Army proper, and was most prevalent at Tonghoo (211·86 per 1,000), and Rangoon (103·09 per 1,000).

Secunderabad, which used formerly to suffer so severely from these diseases, had (in 1875) 76·04 admissions per 1,000 from hepatic affections, and 88·28 per 1,000 from dysentery, both proportions still far too high.

7. *Enteric fever*.—This admission cause has notably diminished in frequency. In 1874 the rate was 3·12 per 1,000, and in 1875 it was 2·14 per 1,000. Out of 23 cases in 1875, 10 took place at Secunderabad and 4 at its former head-quarters Cannanore.

8. *Cholera* occasioned only 7 admissions among British troops during a year of cholera prevalence over India.

9. The chief death causes were as follow:—

Hepatitis	29 deaths.
Dysentery	16 "
Drowning	14 "
Aneurisms	14 "
Phthisis	13 "
Enteric fever	7 "
Hepatic abscess	6 "
Secondary syphilis	5 "
Cholera	4 "
Insolation	4 "
Alcoholic poisoning	4 "
Delirium tremens	3 "
Remittent fever	2 "

The two most important death causes, so far as Indian diseases are concerned, were thus, hepatitis, including hepatic abscess, and dysentery. As a step towards better knowledge of

reasons for their prevalence the following proportions for the larger stations may be extracted from the Report :—

Stations.	Deaths per 1,000.		
	Dysentery.	Hepatic Diseases.	Total.
St. Thomas' Mount	5.43	5.43	10.86
Secunderabad	8.05	5.68	8.73
Tonghoo	2.11	6.35	8.46
Rangoon	1.28	2.57	3.85
Bangalore	0.59	2.99	3.58
Trichinopoly	3.58	—	3.58
Cannanore	—	3.26	3.26
Kamptee	—	1.99	1.99

The rates vary so materially at these stations as to call for local inquiry, including under this the intemperate habits, diet, and regimen of the men. It may be suggested whether impure water-supply at stations affected by dysentery may not be a cause of this disease, as it was found to be among French troops in Algeria. Providing good water was in this instance attended by a notable reduction in deaths from dysentery. It may also be recalled that evidence was given before the Royal Commission on the Sanitary State of the Indian Army which went to show that exposure of the men at night to draughts of cold air while in bed was a cause of hepatitis, admitting of easy remedy.

10. As a general rule, those stations where a few troops only are placed show the highest sick and death-rates. Thus Poonamallee, with 196 men, showed an admission ratio of 2,428½ per 1,000, and a death-rate of 81.63 per 1,000. It is an invalid depôt, but still the statistics are most unfavourable. Trichinopoly, with 279 men, showed a death-rate of 25 per 1,000 strength.

Compared with previous years, the death-rate for 1875 was under the mean :—

	Deaths per 1,000.
1869	23.25
1870	10.43
1871	19.18
1872	19.21
1873	18.51
1874	13.40
Mean, 6 years	18.74
1875	14.81

The more important death causes for the same six years afford the following data :—

	Deaths per 1,000 Strength.	
	Mean of 6 Years, 1869-74.	1875.
Typhoid fever	1.28	0.63
Continued ditto	0.27	0.18
Remittent ditto	0.45	0.18
Cholera	1.82	0.36
Dysentery	2.01	1.45
Hepatic diseases	4.02	3.36
Sunstroke and apoplexy	0.73	0.45

This abstract shows a favourable reduction in the mortality from Indian diseases in 1875. But it must be considered together with the question of invaliding, which is excessive in the Madras Army.

11. The Report contains a table of invaliding, which shows that during 15 years, 1860 to 1874, the invaliding for discharge amounted to an average of 11.45 per 1,000, and for change to 40.09 per 1,000. But in 1875 the invaliding for discharge was 16.08 per 1,000, and for change no less than 62.42 per 1,000 ; together equal to a loss of 78.50 per 1,000.

The actual loss in 1875 amounted to 687 men for change of climate, and 177 for discharge, or together 864, the strength of a battalion. Of this number, 160 men were sent for change on account of liver disease, and 6 for discharge ; 124 men were sent away for change, and 29 for discharge, on account of debility ; for dysentery the numbers were 97 and 5 ; for phthisis, 37 and 32 ; for secondary syphilis, 50 and 7 ; and for rheumatism, 27 and 14.

These figures are sufficient to show how little dependence can be placed on reduced death-rates in the Madras Army as indicating improved health, but they also show that the question of invaliding in the Madras Army requires to be examined into. On the general subject, reference may be made to the remarks of the Commission on the Report for 1874 of the Sanitary Commissioner with the Government of India, para. 21, printed in the India Office Blue Book for 1876.

There must be something radically wrong at the stations themselves, or in the class of men, or in their habits, which show the following result for 1875 :—

	Invalid Ratio per 1,000 Strength.
Rangoon	70
St. Thomas' Mount	89·67
Tonghoo	105·93
Trichinopoly	100·35
Secunderabad	113·19
Cannanore	116·
Malliapooram	135·
Madras	168·93
Calicut	224·48

These figures require no comment. They are sufficient of themselves to afford reason for a searching inquiry into the entire subject of invaliding; and in the meantime it would be unsafe to deduce from the mortality statistics alone any decided opinion as to the actual sanitary state of the Army.

12. The total strength of women belonging to the Army proper was 1,440, among whom the admissions to hospital were 1,302 = 904·7 per 1,000. The daily sick were 31·22 per 1,000. Of the admissions, 314 were due to childbirth. The chief diseases admitted were simple continued fever, intermittent fever, diarrhœa, dysentery, and hepatic affections.

The death-rate among women was 18·05 per 1,000, chiefly from phthisis, dysentery, and fevers (2 from enteric fever).

13. The average strength of children was 2,296. The admission-rate was 556·07 per 1,000, and the deaths 49·40 per 1,000.

The most fatal diseases among children were teething, diarrhœa, and convulsions, which together occasioned 71 deaths out of a total of 148.

This fact affords an additional illustration of the need of special care in rearing children in Indian climates, for the chief death causes are only aggravated forms of those prevalent in England, and they were most fatal in children under one year of age, who yielded 79 deaths, more than half the entire mortality.

14. Before proceeding further, it may be well to call attention to the remarkable immunity from cholera of the British troops in 1875.

The total cholera deaths in Madras Presidency during the year amounted to 94,657, or 3·1 per 1,000 of the census population. As has been already stated, there were only 4 cholera deaths among British troops (2 at Trichinopoly, 1 at Madras, and 1 at St. Thomas' Mount), equal to a death-rate of 0·36 per 1,000. Among Native troops the cholera deaths were 1·47 per 1,000.

Hence the cholera deaths during 1875 showed the following ratios :—

British troops	-	-	-	1
Native troops	-	-	-	4
Civil population	-	-	-	8½

Considering the history of cholera among British troops in times past, the question may fairly be suggested whether the results of a great epidemic year such as 1875 do not show some return for the care and outlay which have been incurred on the stations both of British and Native troops?

This point is one not influenced by the amount of invaliding.

15. The second section of the Report gives the statistical facts, station by station, together with a few notes on diseases.

The only station in regard to which any sanitary information is given is Bangalore, but this is of a satisfactory kind. The Acting Sanitary Commissioner says :—“The municipality completed 1,836 feet of box drains and 11,780 of V section drains during the year. The drainage of the Cavalry and Artillery barracks is proceeding. The works necessary for the conversion into dry land of the swampy ground at the tail of the Dumloor tank, a fertile source of malaria, have been sanctioned. The diversion of the sewage of the eastern side of the Infantry barracks from the Ulsoor tank into the main sewer has also been sanctioned. The great water-supply scheme is progressing, and several new wells have been dug and old ones improved.” All this is work in the right direction, except the “box drains,” which will have to be replaced some time or other, unless square sections influence sewage flow in a different degree in India than they do in England.

There is little information about cholera. At some stations a very necessary precaution was taken, viz., preventing men from going into infected places.

Quarantine appears to have been tried for cantonments, but without very evident success. It was tried at Bangalore, but cholera, nevertheless, broke out in the cantonment bazaar and St. John's Hill. There were 584 cases reported, and 360 deaths. Except a single fatal case in a soldier's wife, none of the troops suffered.

Notes on venereal diseases reveal the usual administrative difficulties in dealing with these affections, and show little or no progress in protecting troops from them.

(Native Troops.)

16. Section 4 gives details regarding the Native Army, but, as these have been referred to the Commission on other papers, it is unnecessary to deal with them at present.

(Civil Population.)

17. Section 1 of Part II. of the Report is devoted to the civil population, and the mortuary statistics are based on the census of 1871, which gave the following population for the districts and towns :—

Males	-	-	-	15,178,449
Females	-	-	-	15,100,454
Total	-	-	-	<u>30,278,903</u>

The registered deaths in 1875 amounted to—

Males	-	-	-	335,388
Females	-	-	-	305,872
Total	-	-	-	<u>641,260</u>

equal to a death-rate of 21·1 per 1,000 (4 per 1,000 higher than in 1874).

The births registered were of—

Males	-	-	-	327,754
Females	-	-	-	311,017
Total	-	-	-	<u>638,771</u>

or a birth-rate of 21·09 per 1,000.

These are perhaps the best registration results yet obtained, but both ratios are evidently too low, particularly that for births. The figures show nothing more than progress towards greater efficiency in registration, and are so far encouraging.

18. The deaths registered from the principal diseases among the civil population were from—

	Deaths.
Cholera	- 94,657
Small-pox	- 24,787
Fevers	- 252,131
Bowel complaints	- 37,613
Other causes	- 245,865

Among the latter are included 2,036 deaths by snake-bite, and 247 by wild beasts.

There are a few points of interest respecting the chief death causes which may be usefully noticed.

19. *Cholera*.—The following important statistical facts show the annual force of cholera for the last 10 years in the Madras Presidency :—

	Deaths from Cholera.
1866	- 200,961
1867	- 33,205
1868	- 8,036
1869	- 21,034
1870	- 55,867
1871	- 17,656
1872	- 13,247
1873	- 840
1874	- 313
1875	- 94,657

A simple inspection of this table is sufficient to set at rest all discussions on cholera theory up to the present time, for it is a self-evident proposition that none of them can account for the facts, and that it is worse than useless to seek for help from any of them. The one consolatory circumstance presented by the figures is that, whereas the deaths for the first five years of the series were 319,103, for the second five years they amounted to 126,713, or about one half; and it is allowable in such a comparison to state that sanitary work has progressed during the second period more than it did during the first.

The following remarks on the origin of the epidemic of 1875 by the Acting Sanitary Commissioner contain truthful propositions:—"I do not intend," he says, "to express any opinion on the origin of the epidemic of cholera which began in April 1875. In the present state of our knowledge, I prefer that theories of the ætiology of cholera should come, as hitherto, neither from the east nor from the west, nor yet from the south. . . . It is obvious," he says, "that our epidemic of 1875 did not come from the north, but from the south-east."

This statement is important in its bearing on the history of Madras cholera in its relation to cholera in Ceylon, which latter used to be considered as a direct importation from India. The history of cholera in Madras in 1875 shows that it existed in scattered cases in Southern India, and that the disease was epidemic in Ceylon before it assumed the proportions of an epidemic in Madras. On the practical question as to whether the disease was this time imported from Ceylon the Acting Commissioner says: "It may as well be laid down at once that the exclusion of epidemic disease prevalent in Ceylon from the south of India by quarantine is impossible, on account of the innumerable points of seaboard where landing can be effected."

The disease became epidemic in Ceylon in January 1875, and continued so with varying force throughout the year.

As regards India, there were isolated cases in North Arcot in February 1874, and elsewhere in Southern India during that year. In Tanjore there were deaths in every month of 1874, except January and June. In this district there were two deaths in January 1875 (12th and 15th of the month), another on February 9th, and again on the 13th and 15th. There was one on the 28th February, and none till March 22nd. The disease assumed the epidemic intensity in Tanjore in April.

The deaths in Ceylon for the first months of 1875 were,—

January	-	-	-	-	-	16
February	-	-	-	-	-	70
March	-	-	-	-	-	281
April	-	-	-	-	-	102

Thus, in Southern India the period of epidemic outburst corresponded with the fourth epidemic month in Ceylon.

The disease appeared in Madras districts in the following order :—

January	-	-	-	-	-	South Arcot.
					-	Tanjore.
					-	Malabar.
February	-	-	-	-	-	Ganjam.
March	-	-	-	-	-	Trichinopoly.
April	-	-	-	-	-	Tinevelly.
					-	Chingleput.
June	-	-	-	-	-	Cuddapah.
					-	Madura.
					-	Coimbatore.
					-	Nellore.
July	-	-	-	-	-	Bellary.
					-	North Arcot.
					-	Salem.
					-	Madras.
August	-	-	-	-	-	Kurnool.
					-	Nilgherries.
September	-	-	-	-	-	Nellore.
					-	Kistna.
November	-	-	-	-	-	South Canara.
December	-	-	-	-	-	Godavery.

20. The map which accompanies the Report affords important information as to the connection of this epidemic with railway communication, which it may be well to abstract as a contribution to one part of the Indian Cholera Inquiry.

A railway line begins at Negapatam, and after a course of about 80 miles arrives at a branching of the line within the circle of Trichinopoly. In Negapatam circle cholera appeared on January 16th. In circles immediately north of Negapatam the disease occurred about the same date, but in the circle first traversed by the railway cholera did not appear till the 22nd May.

In Tanjore circle, the one next traversed, it appeared a month earlier, on March 17th. The next circle, Trichinopoly, was attacked on June 1st. The fact then is that with frequent railway traffic cholera took $4\frac{1}{2}$ months to travel 80 miles.

The first branch of the line turns off to the south in this circle, within which, as has been stated, there was cholera on June 1st. The first and adjoining circle traversed by the south branch was attacked on June 30th. The next traversed circle was attacked on July 11th; but a circle close to the line was attacked on June 10th. The next circle on the line had cases on July 1st. The next on July 17th. The next on August 3rd. The next on August 6th. But in Tinevelly, the district in which the line terminates, a seaport was attacked in April. Leaving out Tinevelly, the disease traversed 180 miles between June 1st and August 6th. But this was the course followed by the epidemic in districts far away from the line and parallel with its course.

Returning to Trichinopoly, we shall next trace the progress of cholera westward to Bepore and the extremity of this division of the railway.

Cholera was in Trichinopoly circle on June 1st, after having taken $4\frac{1}{2}$ months to travel from its commencement at Negapatam. The first circle westward traversed by the railway was attacked on June 30th. The next on July 7th. The next (Perindoray taluq, where the railway again divides) on June 16th. The next circle to the south-west was attacked on July 1st. The next on August 1st. The next on March 8th. The next two districts, between which the line runs, were attacked, one on 18th January, the other on 21st February. The last two districts traversed by the railway were attacked, one on the 21st September, and the terminal one on the 8th June.

These dates appear to show that there was no relation between the railway and the epidemic in the South of India.

Following the line from Perindoray taluq, where cholera first appeared on June 16th, the dates of attack in successive districts towards Madras were as follow :—

July 4th.	August 6th.
August 1st.	August 2nd.
July 7th.	June 6th.
August 7th.	Madras, August 18th.
July 30th.	

Bangalore, at the end of a branch 120 miles long, was attacked on September 1st, which was the time of attack of many districts in the vicinity quite unconnected with the railway. The districts through which the line passed to Bangalore were attacked, one in August and two in December.

Along the north-western line, proceeding towards Bombay, there was a similar absence of relation between the course of the railway and the epidemic.

All the northern circles were attacked in July and August. The furthest north circle on the line had its first case on August 1st, and the circle immediately adjacent was attacked on February 8th. Cuddapah, in the mid-length of the line, was attacked on June 3rd. Generally the earliest dates of attack are to be found in sea-side circles south of Pondicherry, but, proceeding inland, the dates suddenly pass over several months.

The tables in the Report show cholera as first making head in South Arcot, Trichinopoly, and Tanjore, and arriving at its maximum in July, August, September, and October.

As regards railways, there is no evidence to show that the disease was in any way affected by the traffic over them.

The longest length of railway is that between Negapatam and Adoni taluq, about 600 miles. Cholera was in Negapatam in the middle of January, and, notwithstanding the railway, it did not reach Adoni until 1st August.

21. *Bowel Complaints.*—Attention has frequently been called by the Commission to the necessity of inquiring into the diseases classed as “bowel complaints” in the statistical tables, with the view of ascertaining their real nature and their relations to cholera.

The deaths registered under this head in 1875 amounted, as already stated, to 37,613, many of which, no doubt, were from dysentery. The first results of such an inquiry as the one proposed are given in the Proceedings of the Sanitary Commissioner for Madras for May 1876, respecting “bowel complaints” prevailing in Malabar, and are stated briefly as follows by Deputy Surgeon General Stewart, who made the inquiry:—“From the commencement of my inquiry into the “so-called ‘bowel complaints,’ I was unable to learn that the disease which had prevailed in “any of the towns which I had visited was any other than cholera.” And the decision of the Government was “that there is no reason to admit any longer the erroneous nomenclature “advocated by the zillah surgeon, and the cases will be returned as cholera in future health and “season reports.”

This is the first step which has been taken to clear up the history of Indian “bowel complaints.”

The mortality in the present case was 158 deaths out of 226 cases, and there is no apparent difference in the history from that of cholera, except that the cases occurred singly, “in most “isolated instances never attacking many individuals in the same house or place.” Had these “bowel complaints” been epidemic, they would have been reported upon as epidemic cholera. We have thus arrived at another example, besides those given a few years ago by the Sanitary Commissioner for Madras, of the existence of cholera in unconnected cases, in which the disease, although retaining all its fatality, does not extend beyond the individuals attacked. It would be most important for future sanitary work to continue the inquiry, and to extend it into the ætiological and pathological relations of this form of the disease.

22. *Fevers.*—The total fever deaths in 1875, including Europeans and Eurasians, amounted to 252,131.

The following abstract of a table given in the Report shows the annual mortality for 10 years:—

	Deaths from Fevers.
1866	110,102
1867	112,511
1868	105,692
1869	132,346
1870	151,027
1871	192,469
1872	214,148
1873	222,843
1874	226,309
1875	252,131

The Sanitary Commissioner considers that the disease has been increasing, but part of the apparent increase may be due to better registration. Any way, the facts are of serious importance, and point out the need of local investigation and remedy; of the results of the former of which a very striking illustration is afforded by a report on the causes of fever at Cumbum, drawn up by Mr. Farmer, Acting Head Assistant Collector, and Vice President of the Municipal Commission.

23. This report is contained in the Minutes of Proceedings of the Sanitary Commissioner of Madras for March and April 1876, and should be brought under the notice of every Government and municipal authority in India, as a guide to them in dealing with similar local fevers and their causes. The following are the chief practical points in this important paper, premising that attention had been previously called by the Army Sanitary Commission to the extraordinary prevalence of malarial fever and its deplorable results in this locality.

In former times Cumbum was a favourite station, and was by no means unhealthy. At a certain date fever began to prevail, and attracted notice in 1866, mainly, as it appears, from its attacks on local officers and their subordinates. The death-rate went on increasing, and for the six months preceding the date of a municipal report it was 10 per cent. per annum.

The accompanying details are in accordance with these facts, and more resemble those following on a great pestilence than the usual concomitants of periodic fever.

Amongst other results, residence at Cumbum had been certified medically as being dangerous to life, and the only thing that could apparently be done was to remove the station, and to leave the people to their fate. The fever is of a very aggravated type, attended by enlarged spleen.

The population of the place has been, of course diminishing, and the decay and ruin of this once favoured locality appeared inevitable.

What was the cause of this calamity? Could it be accounted for on any fever theory? Unfortunately none such presented itself bringing any remedy with it, except the desertion of what was once a flourishing town. It may turn out to be a most fortunate event, not only for Cumbum but for other fever stricken localities in India, that the Vice President of the Municipal Commission was so well aware of the nature of the problem with which he had to deal, and of the inadequacy of any theoretical considerations to account for the facts. He therefore sets theory on one side, and by patient and careful analysis he appears to have arrived at the real causes and the means for their removal.

Cumbum is situated in a hilly district, about 70 miles from the Indian Ocean. Its population should have been 10,000, instead of 6,000 to 7,000, the present number. There is a considerable amount of irrigated land, to supply which with water a bund, 308 yards in length and $27\frac{1}{2}$ yards in breadth at the top, had been thrown across a valley some hundreds of years ago, to form a large lake, irrigating the lands of 15 villages, which ought to yield half a lac of rupees per annum of revenue.

Curiously enough a large falling off of the revenue gave the key to the subsequent inquiry. It was found that in Cumbum itself the decline since 1868 had been 2·3 per cent., but in the villages the decline was in proportion to the distance of the village from the water source, although the population in these villages had been increasing while in Cumbum it had been diminishing. The reporter says: "In fact, any ryot would explain that directly by saying that 'the water did not reach the village. . . . One of the chief causes of falling off of revenue' was reported to be the leaky and silted up state of the channels which conveyed the water 'from the tank; by the time the channels reach the distant villages hardly any water is left.' The point was thus reached that, although the great tank was still supplying water for irrigation, the water did not reach its destination, to the detriment of the revenue, and must have been going somewhere else.

Mr. Farmer at once proceeded to make inquiry into the facts, for which the report itself may be profitably referred to. It will be sufficient for the present purpose to give the results of his work.

It appears that, from some misunderstanding as to the parties who ought to have kept the irrigation channels open, these became more or less silted up and out of repair, and hence the falling water-supply for the more distant village irrigation.

It appears further that the surplus water from the great irrigation tank, which should have been carried by the irrigation channels, made its way into the old bed of the stream (below the bund), which had been impounded to form the tank in the valley above, and that, to supply the place of the water which could not pass by the proper channels, this stream had been banked up and backwatered in order to obtain a head of irrigation water, so that not only was the town drainage, which ought to have passed into the stream, interfered with, but the running stream was converted into a stagnant marsh and swamp, "studded with floating islands formed by rank vegetation, refuse, and so forth."

The solution of the problem is hence as follows:—

"From the channels falling out of repair resulted directly loss of revenue, and by an attempt at increasing the head of water in these leaky channels, by damming up the stream into which the drainage of the town should flow, a useful drain was turned into a pestilential morass, the subsoil became water-logged, and evil consequences acted and re-acted. Thus the Cumbum tank was turned from a blessing to a curse upon the sickly and dying inhabitants of the place. Subsoil drainage is now a thing unknown; the water in the wells in many places on a level with the surface of the ground, and in most places only a few feet below the surface. The water is, of course, a little lower in the hot weather, and this is followed by a slightly improved subsoil drainage and a proportionally decreasing death-rate." It must, at the same time, be kept in mind that the place contains 66 graveyards, which, no doubt, add to the impurity of the "drinking water defiled by putrefying corpses and crumbling bones." Medical evidence is given that the drinking water is injurious to health.

Similar views as to the causes of unhealthiness at Cumbum are subsequently given by Dr. King, Acting Sanitary Commissioner (who in his Report makes this statement, that "more tombs than living persons are visible in the town"), and also by Deputy Surgeon-General Smith, who agrees with Mr. Farmer as to the remedies required, viz., restoring the drainages and repair of irrigation channels, improving the water-supply, closure of burial grounds, and better conservancy, including the abolition of cesspits.

By a Government Order of 1st April 1876 the evils and their causes are fully recognized, and authority is issued for providing remedies.

The case of Cumbum, in its most essential particulars, resembles the case of Bona, in Algeria, given in the report of the Commission on the causes of reduced mortality in the French Army serving in Algeria (1867). There was the same increased death-rate from silting up of the drainages, and the subsequent result of improved health when the drainages were improved will, it is hoped, be experienced at Cumbum.

The importance of the case lies in its being without doubt a typical one in India, and as pointing out the necessity of very careful inquiries into local fever death-rates, and careful analyses of all the local facts wherever the death-rates are above the average due to the district. In other words, to be practically useful sanitary statistics must deal specially with localities, and in doing so they will best prepare work for the engineer and inspector.

(*Personal Proceedings.*)

24. The "personal proceedings" of the Commissioner are given only in outline in the present Report, and the details are referred to in the monthly record of "Minutes of Proceedings," from

which the facts regarding Cumbum have been taken. A number of localities were visited in the course of the year, and their sanitary condition reported on. In many points immediate action is required almost as much as at Cumbum to remove very obvious disease causes. It is necessary to state this conclusion, as the Commission has no means of knowing what steps have been taken in these matters. For example, the water from Chetty Colum tank, Salem, which has suffered so much from cholera recently, has been analysed by the Acting Chemical Examiner at Madras, who has found that the volatile matters in it weigh nearly the same as the fixed salts, that the odour of the water is "barely distinguishable from drying faecal matter," and that it is of course quite unfit for use.

25. In a Memorandum of the Army Sanitary Commission on papers relating to the cholera in Salem in 1875 (printed in Vol. VIII. of the India Office Sanitary Reports) the following recommendation was made:—"There is no sufficient information as to the real sanitary condition of the town, and nothing is said about the water-supply. Under these circumstances the only remark which appears to be called for is, that it would be advantageous to have a special and skilled inquiry made into the local causes present before the epidemic appeared, with a view to such improvements being carried out in water-supply, drainage, cleansing, and general regulation as may be found to be required."

The Government of Madras placed the proposed inquiry in the hands of Mr. H. H. Smith, Acting Zillah Surgeon at Salem, who has embodied the results in an excellent practical report (dated 30th November 1876), which the Army Sanitary Commission has received from the India Office since the Madras Report for 1875 was submitted to them.

Mr. Smith's inquiry has effectually cleared away any obscurity which may have existed as to the reasons why Salem has been subject to severe periodical outbreaks of cholera, and has indicated clearly the nature of the required remedies.

Salem is built on a plain, partly surrounded by hills, at a height of 950 feet above sea level. The soil is red loam resting on gravel and rock, and the vicinity is under dry and wet cultivation. The town is built on both sides of Salem river.

The population is as follows:—

Hindoos (all castes)	-	-	-	45,897
Mahomedans	-	-	-	3,782
Europeans and Eurasians	-	-	-	333
Total	-	-	-	50,012

Houses are built of brick and chunam, or of mud, with thatched roofs. They are generally clean, but unventilated. The back-yards are "simply filthy," and amongst the Mahomedans are used as privies. There are also private privies and cesspits in some houses. Many houses have wells in these back-yards from 10 to 30 feet deep. The water is stated never to be used for drinking. The sewage of the back-yards is made up of bathing and washing water, and urine of cattle kept in the yards; it sinks into the soil, or is dried up by the sun, or escapes by a hole in the wall to the street drain. "The drainage of the town is exceedingly defective, and until this and the water-supply are put on a proper footing, Salem must always be a hotbed of cholera."

There is no drainage system, only fragments of surface drains "made without regard to level or direction," and the practical result is to pollute the subsoil and the river, the former supplying the wells, but the latter used by the people for drinking. "The water-supply of Salem is at present as bad as it well can be as regards the quality, . . . and I think that it is to the water that we must in a great measure look for the reasons of the prevalence of cholera in the town." The river water is defiled "by the filth from drains, the filth from dirty clothes, and the filth from men's bodies." The river itself is backwatered by three dams thrown across it, forming "three large stagnant pools" into which all dirt and filth are washed, until a rare flood sweeps them clean, and this is the water which the people drink.

It is unnecessary to go into the details of Mr. Smith's report. He has clearly shown that Salem is no exception to the general rule that cholera is sure to locate itself where it can find a home. And he has fully substantiated his conclusion that, although "as regards the streets and general aspect of the town it appears sufficiently clean, it never can be free from cholera until the Municipal Commissioners make up their minds to expend a large sum of money on the drainage and water-supply." And it may be added that they will in the end find it true economy to do so.*

26. Attention may also be called to an analysis, in the same "Minutes of Proceedings" (page 97), of the Red Hill water supplying Madras, showing that this water contains a large quantity of ammonia, nitrates, and common salt, in all probability derived from surface impurities or from the channels. It is evident that the subject requires a searching investigation, and, considering the present state of the subsoil of Madras, it seems not unlikely, as suggested by the Surgeon-General, that "sewage leakage" may have something to do with the foulness of certain local supplies; but the evil must be traced higher up to its source.

* Since this Memorandum was completed, the Commission has received from the India Office a paper of remarks (5th February 1877) on Mr. Smith's report by Mr. Cornish, written since his return to India, in which he recalls the fact that he had in previous reports pointed out the chief sanitary defects of Salem enumerated by Mr. Smith, and he says that, "while defective sanitation is permitted to add to the dangers of an originally faulty site, I fear there will be no real diminution of mortality from this particular epidemic disease." He gives in proof of this view the remarkable reduction in cholera among prisoners since the jail was removed to a more healthy site. There is no difference of opinion that irremediably bad local position is a predisposing cause of cholera, but there are no facts in any documents which have come before the Commission to show that the site of Salem cannot be materially improved by engineering works. The only practical course to take, seeing that the town cannot be removed, is to set free the subsoil drainage, to drain the houses, to supply them with water, and to introduce a rigid sanitary police, and there is no evidence to show that reduction of cholera mortality would not follow these works at Salem as elsewhere.

(Sanitary Progress.)

27. Sanitary work is carried out by "local fund circles" and "municipalities." There are 34 circles and 48 municipal towns. There are no details of work within the circles, except that, out of a total income of 119,314*l.*, the amount spent on sanitary work is 27,660*l.*, or 23·1 per cent. In some instances, however, nothing is spent on public health.

In the municipalities a sum of 30,392*l.* out of a total income of 163,018*l.*, is spent on sanitary works, of which a brief tabular summary is given in the Report. They include improvements in surface cleansing and conservancy, new latrines, surface drains, dust bins, improved water-supplies, widening streets, cutting underwood, improved slaughter-houses, and the like. Considering the extent of population represented by the municipalities and local fund circles, and the smallness of the expenditure, not much result can be expected as yet. A beginning has, however, been made, and if the work of the Sanitary Commissioner can be so arranged as to bring his influence to bear on the sanitary administration, such as it is, much good may be no doubt anticipated. The Acting Sanitary Commissioner has even now attempted to show that there is a relation between the sanitary expenditure and the death-rate. He says that the registered "death-rate in 13 towns whose expenditure on conservancy was 34·8 per cent. of income was 27·7 per 1,000, that of 13 whose mean expenditure was 15·5 per cent. " was 33·8, or 6·1 per 1,000 higher." Of course other elements must be considered in such a problem, but as the money spent in this comparison represents the extent of cleansing done, it is possible that the reduced death-rate may represent a fact due to it. Excluding cholera, the better conserved towns had a death-rate of 5·4 per 1,000 under the others.

The practical result of this part of the Report is that in municipalities, local fund circles, and villages more local interest in sanitary work is very desirable, and that the efforts of the Sanitary Commissioner, aided by some simple instructions for the use of the people and Native authorities, would materially expedite the work of improvement.

(Jails.)

28. The average monthly strength of prisoners was 9,849 during the year 1875.

The admissions were 752·56 per 1,000, and the deaths 39·19 per 1,000 by the Inspector's return, by the medical return 38·68. Of this rate 4·1 per 1,000 was due to cholera (40 deaths). Even with this deduction the rate was higher than of late years, as the following abstract shows :—

Periods.	Ratio per 1,000.	
	Admissions.	Deaths.
1861-66	1,371·1	107·0
1867	1,012·4	53·9
1868	869·1	33·8
1869-74	719·2	27·2
1875	752·6	38·7

The influence of zymotic diseases on these rates was as follows :—

Periods.	Deaths per 1,000.				
	Cholera.	Dysentery.	Diarrhœa.	All others.	Total.
1861-66	23·6	12·9	22·5	48·0	107·0
1867	0·8	8·8	10·5	33·8	53·9
1868	0·2	5·5	7·3	20·8	33·8
1869-74	1·3	4·7	5·0	16·2	27·2
1875	4·1	6·4	7·7	20·5	38·7

These facts are sufficient to show how much jail mortality has been influenced by diseases of the epidemic class. So far as local fevers have contributed to the death-rate, their incidence is represented during 1875 by a death-rate of ·30 for continued fever, 1·62 for intermittent, and 0·81 for remittent fever, together 2·73 per 1,000.

For some reason the jail death-rate has ceased to decline of late years. The higher death-rates have been in the district jails, in which death-rates above 4 per cent. have not been unfrequent. Three jails, Rajahmundry, Berhampore, and Trichinopoly, had death-rates between 4 and 5 per cent. Tranquebar, Palamcottah, and Vizagapatam had death-rates between 5 and 6 per cent. At Madura the rate was nearly 7 per cent. At Mangalore it was 8½ per cent. At Cuddapah it was 9¾ per cent. At Coimbatore it was 11¾ per cent.; and at Tanjore the death-rate was the highest during the year, 13·6 per cent.

In the central jails the lowest death-rate, 24·21 per 1,000, was at Rajahmundry; the highest, 54·79 per 1,000, at Trichinopoly. The district jails, as usual, show the highest death-rates, and stand most in need of improvement. No doubt much has been done in Madras Presidency in this matter, but the figures in the present Report are not satisfactory.

There is an Appendix to the Report containing reports from 11 civil surgeons on leprosy within their districts. Although they contain no new facts on the subject, it may be suggested whether something might not be done to alleviate the sufferings of so many persons attacked by this disease, and possibly to put some check on its propagation. There are many medical officers in

India who are conversant with the subject, and it seems probable that, if each civil station or municipality were to devote a small sum for the purpose, the disease might be attacked in detail, and much good effected at small outlay.

29. From what has been stated, it will be seen that the Madras Report for 1875 contains many points of practical importance to sanitary progress in India.

(1.) The most important of these is the reference to Cumbum in the "Minutes" from which the notice in these remarks has been taken. In some points this case is similar to that of the Godavery and Meerut fevers. In the localities where these fevers prevailed the same obstructed state of the drainages was discovered. But the special importance of the Cumbum inquiry is that it shows how much may be done by local officers in investigating disease causes in their districts, and pointing out generally the remedies. For this reason, and on account of the enormous death-rates attributed to fevers in the mortality returns (252,131 for Madras in 1875), the facts merit a wide circulation over India.

(2.) Attention should again be called to the great prevalence of venereal diseases in the Madras Army, and to the apparent inefficiency of the existing preventive agency.

(3.) Although hepatic diseases have somewhat diminished in fatality, it may be suggested that some account should be given of the reasons why they prevail so much more extensively at certain stations than at others. A similar remark applies to dysentery.

(4.) Although enteric fever has diminished in frequency it still exists, and the local and personal causes should be reported in every case.

(5.) It would be most desirable to examine into the whole question of invaliding in the Madras Army, with the view of ascertaining whether the amount might not be diminished by changing the date of invaliding boards, as suggested in the remarks of the Commission on Dr. Cuningham's Report in last year's India Office Blue Book.

(6.) As contributions to the Indian Cholera Inquiry, attention may be directed to the fact that the rate of progress of cholera in the Madras Presidency in 1875 appeared to have no relation to railway travelling, and that in Malabar an investigation into deaths reported as from "bowel complaint" resulted in the discovery that the cases were true cholera, not epidemic, and not spreading from person to person. And that, as the reported deaths from bowel complaints in India form so large a proportion of the total mortality of the civil population, it would be advisable to make inquiry in other districts of the country as to the real nature of these diseases and their relation to cholera. The Commission is desirous likewise of calling attention to the great reduction of deaths from cholera among British troops in Madras Presidency during a great epidemic year, 1875, as to all appearance having been connected with the progressive sanitary improvement of stations, and the encouragement thus given to continued advance in the same direction.

(7.) The great mortality from cholera in Salem appears to have been connected with an extraordinarily foul condition of the water-supply, as well as with want of drainage and other serious defects.

(8.) The analysis of Red Hill water, given in the Minutes of the Sanitary Commissioner's Proceedings, March and April 1876, shows that, in the interests of public health in Madras, an immediate inquiry should be made into the sources of pollution on the gathering surface, the water channels, and distribution arrangements of the water, and remedy applied.

(9.) There is evidence of commencing improvement in a number of municipalities and local fund circles, and it may be suggested whether the work might not be expedited if the Sanitary Commissioner were enabled to devote more of his time to local inspections, and aiding the authorities by instruction and advice. As recommended for other districts, a few terse sanitary rules for the information and guidance of these authorities and the village population generally would do much good.

(10.) Attention might be directed with advantage to the jail statistics for 1875, which cannot be considered satisfactory, in many cases at least.

24th May 1877.

No. 3.

MEMORANDUM of the ARMY SANITARY COMMISSION on the REPORT of the SANITARY COMMISSIONER for BOMBAY for 1875.

The present Report is one of considerable interest and importance, as showing the transition stage of sanitary administration in Bombay Presidency from its first, almost statistical, aspect into that of real practical struggle with known disease causes.

The statistical part of the Report is as full as usual, but it is satisfactory to learn, from the Commissioner's "Personal Proceedings," that there is now a fair prospect of registration work being otherwise provided for, and that the Commissioner will in future, in accordance with repeated recommendations made by the Army Sanitary Commission, be enabled to devote his whole time to his special duties of disease prevention.

Another important step taken by the Bombay Government, in accordance with the recommendation of this Commission, has been, entrusting sanitary work to the Vaccination Department, so admirably organized by Dr. Pinkerton, thereby recognizing that vaccination is really a sanitary proceeding, and that the officers engaged on it may, without interfering with the efficient discharge of their vaccination duties, render efficient help in bringing to notice disease causes coming under their observation, and in giving advice to village authorities and inhabitants on steps that should be taken for improving their own health.

During Mr. Lumsdaine's absence on three months' leave, Mr. Hewlett became Acting Commissioner, and was thus enabled to bring to the sanitary inspection of Tanna, Poona, Ahmedabad, and Ahmednuggur the knowledge and experience obtained during his laborious and successful work while he was Officer of Health for the City of Bombay, and the resulting reports are a real practical addition to our knowledge of disease causes in Indian cities, and of the general principles on which they ought to be dealt with. These reports cannot fail to be of use to the local authorities, as well as to officers engaged on the reformed sanitary service of the Presidency.

The last section (VI.) of the Report is occupied by a detailed account of sanitary progress in the Presidency cantonments, and of works executed in barracks, hospitals, &c., for accommodation, health, and comfort of troops.

As there are several points in the Report of practical importance, it is proposed to call attention to them as briefly as possible.

1. The death-rates are calculated on the census population of 1872, which amounted for the 24 registration districts to 16,228,774.

The districts include 223 rural circles, 55 town circles, and 7 cantonment circles, within which there were registered (in 1875) 375,718 deaths (exclusive of dead-born) and 340,829 births. Both numbers considerably exceed those of previous years.

Mr. Lumsdaine calculates the births registered and unregistered at 664,705=40 per 1,000 of the population. The registered deaths give a death-rate for 1875 of 23·2 per 1,000 (including cholera), which is manifestly too low. The tables in the Report present considerable discrepancies in the returns, which show registration mortality results varying from 6·34 per 1,000 to 32·03 per 1,000, and birth-rates lying between 1·90 and 60·84 per 1,000 of the population. All that can be said is that the total numbers of births and deaths registered are slowly increasing, but the tables of registration circles show where the defects exist and where greater accuracy is urgently needed. The means of effecting the required improvements can only be settled in India, and the following are the steps proposed by the Bombay Government, which appear to be founded on the facts of the case.

2. They propose to work the registration under the orders of the Collector, until a separate agency can be found. "Seeing that the village is the primary unit, the initial register must begin there;" but unfortunately many patels can neither read nor write, and have to give information from memory. The people are to be urged to give them information nevertheless, and there will always be found some one in the village to write it down. "In the smallest villages there is generally one buniah who can write, and whose entries would be available for the kulkarni when he paid his visit."

Under the new organization of the sanitary and vaccination services, the inspecting officers would undertake the duty of inspecting and compiling the registers of births and deaths.

One important element in this change is that the people themselves are called on to assist in providing correct information for entry in the records, and may thus be led to take greater interest in measures for diminishing their village death-rates. So far as concerns the general sanitary work of the Presidency, these proposals will have the immense advantage of liberating the Sanitary Commissioner from statistical details, and thus enabling him to devote his whole time to his proper functions. The plan, as a whole, is worthy of a full trial, and will doubtless lead to greater completeness in registration, and possibly in time, and by the influence of the inspectors, who are all medical men, to more accurate knowledge of the chief death causes than has hitherto been possible.

3. The following are the death causes as at present classified, in the two latest years:—

Causes of Death.	Deaths.	
	1874.	1875.
Cholera	37	47,555
Small-pox	3,903	3,461
Fevers	183,717	219,156
Bowel complaints	26,990	33,650
Accident or violence	6,165	6,217
All other causes	57,840	65,679
Totals	278,652	375,718

This abstract shows deficiencies in the numbers registered, and inaccuracies in the diagnosis, which it is hoped may be diminished under the new arrangement, but there is no mistaking the great importance of fevers to the well-being of the people.

The great cholera epidemic of 1875 is a small matter when compared with the deaths from endemic fevers, and if dependence could be placed on the diagnosis, the figures would go to show that, when the local causes of fever are most active, cholera is most to be dreaded.

4. *Cholera*.—This cholera pestilence appears to have attacked the registration circles in Bombay with few exceptions, but its exact distribution as regards villages, a matter of great importance in dealing practically with local measures of prevention, cannot be ascertained from the returns. It may be suggested whether it would not be advisable, in future returns of the more important epidemic diseases, such as cholera, fever, small-pox, not only to state the total number of villages and their population, as in the tables of the present Report, but also to give the number of villages and their population *attacked* and *exempted* each year.

So far as can be learned from the data, there were 2,466 villages attacked (but the population is not stated) out of upwards of 40,000 villages in the Presidency, and 96,012 persons were attacked, while 13,064,136 escaped cholera.

It follows from these facts that during the great epidemic of 1875 cholera selected its victims, not by diffusing itself over the country, but by fastening itself upon a comparatively few defined localities. As another element of the history, it will be seen from the following abstract that the prevalence of the epidemic was materially influenced by the season :—

Months.		Cholera Deaths registered in 1875.
January	- - - - -	1
February	- - - - -	1
March	- - - - -	10
April	- - - - -	795
May	- - - - -	5,359
June	- - - - -	10,374
July	- - - - -	12,906
August	- - - - -	8,609
September	- - - - -	3,493
October	- - - - -	3,548
November	- - - - -	1,640
December	- - - - -	819
Total		47,555

The hottest, moistest months were the most fatal.

Mr. Lumsdaine calls attention to another very important fact regarding cholera epidemics in Bombay, viz., their tendency to recur in greatest severity during certain years. As the data have an important bearing, not only on the history of cholera, but also on the introduction of sanitary measures, it may be well to introduce them here.

Years.	Reported Deaths in Civil Population.	Ratio per 1,000.
1866	23,037	1·85
1867	5,143	·39
1868	6,447	·50
1869	52,380	3·77
1870	2,666	·20
1871	5,821	·41
1872	15,642	1·03
1873	232	·02
1874	37	·01
1875	47,555	2·93

In 1865 there were 83,148 recorded cholera deaths, and since then there have been remarkable outbreaks of the disease every third year, all the conditions remaining apparently the same. The lesson taught by the table is, amongst others, that increasing vigilance, not only in effecting sanitary improvement, but in maintaining it in all towns and villages, is a matter of primary necessity. Who could have otherwise predicted that the exemption of 1874 would have been followed by the calamity of 1875? The facts all show the danger of dealing with cholera on any merely hypothetical grounds, or in conformity with any disease theories. It is evident that there are undiscovered reasons, possibly connected with seasonal and personal peculiarities, which tend to augment the activity of recognized local causes at certain periods; and if this be in any sense true, it affords an additional reason for removing all such causes and preventing their recurrence.

5. An illustration of the importance of this view is afforded by an outbreak of cholera among prisoners in Yerrowda Central Jail, near Poona, in the end of May 1875, a report on which is given by Surgeon-Major Blanc, the Superintendent. Between 27th May and 1st June the attack comprised 24 cases and 8 deaths out of 1,279 prisoners. Of the total cases, 22 took place among men engaged at work on a public road, and 2 cases among men not so employed. Of the total number of prisoners, from 725 to 728 were employed out of doors, and of this number from 61 to 134 were employed on the road on the 24th, 25th, and 26th May. It was amongst these that 22 out of the 24 cholera attacks occurred, and the question which the Superintendent had to answer was, why the outbreak should have been mostly confined to this batch of prisoners? He considers that there is proof of the following kind to show that the case was one of cholera water poisoning.

The jail is supplied with water from the river Mula before it reaches Kirkee, where the river makes a bend, and returns, as it were, on itself in its downward course to a point about a mile and a half from where the jail water is drawn, and at this lower point a dam is thrown across the river, over which no water had passed for several days. Consequently, the river below the dam was stagnant, and contained water in pools. The road gang drew water, for watering the road, about half a mile below the dam, and, instead of drinking water from the usual source, it appears that they drank of the water intended for the road.

What relation had this fact to the outbreak of cholera? To this question one of two replies may be given. Dr. Blanc considers that the evidence is in favour of the cause having been

cholera poison in the water. He shows that on 22nd May, five days before the outbreak, there were two fatal cases of cholera in the village of Yerrowda, close to the dam, and that on the evening of the same day the dead bodies were burnt and the clothes washed within 20 yards of the spot where water had been drunk *by some of the prisoners*; and this fact of drinking water from the locality was admitted by those who suffered from cholera.

There are, however, other facts requiring to be valued. Cholera was in the vicinity, and was indeed epidemic in the country. There were washermen at work polluting the water. Two analyses of the water are given, one taken above, the other below, the dam. Both are so unfavourable that the analyst, Mr. Gray, is quite justified in his opinion "that both specimens" are so highly charged with decaying organic matter that their use as drinking waters ought to "be strictly prohibited." Active measures were taken within the prison by Surgeon-Major Blanc for coping with the outbreak.

There is reason to believe from the facts that foul drinking water was an exciting cause of cholera among certain of those who used it. But, as already stated, these were not the only sufferers; whether there was cholera poison in the water or not there are no means of determining, but there can be no doubt that the Acting Chemical Analyser to Government, Mr. Gray, took the only really practical view of the teaching supplied by the case. But it is not meant by this view to support in any way those dangerous Indian customs of disposing of dead bodies and the washing of foul clothes in river courses which may afterwards be used by people for domestic water-supplies. The pollution of rivers requires quite as much attention in India as it does in this country, although it is not carried to the same baneful extent there as it is within the United Kingdom.

6. *Small-pox*.—The small-pox mortality of 1875 was the lowest on record, namely, 3,461. Bombay has the most efficient vaccination service in India, and part of this favourable result is, no doubt, due to its operation. The real test of success must, however, be sought at periods when small-pox has a tendency to become epidemic, which appears to be the case in Bombay every third or fourth year.

7. *Fevers*.—Every district of Bombay Presidency returned fever deaths, or at least those so registered, during 1875. The registered fever deaths varied in different districts from $6\frac{1}{2}$ to 21 per 1,000. In some circles the mortality was very high. In 11 out of 85 registration circles it exceeded 2 per cent. of the population. In Ahmedabad it exceeded 3 per cent. During the last six years, 60 per cent. of the total deaths in Bombay Presidency have been ascribed to fevers. The mortality is greatest during the cold and rainy months of the year.

To discover and deal with local conditions in places where fever prevails most is obviously one of the most important functions of the new sanitary administration.

8. *Bowel Complaints*.—As already stated, there were 47,555 registered deaths from "cholera," and 33,650 deaths from "bowel complaints." In face of these facts it seems necessary to inquire what diseases are classed as "bowel complaints." Are many of them choleraic in character, and, if so, are they not part of the cholera epidemic of the year? If "bowel complaint" is a distinct disease, it must be admitted that from its constant existence it is of more importance to the public health than cholera. During the two years 1874 and 1875 there were 47,592 deaths from cholera in the Presidency, and 60,640 from bowel complaints. The facts speak for themselves.

9. In former years the Commission called attention to the large number of deaths from drowning in water sources, such as wells and tanks.

There were 2,845 deaths from this cause in Bombay Presidency last year. Of these deaths 525 were suicides, 2,084 were accidental, and 236 occurred otherwise. Of these drownings 884 were in wells, by accident, and 400 by suicide, in all 1,284 deaths in wells. There were 49 suicides in tanks, and 354 accidental drownings in tanks. So that 1,638 deaths took place during the year in water sources used by the people. Surely some simple and inexpensive means of protecting water and saving human life might be adopted. There appears to have been little improvement in this matter since it was last referred to years ago.

10. The most important subject in this Report, in reference to future sanitary progress, is contained in Section V., the "Record of Personal Proceedings" of the Sanitary Commissioner, which contains a sketch of the future sanitary organization of the Presidency, based on the proposal of this Commission to utilize the vaccination service for sanitary reporting.

Under the reorganization, the vaccination service will pass into the hands of the Sanitary Commissioner, as being not a separate but an integral part of the public health department of the Presidency, but it will continue to be administered by its own inspectors and superintendents. According to the Government scheme, the superintendents of vaccination will also be the officers of health of their districts, and in this capacity will be under the Sanitary Commissioner. They will inspect the birth and death registers, and advise about them. They will advise on all local sanitary matters, cleansing, draining, water conservancy, and the like, and also on measures required for epidemics. But neither superintendents, nor their subordinates, will do more than advise the people and patels on such simple matters as are within the reach of the people and their means, such as village cleanliness, conservation of wells, tanks, &c. They will have no power to issue any orders. All action must be taken by Collectors and their assistants.

It appears to the Commission that much good would be done by issuing a short code of explanatory rules for the guidance of the people and village authorities, setting forth the objects of these improved sanitary arrangements, and the direction in which the people could aid the authorities in protecting their own health.

It is unnecessary to discuss the details proposed for carrying out the improved administration, as all such questions must be decided by the Government. So far as the principle is concerned, it is in every way worthy of being carefully applied, for there can be no doubt as to the uniform testimony of every report on public health questions received from India, which shows conclusively

that to the action and co-operation of the people themselves and the village officers we must mainly look for the general sanitary improvement of country districts, and the matters in which Government might give aid beneficially will soon become manifest.

The general result may confidently be expected to lie in the direction of improved registration of births and deaths, in enlisting the people in the preservation of their own health by carrying out simple local improvements, and in diminished liability to epidemic diseases.

11. Thus, under the new arrangements, the Sanitary Commissioner will cease to be a mere registrar of deaths, and he will very soon find that he has as much real practical sanitary work to do as will fill up his whole time. He is appointed, indeed, with this very object, and it would be as wide a departure from the real purposes of this important office if its occupant were to devote his time to scientific pathological inquiries as if he were to return again to the functions of registrar. It is not intended, by these remarks, to undervalue either statistics or scientific research, but, as the duties of the Sanitary Commissioner's office are being re-arranged, it is necessary that their real object should be distinctly stated, especially as scientific investigations into Indian diseases are entrusted at present to very competent inquirers there, and the duty of the advising sanitary authority is to take account of every new fact which may throw light on disease causes, and to apply all such facts to practical use.

This is quite enough for one man's superintending work in Bombay Presidency.

12. Mr. Hewlett's reports follow next in order. The first one, on an outbreak of cholera at Tanna, is accompanied by a report on the same outbreak drawn up by Dr. Hojel, Acting Civil Surgeon. These reports give an instructive insight into the internal economy of Indian rural towns in relation to cholera, and show that there is no mystery connected with the localization of the disease, however difficult it may be to account for its being there at all.

The town is situated on the low banks of a creek, its population is about 14,299, of whom 11,340 are without wholesome provision for natural purposes, and hence every sequestered place, even the streets, are fouled. In numbers of houses there are cesspits; the streets are unpaved and unsewered, street drains are merely surface cesspools. "Everywhere," says Mr. Hewlett, "I saw the same disgraceful surface uncleanness, the same want of all proper municipal supervision, and the same absence of persistent sanitary work. . . . The water-supply is on a par with the drainage. The people are solely dependent on surface wells and a large tank," which latter is in a filthy state. Many of the houses appear to be in a very inferior condition, and overcrowded.

Tanna is one of a group of about a dozen registration circles at no great distance from Bombay within which cholera broke out in May 1875. The first case in Tanna appears to have been an imported one, but Dr. Hojel infers the existence of "a septic state of the atmosphere, by the fact that people were attacked in four different quarters of the town." The attack lasted from the 21st of May to the 31st of August 1875, during which period 296 people were affected, and 173 died.

Both reports give details of the sanitary condition of the town, and of energetic sanitary and relief measures carried out by Dr. Hojel, one of which was removing the tiles from the roof of an affected house, pulling down and burning partitions, and digging up the floors. Mr. Hewlett's reason for these proceedings involves an important point in sanitary practice. He says: "Such action has always been found effectual in Bombay, where we have learned from experience that cholera poison cannot live in plenty of air and light."

Both of these reports are valuable additions to practical sanitary literature, and may serve as guides to similar work elsewhere.

13. Mr. Hewlett's reports on the sanitary state of Poona, Ahmednuggur, and Ahmedabad are marked by the same skill in laying hold of the main sanitary defects in each city as have characterized his reports on Bombay. The reports are devoted to real practical points, and may very well be used as guides for improving the cities to which they refer.

The salient facts which appear on the face of each of them are the following :—

- 1st. That no sufficient means have been adopted in times past for keeping these towns free of excrementitious matters of human beings and of animals, and, as a consequence, the entire subsoil has been fouled in such a manner as to taint not only the whole area on which the cities are built, but all the water sources, and the air in the streets and houses.
- 2nd. That the death-rates appear to show that without immigration, one or two of the cities would, in the absence of improvements, cease to be inhabited, and this without taking into account the periodical losses from epidemics.
- 3rd. That the chief death causes are local fevers and bowel complaints, as shown by the following abstract :—

Deaths per 1,000 of Population.					
Poona (4 Years' Average).		Ahmedabad (4 Years' Average).		Ahmednuggur (3 Years' Average).	
Fevers.	Bowel Complaints.	Fevers.	Bowel Complaints.	Fevers.	Bowel Complaints.
12·49	1·73	27·70	2·27	15·9	1·8

To show the importance of these facts, it is sufficient to state that, during the same term of years, the cholera death-rate, so much dreaded, only averaged ·98 at Poona; it was scarcely appreciable statistically at Ahmedabad; and it was 0·03 at Ahmednuggur.

4th. That the remedies for this dangerous condition of these cities must be sought in means for cleansing the subsoils of their pollutions, and at the same time arresting completely their recurrence; that the existing water sources, especially in Ahmedabad and Ahmednuggur, are dangerously impure, and require to be either abandoned or improved, if this be practicable.

5th. That the cities must be drained and paved, animals and noxious trades removed out of them, nuisances prevented, and a rigorous sanitary administration introduced.

It is satisfactory to learn from the reports that some improvements have already been introduced, and that there is no indisposition to proceed. But the revelations made by Mr. Hewlett show that the work before the municipal authorities is one of no ordinary magnitude, and will tax both their resources and energies to cope with it.

14. *Sanitary Reports on Cantonments.*—These reports are 28 in number, and are mainly devoted to departmental details. The sanitary information contained in them is too fragmentary to enable the Commission to discuss them. Generally, however, the impression which they convey is that useful sanitary work is being done, and that, as a whole, the condition of the cantonments in Bombay Presidency is undergoing progressive improvement.

There are, however, a few exceptions to this rule, and these have in former years been made subjects of comment on account of the extent of the problems to be dealt with.

Jacobabad is still suffering from its defective local position, and the cantonment report states that "health is unsatisfactory in all regiments; families in the same condition; health of the "Native community indifferent." The chief disease cause is malaria, from water-logged subsoil, and probably impure water. Some improvements have been carried out, but it is evident that those connected with the drainage have yet to be done.

Mehidpur still suffers from a similar condition of the subsoil. In 1875, out of 858 admissions to hospital no fewer than 500 were from fever. A large portion of the men are stated to be suffering from malarial cachexy, and at ordinary parades sometimes eight men will fall out in a morning. The drainage is said to have been completed, but too late to be beneficial during the year. Attempts were being made to supply better water. Time must be given to show the results of better surface drainage, but in the meantime it is most unsatisfactory to be informed that, out of an average strength of 361, there were 858 admissions to hospital, of which 500 were from local fevers.

Nusseerabad.—Attention has been more than once directed to the condition of Nusseerabad, as regards its surface drainage and water supply. The latter will now be improved, as a scheme has been sanctioned. Complaints as to the state of the surface drainage resolved themselves into an existing malarial condition of surface, from want of a proper system of surface drainage, and the presence at certain seasons of water surfaces, to which injury to health had been traced. Since then the station authorities appear to have been replaced by others, and these have concurred with their predecessors in their views as to the manner in which the drainage should be dealt with.

These views are sustained, in the present Report, by a medical opinion that "the health of "European troops, during the past year, has been unexceptionably good." Let us now see how far this view is sustained by the statistics given by the reporters.

From the 10th March to the 31st December 1875, *i.e.*, during ten months and ten days, out of a strength of 152 men of the Royal Artillery, there were 300 admissions to hospital and 4 deaths.

During the year 1875, there were at the station 450 men of the 108th Regiment, among whom there were 611 admissions to hospital and 13 deaths.

Putting both arms together, and making the necessary addition to the Royal Artillery for completing the year, the admission-rate was 1,600 per 1,000, and the death-rate about 30 per 1,000. The year entire would have furnished nearly 300 fever admissions to hospital, besides "a number of mild cases of this disease, coming under the denomination of heat fevers, "requiring little medical treatment." With these facts before them, the Commission cannot depart in any degree from opinions already expressed by them regarding the defective drainage plans for this station.

Mhow.—The water-supply of this important station appears still to be unsatisfactory, both as regards quantity and quality.

The only other remark called for by these cantonment reports is that in all probability more rapid and certain progress will be made in the work under the supervision of the Sanitary Commissioner from the time the new service is in operation.

15. *Appendix No. III.* contains a list of works of construction, additions, and alterations, completed or in progress during 1875 in barracks, hospitals, and cantonments generally in connection with the accommodation, health, and comfort of troops. It gives returns from 25 stations, and includes new barracks and other buildings, improvements in existing buildings, in ventilation, surface drainage, latrines, lavatories, &c., and includes several hundreds of items, all of more or less importance, as regards the health of the troops. The work of improvement appears to be steadily progressing, as funds are available, and the only suggestion which arises out of these returns is whether it would not be more advantageous to direct special attention to the worst stations, such for instance as those already mentioned, and perhaps Colaba also, with a view of putting an end as speedily as possible to the great losses of efficiency accruing at these stations.

16. These remarks may be concluded by a brief notice of an important investigation undertaken by Mr. Hewlett with the view of ascertaining whether the notorious night-soil nuisance in Bombay harbour was likely to injure the purity of water for the supply of ships, which is drawn from the Vehar mains, at the rate of about 100 tons a day, and carried in tanks to the ships. When the tanks were being filled they were surrounded by floating night-soil.

Distilled water was exposed for 24 hours over tanks filled with Vehar water lying at low tide, about 100 yards off the north end of the Bunder. The result was that this ammonia-free distilled water had acquired from the foul atmosphere—

Parts.

•04 of free ammonia,
•06 of albumenoid ammonia,
per million.

Samples taken from the Vehar water pipe supplying the barge tanks gave—of free ammonia •005, and of albumenoid ammonia •15 parts per million. But in the barges the amount of free ammonia had risen to •01, and of albumenoid ammonia to •23, per million. There was a very slight increase in the chlorine and solids in the barge waters, but the increased impurity had come from atmospheric sources.

The practical result of the inquiry is that the Vehar water should be filtered, as was long ago shown to be necessary by this Commission; that the harbour of Bombay should be kept free of night-soil; and that a strict supervision should be kept up over the barges supplying shipping. Greater care is required also in cleansing the ship tanks, for the analyses of water taken from these receptacles show that chlorine and ammonia in the water greatly exceed the amounts due to the Vehar water by which the tanks are supplied.

In conclusion, the Commission desire to express their opinion that the Report under review is the best and most practical yet supplied from Bombay.

18th May 1877.

No. 4.

MEMORANDUM of the ARMY SANITARY COMMISSION on the REPORT of the SANITARY COMMISSIONER for BENGAL for 1875.

The duty of Sanitary Commissioner for Bengal was ably fulfilled in 1875 by Surgeon-Major Pilcher, who acted for Dr. Coates during a year's absence on leave.

The present Report is, therefore, Mr. Pilcher's, and is marked by the same attention to practical details which distinguished Dr. Coates' Report of last year.

1. There is not much to report regarding registration, which is still in its infancy, but the following abstract will show that, while the number of deaths registered in the general circles, and by ordinary methods, is increasing, the death-rates in selected circles remain tolerably constant; but there is no doubt that these rates are still considerably under the truth:—

Years.	Registered Deaths per 1,000.	
	General Circles.	Selected Circles.
1870	3·92	—
1871	4·00	—
1872	5·81	—
1873	7·75	24·85
1874	8·42	24·72
1875	10·01	24·80

A nearer approach to accuracy was obtained by special statistical inquiry in certain villages in the zemindary of Tushbhunder, carried out by the zemindar.

The result was a death-rate of 32·84 per 1,000 for males, 30·92 per 1,000 for females, and for both 31·91 per 1,000.

It need scarcely be pointed out that, if this rate for one year at all represents the state of public health in Bengal villages, it shows them to be very unhealthy. But it also shows that with due care the registration of deaths may become more trustworthy than it is at present. The subject is discussed in the Resolution of the Government of Bengal, which follows the Report, and it may safely be left in their hands. So far, the introduction of selected areas of registration has led to results far in advance of those obtained in general circles.

2. The following abstract gives the registered mortality in some of the principal towns in Bengal for 1875:—

—	Population.	Mortality per 1,000.	—	Population.	Mortality per 1,000.
Burdwan	32,321	25·95	Darjeeling	3,157	43·07
Sooree	9,001	23·33	Dacca	69,212	24·96
Hooghly and Chinsurah	34,761	26·78	Comillah	12,948	27·72
Serampore	24,440	32·48	Chittagong	20,604	24·41
Ooterpara	4,389	42·60	Gya	66,843	36·63
Howrah	97,784	49·03	Mozufferpore	38,223	17·76
North Suburban Town	27,263	42·25	Chuprah	46,287	20·95
Kishnaghur	26,750	21·45	Monghyr	26,274	21·88
Jessore	8,152	29·19	Bhagulpore	30,148	25·44
Rungpore	14,845	39·33			

Some of these death-rates are evidently too low. They represent the best results obtainable at present, but it is something to have got such information regarding the public health statistics of so large a number of towns even for one year.

3. There is no trustworthy information regarding the total deaths in Bengal in 1875. All that is known on this point is the number of deaths registered, which appears to have been nearly 600,000, out of a population of 59,946,314. But how far below the real mortality this number is may be estimated by the fact that the rural population, amounting to 57,975,352, had a death-rate of only 9·54 per 1,000, probably not one fourth of what it should have had during the great cholera epidemic of 1875.

4. *Principal Death Causes.*—Cholera prevailed in every district in Bengal in 1875, and the deaths registered from this cause were 108,262.

Diseases classed as “fevers” gave rise to 368,087 deaths. These are not, however, to be considered as all being deaths from nosological fevers. The Acting Sanitary Commissioner informs us that “almost all diseases associated with febrile symptoms are returned in this class,” but he at the same time states that for practical purposes the class is sufficiently well defined, and that no subdivision of it could be made with advantage. This view would seem to imply that errors in diagnosis in this class are not such as materially to alter the sanitary relations of these diseases.

Bowel complaints occasioned 35,645 deaths, and small-pox 5,280 deaths.

The following table shows the registered monthly mortality from each of these causes of death:—

	Total Deaths registered.			
	Cholera.	Bowel Diseases.	Fever.	Small-pox.
January	4,993	2,829	29,252	397
February	5,580	2,499	22,794	520
March	11,191	2,613	23,403	812
April	12,396	2,807	25,150	908
May	10,695	2,522	24,688	706
June	7,998	2,401	21,479	498
July	6,140	2,932	25,175	352
August	4,297	3,319	31,418	251
September	2,623	3,330	32,750	155
October	5,425	3,294	38,320	112
November	18,363	3,505	48,894	209
December	18,562	3,596	44,764	360

These four diseases account for all the registered mortality in Bengal, except about 83,000 deaths. The monthly numbers show how much more important a death cause is fever than even an epidemic of cholera. Fever is universally prevalent, and in 1875 the mortality from it was above $3\frac{1}{2}$ times that from cholera.

5. There are several practical points of importance connected with the prevalence of these diseases which may be noticed.

The preceding table shows that cholera had two periods of augmentation, viz., March, April, May; and November and December.

The following was its distribution, as stated by Mr. Pilcher. In January it was present in 211 circles of 34 districts (there are in all 44 registration districts and 644 circles). From February it gradually spread over the districts, increasing also in intensity until April, when 367 circles in all the 44 districts were suffering. From May to July the disease declined. In August and September there was a comparative lull, the disease existing in 263 and 242 circles respectively. In October 274 circles in 43 districts were affected. The disease existed in 426 circles, and in all the districts, in November, and in 442 circles in all the districts in December.

It would have been important to have had the distribution of cholera by villages as well as by circles. Information on this point is only given about certain districts. Such as it is, however, the facts are important in their bearing on certain views on the spread of cholera by contagion.

In Jessore district, the old head-quarters of cholera, there are 4,247 villages, of which 1,352 were attacked.

In the 24-Pergunnahs, 1,330 villages out of 4,991 were affected.

Dacca district had cases in 1,275 villages out of 5,016. At the two large fairs held in this district there was a comparative absence of the disease.

Pooree suffered as usual with the adjacent districts. It is stated that “the disease appeared in thanas quite removed from pilgrim routes, and at a time of the year when it usually breaks out. . . . Many thanas through which the main pilgrim route passes are scarcely affected, while others suffer severely. These are facts not in keeping with the theory that cholera is communicated by travellers from infected districts.” They are results of the statistics which have always been the true correctives of hypotheses founded on insufficient data.

The following fact regarding cholera in Durbhunga district may be cited, although it is not very definite:—“In the district of Durbhunga, cholera appeared among the pilgrims at a festival held at Bazitpore in March, and is said to have been disseminated by the pilgrims. Efforts were made to prevent the entrance of pilgrims into the town of Durbhunga by establishing a cordon of police, which failed in its object. After the fair, cholera is said to have broken out along the lines of road taken by the pilgrims,” but there is no statistical proof of this. The total deaths in Durbhunga town were 52, and in the district, 1,950, the chief weight of which fell on the portion of the district furthest from the fair.

The real practical remedy, however, is that there should be no cholera at fairs, so far at least as it can be averted by sanitary measures.

This Commission, many years ago, in their instructions for the Cholera Inquiry in India, directed special attention to the great importance of statistical and topographical details in elucidating the history of Indian cholera.

Of course, as Mr. Pilcher points out, the solution of problems of this class is essentially connected with the advance of registration of deaths.

A few more statistical facts regarding villages may be added :—

Districts.	Total Villages.	Villages attacked with Cholera.
Maldah - - - - -	2,100	382
Rajshahye - - - - -	4,228	176
Rungpore - - - - -	4,206	1,225
Bogra - - - - -	2,666	512
Pubna - - - - -	2,792	1,661
Total - - - - -	15,992	3,956

The attacked villages amounted to about 24½ per cent. of the whole number.

Cholera appeared in the tea gardens in the Terai in 1875. The gardens attacked were in malarial positions, the coolie lines too close together, the ventilation impeded by jungle, which is also the latrine of the place. The food used by the coolies is coarse and unwholesome, and they get drunk on bad liquor, and sleep in the damp, cold open air. In this case fires had no effect on the disease.

6. There is not much information respecting the sanitary state of attacked villages, but what there is shows that nothing could be worse than the condition of those severely affected. There is one remark of importance which may be abstracted, from its connection with the health of the troops. Mr. Pilcher says: "These filthy villages exist around nearly every cantonment, and as they are evident sources of danger, they should receive more attention than they do. . . . To absorb these villages into the cantonments, by taking up the land upon which they are built, would seem, at first sight, to be the most natural way" of meeting the evil, but this it is considered would not answer, and he thinks it the best course to bring them all, as far as practicable, under the Municipal Act.

This is a matter of great importance, and was considered so by the Indian Army Sanitary Commission, who directed special attention to it. The Army Sanitary Commission has also dwelt repeatedly on its connection with health of cantonments, and as it has again been mentioned, the whole subject may very well engage the attention of the authorities in India.

7. Another matter of great importance has received due attention, namely, the sanitary state of shipping in the port of Calcutta, especially with reference to cholera. There were 34 cases on board 20 ships, which there is reason to believe were mainly caused by foul water sold to the ships by boatmen, supplemented by river water. It is very satisfactory to learn that the Port Commissioners and the Chairman of the Justices for Calcutta will afford the means of supplying all ships with good water from the Calcutta mains, and a diminution of cholera attacks may be expected for the future. The grave importance of the state of water supplied to shipping, especially in the case of ships proceeding to sea, can scarcely be overrated, and it is possible that inquiries instituted by the Port Medical Officer, together with the action of the municipal and port authorities, may lead to a marked improvement in the health of the ships in port. An indispensable part of this reform is that the ships' water tanks should be kept clean and wholesome for the reception of the filtered Calcutta water, and it may be further suggested that much benefit might be realized if every ship were provided with a filter for drinking water.

8. The most important fact regarding fever is that a conviction has become general that the fatal Burdwan epidemic was a malarial fever, and that it has passed away for the present. How far this satisfactory occurrence has been the result of improved sanitary condition there are no means of knowing from the Report, and there is no additional information as to the local conditions calling for remark, except, perhaps, the following account of Tipperah. It appears that in consequence of heavy rains in June the river burst its bounds, and inundated the country. "Some 300 villages are reported to have suffered, the inhabitants being driven to take shelter in the sudder station and in other places of higher level. The water thus collected remained on the ground, no means of draining it away being practicable, and as it dried up, sickness, particularly fever and cholera, were very rife and fatal."

As regards Terai fever, it is stated that some Europeans and Natives who live constantly in the Terai may have only slight attacks, but if they go up to Darjeeling they are almost certain to get fever of a much more severe type, running sometimes into remittent and continued forms with cerebral complications.

There are no remarks called for in regard to other diseases. But attention may again be directed to the large mortality from snake-bites shown in the present Report. It is true that this is not given separately, but is included among 9,046 deaths from wild beasts and snake-bites. It is evident that not much progress has yet been made in reducing this preventable death cause. There need be no difficulty now in distinguishing between venomous and non-venomous reptiles, and much good might be done and many lives saved by appointing suitable persons to superintend the destruction of the former in districts where they are most numerous and dangerous to the people.

The most important sections of Mr. Pilcher's report are those relating to sanitary progress, and to his own personal proceedings.

9. *Sanitary Progress.*—A very important step towards the sanitary improvement of the port and shipping of Calcutta was the one already mentioned, viz., the appointment of Surgeon-Major French as Port Medical Officer. He entered on his duties on 1st September 1875, which are as follow :—

1. To superintend the conservancy and sanitation of the port.
2. To board all vessels arriving in port with infectious diseases on board.
3. To inquire into disease among the shipping in the harbour, and into the sanitary condition of vessels.
4. To inspect pilgrim vessels before departure, and grant certificates upon which bills of health will be issued by the Commissioner of Police. "The Health Officer is required to devote his whole time to the duties of his office, and not to engage in private practice. He is also to be guided by the instructions of the Sanitary Commissioner."

It is not stated in what manner the advice of the Port Medical Officer is to be acted on, but it may be taken for granted that there is some executive authority, otherwise the appointment would lead to little good. Under these circumstances, it may not be out of place to enumerate a few practical points that may come under the notice of this new officer.

It may be safely stated that a properly managed ship, especially on the open sea, ought to be tenanted by as healthy a group of people as can be found anywhere in the world. And yet this is not always the case. On the contrary, ships have sometimes had sick and mortality rates far exceeding those of the worst quarters of unhealthy towns. This startling fact is the foundation of quarantine, which, until lately, was the means of levying excessive taxes on commerce. Twenty-five years ago it was calculated that quarantine delays and expenses in the Mediterranean alone amounted to four millions sterling per annum.

The idea of saving this vast outlay by dealing directly with the causes of it seldom occurred to men's minds. The sole fact recognized was that ships might sometimes be unhealthy, or that they might have sailed from unhealthy ports, and that, in either case, it was dangerous to permit intercourse with them, even although the ports claiming this protection were themselves suffering from the very diseases they wished to keep out.

Ports suffering from cholera have kept out ships arriving from other ports where there was none, merely because those ports were suspected. A worse result than the quarantine tax was that quarantine ports took little or no steps for their own improvement, and the people whose commerce suffered never thought of inquiring why ships sometimes carried pestilential diseases among crew or passengers.

A wisely and firmly administered port sanitary service has more in its power in dealing with such questions to protect other ports, to preserve the health of crews, and to save the losses inflicted by quarantine, than all the restrictive measures that human ingenuity can devise.

Let us see what are the usual causes of sickness on board ship. These are, bad and defective accommodation for crews, overcrowded, badly ventilated, and not clean; dirty ships; unwholesome cargoes, against the ill effects of which suitable precautions are not taken; foul unwholesome water; foul bilges, sometimes primarily caused by leakage of putrescent mud and water, and even sewage, in foul ports; want of sufficient means of cleanliness on board: bad articles of diet; sometimes, embarking persons suffering from infectious diseases.

Of late years there have been very considerable improvements in some of these matters, and comparatively little is now heard of ships carrying pestilential diseases on board. If the principle were adopted that certificates of health should be required to state that the ship, cargo, and crew had departed in health, and that all sanitary requirements had been complied with, or otherwise that the certificate should not be granted, and if, moreover, a similar inspection and certificate by the port sanitary authority were required at the port of entry, quarantine would soon cease to be heard of.

If security be taken that there are no known disease causes on board at the time of departure, and that none have arisen on the voyage from careless management, there would be nothing to fear, and the costs of delay from negligence would, in this way, very properly fall not on the whole commerce of a country, but on the property only of those persons who had neglected their obvious duties. Under quarantine law the innocent and the guilty suffer alike.

To complete the reform, the authorities in all seaports should attend to their sanitary improvements.

We must hope that as the metropolis of India has taken the lead in sanitary improvement in the eastern hemisphere, her authorities may also, under the recent port sanitary improvements, be able to set the example of successful treatment of questions of ship hygiene, and help to abolish the tradition of quarantine.

The introduction of ship hygiene on board Her Majesty's Indian troop ships has shown results which ought not only to be aimed at, but which, if intelligently followed up, would be realized elsewhere. These troop ships have practically solved the problem.

10. In the course of 1875 important progress was made in sanitary legislation in Bengal. The Bengal Irrigation Act which was passed in this year provides for carrying out works of irrigation and of general drainage connected with them, for removing drainage obstructions, and for the general conservation of all such works in the interests of the public health amongst other reasons.

The Calcutta Municipal Consolidation Act, passed during the present year, is said "to provide effectually for the maintenance and regulation of all the sanitary matters relating to the inhabitants and town of Calcutta."

At the date of Mr. Pilcher's report, a district Municipal Bill was under consideration which will give enlarged powers for sanitary purposes to town committees.

Existing laws relating to conservancy and improvement of towns, prevention of inoculation, &c., were extended.

In 1868 conservancy rules for villages and suggestions for the preservation of health were circulated. They were recirculated last year among the village communities, and it is stated that great benefit had resulted from this step. They are described as being "an exposition of sanitary truths in the simplest possible form," and direct attention to such matters as "over-crowding, accumulations of garbage, ordure, &c., in and about dwellings, carrying on of insanitary trades, converting of localities in the vicinity of habitations into latrines, sanitary evils arising from ditches and water holes, the pollution of water-supply, excessive growth of underwood and grass near houses, cremation and burial," precautions against cholera, &c.

Instructions on these matters for popular use have long been advised by the Army Sanitary Commission, and their circulation might be extended with great advantage all over India.

11. The following very important orders on sanitary procedure have been issued by the Lieutenant Governor of Bengal, for the guidance of district officers. After inspection of municipal town, Sanitary Commissioner to forward report to district officer, who will lay it, together with his own recommendations thereon, before the Municipal Committee, who will pass resolutions thereon and forward copies to Sanitary Commissioner, who, in his turn, will submit them with a copy of his report to Government. The Civil Medical Officer will report at the end of the year the extent to which the recommendations have been carried out. The Sanitary Commissioner to include this matter in his inspection reports.

A similar procedure is to be followed in non-municipal towns, and in villages, and much benefit may be expected from it.

12. As regards actual progress in improvements, it is most satisfactory to learn from the Report that "there are signs everywhere of activity in promoting minor improvements in connection with drainage, water-supply, conservancy, &c.," although few large costly sanitary works have been undertaken in municipal districts.

Burdwan is being thoroughly improved. Its conservancy arrangements are far in advance of other towns visited, and its water-supply has been improved.

Beerbhūm has been provided with a small-pox hospital, but it is scarcely satisfactory to learn that only one cesspit has been filled up.

Hooghly and *Chinsurah* have had their tanks improved, and considerable water-supply and drainage works are in hand.

In *Serhampore* district many tanks were deepened and new ones excavated. A simple engineering improvement in the Damooda has given the people water and prevented fever. Drainage has been carried out to some extent, and the Municipal Commissioners are fully alive on the subject of cleanliness.

In the 24-*Pergunnahs* cleansing is progressing, but the bustees require improvement. A number of tanks have been deepened and improved.

Moorsheadabad has had public latrines erected. *Dinapore* has been well cleansed, a latrine put up, and a municipal market erected. *Rajshahye* has received the benefit of a public garden and a school. The town is to be surveyed for drainage. *Rungpore* has a large scheme for district drainage before Government. At *Bogra* the water-supply has been improved.

The conservancy at *Darjeeling* has been improved, and loans have been applied for to increase the water-supply and drainage.

Much attention is being paid to the sanitary improvement of *Dacca*.

Considerable improvements are being carried out at *Chittagong* in better water-supply, closing old burial grounds and providing new ones, active conservancy arrangements, and a professional survey for drainage and embanking has been carried out.

Noakholly and *Tipperah* have been somewhat improved in water-supply and drainage.

Patna has had a swamp converted into a garden, but "the sanitary needs of this large town are very numerous," and little has comparatively been done for them.

Improvements have been initiated at a few other towns. It is satisfactory to learn that great efforts have been made to improve *Pooree*, in lodging-house regulations, conservancy, &c. The abominable tank has been cleaned out and protected.

13. Mr. Pilcher states that similar improvements are progressing in many other places. He gives details of inspections carried out by him of 16 municipal towns. Defects were noticed in drainage, water-supply, &c., and brief reports were presented on each. These reports show clearly the general direction in which improvements should be carried out, and when the whole system is in full operation under the orders already referred to, there will apparently be no difficulty in arriving at a proper estimate of the measures required for improving the public health in Bengal.

The inspection details are of more local interest, and must be left to the consideration of the local authorities.

This report, as a whole, is satisfactory. It is evident that sanitary improvement is occupying a considerable share of the attention of the Government, as well as of the municipal and other authorities in Bengal. The work to be done is very great, and all that can be said is that a very hopeful beginning has been made, and that Mr. Pilcher's proceedings and reports have apparently aided in the good work, by far the greatest part of which must, however, be done by the people themselves and by the village authorities, for no Government could undertake and find funds for carrying out all the improvements indicated as necessary in these Bengal reports. The Government itself appears to be moving in the right direction in these important questions.

29th May 1877.

No. 5.

MEMORANDUM of the ARMY SANITARY COMMISSION on the REPORT of the
SANITARY COMMISSIONER for the PUNJAB for 1875.

1. The vital statistics of the Punjab in 1875 are apparently based on the census taken in 1868, which gave the population at—

Males -	-	-	9,509,902
Females -	-	-	7,977,223
Total -	-	-	17,487,125

The following have been the annual numbers of deaths registered in the province since the census year :—

Years.	Deaths.
1869 -	453,821
1870 -	418,926
1871 -	363,378
1872 -	430,608
1873 -	357,153
1874 -	316,713
1875 -	447,208

So far as can be judged of by the figures, the year 1875 was a very unhealthy year. Dr. De Renzy thinks it probable that some part of the increase of deaths may be due to better registration in the municipal towns, but on the other hand there was a cholera epidemic during 1875, which caused 6,246 deaths, and the registered fever mortality underwent a large augmentation. It is true that little dependence can be placed on fever diagnosis in India, but, such as it is, there were 279,841 deaths attributed to fever, being an excess of 89,210 deaths over those of the preceding year, the state of the diagnosis remaining, no doubt, the same.

The death-rate during 1875 amounted to 25·57 per 1,000, a fact which, when tested by other facts, shows that the registration of deaths is far from being reliable.

This point is fully dealt with in the Proceedings of the Government of the Punjab on this Report, and as test facts the following death-rates for five towns, in which the Proceedings state that "the registration was probably fairly accurate," will show how much below the actual truth the death registration is at present :—

	Death-rate per 1,000.
Umritsur -	62
Delhi -	51
Lahore -	43
Peshawur -	45
Mooltan -	34

It is unnecessary to discuss the subject further, as it is receiving the attention of the Government, which will, no doubt, take practical steps for improving the registration. Even as matters are at present, the patent fact which has to be dealt with by sanitary works and measures lies within these enormous ascertained death-rates, which are, no doubt, representative cases, and could be reproduced all over the country.

2. The following table, extracted from the Government Proceedings, shows the chief registered death causes for the seven registration years already alluded to :—

Years.	Total Deaths registered.				
	Cholera.	Small-pox.	Fevers.	Bowel Complaints.	All others.
1869 -	9,258	53,169	272,946	30,953	87,495
1870 -	469	27,163	275,093	27,249	88,952
1871 -	369	25,534	213,548	21,678	102,249
1872 -	8,727	23,728	264,711	23,345	110,097
1873 -	148	25,699	219,909	19,640	91,757
1874 -	78	12,026	190,631	16,407	97,571
1875 -	6,246	13,594	279,841	27,550	119,977

This table shows that of late years cholera epidemics have recurred triennially, and the law might possibly have been traceable backwards had not the great epidemic of 1867 intervened, which caused 43,146 deaths in this province, besides a large mortality throughout the northern and north-western regions of India.

It is proposed to limit our remarks as closely as possible to the practical aspect of the information given by Dr. De Renzy about these diseases, beginning with cholera.

3. The following abstract shows the monthly incidence of cholera mortality in 1875 :—

	Deaths.		Deaths.
January -	4	July -	747
February -	4	August -	1,515
March -	4	September -	2,117
April -	10	October -	1,358
May -	41	November -	129
June -	316	December -	1

It is stated, "with some approach to certainty," that the deaths registered as due to cholera during the first four months were not cholera. Dr. De Renzy considers that these facts show cholera to be essentially a hot weather disease. A table in the Report containing the number of rainy days in each month shows that 70 per cent. of the rainy days took place in the four months June to October inclusive, in which the maximum cholera mortality took place. There was hence both high temperature and moisture during these months.

4. The purely local character of those outbreaks which taken together make up the epidemic mortality of 1875 is shown by the facts that, out of 487 registration circles in the Punjab, only 162, or about 31 per cent., were attacked, and that of 35,740 villages in the province no more than 808, or about $2\frac{1}{4}$ per cent., yielded cholera deaths, although no quarantine restrictions were applied.

Of the 808 attacked villages 582 had fewer than five deaths, and in 256 the mortality exceeded this proportion.

5. With these facts before us it is scarcely necessary to discuss cases of "importation," but as this matter is of practical importance in the Cholera Inquiry, it may be useful to deal briefly with the cases alleged in the present Report.

The following case, in which the dates are given by Dr. Whitwell, will illustrate the character of the evidence adduced in favour of importation.

In Umritsur district there are 107 towns and villages, which yielded 1,268 cholera deaths.

The first case was in June, and the months of maximum mortality were August (504 deaths), and September (583 deaths). Umritsur was attacked in July (26 deaths), and had 402 deaths in August. Under this distribution of the epidemic the alleged importation took place at Kohali, 14 miles from Umritsur. On the 31st August a Sikh traveller arrived at the rest house at Kohali. It is not stated whence he came or what was his state of health. He might have come from an unaffected district in good health. Next day, however, this man was taken ill, and died of cholera. Five feet from the rest house is an unprotected well, from which, it is presumed, the man got water. The day after his death, namely, on the 2nd September, cholera appeared in the village, and 24 deaths out of 722 people took place. Every one of the cases took place in people who used the water from the rest house well. Dr. Whitwell asks: "Am I exceeding the bounds of probability in saying that this solitary traveller alone, friendless, unattended, must have contaminated the water of this well in his efforts to obtain water? . . . so that, as far as it is possible to show, here was an undoubted instance of cholera being propagated by water pollution."

One undoubted fact is that cholera was epidemic all over this region of the Punjab. Another fact must be acknowledged, that only the people, including this traveller, who drank of the same well had cholera. The villagers using other three wells escaped.

On consulting the dates, however, we find that the presumed effect, viz., the attack of the villagers, followed on the traveller's illness and death after a few hours only.

The traveller was attacked on the 1st September, the first villager on the 2nd September. There was hence no time for incubation. In the absence of several important links, among others, the real condition of the well, another question may be asked, namely, does not the evidence as it stands rather lead to the idea that all the cases, including that of the traveller, were due to impure water? But before this view could be accepted it would be necessary to show that the water was impure, that the traveller had made use of it, and that the inhabitants who supplied themselves with water from the well were exposed to no other local causes than those common to the rest of the villagers.

A similar account is given of the introduction of cholera into Umritsur itself. The first case occurred on July 26th in a Cashmiri Mohamedan, and to this body of people the disease was at first confined.

The following was the presumed origin of cholera in Umritsur. "A roaming fakir of Jummoo" (there is no evidence that cholera was then in Jummoo, or in any place through which the man had passed) arrived in the city "just previous to the outbreak" (no date given), and took up his residence in a mosque, and died there 36 hours afterwards with all the symptoms of cholera." But "this case was not seen by a medical officer." His quarters in the mosque were within "a few feet of the well," the mouth of which had no parapet, and "the probabilities are, therefore, that the man's discharges were washed into the well and poisoned the water" (on this point there is no evidence whatever). The Cashmiris used the water from this well, and they were the first to suffer from cholera. There were 80 cases among them; but the total deaths in Umritsur were 756.

These two instances give the circumstances more in detail than other cases of presumed importation, which may be said to amount to simple coincidences, communication of the disease having been adopted not as proved, but as explaining the phenomena.

For example, a man arrives at Delhi from Kurnool on May 10th (where there was no cholera, as shown by the statistics). He is seized with cholera at Delhi, where cholera appeared on May 6th, four days before his arrival. The man was attacked on the 10th, and his son on the 14th. Surely there is nothing in this to prove importation.

It would serve no good purpose to discuss these cases further. We must refer again to our Instructions for the cautions to be observed in investigating such cases, and the present cases only serve to show how difficult it is to keep all the points in mind at the time, and to avoid what afterwards appear to be very obvious sources of error.

6. So far as any practical results have followed from examination of instances of presumed infection in the Punjab, these may be briefly summed up in the following words of the Proceedings of Government on Dr. De Renzy's Report: "In the remarks of the Sanitary Commissioner upon the little value of quarantine as a safeguard against cholera the Lieutenant Governor entirely agrees." The system of quarantine, except under the most exceptional

“ circumstances, the Lieutenant Governor considers to be altogether mischievous and injurious.” He is, however, not unwilling to give this method of protection a fair trial in special cases, which is indeed the very most that can be said on behalf of the system.

It need only be added that the experience of 1875 showed that quarantine restrictions were of no use in any part of India. Of this truth a striking confirmation is given by the Lieutenant Governor in the case of Murree in 1876, which, being a large and important military station, was included in a strict quarantine, until after cholera had actually broken out among the children at this station. The case was inquired into by the Officiating Sanitary Commissioner whose report of 3rd November 1876 states the following conclusions:—

“ 1st. That the disease was *not imported* into Murree, but originated there spontaneously.
 “ 2nd. That it was localized there. 3rd. That it spread by means of atmospheric agency, aided
 “ by direct action of its specific dejector from the human body.”

The report itself has not been printed in the Punjab Report for 1875, so that there is no evidence; only the conclusions are given, and no remark can be made on them except the one practical conclusion which may be put as a question, viz., “ Why, in so fine a climate and position, “ 8,000 feet above the level of the sea, was cholera there at all ? ” It is an old disease at Murree, and this special report will no doubt clear up points on which light is very much wanted.

7. In the meantime here is an account of an infected cholera village which Dr. De Renzy says may be taken as a fair type of the villages of the Punjab at large:—

“ Manure heaps and collections of cowdung all around and in the village itself. Houses full of “ rubbish of every sort. Streets and lanes filthy. A hole containing stinking black water in the “ sweepers’ quarters, and two small shallow tanks near the wells filled with foul water. There “ were three wells in the village, the water of which is used for drinking purposes; the water “ was found to be good in colour and taste, and free from any smell.” (It does not follow that the water was not poisonous.)

For practical purposes this account is worth any amount of discussion about causes of cholera, but it suggests a very obvious question, namely, whether the existence of such a state of things is consistent with avowed sanitary administration?

It may be suggested for consideration whether the vaccination service together with the civil medical service might not be employed in aiding village improvements while on tours of duty, as is now being tried in other parts of India. The villagers and their officers might in this way be instructed in measures for protecting their own health, especially if a few printed rules in the vernacular were circulated, to explain the great dangers of the present condition of villages and the means of removing them.

8. In the Punjab, as in other districts of India, any hope of protection from cordons or quarantine may be considered at an end, and all that now remains to be done is to discard theoretical measures, and to turn to real sanitary work. In furtherance of this object the following sanitary notes, abstracted from the district cholera reports, may be safely taken as guides towards a consistent plan of sanitary improvements so far as they go.

Delhi.—“ The first known cases of cholera in the Delhi district occurred in the city of Delhi “ among a body of chumars (tanners) inhabiting one of the dirtiest quarters, called the ‘ Kali “ Musjid Ward.’ ” The state of this part of Delhi, and its relation to cholera outbreaks among the chumars, has been long known, but hitherto little appears to have been done to improve it.

Simla.—A brief account of the Simla outbreak has been included in our remarks on the Report on Cholera of the Sanitary Commissioner with the Government of India. The following is Dr. De Renzy’s estimate of its sanitary condition:—

“ I inspected the sanitarium in April, and its condition appeared to me then to be extremely bad. “ The public latrines were indescribably foul, a sickening stench, arising from the filth-soaked “ wooden drains and cesspool tubs, pervaded the bazaar, and the water-supply was so scanty that “ people had to wait at the reservoirs for hours before they could fill their water vessels. There “ was not a single source of water-supply even moderately safe against the foulest pollution. “ Water being so scarce, it need hardly be said that the poorer classes are most filthy in their “ persons and dwellings.” Nevertheless the Chemical Examiner pronounces the water “ very good,” an opinion which possibly may be explained by the water pollution taking place at irregular times. The analyses of samples, if correctly printed, would go to show that Simla possesses the softest and purest water anywhere supplied for use. But the Sanitary Commissioner interprets the results as showing that Simla water, so far as regards albumenoid ammonia, “ is just on a par with the Thames water at London Bridge.”

In 1869 *Umritsur* had 3,012 cholera deaths. Since that time two huge holes “ which served as a receptacle for town sewage ” have been filled up. The cholera deaths in 1875 amounted to 756, just a quarter of the former epidemic rate. The reduction cannot, however, be accepted as decided proof of sanitary progress. The outbreak of cholera in 1875 was connected with impure water, and the present Report states a fact which no doubt is unfortunately too common all over India, namely, that the mud floors of houses become contaminated with cholera matter, and the poor people still remain crowded in their dwellings. Some remedy should be found for this dangerous habit, more efficient than the present “ disinfecting ” proceedings. Could not the floor mud be at once dug up and removed, and its place supplied by fresh rammed earth, which is the cleanest and best “ disinfectant ? ” No proceeding which leaves the earth fouled by excreta on the floor can ever obviate danger.

An illustration of the importance of this matter is given in a careful investigation made by the Sanitary Commissioner into an outbreak of cholera in *Lahore Lamentic Asylum*, which resulted in every probable cause of the persistence of the epidemic being discarded except the pollution of the floors. The practice was to scrape the surface, but, considering the absorbent nature of the material, nothing short of digging away the surface and replacing it with clean earth would be likely to answer, except leaving the place altogether.

In another instance, *Lahore Central Jail*, there was another source of danger. The prison excreta are deposited in the prison garden, the drainage from which had access to the wells, and reappeared as ammoniacal and chlorine compounds in the water.

It must be repeated here, what has often been said, that sewage matters ought never to be buried at all near dwellings or water sources, and only at a safe distance when mixed with earth in covered water-tight receptacles to prepare them for agricultural use, and that, when fresh excreta are applied as manure, the amount must be no more than would be made use of by a skilled agriculturist.

9. These are the chief points of importance connected with defective local conditions stated in this Report, and the remark must be made that the local reporters appear to have been much more occupied with questions of "importation" than with removable sanitary defects, which latter occupy a very small space in the reports on cholera in 1875.

10. *Small-pox*.—When tested by the declining annual mortality from small-pox, there is no part of India in which the success of vaccination has been more marked than in the Punjab. Leaving out fractional parts, the following numbers represent the annual small-pox deaths in thousands since 1866,—30, 20, 24, 53, 27, 25, 23, 25, 12, 13.

These are rough averages for the whole country. But the death-rates differ in different districts, and the reasons are assigned by the Sanitary Commissioner as follow :—"In the districts south of the Sutlej, where the Hindoo element greatly preponderates in the population, the prejudice against vaccination continues very strong, and in them also the mortality from small-pox continues great. In Jullundur, Gurdaspur, and other districts the people have become so sensible of the advantages of vaccination that it is not uncommon for them to send in petitions to the district authorities to send vaccinators to vaccinate their children. In these districts the small-pox mortality is trifling."

The greatest small-pox mortality registered in any one district was in Gurgaon, where Sitla, the goddess of small-pox, has a famous temple.

11. *Fevers*.—The Sanitary Commissioner dismisses the enormous registered fever mortality in a few lines, without discussion as to its causes, on account of inaccuracy in the diagnosis. The Lieutenant Governor very properly calls attention to this deficiency, and points out that, "what-ever mistakes may be made in registration by inefficient persons, there is no doubt that the mortality from fevers of what is called the paroxysmal type, due to malaria and a defective drainage, is in certain years enormous," and he considers that the attention of the Sanitary Commissioner might be directed to this circumstance, especially as regards the Jullundur Doab, where fever "reached its height in the town of Jullundur, where upwards of 500 people died in a single week in the present summer out of a population of 33,673," due, in the popular belief, "to the country having become water-logged, the height of the water in the wells having risen 2 or 3 feet, and that the only effective remedy is thorough drainage."

The statistics show that fever deaths were registered in every district of the Punjab in 1875, and that no less than 16 per 1,000 of the population died from this assigned cause. In one district, Hoshiarpur, with a population under one million, the registered fever death-rate was 25·13 per 1,000. In Jullundur district, already referred to, it was 21·49 per 1,000. In Jullundur town the fever death-rate was nearly 25 per 1,000. In Dasuya, a town of 8,453 inhabitants, in Hoshiarpur district, the death-rate assigned to fever exceeded 10 per cent. of the population. In Kamalia, a town of 5,695 inhabitants, in Montgomery district, the fever death-rate was 68·83 per 1,000. These represent some of the highest death-rates in 188 registration circles and towns. But it is a very important fact, in any inquiry into the local causes of these enormous losses from fever, that there are circles and towns within which the death-rates are by no means so high. For instance, in Abbotabad cantonment, with 2,894 inhabitants, there was only one fever death. At Murree there were 16 fever deaths out of 10,605 inhabitants, equal to a death-rate of 1½ per 1,000. In the same Hoshiarpur district in which Dasuya, with its 10 per cent. fever death-rate, is situated, the town of Anandpur shows a death-rate of 7½ per 1,000; and in Jullundur district, with its fever death-rate of nearly 21½ per 1,000 there are two towns showing rates under 10 per 1,000. The practical result of these contrasted rates is to show the necessity for strict local inquiry into the local causes of these losses of life from fever. It would be better, in following out the proposal made by the Lieutenant Governor, to concentrate attention on a few localities, as was done by Mr. Planck in similar investigations in the North-West Provinces a few years ago. If this course were followed in the Punjab, where extensive irrigation works have been carried out, there is every reason to hope that results as practical as those arrived at by Mr. Planck would be obtained through the well known zeal and ability of the Punjab Sanitary Commissioner. We concur, nevertheless, in Dr. De Renzy's view as to defects in fever diagnosis, but there is no help for this at present, and all that can be done is to take the *prima facie* case as it stands in the statistics, while in dealing with a few special cases in this way the exact nature of the diseases registered as "fevers" might possibly be ascertained.

12. Among death causes requiring notice, 979 were registered from snake-bite, against 930 during the preceding year. Nothing appears to have been done, as yet, in destroying snakes in this province. There were 162 deaths from hydrophobia in 1875, and 173 in the preceding year, —an enormous mortality from this cause.

13. *Sanitary Progress*.—The municipalities are engaged in carrying out the current sanitary work, but there is not much to report in the way of permanent improvement during the year.

Delhi has spent 5,509% on sanitary measures, and 3,088% on roads and bridges. The water-supply scheme is in the process of settlement, and we agree with the municipal authorities that 10 gallons per head per day would not be sufficient for the drainage requirements of the city.

Lahore has had a water-supply and drainage scheme under consideration. The former is sanctioned, but there appears to be some difficulty with the drainage scheme, on account of a proposal

to make the sewers large enough to carry off excessive floods, or $\frac{3}{4}$ of an inch of rain per hour. There is a table of rainfall in the present Report, which shows that in 1875 there were only 26 rainy days in the year, and that the greatest rainfall in any one day was 6·2 inches. The total rainfall for the last seven years at Lahore is given in the table as follows:—

	Rain (Inches).
1869	20·1
1870	9·2
1871	8·7
1872	20·3
1873	19·2
1874	15·0
1875	33·2

The proposal is to keep the house sewage out of the sewers, and to adapt them to carry off an occasional flood, the probable recurrence of which may possibly be estimated from these data. In this way, an enormous outlay would have to be permanently incurred for an occasional flood, which might possibly be provided against by surface drainage and improvements, while in the intervals between the rainy days the whole sewage system would generate sewer gases from the deposit left by dirt and street washings, and all the time the city would be as much in need of sewerage and drainage as if the expenditure, estimated at 47,233*l.*, had never been incurred. We must again repeat what has often been said on this subject. In India, provision should be made for exceptional rainfall by surface drainage, and in cities the sewers should be devoted chiefly to removing domestic sewage and foul water, and their dimensions should be proportioned to the work they have to do. On the facts as they stand, Dr. De Renzy was apparently justified in withholding his approval from the scheme, which, indeed, appears to require reconsideration.

Rawul Pindie is in great need of a water-supply, and a scheme, involving an outlay of 20,000*l.*, is under consideration.

The water-supply of *Peshawur* has got the length of settling and filtering tanks, but it is not yet decided by the civil authorities whether the water is to be extended to the city, or whether the new water-supply will only be limited to cantonments. The authorities appear not to be convinced that the city surface wells are insufficient. It will be a great advantage to have the water for cantonments, but if the city authorities have doubts as to its necessity, it may be suggested whether they might not advantageously have the wells on which they depend examined, and their water submitted to chemical analysis. As the facts stand, the sooner the city is supplied with water, the better will it be for the public health.

A list of 27 towns is given in which a few sanitary improvements have been carried out, chiefly surface improvements, cleansing wells and tanks, latrines, paving, levelling, filling up holes, &c.

All this is in the right direction, but the excessive death-rates in some of the principal centres of population, already referred to, are sufficient to show that the evils lie deeper than the mere surface. The following abstract will show the proportion of death causes in 1875 in the first four cities in the list already given:—

	Ratio of Deaths per 1,000 of Population.				
	Cholera.	Small-pox.	Fevers.	Bowel Complaints.	All causes.
Umritsur	5·53	·06	33·19	3·50	62
Delhi	·40	1·01	23·81	3·74	51
Lahore	·43	1·31	27·83	2·00	47
Peshawur	—	9·99	15·37	2·20	45

There can be no mistake about the importance of the local causes which predispose to fever in these towns, the statistics of which are considered reliable. These causes ought to be brought to light, and dealt with. In the Punjab, as in other parts of India, it will be most advantageous, probably, to get a few bad cases in hand, where there are municipal authorities, as soon as possible, for the obvious reason that experience obtained in this way teaches a far more direct lesson than mere repetition of principles.

14. The case is different, however, with village populations, who have to do most of their own work, and it is with pleasure the Commission quotes the following paragraph from the present Report to show one excellent step which is being taken with these cases. Dr. De Renzy says:—

“Under the orders of His Honour the Lieutenant Governor, I held conferences with 18 district committees, with a view of impressing upon them the necessity of improving the sanitary state of villages under their respective jurisdiction. In fulfilment of my instructions, I prepared a pamphlet describing the history and embodying the elementary principles of sanitary science, and I gave at the meetings ocular demonstrations of the effect of sewage on water. The course of procedure followed was that the pamphlet was first read, and afterwards demonstrations made in proof of some of the statements contained in it. The members were then encouraged to ask questions and to offer any objections that occurred to them. The objections were then discussed patiently and considerately. I made no attempt to commit the meetings to any hasty resolutions, but asked them to think over what they had heard and seen, and a copy of the pamphlet was presented to each member. I was most agreeably surprised at the interest which these meetings seemed to excite, and the pamphlet has been in such request

" that it has been necessary to print 22,000 copies of it for circulation among the village population The conferences lately held will, I believe, ultimately be of the greatest use in directing the minds of the people to sanitary evils of which they had previously no conception."

The interest taken in this work by the people themselves is perhaps the best guarantee for its resulting in ultimate good. Dr. De Renzy deprecates any attempt at forcing improvements on the people for which they are not prepared, but it may be suggested whether the proposal already made of enlisting the vaccination officers and civil surgeons in the work might not be a practicable step in advance. Both classes of officers are recognized by the people as acting for their good, and it seems that on this basis the village populations and their officers might be disposed to act on advice given them regarding cleansing of villages and houses, removal of nuisances, filling up water holes and levelling surfaces, protecting wells and tanks and the like from pollution, and in this way much useful work might possibly be accomplished without pressure.

15. There are one or two other points to which attention may be called.

The jail mortality in the Punjab was very high in 1875. In 30 jails it averaged 32 per 1,000, of which only 1·18 was due to cholera. The lowest death-rates were 7 per 1,000 at Gujerat and Kohat. From this ratio the death-rates ascended to 8, 10, 18, 24, 33, 44, 59, 109, and 140 per 1,000.

The chief death causes were,—

Intermittents and remittents	-	-	-	-	94 deaths.
Dysentery and diarrhœa	-	-	-	-	110 "
Pneumonia	-	-	-	-	98 "
					202 "

The total deaths were 456. The chief death causes point to the need of inquiry as to their origin.

16. The Lawrence Asylums gave the following results during 1875.

In the Asylum at Murree there were 50 inmates between 5 and 10 years of age, 82 from 10 to 15, 11 from 15 to 20; in all 143. There were two deaths among them, one from measles.

In the Asylum at Sanawar there were 175 children at ages under 10, there were 211 between 10 and 15, and 45 between 15 and 20; in all, 431 inmates. Amongst these there were 4 deaths among boys and 6 among girls. The following were the death causes :—

Enteric fever	-	-	-	-	4
Epilepsy	-	-	-	-	1
Heart disease	-	-	-	-	1
Respiratory ditto	-	-	-	-	1
Dysentery and diarrhœa	-	-	-	-	2
Others	-	-	-	-	1
					10
Total	-	-	-	-	10

The most noteworthy fact in the statistics of these schools is the absence of enteric fever at Murree and its presence at Sanawar. A number of years ago attention was called to this fact, and to the very probable origin of the disease in water polluted by filth. Nothing appears to have been done to remedy the evil, for Dr. De Renzy says that "the water-supply of the institution remains in the unsatisfactory state described in previous reports."

Dr. De Renzy suspects impure milk as a cause, but there is no source of this kind which does not probably exist at Murree. He does not think the evidence against milk sufficient, but there can be no doubt, from his account of the places it is got from, that it cannot be quite good. It may be suggested whether these institutions might not provide their own milk. As far as regards the water-supply, it may be safely stated that Sanawar Asylum will not be free of enteric disease until good water properly distributed is provided for the children.

17. These are the chief points of practical importance in the Punjab Sanitary Report for 1875.

It was natural that the cholera epidemic, and the contested questions connected with it, should have occupied a prominent share of attention, but the losses from cholera, when compared with the losses from constantly acting death causes, especially those included under the designation of "fevers," show that future progress in sanitary improvement must be mainly in two directions,—

1st. In grappling with the enormous death-rates in the chief towns and cities, especially those attributed to fevers.

2nd. In selecting for improvement special localities where the fever death-rates in suburban and rural districts point to water-logged subsoils, the rise of the subsoil water level from irrigation, and possible pollution of the well water. So far as can be judged from the facts, the best course to take with such cases would be the one already followed in the North-West Provinces.

Other matters of detail already in hand may be left to the judgment of the Sanitary Commissioner, whose practical work, especially in creating a public opinion on behalf of local improvements, is worthy of commendation.

30th May 1877.

No. 6.

MEMORANDUM of the ARMY SANITARY COMMISSION on the REPORTS of the
SANITARY COMMISSIONER for the NORTH-WEST PROVINCES for 1874 and 1875.

As these two Reports have been referred to the Army Sanitary Commission at the same time, it is thought advisable to include the remarks of the Commission on both Reports in the same Memorandum. The cause of the delay in issuing the first Report is explained in the appended Government Letter as having arisen from important points on the questions of irrigation and drainage, necessitating inquiry in the Irrigation Department, having been brought forward by the Sanitary Commissioner. The Reports taken together contain information on the sanitary state of these provinces, and on steps taken for removing disease causes, of great interest and importance to the progress of public health improvements, not only in the North-West Provinces but in other districts of India.

1. Assuming the population of the North-West Provinces at 30,769,056, the registered mortality gave a death-rate for 1874 of 21·82 per 1,000, and for 1875 of 21·8 per 1,000. These rates are, however, below the real death-rates, and only indicate the deaths registered during these two years. The registration is improving, but Mr. Planck, the Commissioner, says that he does not, "as a rule, endeavour to prove anything by the mortuary figures," and that "it is bad ground to tread upon yet." This is quite true, and it must necessarily be the case in any country into which such records have recently been introduced. In cantonments, excluding instances of neglect, the death-rate for 1875 was 23·32 per 1,000, a better result. On the whole, the registration appears to be improving, although the numbers of deaths registered in one part of the country are still double the numbers registered in another. Mr. Planck ascribes the deficiencies of registration to the want of trustworthy agency for the report to the registrars of deaths which have happened, especially in rural circles, each composed of many villages, sometimes as many of which as 200 report to one centre. The total circles furnishing returns monthly amount to 879. But an important fact is that the town circles, with their machinery, are able to report death-rates averaging 31·70 per 1,000, while the rural circles averaged only 21·07 per 1,000. Notwithstanding the obvious deficiency in both results, especially as regards the rural circles, the fact that so many deaths have been reported to the registrar is by no means discouraging for future progress in vital statistics. The wonder is that so much progress has been made in this important department of public health; while the increase of reported deaths, with the better arrangements possible in town districts, holds out a prospect for similar results being attained in rural circles when the registration arrangements are in better working order. This matter must be left in the hands of the Government.

2. The chief practical interest in these mortuary statistics lies as usual in the death causes, the classification of which partakes, of course, of the inaccuracy incident to the registration itself. But, making any reasonable allowance for such deficiencies, the facts disclosed in Mr. Planck's Reports are of great public importance.

3. Take, for example, the following registered fever deaths for the last five years in the North-West Provinces:—

Seasons.	Registered Deaths from Fever.					Total.
	1871.	1872.	1873.	1874.	1875.	
Cold - - -	158,340	168,357	152,657	154,260	152,902	786,516
Hot - - -	101,198	118,725	125,670	107,366	132,061	585,020
Rains - - -	162,293	203,354	180,025	187,962	171,522	905,156
Total -	421,831	490,436	458,352	449,588	456,485	2,276,692

During the five years 1871-1875 there died above 2¼ millions of people in these provinces from diseases registered as "fevers." The following abstract of the table gives the percentage of total fever deaths according to season:—

		Percentage of Fever Deaths.				
Hot season	March	-	-	-	-	26
	April	-	-	-	-	
	May	-	-	-	-	
	June	-	-	-	-	
Cold season	January	-	-	-	-	35
	February	-	-	-	-	
	November	-	-	-	-	
	December	-	-	-	-	
Rains	July	-	-	-	-	39
	August	-	-	-	-	
	September	-	-	-	-	
	October	-	-	-	-	
						100

The fever mortality varies greatly from year to year in different registration districts. Three of the most unhealthy in 1875 were Terai, where the fever deaths per 1,000 living amounted to 27.99; Bulandshuhr, where the fever death-rate was 24 per 1,000; and Meerut, where it was 21.01. These figures show the great losses sustained from fevers in certain districts of the country, and the need of strict inquiry into their local causes. The Northern and Central Doab had death-rates in 1875 ranging from 16.39 to 24 per 1,000 living from fever alone.

None of the reports from India contain an account of these fevers. That the great part are of malarial origin appears to be beyond question, but it seems doubtful whether ague is attended by such fatality as these abstracts show. Additional light on the subject appears to be thrown by the following observation of Mr. Planck, who says:—"Certainly continued fever is a disease of the North-West Provinces, and is not difficult to find in any centre of population much noted for filthiness, and especially where animal remains are allowed to decay in close proximity to the houses, or where in a year of scarcity poverty has very much pinched the people. But this form of fever is more common about the close of the cold season, and, I suspect, during the hot season." When it is remembered that the fact has only recently been recognized that the fatal fever of British troops serving in India is typhoid fever, and that enteric fever does show itself among Native troops, it may be here suggested, as matter of further inquiry, that possibly much of the mortality from these fevers may be due to enteric fever, and some to relapsing fever.

This suggestion is not intended to call in question Mr. Planck's opinion regarding the Doab fever, "that it prevails at the time of the drying up of the rains in August, September, October, and November," and hence is indicated as of malarial origin.

This is another problem, and one distinctly connected with the drainages of the country.

4. The Doab has been the seat of great irrigation works. The amount of water passed into the subsoil has been sufficient, not only to increase the fertility of land, but to saturate the subsoil with water to such an extent as to occasion a gradual rise nearer the surface of the subsoil water-level, to injure the purity of wells supplying water for domestic purposes, to give rise to swampy ground, and, as is alleged, to cause great sickness and mortality among the population.

In addition to facts on this important matter supplied by the Sanitary Commissioner, he has inserted two reports by Dr. Moir, Civil Surgeon at Meerut, in which the causation of these Doab fevers assigned by Mr. Planck is called in question on certain statistical grounds, which amount to an averment that the registered fever mortality has not always borne a definite relation to the proximity of the districts to irrigation lines. The points raised are similar to those raised in Madras a number of years ago on the Godavery fever. The *prima facie* reply is the same in both cases, and is not that excessive fever death-rates have or have not a defined topographical relation to drainage works, but that they exist at all. Why are there these excessive death-rates? What is their cause? How are they to be prevented or removed?

Dr. Moir's reports appear to be directed against certain opinions prevalent in the country that these fevers have been caused by irrigation. Such opinions, if they became operative, would destroy irrigation works all over India and render many districts unproductive, and Dr. Moir is quite justified in challenging those who hold them to the proof. He shows that these fevers existed before irrigation works existed, and that they are found where such works have never been carried out. All this is quite true, but it scarcely touches the question at issue, which is this. In a country where malaria prevails, and where the drainages have not been improved, what is likely to be the result of carrying over it extensive irrigation works, some of them cutting across the natural drainage lines and obstructing them, and pouring water on the surface and into the subsoil in quantities far in excess of what is needed to supply the wants of vegetation?

There can be but one answer, that given by Mr. Planck and practically by Dr. Moir himself, viz., that the subsoil will become saturated with water, the wells injured, and the surface, without perhaps even visible appearance of water, will be converted into a swamp, and of course the usual results to health and life will follow, but not necessarily in these precise localities where the evils are most apparent.

5. To all assertions about the economical results of irrigation works it is imperative to reply that in future the cost of such works should include the costs of drainage of the country to be irrigated. This must either be done at the time, or, if it be neglected, the neglect must be repaired at great outlay, and consequent disappearance of profit, and after great sacrifice of human life. The Government of the North-West Provinces is now actively engaged at large outlay in draining away the excess of water supplied by irrigation works; a measure which will not only improve the public health, but will improve at the same time the produce of irrigated districts.

One of the concluding paragraphs of Dr. Moir's report may be cited as a practical reply to opponents of irrigation, and also to those who would carry out irrigation while ignoring its necessary accompaniments. He says:—"It is most fully conceded here, and without any reservation whatever, that good drainage is the panacea for malarious fevers, as all experience teaches. This is allowed on all hands by all who are in a position to form an opinion on the subject. The object of these memoranda, however, has not been to inculcate this well-known truth, admitted as it is by everyone, but rather to expose the groundlessness of the statements made with such confidence on many sides that canal irrigation has caused fever."

There is, hence, no real difference of opinion on the practical remedy for malarial fever, and nobody disputes the advantage of irrigation accompanied by drainage in all districts where water for agricultural use is required.

6. In the present state of registration the precise influence comparatively of local disease causes must be arrived at in the way stated by Mr. Planck, who says:—"I believe the truth can be learnt in respect to this matter only by actual inspection of places where the fever death-rate is known to be great, and as I have over and over again seen the dampness of floors and walls which has resulted from the rise in the spring level in these places, have over and over again heard the

“ bitter complaints of it from all classes of people as a cause of frequent sickness and death, I am unable to resist the conclusion that the dampness is the principal cause of their trouble.”

It appeared to be necessary to notice these points, before proceeding to show what is being done in the way of improvement in drainage, with special reference to existing irrigation works, but as these malarial fevers prevail over the whole country they can only be effectually dealt with by improved agriculture, including the necessary drainage works.

7. *Cholera*.—During 1875 cholera prevailed over India as a great epidemic, and its ravages were extended over the North-West Provinces, as will be seen from the following abstract, showing the movement of cholera mortality in these provinces for the last 11 years :—

Deaths from Cholera.					
1865	-	-	-	-	76,322
1866	-	-	-	-	8,175
1867	-	-	-	-	57,837
1868	-	-	-	-	20,680
1869	-	-	-	-	90,770
1870	-	-	-	-	13,123
1871	-	-	-	-	3,473
1872	-	-	-	-	50,565
1873	-	-	-	-	15,268
1874	-	-	-	-	6,396
1875	-	-	-	-	41,106

We know little as yet of the laws which determine the intensity of epidemic cholera, but it is not an unimportant feature in this record of mortality that the aggravations of the disease have been less intense during the latter than during the former years of the series, and that the total mortality has diminished. Thus, during the five years 1865 to 1869, the registered cholera deaths amounted to 253,784, and during the six years from 1870 to 1875 the deaths were 129,931. It is not unlikely also that, since the introduction of death registration, the numbers registered during the last six years have approached much nearer the truth than those of the first five years of the series.

8. The next abstract shows the prevalence of cholera mortality in relation to season for the last five years :—

Seasons.	Registered Deaths from Cholera.					Total.
	1871.	1872.	1873.	1874.	1875.	
Cold - - -	596	1,526	676	860	1,452	5,110
Hot - - -	1,833	30,937	6,124	565	18,160	57,619
Rains - - -	1,044	18,102	8,468	4,971	21,494	54,079
Total -	3,473	50,565	15,268	6,396	41,106	116,808

The effect of climate on the intensity of cholera is very evident from this table.

When reduced to a common percentage, the ratio of deaths for each season to the total deaths gives the following result :—

				Percentage of Cholera deaths.
Cold season	{	January -	- - -	4.37
		February -		
		November -		
		December -		
Rains -	{	July -	- - -	46.3
		August -		
		September -		
		October -		
Hot season	{	March -	- - -	49.33
		April -		
		May -		
		June -		
				100.00

As shown above, the deaths from cholera in 1874 were 6,396; and the following is the account given by Mr. Planck of the progress of cholera in 1875 :—“ During 1875 cholera disease prevailed in all parts of the province excepting Jhansi and Lalitpur in the south, and Kumaon in the north. During the months of January and February a few sporadic cases occurred in all parts of the province. In March the disease commenced to be epidemic in the eastern districts, Basti, Benares, Mirzapur, Jounpur, and Allahabad. In April the disease had become epidemic in all the eastern districts. In May the influence had extended to nearly all the central and western districts. During June, July, and August this extended prevalence continued, the mortality nowhere very severe. In September and October the prevalence declined in the eastern, while it increased in the western districts. In November the disease prevailed to any extent only in Rohilkund, and in December only in Basti.”

The special characteristic of the epidemic of 1875 was its universal diffusion over the provinces accompanied however by a tendency to concentrate its severity on particular rural circles, and chiefly in certain areas within these circles. A list of 24 severely affected areas is given by Mr. Planck, within which the deaths to population were between 5 and 16 per 1,000. The disease prevailed at the same time in districts separated from each other by 6 degrees of longitude and 5 of latitude.

9. The most important element for practical purposes is the distribution of cholera within the circles, but up to the present time little information has been recorded under this head. The following facts are, however, stated by Mr. Planck. In Amora circle of Basti 60 villages in its south-eastern quarter were attacked. In Pilkhuwa circle of Meerut the deaths occurred in 10 villages, and one-fourth in one village. In Banda district there are 1,231 centres of population (villages), of which cholera attacked 220; in only 26 villages were there more than 10 deaths recorded. The attacked villages were in three groups, and in many instances those on contiguous lands were attacked. Mr. Planck states that centres of population situated on or near lines of traffic were very often affected. This must be true wherever cholera is diffused over a country where there are lines of traffic, but a glance at the map shows that the most severely affected districts were very often removed from the main road and railway lines. They appear to have had more relation to river banks.

There are no new facts bearing on the vexed question of spread of cholera by personal communication. Many years ago this Commission prepared instructions for the Indian Cholera Inquiry, in which special attention was directed to this subject, but it is a noteworthy fact that, although cholera has prevailed more or less over India ever since, not a single occurrence has been brought to light of which it can be said that here we have been able to trace in one instance at least the importation of cholera from one part of a country into another. The evidence up to the present time is beyond a doubt that, if cholera is spread in this manner, the process has not been detected, although, if it were the means by which an epidemic is diffused, it should be above all facts the one most frequently observed about cholera. Mr. Planck has a suspicion that cholera may be spread by human intercourse, but this is scarcely justified by the alleged facts. He states that the first deaths in Banda district (there are 35 districts in all) took place on 10th April on the east of the district, on the 22nd April in the centre of the district, and on the 25th April in the west, and that the villages were attacked in the most irregular manner, not to be explained by atmospheric causes, but possibly by "chance movements of mankind" (the very point which it is so desirable to settle). On the other hand, the district statistical table of cholera deaths shows that cholera existed in January 1875 in 13 out of 35 districts at long distances from each other. The only way to lay the foundation for better knowledge of this disease is to follow some such course as Mr. Planck himself proposes, viz., to map correctly the course of the disease.

To show even in one district all the villages attacked, with the dates of attack, and all the villages exempted, would afford important information as to the laws of cholera.

10. *Small-pox*.—The following abstract gives the small-pox mortality for the North-West Provinces, arranged according to seasons, during the last five years, including those in the present Reports:—

Seasons.	Registered Deaths from Small-pox.					Total.
	1871.	1872.	1873.	1874.	1875.	
Cold - - -	3,521	4,050	11,995	13,867	4,580	38,013
Hot - - -	26,850	18,673	65,887	66,879	15,845	194,134
Rains - - -	8,078	7,350	19,211	12,501	5,394	52,534
Total - - -	38,449	30,073	97,093	93,247	25,819	284,681

This table shows that, like other epidemic diseases, small-pox has its own relation to season, a fact which is more clearly brought out by the following percentages of deaths in each season:—

		Percentage of Small-pox deaths.
Cold season	January -	13.35
	February -	
	November -	
	December -	
Rains	July -	18.45
	August -	
	September -	
	October -	
Hot season	March -	68.20
	April -	
	May -	
	June -	
		100.00

On comparing these percentages with those already given for fever and cholera, it appears that the rains and cold seasons are the fever seasons, that the hot and rainy seasons are the cholera seasons, and that the hot season is the special season of small-pox prevalence. As regards the epidemiology of the North-West Provinces, these facts are of great importance for practical purposes.

11. Small-pox mortality was very unequally distributed throughout the provinces. In 1875 the total small-pox mortality for the provinces was '83 per 1,000 of the population.

The lowest rate was '01 per 1,000 in Kumaon, and the highest 16'12 per 1,000 in Lalitpur district. In three districts, Kumaon, Gurhwal, and Dehra Doon, the absence of this disease is attributed to the "labours of the vaccination department, by which all the infant population of "that large tract of country is brought under the protecting influence of vaccination;" a fact which apparently shows that under improved vaccination arrangements similar results might be attained in other districts.

12. *Bowel Complaints*.—From diseases (chiefly diarrhœa and dysentery, Mr. Planck says) classed under this designation there were, in—

	Deaths.
1874 - - - - -	60,865
1875 - - - - -	80,337

It appears to be necessary to recall a comparison frequently made between the mortality from bowel complaints and the deaths from cholera.

As already stated, the cholera deaths for the same years stood as follow :—

	Cholera deaths.
1874 - - - - -	6,396
1875 - - - - -	41,106

Last year was one of a great cholera epidemic, and yet the bowel complaint deaths were nearly double the cholera deaths. Taking the two years together, the cholera deaths were to the bowel complaint deaths as 1 to 3, and it is worthy of remark that the largest mortality from "bowel complaints" took place in the cholera epidemic year.

13. For practical purposes it is very important to ascertain the relation of these "bowel complaints" to cholera. If there is no "choleraic" relation between them, then cholera must take a subordinate place among Indian death causes.

A remark made by Mr. Planck that he is "inclined to think that deaths from enteric fever are "sometimes entered under this head" is worthy of being followed up. We require to know much more of Indian "fevers" and "bowel complaints" than is the case at present, in order to be able to deal with them, and why it is that the mortality from bowel complaints "appears to fall principally upon the people of Bundelcund and the Himalayas, and upon the people of certain "districts of the Doab ad Rohilkund," while the eastern districts comparatively escape.

14. So far as can be estimated from two years' returns, there appears to be a distinct relation between bowel complaints and seasons. This is shown by the percentage of deaths during the same months as those adopted with the other death causes :—

Seasons.	Percentage of Bowel Complaint Deaths.
Hot - - - - -	19'0
Cold - - - - -	32'3
Rains - - - - -	48'7
	100'0

The seasonal relation of mortality from "bowel complaints" follows in the same order as that of "fevers," *i.e.* greatest in the rains and cold season, and lowest in the hot season. It differs in this respect from the mortality of cholera and small-pox, which is greatest in the hot season, less so in the rains, and least in the cold season. Rain and cold and their concomitants must, therefore, take their places in the bowel complaint etiology of the North-West Provinces, as in the Berars, where the climatic relations are so much the same that the Sanitary Commissioner considers that in searching for the cause of the one disease we may also find the cause of the other. If on further inquiry this remark is found applicable in other districts of India, we should have statistical proof of the causative relation of want of drainage, and its results on the present state of agriculture, inferior dwellings, and insufficient clothing and sustenance, to the prevalence of fever and bowel diseases which are the chief death causes in India.

15. *Sanitary Commissioner's Inspection Reports*.—These reports afford much information tersely given as to the sanitary state of a large number of towns and districts, showing the character of local disease causes, and the nature of the chief sanitary improvements which have been carried out in them. Among the localities inspected in 1874 were 21 municipal towns and 2 large villages, and 33 were inspected in 1875.

In most of these places sanitary improvement is making progress. In some of them considerable works have been carried out.

Cleansing and surface draining are more or less attended to, and increasing interest appears to be taken by the authorities in the subject. Paving is being introduced in some places with advantage. Town sewage is disposed of in various ways, more or less advantageously; but there is one practice followed at Bijnor, which is curiously in accordance with the Mosaic precept in this matter, and in conformity with sound sanitary principle. Six sarpat plantations have been provided for retirement, and as affording the necessary privacy, and a sweeper is attached to them, furnished with a hoe for covering all impurities at once with earth. A long time ago the Commission called attention to this subject, and as the practice has been successfully introduced at Bijnor, there is no reason why it should not be generally followed. It would put an end to air pollution by excretal dust, and with due care in changing ground after a sufficient quantity of manure had been deposited in it to admit of cultivation, it would prevent the fouling both of earth and water. It would be quite worth while to call the attention of other municipalities to this practice already followed in one of them.

16. The chief disease cause at all the places inspected by the Commissioner in both years is subsoil wetness, showing itself in expanses of stagnant water, wet and marshy ground, damp surface, damp rising in walls of houses, and in districts under irrigation,—all these evils aggravated by throwing additional water into the subsoil, and thus raising the subsoil water level, and endangering the purity of wells. In some instances the water level has been so much raised as to occasion flow of water in otherwise dry nullahs.

The Reports contain many important observations of this matter, and must be referred to for the details. The practical result of the whole is that those parts of the country which are suffering most should be drained without loss of time.

17. Some skilled assistance is evidently required for local sanitary works. Some time ago attention was called to the drainage of Cawnpore, and its want of adaptation to the requirements of the city. There is little said about it in the present Reports, but what there is mentioned is illustrative of the necessity referred to. Mr. Planck says:—"The new great drain of this city was seen to be embanked with earth near its termination, said to be done expressly to cause stagnation of the sewerage, and bring about deposit of earth and impurities it contains . . . when dug out it is bad smelling and makes good manure, but its collection in this way is not likely to improve the sanitary state of the city."

Mr. Planck's account of the conservancy arrangements is not favourable, and it shows that for all domestic purposes Cawnpore is still undrained, notwithstanding the great outlay which has been incurred. This matter will have to be taken in hand some time, because the present practices cannot be continued without future injury to health. The case is one which may very well serve as a warning to other municipalities.

18. *Sanitary Improvement.*—By far the most important part of these Reports is that which relates to sanitary improvements in progress, or which have been already completed, and first in order must stand land drainage, intended not only to remove the excess of water poured into certain districts of the North-West Provinces by excessive canal irrigation, but also to lower the natural water level of parts of the district. It is only justice to state that the Government of the provinces has acted in these measures with an enlightened regard to the interests of the district and the health of the people, and that they may expect to reap the advantages of their labours in diminished sickness as well as in increased productiveness of the soil.

After numerous inspections and conferences with irrigation officers, which revealed the fact that large tracts of land were in a marshy condition, that the soil was deteriorating and crops suffering, and that the labourers themselves were enduring all the miseries and losses incident to this state of the country, a large number of drainage works were sanctioned in the following districts—Saharanpur, Muzaffarnuggur, Meerut, Bulandshuhr, Aligurh.

One single work will drain 150 square miles of country.

Alluding to the extent of these works, the Sanitary Commissioner says:—"The summary shows how numerous these cuts are. They undoubtedly represent a great network of artificial drainage channels, which will direct the surplus moisture of many portions of the country to the natural drainage lines I believe this drainage work is of very great importance, and in its entirety constitutes a work of the first magnitude, in regard to the endeavour to improve the sanitary aspect of a wide surface of country densely peopled." It is the first attempt on a large scale to deal with causes of malaria, but it will at the same time improve the agricultural products of the district both in quality and amount.

19. Sufficient time has not elapsed to show results, nevertheless there is a table in Dr. Moir's report of the 25th March 1876 which may be put on record as exhibiting a singular coincidence with, if not an effect of, one of the most important of these drainage works, viz., at Meerut. These works were sanctioned on 4th February 1875, because, "seeing the extreme urgency of this case, His Honour the Lieutenant Governor has decided that the drainage of Meerut shall be proceeded with at once, and separate orders have been already issued on the subject" (those referred to above).

Bearing the date in mind, the following are the facts about the fever of 1875, as compared with those of 1874:—

Months.	Monthly Admissions from Malarial Fevers.					
	British Troops.		Native Troops.		Civil Hospital.	
	1874.	1875.	1874.	1875.	1874.	1875.
	Strength	Strength	Strength	Strength	Total Admissions.	Total Admissions.
	1,491.	1,398.	764.	887.	17,021.	14,048.
January	38	85	37	40	65	137
February	45	88	21	14	56	69
March	40	73	15	19	79	147
April	62	145	22	31	124	212
May	108	122	40	43	198	257
June	108	111	52	14	194	262
July	189	136	104	2	410	226
August	413	108	298	20	1,100	265
September	458	97	306	48	1,063	286
October	356	99	239	50	906	333
November	205	72	84	27	414	226
December	160	16	60	12	226	130
Admissions per 1,000	1,463·4	823·9	1,672·7	360·6	284	181·5

The reduction of fever shown by this abstract is great and incontestable. Mr. Planck, while declining to accept figures for so short a term, admits the evidence. And Dr. Moir appears to consider that the decline in admissions was due to the natural law of the disease. A similar reduction of fever took place in the prisons, as follows:—

Fever Admissions per 1,000 Strength.

	1874.	1875.
Central prison - - - - -	1,054·95	386·69
District jail - - - - -	1,336·7	633·78

If these figures represent a law of malarial fever in the North-West Provinces, it is well to know it; but if the drainage works executed after 4th February 1875 have had any influence on these striking results of the two years, they must be classed as among the most successful applications of sanitary principles on record. We simply abstract the facts, and leave the reasons to be assigned by future experience. If, as Mr. Planck remarks, Dr. Moir's view be the correct one, "our best safeguards against a return of the epidemic prevalence in future years are the completion of the drainage scheme now progressing;" of the truth of this view there can be no doubt.

20. The 1875 Report contains other instances of improved health following on the execution of drainage works. Referring to the Khurja Drainage Scheme, Dr. Wilcocks, the health officer of Bulandshuhr district, states "that this drainage scheme completely drained a country which formerly was remarkable for swamp and stagnant moisture in and after the rainy season;" and to this he attributes the improvement of the death-rate, which was no less than 107 per 1,000 in 1874, but fell to 29·6 per 1,000 in 1875, "due in greatest measure to the removal of excessive moisture from the town precincts, and from the country surrounding the town."

The city of Saharunpur and its precincts have been drained with the result stated "that Saharunpur, formerly noted for its high ratio of mortality, has during the past two years taken rank amongst the towns of lowest ratio of mortality in the Doab."

A great sanitary improvement in surface drainage has been effected at Meerut by simply filling up a series of noxious ponds, and converting another one into a useful water tank. The reclaimed land will more than pay all the outlay.

The site of Muzaffarnuggur has been drained, and its death-rate (27·6 per 1,000 for 1875) is the lowest of any town in the Upper Doab.

Extensive drainage works have been carried out in the Terai, reclamation has been thorough, the land drained and surfaces levelled. Besides other benefits, this will considerably improve the local climate.

These illustrations will show the kind of drainage works in progress, and their prospective results to health.

21. But, besides these drainage works, extensive improvements are being carried out by many municipalities. The Report for 1874 contains a very brief abstract of measures adopted in 55 municipal towns during the preceding five years, or since municipal management was established. The details are far too numerous to be given separately. All that can be done is to state the general character of the work.

Road making and surface drainage connected with it appear to have occupied much attention, and, as part of this improvement, levelling of surfaces, filling up holes, and other simple surface drainage improvements have been attended to. Public latrines have been erected in many towns, and the conservancy has been much improved. Tanks and wells have been constructed and repaired, new markets built, and slaughter-places provided and regulated.

Trees have also been planted in several towns. But, except the great land drainage works, no extensive works have been undertaken for the improvement of towns.

The general result, as stated by the Commissioner, is "that the municipal towns are, as a rule, admirably kept in regard to surface cleanliness, . . . which has brought about a marked improvement in the freshness and purity of the air which circulates in the towns." He admits exceptions to this in out-of-the-way localities, and also in the villages, in many of which and the smaller towns no material progress towards sanitary improvements has been effected. The absolute filthiness of village sites is not seen so frequently now as it was formerly, "but nothing of importance has been done to improve the sites by levelling broken surfaces, or by planting trees in and around the site." What is really wanted to meet these requirements is to enlist the people in the work, and to give them some general instructions showing what is required for the improvement of villages in surface draining and levelling, protecting wells and tanks, cleanliness, and removing cattle and all filth beyond the village precincts, and impressing on them the need of carrying them out for protecting the villages from the attacks of epidemic diseases.

22. Mr. Planck's Report for 1875 shows continued advances in public health improvements, especially in those connected with the drainage of the country.

A list of 36 separate drainage works in nine districts of the North-West Provinces is given, in which it is shown that during the year 30,890,433 cubic feet of excavations were completed for drainage works in connection with the Ganges Canal, and 8,243,869 cubic feet in connection with the Eastern Jumna Canal. In Meerut and Bulandshuhr districts upwards of 16 millions of cubic feet of excavation had been completed, and it seems not unlikely that drainage works of such magnitude may have contributed to the remarkable improvement in health in this district which has been already referred to.

In the course of his inspections of many towns and districts during 1875, Mr. Planck reports continued and, in some instances, striking proofs of interest taken in sanitary proceedings, while, at the same time, he points to numerous neglects of obvious precautions.

23. Part of his duty was to superintend the sanitary arrangements for the crowds of people who were present at Agra during the visit of His Royal Highness the Prince of Wales, so effectually carried out by the Magistrate of Agra, Mr. James Simpson. As every successful work of this kind is important for future example, it may here be stated that every arrangement was made long before a tent was pitched. Camps fell into their proper places in perfect order, and surplus animals were removed to the open country. There was no overcrowding anywhere, surface sweepings were at once buried in shallow pits, the trench system of latrines, with immediate burial of the sewage under a covering of dry earth, was resorted to, and officers were told off to see that no nuisance was anywhere permitted.

Wells for drinking water were marked by flags, and care was taken that no other water was drawn for this purpose. Two temporary hospitals were provided, and provision made for reporting all cases of sickness. The result was that not a single case of any epidemic disease occurred in any camp, that the daily sick lists contained reports of trivial sickness or accident only, and were blank for many days.

There were 3 deaths from fever with pneumonia among camp followers, from exposure and cold on the march, the day after their camp arrived, and one man was injured by an elephant. Mr. Planck says that, "when the camps were removed, the ground appeared, but for here and there a broken surface or a little stable litter, as clean and carefully kept as before the site was inhabited."

So continuous has been the success of similar measures since Mr. Ellis, of the Madras Sanitary Commission, first introduced them at the Conjeveram pilgrimage of 1864, that any outbreak of epidemic disease among large assemblages of people in India would appear to argue the existence of neglect somewhere. It is of more importance, however, to remark that measures of this class really embody nearly all the principles required for the improvement of country populations in India.

24. As regards town improvements during 1875, Mr. Planck says that "they consist almost invariably of the results of well-directed efforts to improve the local drainage, to raise and consolidate the public thoroughfares, and to fill up unwholesome excavations. In some towns a considerable amount of improvement has been effected, or is being effected, in the direction of better ventilation by means of straightening existing roadways, or opening out new ways in more crowded portions of the site." He states that, wherever the means of improvement are readily forthcoming from local resources, improvement has made and is making good way in the towns from one end of the country to the other; that both English and superior Native officials are far advanced in knowledge of sanitary matters, and convinced of the advantage of sanitary improvements; and in the present state of the larger towns he considers that it will be more advantageous to turn his attention to the smaller groups of population.

25. The mortality statistics show that great improvements are still required throughout the provinces, as well as further investigation into the nature of local diseases, their causes and remedies, but it is impossible to peruse these Reports without recognizing the earnest, active, and intelligent practical work done by the Government of these provinces and by their Sanitary Commissioner, and at the same time not to express a desire that similar work may ere long be reported from every district of India.

In conclusion, the Commission is desirous of directing special attention to the following practical results of these two interesting Reports as likely to be useful in other parts of India:—

1. Tracing the Doab fevers to want of drainage in connection with irrigation works; taking active steps for draining the worst districts; and the apparent prompt effect of local drainage in reducing the amount of fever.
2. The efficiency of vaccination as a protection against epidemic small-pox when thoroughly carried out.
3. The practicability of introducing perfectly safe arrangements for disposing of sewage when deposited on the ground by covering it at once, as illustrated in the experience at Bijnor, which would apparently be applicable in most parts of India, if not everywhere.
4. The admirable temporary sanitary system, at once simple and efficacious, introduced by Messrs. Simpson and Planck for the protection of the camps assembled at Agra during the visit of His Royal Highness the Prince of Wales, as affording another illustration of the success of a class of measures applicable to all similar public assemblages in India.
5. The practicability generally, under careful supervision of the Sanitary Commissioner, of ensuring the progress of sanitary improvement.
6. The great importance of enlisting the village authorities and people in improving the sanitary state of villages.
7. Continuing the same course of local investigations already followed in past years by Mr. Planck into the history of epidemic diseases in selected localities, with the view to ascertaining their removable local causes.
8. Recognition of the principle that questions of drainage and of irrigation ought to be considered together as forming parts of the same work.

21st May 1877.

No. 7.

MEMORANDUM of the ARMY SANITARY COMMISSION on the REPORT of the
SANITARY COMMISSIONER for OUDE for 1875.

This Report, prepared by the Officiating Sanitary Commissioner, contains less information than usual of a sanitary kind. It is mainly devoted to statistics of more than doubtful reliability, and to a general account of the cholera epidemic of 1875. The Officiating Sanitary Commissioner states that "the reports of Health Officers of districts with the remarks of local authorities are "attached in original," and as these reports are not printed either entire or in abstract, and as there are no accounts of sanitary inspections by the Commissioner himself, there is very little calling for remarks by the Army Sanitary Commission, except to point out these deficiencies, and to repeat what has been frequently said before, that whoever is appointed to do sanitary work should as far as possible confine himself to it, and leave statistical work to others, except in so far as statistics may help him to do his special duties.

The chief interest in the present Report lies in the account given of the cholera of 1875, of which a brief abstract may be useful, in order to show the relation of the Oude cholera to the epidemic which prevailed in all the adjacent districts during the year, premising a few remarks on the general mortality of the province.

1. The mortality of Oude is taken on the census population of 1869, which consisted of—

Males	5,796,697
Females	5,376,841
Total	11,173,538

The registered deaths in 1875 amounted to 181,599, or at the rate of 16·25 per mille.

This apparently favourable result is arrived at as follows: "It has been found on actual inquiry that young children, girls especially, count for nothing, so too aged women; what they consider it necessary to report is the deaths of able-bodied men and males in general, and next adult women with a limit of discretion." The actual numbers of each sex registered in 1875 show that a considerable latitude is taken in this matter of "discretion." The registered deaths were of—

Males	100,957
Females	80,642
Total	181,599

This cause of fallacy being known, there ought to be little difficulty in arriving at a remedy.

Something nearer the actual mortality among the country population was arrived at by the Civil Surgeon of Sultanpore, who by the aid of his assistant managed to obtain the actual number of deaths in 21 villages between the 30th January 1875 and the 31st January 1876, as follows:—

Population	7,561
Deaths	192
Deaths per 1,000, including 4 per 1,000 from cholera	25·4

The district death-rates have not yet been determined, and the returns show the usual discrepancies. The rates lowest and highest were:—

Fyzabad	10·07 per 1,000
Baraich	22·94 „

Among town death-rates, Pertabgurh showed 38 and Sitapur 47 per 1,000 in 1875.

These recorded data show that registration in Oude is still in its infancy.

2. *Causes of Death.*—The following death-rates, giving the chief mortality causes, are of little use, except perhaps to show in some degree the relative mortality from each class:—

Cause of Death.	Ratio per 1,000 of Population.	Ratio per Cent. of Total Deaths.
Fever	11·69	71·9
Cholera	2·09	12·8
Bowel complaints	0·58	3·6
Small-pox	0·50	3·1
Injuries	0·50	3·0
All other causes	0·89	5·4

This abstract shows the excessive prevalence of fever in Oude.

Deaths from snake-bite are not separately given, but they must be very numerous, as the deaths from animals amounted to 1,588.

3. *Cholera.*—The following are the chief points in the history of cholera:

There were 68 recorded deaths from cholera in 1874, and 23,321 in 1875. The next table shows the monthly prevalence of cholera in Oude from 1869 to 1875:—

Year.	Jan.	Feb.	March.	April.	May.	June.	July.	August.	Sept.	Oct.	Nov.	Dec.
1869 - -	327	177	689	2,614	3,394	4,149	3,548	4,239	1,725	1,521	491	260
1870 - -	113	184	540	2,360	3,610	1,203	607	1,158	1,276	1,722	1,826	719
1871 - -	216	95	101	128	102	99	239	845	760	3,610	6,476	3,861
1872 - -	251	51	1,661	6,052	6,717	4,320	1,981	1,997	1,413	1,524	482	117
1873 - -	127	2	40	303	97	603	726	945	433	227	316	142
1874 - -	1	9	6	4	7	1	11	10	—	1	7	11
1875 - -	—	56	824	8,726	4,206	2,137	1,050	979	1,636	1,856	862	989
Total	1,035	574	3,861	20,196	18,133	12,512	8,162	9,673	7,243	10,461	10,460	6,090

Cholera mortality in Oude has afforded the following annual variations during the last 7 years:—

	Deaths.
1869	23,134
1870	15,318
1871	16,032
1872	26,566
1873	3,961
1874	68
1875	23,321

The deaths registered in 1874 are apparently below the truth.

4. The time relation of the Oude epidemic of 1875 to cholera in the North-West Provinces was as follows.

The district of Basti, in the North-West Provinces, which adjoins the district of Fyzabad, in Oude, registered 274 deaths from cholera in March. The first registered cholera death in Fyzabad was on the 16th February. Azimgurh, in the North-West Provinces, adjoins Fyzabad district at its south-eastern end. There were 11 deaths from cholera in Azimgurh in February, the same month in which Fyzabad was attacked.

The next frontier district of the North-West Provinces, viz., Jounpur, had 40 cholera deaths in February; the adjacent district in Oude, Pertabgurh, was attacked on the 19th February. Crossing the Ganges, Allahabad had two deaths.

The adjoining North-West district of Futtehpur had one death in February. The adjacent Oude district, Roy Bareilly, was attacked on the 17th February.

Cawnpore, in the North-West Provinces, had five deaths in January; Unao, in Oude, about 12 miles distant, was attacked on 13th March.

There was thus no apparent relation between the epidemic in the North-West Provinces and the disease in Oude, except that they were both parts of the same outbreak. Within the province of Oude itself cholera was distributed according to the same law. The Acting Sanitary Commissioner states that "throughout the epidemic there was no regular progress in any definite direction, either from east to west, or otherwise, along main lines of communication. There was a series of isolated outbreaks, commencing in given spots, and spreading thence in every or in any direction On examining the several districts, the same irregularity of incidence and course is met with, the disease appearing and spreading from several centres apparently at or about the same time." The prevailing local tendency was to look on the Oude epidemic as having been imported by pilgrims, but the Acting Sanitary Commissioner says that he has no evidence that such was the case, or "why it should have been necessarily imported, as the experience of previous years seems to point to the fact that cholera has taken up its permanent residence in Oude."

5. Some investigation appears to have been carried out regarding the importation of cholera and its communicability, which the Acting Sanitary Commissioner appears to have thought unnecessary, as there is already sufficient evidence in the affirmative.

This is a very important statement, but it may be suggested whether it ought not to be supplemented by a distinct reference to unimpeachable evidence.

This Commission called for such evidence a number of years ago, with the view of ascertaining the real facts, and turning them to practical account, but hitherto without success.

The present Report contains a number of cases of presumed communication, but the following judgment passed on them by the Acting Sanitary Commissioner can scarcely be considered as showing that the inquiries have been of a satisfactory nature. He says: "The upshot was that, whilst in certain instances the reporters were satisfied that the disease was imported and propagated by human means, in others no such history could be obtained."

The cases themselves cannot be said to show that amount of skill and care in their investigation which is necessary to settle the questions at issue. Many important details in them are not given, and the result is that they can be considered only in the light of individual opinions on such evidence as came directly or indirectly to the knowledge of the reporters.

All that can be done is to refer back to our instructions prepared for the Indian Cholera Inquiry (1869), in which the following principle was laid down: "The inquiry is not to be undertaken with the view of establishing any particular doctrine or hypothesis in regard to cholera, nor is it to be carried out from any central doctrine or hypothesis round which the facts are expected to range themselves. If any beneficial result is to follow from it, the inquiry must be pursued without prepossession, and with the single object of ascertaining what is true."

The points to be inquired into in this spirit are fully detailed in the instructions.

6. The Acting Sanitary Commissioner states that the natives themselves had applied active quarantine restrictions. A comparison of the death-rates of the last two years will show with what results.

From the same principle the natives adopted another proceeding, which the Commissioner very properly says "cannot be upheld as a sanitary measure." They have adopted hasty burial of persons dying of cholera "in shallow graves, close at hand, to disinter them for either incineration or disposal in the sacred rivers when the epidemic has ceased."

This insanitary proceeding is both mischievous and dangerous to the public health.

The Commissioner's own opinion includes the really practical result, hitherto attained, of all these disputed contagion questions. He says, in regard to quarantine, "that it is useless to attempt carrying it out, as it is simply impossible to do it so thoroughly and effectively as to be of any use." The only other course is to follow the example of the Government of the North-West Provinces, and to take the sanitary condition of Oude in hand vigorously.

7. In the present Report important and useful facts bearing on the law of cholera distribution are given, from which the proportion of attacked villages in each district can be arrived at for the first time in Oude. The following table contains the results :—

Districts.	Total Deaths.	Total Villages.	Villages attacked.	Per Cent. of Villages.	
				Attacked.	Escaped.
Fyzabad - - -	2,034	2,119	448	21·	79·
Sultanpur - - -	2,807	2,526	467	18·4	81·6
Pertabgurh - - -	829	2,244	239	10·6	89·4
Roy Bareilly - - -	1,573	1,773	255	14·4	85·6
Gonda - - -	3,804	2,834	664	23·4	76·6
Baraich - - -	3,376	1,943	581	30·	70·
Bari Banki - - -	1,147	2,094	262	12·5	87·5
Lucknow - - -	808	960	166	17·3	82·7
Unao - - -	1,605	1,739	460	26·4	73·6
Kheri - - -	458	1,777	69	3·3	96·7
Sitapur - - -	1,464	2,389	232	1·	99·
Hardoi - - -	2,937	1,976	365	18·5	81·5
Total - - -	22,842	24,374	4,208	17·2	82·8

The facts are remarkable. There are 24,374 groups of population accounted for, and the total cholera deaths during a severe epidemic were less than one to each group. Of these 24,374 village groups, 4,208, or 17·2 per cent., furnished deaths, and 20,166, or 82·8 per cent., escaped. The deaths, if divided equally among the attacked villages, would average under 6 each.

The facts show how important it would have been to have had more information on the causes of this singular distribution of the disease, and also as to any special sanitary defects in the most severely attacked groups. All that we have on this latter point is the general statement of the Acting Sanitary Commissioner that "as regards the sanitary condition of the villages the reports are always the same, that they are filthy in the extreme, and with all sanitary rules set at defiance." The water is said to be "fair in quality," which the Commissioner very properly doubts, for the two statements are practically in contradiction.

The facts regarding villages are given for each parganah, of which there are 169, and they are a very important instalment of the topographical history of Indian cholera.

They give the dates of first and last deaths, and also the periods of maxima for each parganah, and suggest that a great step in advance would be to map carefully the attacked and escaped villages. Even a few districts so dealt with would afford some really important information, not otherwise obtainable, regarding the local movements of cholera.

8. *Fevers*.—The deaths attributed to fevers were 130,609 = a death-rate of 11·69 per 1,000 of the population. The Government has instituted local inquiries into the history and concomitants of these fevers, which are still in progress.

The present Report contains little information on the subject that has not been already discussed by the Commission. But two facts in regard to one district are stated which confirm the conclusions previously arrived at as to the nature and local causes of these fevers. In the fever tract along the Katwa river the inquiry in 20 villages resulted as follows,—that the greatest prevalence and mortality of the fever took place in August, September, and October; that in villages situated on low-lying lands the prevalence and virulence of the disease was comparatively greater. The cultivation of particular crops did not appear to exert any influence.

The reports are not given in detail, but, on reviewing their contents, the Sanitary Commissioner says: "The only conclusion to be drawn at present is that fatal malarious fever is not so universally prevalent all over the province of Oude as chaukidars would have us believe, and that it is most so in sub-Himalayan tracts of country, and in low-lying khadir lands, and where jhils abound and the land is water-logged. But there is nothing new in this." And then follows the account of villages already quoted.

There is enough information in the present and preceding Reports to show the need of an exhaustive inquiry into these Oude fevers, especially with regard to their comparative prevalence in specific localities, their local characteristics, and the conditions under which they are the most fatal.

9. *Small-pox*.—Little has yet been done in Oude to cope with this pestilence. The Acting Sanitary Commissioner informs us that in six years ending 1874 there were 100,242 small-pox

deaths, which he contrasts with 85,079 cholera deaths during the same period. There were 5,612 small-pox deaths in 1875.

The total vaccinations amounted to 27,656, of which 22,450, or 85 per cent. (excluding those the results of which were not known), were reported as successful.

The population of Oude in the districts of the vaccination return is 11,173,538. A comparison of the two totals will show how small is the progress yet made in this department.

10. *Bowel complaints* caused 6,515 deaths, registered as such, a number probably under the truth, seeing that 1875 was a cholera epidemic year.

11. *Sanitary progress*.—The only reference to this most important detail in all sanitary reports is the amount for so-called sanitary works and services spent by the 17 municipalities in the list. No account is given of the items included under these heads, except in the case of Lucknow, where 2,555*l.* were spent “on new drains.” The total expenditure of the 17 municipalities was 9,028*l.*, of which 315*l.* was recovered by the sale of refuse.

12. Although the present Report contains some useful contributions to the history of cholera distribution in Oude, it cannot be said to show any advance throughout the province in real sanitary improvement.

So far as can be learned from the reports, there has been less done in this direction in Oude than in any other district in India. The Army Sanitary Commission would beg to suggest whether some systematic method of dealing with the more obvious sanitary defects might not be adopted.

Take for example the facts about fever already ascertained, which show that its prevalence is due to undrained, and in some cases to inundated, land. The North-West Provinces are now affording practical examples of the manner of dealing with disease causes of this class. Sufficient is known of the sanitary state of the villages to justify a recommendation that means might be adopted to enlist the village officers and the people themselves in protecting their own health. The publication of a few simple rules and a little advice on the subject of cleanliness, improved surface drainage, filling up holes and levelling, removing filth beyond the precincts of villages, keeping cattle away from dwellings, and protecting the water-supply, would, at all events, be a beginning, and would enable many potent disease causes to be removed forthwith.

There is nothing new in this recommendation. We have often made it, and it is being acted on in many districts of India.

Statistics are not to be undervalued in their proper place, but it must be repeated that sanitary work is not statistical work. It is a practical hand to hand fight with disease and its local and personal causes, and, so far as can be learned from these reports, little has been as yet done for Oude in this contest.

18th May 1877.

No. 8.

MEMORANDUM of the ARMY SANITARY COMMISSION on the REPORT of the SANITARY COMMISSIONER for the CENTRAL PROVINCES for 1875.

Out of upwards of 100 pages of which this Report consists, very few are devoted to sanitary work properly so called. The Report is chiefly made up of statistical details, not without a certain relation to the health of the provinces, but which could mostly have been supplied by another agency, so that the Sanitary Commissioner might have been enabled to devote his whole time to his proper work. It is evident that the relation of the Sanitary Commissioner to the progress of public health improvements requires to be considered in the Central Provinces as in other Governments in India. There are, nevertheless, a few matters of practical importance contained in the Report to which attention may be directed.

1. According to the census of 1872, the population of the Central Provinces was constituted as follows:—

Males	-	-	-	-	3,769,821
Females	-	-	-	-	3,638,253
Total	-	-	-	-	<u>7,408,074</u>

The births were of—

Males	-	-	-	-	139,412
Females	-	-	-	-	122,494
Total	-	-	-	-	<u>261,906</u>

The deaths registered were of—

Males	-	-	-	-	105,446
Females	-	-	-	-	89,577
Total	-	-	-	-	<u>195,023</u>

Hence the registered births exceeded the registered deaths by 66,883.

The ratios per 1,000 of the population were—

Births	-	-	-	-	35.35
Deaths	-	-	-	-	26.32

Increase of the year - 9.03

The Commissioner says that the registration has on the whole improved, but there is still room for improvement in many districts. This view is borne out by the facts.

2. The registered deaths of 1875 exceeded those of the preceding year by 20,577, showing the influence of epidemics in 1875, fully confirmed by the following details of the chief death causes in that year :—

	Number of Deaths.
Cholera - - - - -	14,643
Small-pox - - - - -	20,226
Fever - - - - -	120,480
Bowel complaints - - - - -	15,562
Other causes, including 951 deaths from wild beasts and snake-bites -	24,112
Total deaths - - - - -	195,023

The first four endemic and epidemic death causes gave rise to nearly 88 per cent. of the total mortality. These, in fact, constitute the sanitary problem in the Central Provinces, and it is towards their mitigation that the sanitary work of the Commissioner and local authorities has to be mainly directed.

The Report contains very little information regarding removable local conditions attending on these diseases. But a special report on the cholera epidemic is promised. All that can be done at present is to deal with such facts as are before us.

3. *Cholera*.—The first cases of cholera in the Central Provinces took place in some rural circles of Bilaspur district, at a long distance from any other affected districts. There were 7 deaths in February. It already existed as a severe epidemic in Bengal proper. It was beginning to take on epidemic intensity in other parts of Bengal, in Oude, and the North-West Provinces. Only a few cases had appeared in the Punjab. There had been only 2 deaths in Bombay Presidency (in the city). There had been 24 fatal cases in Madras Presidency, and none as yet in the Berars, or in Rajpootana, Hyderabad, or Central India. The disease was epidemic in Ceylon, and there had been one death in Burma. Having attacked Bilaspur, the disease had a distinct period of rise and decline, ending in October, having occasioned 2,525 deaths in this district. The next district attacked was Raipur, in the rural circles of which there were 16 deaths in March, but none in April. The disease, however, existed till the end of the year, and occasioned a mortality of 4,449. The two district towns are about 80 miles apart, the districts adjoining each other, and the cholera in both was apparently a distinct epidemic outbreak. A similar outbreak took place in Hoshungabad and Nimar Districts, 150 to 200 miles away. It began in April and lasted to the end of the year. In other parts of the province there were severe outbreaks lasting a shorter time, and some parts of the province escaped comparatively, including Sambalpur and the country nearest to Balasore, Cuttack, and Pooree (within the endemic area), where cholera existed during the entire year, and gave rise to nearly 8,000 deaths. Sambalpur district was not attacked until July, and had altogether 254 deaths.

This experience is important on account of an opinion which has prevailed that cholera invades the Central Provinces from the endemic area, and is carried into these provinces by pilgrims. So far as can be gathered from the statistics, the late epidemic appears to have been made up of sudden and severe local outbreaks in special districts of these provinces.

4. The conditions which determined the greater prevalence of cholera in some districts than in others will be included in the Sanitary Commissioner's promised report, but in the meantime some useful points of experience in this matter may be gathered from the 4th section of the present Report, on "*Sanitary Progress*." The following abstract contains the results for the year.

No works of any magnitude have been carried out, but improvements generally in cleanliness, conservancy, and drainage in the towns have been progressing. Water-supply has been attended to so far as means have been available. Wells have been cleaned out, deepened, and kept in repair, and precautions generally taken to prevent pollution. But in many large towns much more than this is required.

Improvements in drainage and water-supply have been carried out at Saugor, Deori, Garha Khota, and Damoli. These towns appear to have escaped cholera.

Narsingpur had no conservancy arrangements. It had 2 deaths from cholera.

Hoshungabad is undergoing improvement. It had 14 deaths from cholera out of a population of 11,613. Other towns in the district, Sohagpur, Seoni, and Harda have also been improved. They had altogether 39 deaths from cholera out of an aggregate population of 24,701.

Khandwa, with 14,199 inhabitants, had 5 cholera deaths among them. The town was cleansed, and the water-supply protected as far as practicable.

Burhanpur is drained into cesspits, and the people do not desire to change the system. Fortunately the water-supply is from a distance. There were in this town 75 deaths from cholera from among 29,303 inhabitants.

Betul.—A dirty town, with 4,600 inhabitants, had 34 cholera deaths.

Chindwara.—An unimproved town, of 8,626 inhabitants, had 14 cholera deaths.

Lodikhhera.—Town in the same district, in which "measures of conservancy are urgently called for," had 114 deaths from cholera among 5,219 people. The conservancy and water-supply are both equally bad.

Seoni, with a population of 9,557, was being supplied with good water, and was fairly clean. It had no cholera.

Bhandara.—Conservancy has been greatly improved, and suspicious wells were closed. There were 2 deaths from cholera in the town during the rains, and 12 afterwards among low caste

people in the outskirts using tank water. In 1866 there were 150 cholera deaths, and in 1869 there were 185 cholera deaths. The epidemic on each occasion appeared in the same months. The population is 11,433.

Nagpur.—The experience of this city of 84,441 inhabitants is sufficiently striking to be given entire.

"The conservancy system, which was introduced in 1873, has continued to work well. Considerable improvements have been effected in the drainage of certain parts of the town, and in the Seetabuldee bazaar, but a comprehensive scheme of drainage for the town, which is much required, cannot yet be undertaken for want of funds, the cost of the new waterworks being still a heavy burden on the finances of the municipality. The people fully appreciate the boon that has been conferred on them in an abundant supply of good water, and there is every reason to believe that the health of the population has been greatly improved thereby.

"In 1866 cholera visited the town in the rainy season, and in the months July to September 635 cases were reported, of which 383 were fatal.

"In 1869 it came again at the same season of the year, and 640 cases were reported, of which 343 were fatal. In that year there were 1,292 deaths from cholera in the district.

"The water from the Ambajhari reservoir was let into the town on the 23rd July 1872. A few cases of cholera had occurred in the town in June, and it was commencing to spread in July before the water was let into the mains. The epidemic did not cease till the end of August, but it was remarkable for the small fatality of the cases.

"Between the 16th and 23rd July inclusive 27 cases occurred, of which 9 proved fatal. Between the 24th July and the 31st August 115 cases were reported, of which only 11 proved fatal. Epidemic cholera did not prevail in the district in 1872.

"In 1875 cholera broke out in the district in the latter end of July; it spread very rapidly, and in the course of the next two months was the cause of 2,111 deaths."

Now let us see what occurred in Nagpore itself.

"One or two cases occurred in the town in the last week of July and first week of August in persons belonging to the villages in the neighbourhood where cholera was prevalent, but no resident in the town or station was attacked till the 14th August. Between this date and the middle of September 59 cases were reported, of which 30 proved fatal, but the majority of these occurred in parts of the town not supplied by the Ambajhari water. Many too occurred among a community of Dhers living on the outskirts of Seetabuldee bazaar, on the banks of the Nag stream, who, it was found on inquiry, were not allowed by the other castes to draw water from the hydrants.

"The water service is now being extended to parts of the town which were not at first supplied with it."

One escape from a cholera epidemic is not sufficient to prove immunity, but there is certainly sufficient in this remarkable experience to justify the municipality in pressing forward with the improvement of their city, and at the same time to encourage other municipalities throughout India to undertake similar sanitary work.

Chanda.—The experience of cholera in this district is worthy of notice. The town contains 16,233 inhabitants, and had only one death from cholera. The municipality had carried out improvements in conservancy, drainage and water-supply. In the district, however, there were 551 cholera deaths. In one town in the district the people who suffered from cholera were found to be using polluted water. This was prevented, "and cholera ceased at once."

Raipur.—This district suffered severely from cholera, and showed a death-rate of 5·2 per 1,000 for the country circles. The town of Raipur, with a population of 19,116, had 30 cholera deaths = 1·5 per 1,000. The town conservancy had been well attended to, surface drainage had been considerably extended, the water-sources were well protected, and, what was of great importance, both quality and amount had been improved by abundant rainfall. Before the previous epidemic in 1869 the rainfall was very deficient, and when cholera appeared "every well in the town was dry, and the little water remaining in the tanks was putrid." Under this condition of the water-supply there were 1,200 cases of cholera, and 601 deaths, = a death-rate of 30 per 1,000. The contrast is very striking, and affords proof of the close relation between impure water and cholera during epidemic seasons. It ought to confirm the municipal authorities in their work of improvement, and especially in that of extended water-supply.

Bilaspur and *Sambalpur* are deficient in conservancy arrangements, and their water-supply is of suspicious quality. Nothing in the way of preparation for the epidemic had been done in either of them. At Bilaspur the cholera death-rate was 23 per 1,000, and at Sambalpur 9·8 per 1,000.

5. From the preceding abstract it will be seen that the weight of cholera mortality fell on the country districts and unimproved towns; that the most obvious localizing cause was impure water, and that from which this defect proceeds, namely, foul subsoil and deficient rainfall.

6. The municipal towns appear to be poor, if we judge of this by the amount spent per head on local work. The highest expenditure per head was 6a. 4p. at Nagpur, the lowest 8p. at Sambalpur. The aggregate appears to have been for the whole 20 municipalities about 4½d. per head of the population. Labour is so cheap that the Commissioner says good conservancy can be attained at a cost of 3 to 4 annas a head of the population (probably 4½d. to 6d. a head); with such rates as these there ought to be no difficulty in keeping every town and village throughout these provinces in an efficient sanitary state, exclusive, of course, of improved wells and other improved water sources. But even in the case of Nagpur, which has water laid on to it, the rate per head was about 9½d.

The result of these facts appears to be that, after making every allowance for the poverty of the people, the Sanitary Commissioner may, without fear of excessive cost, press the question of improvement steadily on the local authorities, for, to use his own words, the outlay "does not

“ seem a high rate of insurance against the grievous loss of life which sooner or later will certainly ensue on neglect of conservancy.” It has been well said that to economize in this important matter is to economize the means of economy.

7. *Small-pox*.—As already stated, there were 20,266 deaths from small-pox in 1875, or nearly a third more than from cholera. The present small-pox epidemic began in the extreme west of the Central Provinces in 1871, and has been making progress ever since. The Report under review gives full details of the vaccination department of the public service, and it will only be necessary to state the results very generally.

The whole vaccination establishment is now under the general control and superintendence of the Sanitary Commissioner, and was made up as follows in 1875 :—

1 Deputy Superintendent.
16 Native Superintendents.
130 Vaccinators.

The hospital assistants have also aided in the work.

The total number of persons vaccinated in 1875 amounted to 222,633, or 23 per cent. above the number vaccinated in 1874.

The total successful vaccinations during five years, 1871—1875, have been 574,045.

The results on the death-rates may be represented as follows :—

		Successful Vaccinations per 1,000 of Population.	Deaths from Small-pox per 1,000 of Population.
Total five years, 1871—1875	-	75·53	7·03
Annual average	- - -	15·10	1·40
1875-76	- - - -	26·91	2·73

In the earlier years of the series small-pox was not very prevalent, and the vaccination service was probably not so efficient.

In a number of districts the small-pox mortality has been notably reduced under vaccination, but “ the death-rates from small-pox do not fall in a very constant proportion to the vaccination “ rates.” It is satisfactory to know that this service is increasing in efficiency.

8. *Fevers*.—These are by far the most important death causes in the Central Provinces, as is shown by the fact that, out of 195,023 deaths, “ fevers ” are credited with 120,480 deaths, or 61·9 per cent. of the total mortality. Every district suffers from them, but the death-rates are not equally distributed. This fact is shown in the tables, from which a few of the highest and lowest death-rates may be here abstracted :—

District.	Mortality per 1,000 of the Population from “ Fevers.”		
	Average of Five Years 1870-1874.	1874.	1875.
Nimar - - - -	22·29	21·90	27·22
Burhanpur - - -	22·03	19·63	18·55
Jubbulpore - - -	16·18	18·79	16·96
Upper Godavery -	7·39	9·86	10·52
Sambalpur - - -	8·36	8·47	9·22

In many districts the fever death-rates appear to be increasing, and there is a general uniformity in different years, as is shown in the above abstract, which gives the key to the remedy. Within the districts themselves these fever death-rates vary greatly, as will be seen from the following instances, showing the fever deaths per 1,000 of the population:

Towns.	Fever Deaths per 1,000 in 1875.
Ratanpur - - - -	32·08
Bilaspur - - - -	25·72
Hoshungabad - - -	27·81
Betul - - - -	23·29
Nagpur - - - -	14·25
Chindwara - - - -	10·20
Khurai - - - -	9·26
Jubbulpore, cantonment	7·85
Damoh - - - -	3·90
Lodikhara - - - -	1·91

These data, if representing the current relative proportion of fever deaths in different districts and towns, show clearly where inquiry should be made for the discovery of sources of malaria. There is no information in the present Report on this very important subject, and it may be suggested whether it is not one to which special attention should be given. If the worst localities

in the tables were taken in hand at once there would be little difficulty in dealing with the causes. By pursuing this course Mr. Planck has been able to do good service in the fever localities of the North-West Provinces.

9. This is the chief point of practical importance in the fever statistics, and the relation of fever mortality to the amount of rainfall apparently suggests that inquiry might be made into the condition of the drainage by which the rainfall has to escape.

Take, for example, the following striking points in the relation of rainfall to fever deaths in two or three of the districts during the second half of the years 1872 to 1875 :—

		Saugor.	Betul.	Bilaspur.	Sambalpur.
1872	Monsoon rainfall - -	45·80 in.	35·86 in.	43·92 in.	65·51 in.
	Fever deaths per 1,000 per annum - - -	17·26	22·74	20·67	7·74
1873	Monsoon rainfall - -	40·17 in.	25·78 in.	30·41 in.	48·91 in.
	Fever deaths per 1,000 per annum - - -	14·67	11·19	17·14	7·29
1874	Monsoon rainfall - -	66·56 in.	30·44 in.	48·27 in.	61·87 in.
	Fever deaths per 1,000 per annum - - -	17·64	21·98	23·22	9·39
1875	Monsoon rainfall - -	59·76 in.	52·23 in.	36·95 in.	60·88 in.
	Fever deaths per 1,000 per annum - - -	16·38	16·26	25·06	9·90

From these examples it is evident that there must be some reason (probably connected with local elevation and drainage capabilities) why rainfall should give rise to such very different results in different localities.

It is possible that by following up this inquiry a clue might be found to the death-rates and their causes.

10. There is one other point in the Report, which has an important bearing on the recommendation of the Army Sanitary Commission to make use of the vaccination service for general sanitary purposes, the first result of which received from India is stated as follows :—

“The employment of the vaccination establishment in general sanitary work, as suggested in the orders of Government on the Vaccination Report of these provinces for 1873, and again referred to in the orders on the Report of 1874, has been kept in view. Cholera has been prevalent in nearly all the districts of the provinces during the last two years, and the district vaccination establishments have been found most useful in distributing medicines in the villages suffering from the epidemic, and in urging on the malguzars and the people generally attention to the precautions prescribed with a view to mitigating the ravages of the epidemic, and I believe that, as the men become more trained to the work, and gain the confidence of the people, the district vaccination establishment will every year be found more useful in sanitary work.”

There is thus a fair prospect that, before long, the vaccination establishment will become one of the most efficient agencies for improving public health in India.

11. In conclusion, the experience of the great cholera epidemic of 1875 shows that increasing care should be bestowed on cleansing, draining, and water-supply of the towns in these provinces; but the statistical facts show how large a share of the mortality fell to the village populations, and the great prospective advantages which may be derived from the vaccination establishments in forwarding sanitary improvements among them.

And, as regards the fever mortality, there is quite sufficient in the statistics appended to this Report to show where the chief death-rates take place, and where inquiries into local causes of malaria with a view to their mitigation may be most usefully carried out.

Lastly, it may be suggested that in any future cholera reports the number of villages attacked, and the number which escaped the pestilence, would be a useful addition to the epidemic history of these provinces.

21st May 1877.

No. 9.

MEMORANDUM of the ARMY SANITARY COMMISSION on the REPORT of the SANITARY COMMISSIONER FOR BERAR for 1875.

The last census of the Assigned Districts was taken in 1867, and as the laws of population and its movements are not yet ascertained in India, the death-rates of districts in this Government are only approximations.

1. In 1875 the registered births were 36·8 per 1,000 of the population. The death-rate including cholera, was above 4 per cent. (40·2 per 1,000), and it would appear to follow that the population has increased since 1867, while the death-rates are taken on the old numbers. When compared with one another, the registration circles present some unexpected results. The lowest registered death-rate in any circle is 16·9 per 1,000; another circle returns a rate of 18·2. In 16 circles the death-rates lie between 2 and 3 per cent. In 12 circles the rate is between 3 and 4 per cent. In 16 circles it lies between 4 and 5 per cent. In 15 circles the death-rate is between

5 and 6 per cent. In 3 circles it is between 6 and 7 per cent. ; and one circle, with the maximum mortality, gives 7·7 per cent.

The facts speak for themselves, and, if correct, would imply that the Berars were undergoing a rapid process of depopulation.

The following abstract from the Report gives the comparative death-rates of the Berars :—

Countries.	Years.	Deaths per 1,000.
Ireland	1872	27·6
England and Wales	1873	21·1
Scotland	1874	23·3
Indian jails	1874	39·9
Oomraotee district	1875	33·8
Ellichpur ditto	1875	39·4
Akola ditto	1875	52·1
Basim ditto	1875	34·1
Woon ditto	1875	29·6
Buldana ditto	1875	48·4
Province of Berar	1875	40·2

The data show clearly that, although it may be possible to obtain the total numbers of deaths in a district, it will not answer any good purpose to calculate percentages, unless the other factor, namely, the population, is known. Dr. Abbott is well aware of this defect, which is a fatal one when the percentages have to be used for sanitary purposes. A census of districts at short intervals is the only remedy.

2. The total number of deaths registered in 1875 was 88,068, against 60,795 in the previous year. Such as it is, the death-rate in 1875 was 37·9 per 1,000 for towns, and 40·7 for villages.

It seems probable that the town population furnishing the deaths has increased since the census of 1867.

There is little doubt that the registration both of births and of deaths has been progressively improving, but the diagnosis of death causes also requires improvement.

Of 88,068 deaths registered in 1875, the following were the principal registered death causes :—

	Deaths.
Fevers	26,076
Cholera	22,465
Bowel Complaints	9,452
Small-pox	927

These numbers, however, cannot be relied on, for Dr. Abbott shows that the heading “all other causes” may include the bulk of the mortality, or that fevers may be credited with a similar fatality. All this is no more than might have been expected. Registration at all to be depended upon for accuracy grows slowly with time ; the real wonder is that so much has been done.

3. Under the “history of the chief diseases during the year” is given some interesting information about *cholera*. Dr. Abbott considers that the epidemic travelled from Bombay into the Assigned Districts. The deaths in Bombay Presidency are given as follow: February, 1 ; March, 10 ; April, 795 ; May, 5,359. In this last month cholera invaded the Assigned Districts. The first case appeared in the village of Takli, on the banks of the Poorna, in the Buldana district, near its western point, where the railway enters the district. Next day it appeared on the opposite side of the river, at some distance, and, on comparing dates with localities, the epidemic appears to have advanced with a front curved to the eastward until it covered the country, travelling in some directions more speedily than in others. It took 66 days to traverse a distance of 90 miles from west to east. The monthly deaths from cholera were :—

May	249
June	3,625
July	10,374
August	5,840
September	2,007
October	318
November	52

Total deaths - 22,465

4. The following abstract shows the ratio of attacked villages in each district :—

Districts.	Total Number of Villages.	Villages affected with Cholera.	Villages not affected with Cholera.
Buldana	894	495	899
Akola	980	708	272
Ellichpur	475	256	219
Oomraotee	1,060	434	626
Basim	796	245	551
Woon	1,222	293	929
Total	5,427	2,431	2,996

During this epidemic the proportion of attacked villages was nearly 45 per cent. of the whole number, a ratio many times greater than in the southern districts of India generally, while at the same time the death-rate registered from cholera to the population of 1867 was above 10·2 per 1,000. Intensity of the epidemic in this instance co-existed with its prevalence at a greater number of points of the country.

5. There were facts observed which seemed to point to importation of the disease into villages. The following is their character.

The first village attacked was Takli, and the occurrence is accounted for as follows :—"A Manbhao from where the disease was prevalent came on a visit. He was ill on arrival, and two days afterwards the disease appeared in Takli. . . . A Manbhao, who was ill at Takli thought a change would do him good, and had himself removed to Dudgaon, where he died, and in two days the disease broke out here also."

Other cases are referred to as similar, "but in an equal if not greater number there was no evidence whatsoever in favour of importation."

Cases of this class were specially provided for in the Instructions for the Indian Cholera Inquiry drawn up by the Army Sanitary Commission many years ago, and it was therein pointed out that such events were not in themselves proofs of importation, but were only facts to be inquired into with the view of ascertaining whether they were anything more than mere coincidences. As they stand, the cases cannot be accepted as proofs of importation, especially as the entire process of the transport, reception, incubation, and appearance of the disease occupied no more than two days, while the history of the imported cases and of those which followed them is, with the single fact of the two days' sequence, omitted.

6. The relation of atmospheric changes to the progress of cholera appears not to have been very definite. There is a slight elevation of temperature above the mean in cholera years, but this is all that can be said at present. The subsoil water level was nearer the surface in some cholera months than in others. It was nearer the surface on the average in 1875 than in the preceding year.

The depth from the surface and the rainfall compared with mortality were as follow :—

Months.				Depth of Water Level.	Deaths from Cholera.	Rainfall.
				Ft. In.		
May	-	-	-	34 10	249	·77
June	-	-	-	34 8	3,625	7·25
July	-	-	-	33 10	10,374	·74
August	-	-	-	31 7	5,840	4·82
September	-	-	-	25 3	2,007	10·06
October	-	-	-	23 1	318	1·27

There was at least a gradual rise in the water level from the period of maximum of cholera.

There is no definite information given about the sanitary state of affected villages as regards cleansing, water-supply, drainage, or other sanitary conditions with reference to cholera.

7. *Fevers*.—As already stated, the fever deaths amounted in 1875 to 26,076. The "fever" mortality varies considerably in different years, "and the differences in the mortality in each year can be accounted for by meteorological conditions." But Dr. Abbott appears to think that the rule applies locally rather than generally, and that "it is not so much the unhealthiness of the country surrounding our habitations as of the sites of them that prejudicially affects the mortality which occurs among us." Local meteorology, both aerial and terrestrial, are thus of greater importance to local health than general conditions affecting entire districts. The principle with certain limitations is a well known one, and leads to the conclusion which similar inquiries have established in other parts of India, namely, that disease causes, whether natural or superinduced, may be most effectually dealt with by studying and dealing with local details of sanitary work. If every one keeps his own house and property healthy, improved sanitary condition of districts will be the result.

8. *Bowel complaints* were as usual very prevalent, and in 1875 they gave rise to a death rate of 9·5 per 1,000. No additional information is contained in the present Report as to their causes, but there are a few comparisons showing their relative prevalence which it may be useful to quote:—

Locality.	Death-rates per 1,000, 1874.
Punjab	·94
North-West Provinces	1·98
Oude	·38
Central Provinces	1·95
Berar	8·5
Indian jails	16·88

With these figures on record, the question must again be asked why it is that mortality from bowel complaints shows these differences, and also why Indian jails should have a death-rate

from bowel diseases almost double that prevailing in the Berars, where the death-rates from them during the last five years have been as follow :—

1871	-	-	-	-	3.9 per 1,000.
1872	-	-	-	-	10.0 "
1873	-	-	-	-	5.0 "
1874	-	-	-	-	8.5 "
1875	-	-	-	-	9.5 "

Dr. Abbott states that "the annual mortality from fevers and bowel complaints can be accounted for by meteorological conditions," viz., rainfall, humidity, and distance of water from the surface of the ground.

Such conditions, no doubt, have a general influence on the prevalence of these diseases, but the real local conditions, although they may be influenced by them, can scarcely be said to be included in them. They must be sought for and dealt with on the spot.

9. *Progress of Sanitary Improvement.*—Dr. Abbott's record of personal proceedings and of sanitary progress shows that much has been done already on the spot, even since his report of last year. But, unfortunately, to his other work has been added the control over all the dispensaries in the province; this, with vaccination inspection, he says, "took up so much of my time that I was not able to pay as much attention to the sanitary condition of the places visited as was heretofore my custom." This is unfortunate, especially as there is plenty of sanitary work to do. He says: "In the valley of Berar it is impossible for the people to keep their villages clean, as there is no waste land about them to resort to for the purposes of nature, and to store their refuse on, and the result is the people have to ease themselves on the road sides and approaches to villages." It is impossible that such a state of things can exist without danger to health. It was referred to last year, and it is some satisfaction to learn from the Commissioner's letter prefixed to the Report under review that instructions have been issued to district officers "empowering them to take up land for the extension of village dwellings, for disposal of refuse, for stalling cattle, and for public resort, the owners being compensated for the same." This is the first step towards improvement, which, from the facts in this and preceding Reports, will lead to great amelioration in the health of villages.

Still, improvement has been advancing, for Dr. Abbott says that, "from a sanitary point of view, Berar, as it now is, is incomparable with the Berar of five or six years since. But much as has been done, still more remains to be accomplished." He recommends enlargement of village sites, tree planting, "above all, water must be stored where it is required." Looking at these recommendations generally, the question arises whether, after all, the enforced filth of villages and their immediate environs, with bad and insufficient water, has not much to do with both fevers and bowel complaints. The last recommendation is a very important one, namely, that "people should be further instructed in the laws of health and be made to act on them." Some simple vernacular expositions and directions would do much good in this matter, but, as it is, the improvements which have been effected are stated to be entirely due to proceedings of this class through the Commissioner and district officers taken by the village officials, eleven of whom we are glad to see have been singled out for special mention.

The civil stations, especially Yeotmal, Oomraotee, and Akola, have been more or less improved during the year.

The total outlay in 1875 for sanitary improvements and conservancy has been 3,458*l.* for municipal towns, and 9,202*l.* for other towns and villages. It is feared that these amounts, small as they are, will be reduced from falling off of funds. A small cess is suggested by Dr. Abbott to meet the deficiency. The subject was, however, under consideration.

Although little has been spent, much good work has been done by the people themselves, so much, indeed, that Dr. Abbott considers it necessary to reply to a question as to how it happens that epidemics nevertheless exist. The answer is supplied by the facts in the Report. Until village conservancy is systematized and regulated and rendered practicable by providing space, and by removing cattle to the outskirts, and until the water-supply, which is doubtless as bad in quality as it is deficient in quantity, is improved, there will be periodical outbreaks of cholera and other epidemics. Mere apparent surface work is not all that is needed. Improvement must go deeper, and provide for the purity of the village subsoil and for the safety of the water which it supplies.

Dr. Abbott clearly shows that, even admitting cholera to have its own laws, "that its ravages may be mitigated by sanitary measures we have proof in our jail statistics, as also from the fact that the disease in Berar was more severe in the valley than in the highlands, where the villages are cleaner, and not so crowded as in the plains." Even as regards the question of removing cattle out of villages he shows that the difficulties are more apparent than real, that at certain seasons the people do this of their own accord, and that some little help for sheds would remove every obstacle to this great improvement. This matter also is under consideration.

Dr. Abbott's Report is an excellent practical document, and may safely be taken as a guide for the direction in which future improvements ought to be carried out.

We are glad to see that the thanks of the Resident have been conveyed to Dr. Abbott in acknowledgment of the manner in which his duties have been discharged, and that this has been concurred in by the Government of India.

25th May 1877.

No. 10.

MEMORANDUM of the ARMY SANITARY COMMISSION on the REPORT of the
SANITARY COMMISSIONER for BRITISH BURMA for 1875.

A large part of the present Report is devoted to meteorology, vital statistics, jails, and vaccination, and there is not so much information as could be wished on sanitary condition. The Report is, nevertheless, in advance of those which have preceded it in several important particulars, and some of the facts it contains are new to the sanitary history of this province.

1. Registration of deaths was carried out in 14 towns and 14 rural circles in British Burma in 1875. The assigned population amounts to 2,866,473, and the registered deaths to 40,370 = a death-rate of 14.08 per 1,000. The lowest rate was 7.75 per 1,000 at Shwe-gyeen; the highest was 40.55 per 1,000 at Bassein town, in which 1,133 deaths were registered out of a population of about 28,000. In six towns the death-rates exceed 22 per 1,000, and these are the only instances, probably, for which the death-rates are approximately correct. Registration is still very defective in many rural circles, and in several of the towns. One peculiarity of the registration of deaths is that the numbers are returned once a quarter in 15 towns and districts, a practice which, even if it were sufficient for making up the annual statistics, would be of no use for sanitary purposes and the prevention of disease, since for such objects the sanitary authority must be kept informed of the amount and kind of epidemic disease current in the districts over which the authority is exercised. It appears to be unnecessary to say more on the subject, as it is receiving the attention of the Government.

2. The following were the chief registered death causes in 1875 :—

	Number of Deaths.
Fevers	25,075
Bowel complaints	5,212
Small-pox	752
Cholera	761
All others	8,570
	40,370

Taking the registration as it is, it will be seen that the diseases classed as fevers and bowel complaints were the cause of three-fourths of the registered mortality.

3. The registered *fever* death-rate for the districts and towns in the tables was 8.74 per 1,000, and in 14 towns with populations over 5,000 the fever death-rate was 6½ per 1,000. The lowest rate, 2.71 per 1,000, was returned from Henzada with a population of 15,482, and the highest, 17.9 per 1,000, from Shwe-gyeen with 7,486 inhabitants. But there is reason to believe that the fever death-rate expresses only the diagnosis made by the village officer, whose qualifications in the matter appears to be limited to the classification of diseases with heat of skin under the general term “fever,” and all bowel fluxes under one general designation of “bowel complaints,” as may be learned from the account of this matter given by the Sanitary Commissioner, who says “that the ignorant village headmen who record deaths in each village invariably attributed to fever all deaths resulting from diseases attended with febrile symptoms as indicated by hot skin, quickened respiration, or delirium; deaths from pneumonia, for instance, which is a more common disease than is generally thought amongst the inhabitants of this country, being invariably attributed to fever.” A comparison between the fever death-rates among the civil population, as registered, and among prisoners in jails, as diagnosed by Medical Officers will show how large the probable error in the mortuary statistics really is :—

	Ratio of Fever Deaths per 1,000 Population.
Civil population	8.74
Jails	1.75

The deduction from these comparative statements is that the headmen's diagnoses are worth little for sanitary purposes, and that possibly improvement might be made in fever diagnosis if some simple instructions were printed and sent to the village registrars defining the diseases to be classed as “fevers.”

A similar remark applies to the diagnosis of bowel complaints (“diarrhoea and dysentery”), in which, however, the balance is on the other side, as will be seen by the following comparisons :—

	Ratio of Bowel Complaint Deaths per 1,000 Population.
Jails	6.59
Civil population	1.81

As reference has been made to the jails, it may be well to state the following important points of experience from them. Taken on the daily average number of prisoners, the death-rate was 24½ per 1,000. The lowest rate was 15.2 per 1,000 at Bassein, the highest 69.1 per 1,000 at Akyab, rates which compare favourably with those in Indian jails.

The jail wards are raised on post 12 to 14 feet above ground, and amply ventilated. The dry-earth conservancy system is in use, and the soil is applied to gardens. All refuse water is carried away. Culinary water is obtained from wells. There is deficiency of superficial area,

36 square feet per man, and it is found that even raised and ventilated wards do not prevent the results of lowering the space. The chief death causes, "diarrhoea and dysentery," gave rise to 6.9 per 1,000 mortality. The fever death-rate is remarkably low.

4. In our remarks on the Burma Sanitary Report of 1873 attention was called to the nature of these fevers prevailing among the civil population, and in the Report under review it is stated that the fevers "are principally febricula and quotidian intermittent of a mild type. But in certain localities, Mendoon, in the north of Pegu, and the Youzaleen, for instance, paludal fevers of a severe type attended with cerebral symptoms no doubt occur and are very rapidly fatal, but these localities are very few and are well known places, situated on low hills at the foot of high mountains or on spurs leading from the mountain ranges."

Civil Medical Officers were invited to state the nature of the fevers, but as yet only two reports had been received, one by Dr. Crombie of Rangoon, which affords important information on the subject. As a proof of the mildness of Burmese fevers, Dr. Crombie states that, out of 145 post-mortem examinations, he had found only 4 cases of enlarged spleen, two of which were in natives of India and one a Chinaman. He says that the commonest fever in Rangoon Jail is febricula, a disease of three or four days' duration; next in frequency comes ague, of which disease interesting temperature charts are given to show the progress of the cases.

Remittent fevers are rare. Perhaps the most important fevers in their sanitary relations are classed under "continued fevers," from the fact that some of the cases resemble enteric fever, of which Dr. Crombie states that he had three fatal cases "in which the diagnosis was placed beyond a doubt on the post-mortem table, . . . I believe the first that have been registered under that name in Burma." The notes of a fourth case, not fatal, are also given. There is reason to believe that this inquiry into the nature of these local fevers will result in showing how largely the "enteric element" enters into their history. It is now (but only recently) known that the fatal fever among British troops in India is enteric fever, and every year's experience shows that the same fever exists among the Native population. It follows from the facts that increasing attention must be devoted to all measures required for removing filth and other putrescible matter from towns and dwellings, and for protecting wells and other water sources from pollution.

A distinct step has thus been gained in the practical sanitary history of these countries.

5. It is not easy to account for the comparative mildness of periodic fevers in a country of great rivers and river deltas, where, at first sight, the local conditions are so favourable to their existence.

There are certain facts, nevertheless, stated by Dr. Crombie which throw some light on this question. In the first place, natives of Lower Bengal suffer from fevers in Burma very much as they would do at home. These immigrants "thrive badly in Burma," and the 20 or 30 men who are always in the depôt hospital are probably the most miserable looking creatures on this side the bay. "They present every variety of the evidences of malarial poisoning." Race, stamina, and predisposition are thus against the Bengalee, but the malarial poison is in Burma. The geological features of the Burma deltas generally are those not of recent alluvium, like the Ganges delta, which is being constantly added to by fresh deposit, but of ancient alluvium raised from the sea bottom and not subject to additions except over 200 square miles; "the fact of the elevation of the Native houses on piles has probably much to do with it" (less fever), "but, as a matter of fact, a large number of Native houses are not so raised, or are only so to the extent of a few feet."

This remark is an important one, and suggests inquiry into the proportion of fever among people who sleep on the ground level and those who sleep on raised floors. It is just possible that the largest fever ratios may come from the ground-floor houses.

6. As regards the causes of enteric fever, the Sanitary Commissioner says:—

"Many of the exciting causes of enteric fever exist in the towns and villages of this province, such as filthy and stagnant drains, and cess-pits in close proximity to sources of water-supply, and it is only reasonable to suppose that deaths do occur from it which are attributed to remittent fever, especially when the marked nature of some of the most important symptoms is considered, and that it has been found to exist in a jail, the sanitary condition of which is far superior to anything to be hoped for amongst the general population of towns and villages."

The conclusion from the whole of the facts appears to be that a not inconsiderable amount of the civil mortality registered from fever is really due to enteric complications, the local causes of which are very evident, and that in dealing with the prevention of Burmese fevers this aspect of the case must be kept in view.

It is probable, also, that periodic fevers are not of fatal character, and that their comparative mildness is in great part due to the Native habit of living in houses raised on piles, by which the immediate ground malaria, always the most important to health, is in great measure cut off.

Experience of this class is of great importance for India, and might very well be taken into consideration in providing living accommodation in many parts of the country.

7. One apparently exceptional condition co-existing with mild periodic fevers in Burma is the very large amount of rainfall.

There are 13 stations at which this climatic element is registered, and the tables show that the least fall during 1875 was 43.9 in. at Promé; Rangoon had a rainfall of 79½ in.; Tongoo, of 93 in.; Bassein, 114 in.; Moulmein and Tavoy, 229½ in.; and Sandway, 230 in.

It is evident that excessive rainfall is not necessarily accompanied with fatal paludal fevers in tropical climates, and the Burmese experience confirms, in another way, the observation made in India that the chief danger lies in the state of the subsoil after rain. If the rainfall waterlogs the subsoil, the first condition for the production of malarial fever is present, whatever the amount of rainfall may be. In Burma inquiry might easily be made as to what becomes of the rain. It

seems probable that it escapes over the surface, or drains readily through the subsoil, in any case that it does not stagnate, except in specially unfavourable localities, and in such, where they exist, it would be important for sanitary work to ascertain the comparative amount and character of fevers which prevail. The facts, as they stand, appear to point to the conclusion that the heavy rainfall could be best removed by improved surface drainage, where needed, and that in a few exceptional localities only would drainage operations, properly so called, be required.

In the special case mentioned, where severe paludal fevers occur on the skirts of mountain ranges, the causes of malaria may be at a distance from the town sites, and in the upper ends of valleys, or in districts resembling the Terai of Northern India. But the whole subject well merits investigation.

8. *Cholera*.—There were 761 deaths registered as cholera in 1875, but it seems doubtful if many of them were true epidemic cases. The disease existed from March to December in different parts of the country.

The same law of diffusion was observed as in India, and only a small proportion of groups of population was attacked.

The ratios are given for only 6 districts, and these show that, out of 1,423 villages, 108 only had cholera cases. No account is given of the state of the attacked villages.

9. *Small-pox*.—There were 752 deaths from this disease. "The greatest number of deaths were in March, at which season the inoculators do the greatest part of their work." The fact suggests the remedy. In spite of inoculation, the deaths were comparatively few, fewer, indeed, than the ratio in England and Wales in non-epidemic years. In four districts and seven towns there was no small-pox, a result to which vaccination is said to have "contributed in some degree." "This is especially noticeable wherever the civil authorities and the civil surgeons take an interest in the work of vaccination." The total vaccinations in 1875 amounted to 24,381, of which 20,112, or 82·89 per cent., were successful.

10. *Bowel Complaints*.—There were 5,312 deaths registered under this head in 1875. In two towns the death ratios from these diseases were 10·35 and 18·83 per 1,000. It is satisfactory to learn from the Report that inquiry is to be made into the causes of this high mortality, and it may be suggested that an opportunity may be taken to learn what diseases are registered under this head. An inquiry in Madras Presidency on the same subject has resulted in an order to class the diseases in future as "cholera."

11. *Leprosy*.—There is not much of importance under this head. The total number of lepers, according to the last Census, was 3,203 = 1·20 per 1,000 of the population.

The practical results of the inquiry up to the present time appear to be that leprosy is not contagious; that in one third of the cases it was hereditary; that the conditions which produce malarious fevers have no influence in the causation of leprosy; that fish diet is not a cause of the disease; that by far the greater proportion of cases occur among natives of India; and lastly, "all Medical Officers here consider that poverty, dirt, and insufficient food are the principal exciting causes of leprosy."

12. *Civil Sanitary Improvements*.—Municipalities have been established at Rangoon, Moulmein, Akyab, Bassein, Toungoo, Prome, Henzada, but all of them have not furnished reports. Those which have done so appear to be engaged in carrying out the simpler reforms, but no work of any great importance has been undertaken.

The following brief abstract will show the nature of measures in operation.

Rangoon.—The town has been lighted. 7,595 lineal feet of brick drains have been laid down, other open drains have been arched over, but to drain the town effectually there should be plans, surveys, a proper system, and water. Tanks have been excavated and deepened, cavities filled up, and large areas of the strand bank have been filled in. A dry-earth latrine has been put up on trial. The town pumps, 21 in number, have been put in good order, and the wells improved, but a proper water-supply is required. Conservancy arrangements have been improved, street watering has been extended. But all night-soil is thrown into the river, a most unsafe practice.

Moulmein.—Very little has been done during the year, except current surface cleansing. Cesspits with their abominations and dangers are in use, and low-lying districts are liable to flooding to such an extent that "stagnant water cannot be said to exist." The whole sanitary work has evidently to be done.

Akyab.—The work done here has been apparently improvement in surface drainage and tree planting.

Bassein.—The chief work done is road making, which appears to have been much required, but the Report deals rather with what it is desirable to do than with anything that has been done, except the building of a slaughter-house.

Prome.—Water is obtained from the Irrawaddy, but requires filtering. None of the town wells are fit for drinking. There are no drains, only ditches which carry the water into a swamp without an outlet. Two roads have been metalled, the main streets are fairly kept, but the by-lanes are neglected. Conservancy very defective. Cesspools are in use, no public latrines.

Tavoy.—Nothing reported in the way of sanitary work, except surface cleansing, &c.

All that can be said about these reports is that a beginning has scarcely been made in initiating public health improvements, and that, as the municipalities are now organized, it would be most desirable that the towns should be inspected by the Sanitary Commissioner and some Engineering Officer, with a view of obtaining a grasp over the problem presented by each town, and advising the municipalities on the most efficient and economical methods of dealing with evils brought to light. In this way much useless or unnecessarily costly work might be avoided, and consistent plans adopted for future guidance.

13. The Commissioner states that "no improvements have been effected in the sanitary state of the villages of the province, but much might be done in the way of simple improvements, to

"be carried out by the people themselves; many of them are situated on the banks of rivers and the houses being all raised from 3 to 10 feet off the ground, they are washed clean once a year at least by the rise of the rivers, which on falling leave nothing but pure silt behind them; this natural annual cleansing is the most satisfactory sanitary agency at work in the province at present."

The facts suggest that much good might possibly be done by a few simple rules drawn up in the vernacular, pointing out the chief sources of danger to health in towns and villages, and advising simple and easily applied remedies.

14. The Report as a whole is of more interest than others which have preceded it. We have suggested some points of inquiry regarding the more important diseases, which, together with what we have advised regarding the initiatory proceedings in towns and villages, includes the main practical results of the year. It would be well if the municipalities were made to understand that what is now required of them is to put their towns in a proper sanitary state with as little delay as possible, which is indeed the main duty devolving on them by their office.

4th June 1877.

No. 11.

MEMORANDUM of the ARMY SANITARY COMMISSION on the REPORT of the CALCUTTA MUNICIPALITY for 1875.

1. Like preceding Reports, the present one gives a detailed account of the whole round of municipal work during the year, only part of which, that relating to public health, comes within the scope of the Army Sanitary Commission. In this department, as in others, there is evidence of activity and progress, although the work already done is only a small part of the whole. The Justices, in their administrative capacity, have considered "with great care," Mr. Hogg tells us, proposals for—

- (1st.) Completing the drainage works.
- (2nd.) Alternative schemes for doubling and extending the water-supply.
- (3rd.) Improvement of bustees.
- (4th.) Reorganization of drainage, road and conservancy departments.

And the municipal officers appear to have been zealously engaged in their respective duties.

2. The drainage scheme now in progress provides for 39 miles of brick sewers, and 136½ miles of pipe sewers. Of these lengths 37¾ miles of brick sewer and 37 miles of pipe sewer have been completed, leaving 1½ miles of brick sewer and 99½ miles of pipe sewer yet to be constructed. During the year 1875 drainage operations were carried out in 81 streets and places, and a total length of 41,742 feet of sewers was laid down. At the same rate of progress a considerable number of years must elapse before Calcutta will have reached the completion of the requisite drainage lines, and after these are laid the drainage of areas and houses will have to be done before the public health can receive the full benefit of past outlay.

Provision is made in the drainage plan for storm floods, but the usual flow is raised at the outfall to a height of 8 feet average by steam power, and some idea may be formed of the relief which the sewer lines must give to the water-logged and foul subsoil by the statement made by the Engineer that 2,357,478 cubic feet of sewage water are pumped out daily, or 2½ times the daily consumption of water.

At present little of the water-supply passes direct to the sewers, and it is mostly disposed of by evaporation and soakage, so that probably nearly the whole work of the pumping establishment consists in keeping down the subsoil water level, and cleansing the subsoil itself.

3. During the year 1875 the water-supply averaged about 6¼ millions of gallons per diem. During the same year 820 houses were connected with the water mains, raising the total connections to 8,970 houses. As regards the quality of the water, the analyst shows that it compares very favourably with the London water, as follows:—

	Chlorine in Parts per Million.	Total Ammonia in Parts per Million.	Total solid Parts per Million.
Calcutta hydrant water, average of six months, 1875 - - -	9.34	.066	199.9
Southwark Company's water - - -	16.8	.160	261.9
New River Company's water - - -	15.7	.081	252.9

The proportion of ammonia in the Calcutta water is tolerably constant, but the amount of chlorine varies considerably, and has a relation to the tide and rainfall. The main defects of the Calcutta supply are that there is too little water available, and that the filtration is at times not all that could be desired. The analyst admits that the water is turbid and unsightly, but his explanation that this is a proof of the purity of the water can scarcely be accepted as an excuse.

Deficiency of filtered water has been temporarily met by providing unfiltered water for street watering and other purposes.

This outlay, as well as much of the outlay to be incurred for extending the filtered supply, would have been avoided if the course recommended by the Army Sanitary Commission above

ten years ago had been adopted, which was, that the projected works should be capable of supplying double the amount of water then proposed and since provided.

To double the filtered supply now, it appears that besides engine power there would be required three settling tanks, twelve filters, and a brick culvert 13 miles long.

4. It appears that the drainage system has to be extended under considerable difficulties, such as the following, described by the Engineer :—

“ Calcutta is a most difficult city to improve. Buildings have been dropped down in a very peculiar fashion, without regard to regularity or possible future improvement, and with a scarcity of roads where most wanted. Therefore, in laying out the third class sewers, it has been necessary to deal with the materials at hand, and to make the best of them.

“ The first and second class sewers of the drainage system having been completed, they now receive the entire sewage and night-soil of the city, though not exactly in the form it could be desired, or in a manner conducing to the effectual working of the sewers. This can only be expected when an augmented water-supply is available, when the pipe sewers are generally introduced, and every public and private privy connected, and the open ditches as far as possible abolished.”

The drainage system has hence, up to the present time, lowered the subsoil water level, cleansed the subsoil, and removed, partly by hand labour, the entire night-soil of about 450,000 people.

The waterworks have at the same time rendered available for this population about 14 gallons of filtered water per head per diem.

5. Considering what Calcutta was a short time ago, these are certainly no inconsiderable improvements to have carried out in a few years, and to these must be added improved roads and better surface drainage.

There are at present 131½ miles of road in the city, of which 81½ miles are metalled with stone, and 50 miles with brick.

If improvements of this class were all that were requisite for Calcutta, we should naturally anticipate a marked reduction in death-rates. But unfortunately the drainage of a city like Calcutta is only one element in the provision of healthy houses, and until this latter essential improvement is carried out in the worse districts, epidemic years will always show high death-rates. The late Officer of Health, Dr. Tonnere has enabled us to estimate, in a general way, the probable results to health of more extended improvements, especially in dwellings, as follows.

The death-rate during 1875, which was a great cholera epidemic year, was 33·91 per 1,000 on the census of 1872.

The deaths from zymotic diseases during the last 10 years, 1866—1875, when contrasted with the same death causes in 1875, show the following comparative results :—

	Average Annual Number of Deaths for the 10 Years 1866—1875.	Total Deaths in 1875.
Fevers	4,459	5,444
Cholera	2,459	1,726
Dysentery	1,453	1,274
Diarrhoea	689	821

This abstract shows an increase of fever, a decrease of cholera and dysentery, and a slight increase of diarrhoea, in the epidemic year 1875. The 10-year period includes years of dormant cholera, so that 1875 contrasts favourably with the preceding years, except in the element of fever. Dr. Tonnere further affords us the means of localizing these zymotic death-rates between the northern division of Calcutta, which is the poorest and least-improved, and the southern division, in which improvements have been more extensively carried out among a better class of population. The results of the comparison are as follow :—

	Deaths per 1,000 of Population.	
	Northern Division.	Southern Division.
Fevers	8·77	3·39
Cholera	2·79	1·07
Dysentery	2·15	·69
Diarrhoea	1·48	·85

This is not the first year in which the comparison has been made, and it suggests the obvious question whether among people living in the same city it may not be possible eventually to lower these death-rates by sanitary improvements all over Calcutta.

6. With the view of estimating the relative death-rates in the districts, a suggestion was made by the Commission, in their Memorandum on last year's Municipal Report, that this important information might possibly be obtained by inquiry. In the present Report the total deaths are divided among the 18 police sections, but, as the population of the sections is not given, no use can be made of the information. Recourse must, therefore, be had to the results of sanitary inspections, including the state of the bustees (by far the most important sanitary element at the present time), given by Dr. Tonnere, and by Dr. Payne, the present Officer of Health, and it is

not too much to say that the only subject of wonder is that, with such a state of things as these inspections have elicited, Calcutta is not the continual seat of devastating pestilences. On former occasions we have noticed Dr. Tonnerre's reports, and it will be sufficient to state generally the results of examinations made by the present energetic Health Officer, Dr. Payne. In a report to the Chairman of the Corporation, made on 20th February 1877, Dr. Payne shows that the death-rates in different sections of Calcutta vary between 11·6 per 1,000 in Waterloo Street and 33·7 per 1,000 in Toltolla; that the death-rate from zymotic diseases varies from 7·3 per 1,000 of the population in Waterloo Street to 23 per 1,000 in Toltolla; and that, while 57½ per cent. of the total deaths are due to zymotic diseases in Park Street district, and 60·7 per cent. in Waterloo Street, Toltolla has nearly 70 per cent. of its mortality, and Shampookur and Coomartooly districts have 75 per cent. of their mortality, due to zymotics. In Waterloo Street section there is no bustee population. In Toltolla 31½ per cent. of the population live in bustees, and in the other districts used in the above comparison the proportions are somewhat less.

The bustee dwellings are described as being erected round quadrangular spaces, which "are indescribably filthy, and the atmosphere is that of a midden privy." This is caused by digging latrine pits in succession all over the space, which are never covered; "thus the people live on soil saturated with and largely composed of excrement." Tank water is in such a state that it occupies a place "intermediate between urine and liquid sewage; . . . they drink excrement in the water, and bathe in liquid sewage, and the air they breathe is thick with poisonous exhalations. . . . From whatever side the insanitary state of Calcutta is regarded," Dr. Payne says, "it is found to have its centre and origin in the home life of bustees." In consequence of remarks previously made on the subject by the Army Sanitary Commission, the Government of Bengal urged prompt measures of bustee improvement being adopted by the Justices, and a special Committee was appointed to inquire into the subject.

The deplorable state of the population, and the need of reform, are fully admitted after inspection by the Committee; but too much stress appears to be laid in their report on the difficulties in the way of improvement. They say:—"According to the present land system in Calcutta, the land on which each village is built belongs to proprietors who lease out plots of land to tenants, and the tenants construct their own huts according to their own ideas of convenience and comfort, the owners of the land exercising no sort of efficient control over the disposition of the huts. They let out their land at a very high rate of rent, and must therefore be held responsible for the state in which it is kept;" and the root of the reform the Committee proposes is that the costs of the special improvements should be borne by the ground landlords.

7. The details of improvement can only be decided on the spot, but the following proposals of the Committee appear to contain a good instalment of what is required:—

Owners to provide private roads, drained, and of sufficient width.

All unlet waste lands to be raised, drained, and brought to a proper level, and low marshy lands and pools to be filled up.

Filthy unwholesome tanks to be filled up or improved, and waste lands to be kept clean.

Unfortunately these things are to be done "where reasonably practicable" only.

The tenants on their side must provide latrines and drain their premises into drains provided by their landlords, and place in a proper state the land held by them on lease.

There are no doubt difficulties and outlay to be incurred in these improvements, but the first thing to do is to get hold of a right principle of action. These bustees are not away in the open country, where the landlord and his deficiencies can hurt nobody but himself, or those who chose to lease his land; they are, on the contrary, part of a large city, every family of which has an interest in keeping epidemic disease away from its own doors. No man has a right to use his own property so as to injure any one else, and it is better to keep all questions about improvement in such cases free of questions of "practicability," because, if any bustee cannot be improved, it should be dealt with as similar cases are dealt with elsewhere, namely, it should be shut up or pulled down. The really important question is not the point of "practicability," but it is in each case to settle at once the class of improvements most immediately required, and those which may be delayed until means accrue for their completion. From the reports themselves it is to be feared that the most necessary improvements are precisely those regarding which the Committee has introduced the proviso of "reasonable practicability." It appears as if, in many cases, the first thing to do is to drain or fill up marshy ground and tanks in and around the villages, and to provide them with water.

These things are part of the sanitary conditions of sites, without which none should be occupied in a large city, especially in an Indian climate; and when this foundation is laid, the municipal authorities could bring the whole number of bustees (given in Dr. Payne's list at 135, with a population of 76,000) within the scope of ordinary sanitary administration. If, in times past, landlords have profited by keeping back necessary expenditure (probably from not recognizing its necessity for protecting the public health), it is no hardship on them to call on them now, under pain, where necessary, of shutting up unwholesome properties, to improve them; but it is a very great hardship to expose, not only their tenants, but the entire community, to outbreaks of pestilential disease, merely to save themselves the outlay required to put their property in a tenable state.

That this must be done is evident from the facts, and the proper authorities must decide to what extent the landlords and the ratepayers generally should be taxed for improving the state of things which never should have existed. Of course a great difficulty arises from the fact of the poor tenant erecting his own house, but still existing sanitary laws would enable unwholesome houses, occupied by proprietors, to be dealt with just as if they were occupied by tenants.

8. The Municipal Report states that, according to the amended law, the new Corporation will have power to compel owners of bustee property to execute improvements, but, to guard against "the not unlikely contingency" of remissness in this duty, the Government has power under the

law to cause any locality to be inspected by the Sanitary Commissioner for Bengal, and to direct the Corporation to carry out his recommendations, or, in default, to cause the work to be done and the cost charged to the owner of the land. This is as it should be; it is very satisfactory, however, to learn from the Report that one or two proprietors have of their own accord begun the work of improvement. It would be well that proprietors should see not only the duty but the eventual economy to themselves of improving their properties and, together with this, the habits, health, and productive power of their tenants.

It is a matter of constant experience that unhealthy degraded tenants can never be profitable to themselves or to any one else.

The sketch of the condition of the bustees already given from Dr. Payne's report includes Goa Bagan, in which a severe outbreak of cholera took place, the result of which was that "among 599 persons living on an area of 22 beeghas there died no less than 28, or 4·67 per cent., of the population in a period of 18 days." The mere loss of productive labour and means of paying rent accompanying this single incident in the history of one bustee should lead landlords to inquire whether, on the whole, the sanitary improvement of such property would not be a remunerative investment. Dr. Payne shows how impracticable it is to deal with the evils under existing arrangements. He says:—"Calcutta is never free from cholera. In one spot this year, in another the next, it becomes the duty of the Health Department to meet the local calamity as it best can, and to demonstrate the futility of its piecemeal work for all purposes of general or lasting improvement. The root of the evil remains untouched, and the fruit must continue to be reaped, until it be possible to change the habits of the people by so ordering the arrangements of bustee life that common decency and cleanliness may either be the passive result of better means, or be actively enforced by authority." It is very old experience that, just as are the surroundings of the people, such are the habits of the people, and one great object of sanitary improvement is to afford to the poor means of improving their habits.

9. There are other points of interest in the present reports; but, for the first time, the condition of the bustees and the influence of this on the public health of Calcutta appears to have received the prominence it deserves. The Commission, therefore, desire to give this subject a chief place in their remarks on the Report of 1875. If it be practicable to do so, it would be a most useful part of the Officer of Health's duty to work out the sanitary statistics of every bustee in Calcutta, together with a detail of local defects, and the nature of the remedies required for their removal. By doing so he would render efficient aid to the municipal officers, as well as to the Government, in the proper direction of improvements. We make this suggestion, because we fully concur with Dr. Payne in his view, already stated, that in the foul condition of these villages the insanitary state of Calcutta has its centre and origin. This proposition has become more evident since improvements in drainage, water-supply, and conservancy of the city generally have been making progress.

10. The most important practical results of the Calcutta Municipality Report for 1875 are:—

- 1st. The initiation of bustee reform, which should be vigorously followed up.
- 2nd. The extension of drainage lines.
- 3rd. The recognized necessity for doubling the filtered water-supply.
- 4th. The evidence which the Report affords of increasing interest taken in the public health of the metropolis of India by the local authorities, and the continued progress of the work.

And, lastly, it may be stated, as another instance of successful application of sanitary principles, that suitable precautions were taken by the Municipality during the visit of His Royal Highness the Prince of Wales, and, notwithstanding the large influx of foreign population into Calcutta, sanitary rules were successfully applied, and the public health in no way suffered.

25th May 1877.

No. 12.

MEMORANDUM of the ARMY SANITARY COMMISSION on the REPORTS of the MADRAS MUNICIPALITY for 1874-75 and 1875-76.

1. These Reports, having been referred to the Army Sanitary Commission at the same time, may very well be discussed together, and their contents included in one Memorandum, especially as there is little in them that is new, and not much calling for remark of any kind. They form a somewhat striking contrast to a previous report of the late Mr. Gover, in which the sanitary condition of this large city was set forth with a degree of skill and care not often equalled in such inquiries, but which, up to the present time, appears to have led to little practical result.

2. Mr. Gover had shown that the subsoil of a large part of Madras was water-logged and saturated with filth, and that a fundamental condition of improved public health was sewerage and drainage for removing night-soil and freeing the ground from sewage water, together with an extended supply of pure water, and other improvements.

The evil was known, and also the general nature of the remedies, and the Reports under review will enable a judgment to be formed of the extent to which the remedies have hitherto been applied.

3. In the Report for 1875-76 the population of Madras city is given at 397,552. The deaths were 14,408, the births were 10,473, showing an excess of nearly 4,000 deaths over the births. This result is scarcely trustworthy, and must be taken as showing that the registration of deaths

is more efficiently carried out than the registration of births, although, when the sanitary condition of Madras is taken into account, there is reason to believe that the deaths registered are fewer than ought to be. The facts, as they stand, give a death-rate for 1874-75 of 36·2 per 1,000, and a birth-rate of 26·3 per 1,000.

Compared with previous years, the death-rate of 1874-75 stood as follows :—

	Deaths per 1,000.
1870-71	30·9
1871-72	33·2
1872-73	36·2
1873-74	37·4
1874-75	36·2

There is reason to believe that all these rates are too low. The one fact which may be safely deduced from them is that Madras is one of the most unhealthy of cities, and has its real sanitary work yet to do. Even the European death-rate in Madras last year was 3½ per cent. of the European population. The Mahomedans suffered most, and had a death-rate of above 4 per cent. But there is some uncertainty as to this result, for another table gives the death-rate of Europeans at 33·4 per 1,000, and of Mahomedans at 44·5 per 1,000.

4. The chief death causes were the following :—

	Deaths.
Small-pox	199
Fevers	2,418
Cholera	1,450
Dysentery	1,137
Diarrhœa	847

In 1872-73 there was one death only from cholera. In 1873-74 there were five cholera deaths. Next year there was no cholera, and this quiescence was followed, as we have seen, by the epidemic of 1875-76, during which 1,450 deaths from cholera took place.

5. The general death-rate for 1874-75, viz., 36·2 per 1,000, was very unequally distributed among the villages within municipal districts. The most unhealthy was Perambore, which had a death-rate of nearly 6½ per cent. There were 8 villages whose death-rates exceeded the average of the whole city.

These are the most important statistical facts in the latest Report, and it may be as well to state that the mortality was amply accounted for by the previous report of Mr. Gover, which also pointed out the nature of the remedies.

6. With regard to the intervening cholera, the following passage from the Report will show the measures of a temporary nature which were taken to arrest its advance on Madras from districts where it already prevailed in an epidemic form :—

“ Every precautionary measure suggested by the medical authorities to meet the advent of the epidemic and arrest its progress was adopted. To prevent its introduction from the interior, cholera sheds were erected at all stations of ingress, at the toll gates on the Poonamallee road, Mount road, Barber’s Bridge road, Erookuncherry road, Trivatore high road, and Munnar-sawmy Covil road. They were amply supplied with medicines and hospital comforts, and a staff of medical subordinates was detailed for duty at these sheds. None of them, however, were availed of, and after a time they were removed. Within town the houses attacked received the attention of the conservancy department. Carbolic acid, deodorizing powders, and sulphur fumigation were unsparingly used to disinfect them. In spite, however, of all efforts to stay the progress of the disease, it numbered 1,450 victims in 238 days, being at an average of six lives daily.”

Although cholera prevailed at the time all over the south of India, it is interesting to note the fact that the first case in Madras itself took place in Royapooram on August 7th, close to the sea-shore, and the plan of the city in the Report shows that the succeeding cases lay in a zigzag manner over the city.

The death ratios among different classes of the community were :—

Europeans	3 per 1,000.
Hindoos	3·1 ”
Native Christians	4·7 ”
Mahomedans	5·7 ”
Eur Asians	6·5 ”

Total - 3·6 per 1,000 of the population.

The experience, as a whole, leaves the cause of cholera in the same obscurity as ever. It shows that quarantine had no influence in arresting the disease, which, indeed, came not from the land side but from the sea side.

The so-called “disinfectants” were of no practical use, although there was ample time and opportunity during 238 days to have tested their powers, and all the while those deadly local conditions so well described in Mr. Gover’s report were in full activity. The facts were as complete as they would have been in a specially conducted experiment, and the results are satisfactory for the elucidation of truth, however unsatisfactory they may have been to the people who suffered.

7. It follows, from the entire experience, that a proper foundation for sanitary improvement in Madras must be laid in drainage and water-supply, without which nothing of consequence can be effected in improving the dwellings of a large part of the population.

It is satisfactory to learn that Mr. Clark, who sewered Calcutta, had been called in to prepare a scheme for draining Madras, in regard to which the following resolution had been adopted, 3rd May 1875 :—

“ His Excellency the Governor in Council cannot but accept the scheme, elaborated during four months’ continued devotion to the subject on the spot by an Engineer of Mr. Clark’s extensive practical Indian experience, as the most satisfactory solution of the problem of draining Madras that is likely to be attained.” He observes, however, that “ Mr. Clark bases the details of his proposals in a great measure on the local water-supply, and considers that their efficiency is likely to be commensurate with the development of the latter.

“ The Government, as well as the municipality, being financially and otherwise interested in its complete development, which is now retarded owing as much to want of engineering knowledge and experience as to lack of funds, it would appear desirable that arrangements should be entered into for placing both the water-supply and drainage in the hands of a competent Engineer-in-chief such as Mr. Clark.”

The latest notice on the subject is that in February last a Bill had been introduced in the Legislative Council to increase the municipal revenue.

8. Neither Report contains any account of Mr. Clark’s scheme, but we learn from the Government Proceedings that “ Mr. Clark proposes to carry off all fluid filth or house drainage, subsoil water near the surface, and excreta, by a system of main and outfall sewers of brick or laterite in mortar plastered with cement inside and laid in concrete, or of concrete blocks cast to the required shapes, and of subsidiary stoneware drain pipes laid in concrete.” Engine power will be used to raise the sewage into the outfall to the sea, if no arrangements are made for utilizing it, but to enable this to be done 1,300 yards of the outfall will be left open. By this scheme the drainage requirements of 317,479 inhabitants will be provided for, while 80,073, the population of a considerable city, will be unprovided with drainage, upon the principle apparently that it is better to spend the large sum needed in executing the works required for the more dense part of the population at first.

There is no information in the Reports as to the steps to be taken for purifying the Cooum, but it may be safely said that nothing short of keeping the sewage out of this foul estuary will meet the requirements of the case.

The fundamental wants of Madras are thus water-supply all over the part to be drained, and suitable drainage works.

9. In a Memorandum of the Commission on the Report of the Sanitary Commissioner for Madras for 1875 attention was called to the extraordinary degree of impurity shown by chemical analysis in the Red Hill water supplied to the city. In the Municipal Report for 1874-75 are given eight monthly analyses of water samples, in which similar facts are reproduced. Take for example the first analysis of 16th April 1874, which gives the following sanitary results :—

Volatile solids	-	-	-	-	9.6	grains per gallon.
Mineral ditto	-	-	-	-	16.8	”
Common salt	-	-	-	-	5.68	”
Oxygen for readily oxidizable matter in cold	-	-	-	-	.042	”
Ditto, ditto, with heat	-	-	-	-	.105	”
Free ammonia	-	-	-	-	.022	parts per million.
Albumenoid ammonia	-	-	-	-	.05	”
Nitric acid reckoned as ammonia	-	-	-	-	1.00	”

In the face of these facts it is necessary to repeat what was stated in the Memorandum referred to, viz., that a searching inquiry should be made into the reason why Madras, after spending a large sum for water, should have water of this quality in return, and that the inquiry should embrace not only the means of distribution within the city, but also the state of all the water channels, reservoirs, and collecting grounds. Such an investigation is the more necessary as the water distribution is becoming more extended year by year.

10. Notwithstanding this unfavourable state of the water, and the non-execution of drainage works, a considerable amount of surface sanitary work is being done in the way of conservancy, street cleansing, street and road repairs, laying down street surface drains, and general regulation.

All this is in the right direction, but the Report for 1875-76 states that, “ compared with the requirements of the town in the matter of drainage, the work done during the year was but a drop in the ocean.”

At present the work of removing sewage is mainly done by hand labour and carts. The Report for 1875-76 states that for this special hydraulic work, and apart from the surface cleansing, there were employed 125 carts, 376 men coolies, 53 women, and 22 boys, who removed 125,871 cart-loads of sewage matter during the year. The sanitary result of this proceeding is stated as follows :—“ Besides the 22,597 cart-loads of night-soil removed from the public latrines, an enormous quantity is taken away every day in the open rubbish carts. It may be said in fact, without exaggeration, that the whole of the night-soil from all the private houses in the urban portion of the municipality is thus removed. The privy in an ordinary Madras house is so constructed that the urine flows off by a gutter into the street drain along with the other slops of the house, and the solid deposit alone remains to be removed by the scavenger, who attends once a day or oftener for that purpose.” This proceeding accounts for the saturation of the subsoil with filth so well shown in Mr. Gover’s report already referred to, and also for a public complaint that the cleansing of the drains “ is attended with a very powerful stench ”; but

“ wherever the drains are of good construction and in good order, and can be flushed, the nuisance does not exist.”

11. The accounts do not enable the exact cost of hand sewage operations to be deduced. There are, however, two items in the accounts for 1874-76 as follows:—

	£
Conservancy, out-door	21,057
Conservancy, other than establishment	2,318
	£23,475

If this amount be divided between street cleansing and conservancy in proportion to the staffs employed on each, about two thirds will be reckoned for conservancy, or 15,600% in round numbers.

This, though by no means so liberal an amount as is allotted for hand cleansing in Bombay, would still represent a sum of 312,000% if capitalized at 5 per cent., and if to this were added the capital representing the annual amount spent on house scavengers, there would be a very considerable amount to spend on drainage and sewerage work proper, and the inhabitants would have little to complain of in the way of rates, besides getting rid of the present unenviable repute of their city.

12. The Reports contain accounts of vaccination work, but this is a very small matter compared with the general sanitary requirements of Madras, and it may be dismissed with the following remarks from a report on the subject made in 1872 by Colonel Ritherdon, which was adopted by Mr. V. Kristnama Chariar in his inspection report of 8th February 1876:—

“ Vaccination, though highly important, is not the most crying want of Madras. Its needs are many, its means are limited. We are compelled to stint everything in order to be able to do something for many of these great necessities. . . . For every death by small-pox, fever carries off seven, dysentery three, diarrhoea takes three more, cholera nearly two. These are our greatest evils. They are to be met by drains. Drainage is tenfold more important than anything else, and it is my duty to urge that this should employ our spare cash, should demand our every effort. Much has been done to fight against small-pox in the remodelling of the parcheries in addition to vaccination.”

Lastly. The result of our examination of these two years' Municipal Reports, so far as concerns the public health of Madras, is that the drainage works should be carried out immediately, and that steps should be at once taken to purify the Red Hill water-supply. No doubt other sanitary improvements are required; but these mentioned above admit of no delay.

28th May 1877.

No. 13.

MEMORANDUM of the ARMY SANITARY COMMISSION on the REPORT of the BOMBAY MUNICIPALITY for 1875.

1. It may be a not unsuitable preface to the remarks on this Report to quote the following passage from the address of the Municipal Corporation of Bombay presented to His Royal Highness the Prince of Wales on his landing in the capital of Western India. Alluding to the early history of the city, the Municipal Commissioners state as follows:—

“ From a barren rock, whose only wealth consisted in cocoa-nuts and dried fish, whose scanty population of 10,000 souls paid a total revenue to the State of not more than 6,000% a year, whose trade was of less value than that of Tanna and Bassein, and whose climate was so deadly to Europeans that two monsoons were said to be the life of a man, she has blossomed into a fair and wholesome city, with a population which makes her rank next to London among the cities of the British Empire, with a municipal revenue amounting to 300,000% a year, and with a foreign commerce worth forty-five millions, and yielding in customs duties to the Imperial treasury three millions a year. All this material prosperity she owes to the strong and wise Government which has secured her in the enjoyment of peace and order, of equality before the law, of religious liberty, and of freedom of trade . . . under the shadow of the British flag.”

2. Among not the least of these enumerated advantages must be classed the public health improvements carried out by the local authorities and their officers, which have already done so much to save Bombay from periodical visitations of severe epidemics, although it may be freely admitted that much yet remains to be accomplished in this direction.

3. Mr. Pedder's Report for the present year states briefly the chief improvements carried out or completed during the year, and refers for details to accompanying reports, of which that of Mr. Weir, the Officer of Health, ranks first in importance in relation to public health.

Among improvements enumerated by Mr. Pedder are the following.

House building proceeds at the rate of about 300 new houses a year.

The new markets at Mazagon were nearly finished during the year, and would be opened immediately.

Some attempt has been made to diminish the abominable nuisance and risk to health occasioned by the discharge of night-soil into Bombay harbour. The depôt has been improved, the discharge pipe has been relaid, and the night-soil accumulated in the depôt is washed out to

below low water by means of salt water pumped up from the harbour. Mr. Pedder says "the improvement is immense, and greater than was anticipated." But the whole affair should be put an end to as speedily as possible by the sewerage of Bombay.

The public gardens have been improved, and new burial grounds for Mahomedans and low-caste Hindoos were being provided. In 58 localities streets had been widened.

The quantity of sewage which finds access to the present drainage system is increasing.

Plans for conducting additional water from the Tulsi reservoir direct to Bombay have been finally settled, and hopes are entertained that the water will reach the city in 1878.

Reforms and reorganizations of market and slaughter-house administration have been satisfactorily carried out.

4. The following abstract given by Mr. Pedder shows the work done for conservancy purposes during the last two years :—

		1874.	1875.
Covered drains opened and cleaned	- Miles	162	166
Garbage collected and removed	- Tons	114,891	118,407
Night-soil collected and removed	- „	61,875	65,915
Houses visited and disinfected after infectious cases	- No.	6,546	9,069
Notices served on offenders	- „	4,709	4,924
Summonses ditto ditto	- „	2,344	3,342

These proceedings no doubt show great and increasing activity in public health administration. But reference must again be made to the fact that under a proper drainage system two at least of the items in the list would have been unnecessary.

A moment's consideration will show the waste and inefficiency involved in the present system of drain cleaning. In the accounts the cost of this operation is entered, in round numbers, at 7,457*l.* (Rs. 74,579. 2. 11), representing a capital at five per cent. of 149,140*l.*, which would form a not inconsiderable instalment of the cost of an efficient self-cleansing drainage system.

Again, the cost of removing and disposing of the night-soil by the present abominable process is as follows :—

	R.	A.	P.
Collection	168,732	5	3
Removal	49,252	12	4

or, in round numbers, 21,798*l.*; to which ought to be added the cost of the new night-soil pipe, 1,223*l.*, incurred the same year. The total outlay was 30,478*l.* for work which could have been infinitely better done by a proper drainage system,—a sum which, if capitalized at five per cent. would have enabled 609,560*l.* to be borrowed for drainage purposes.

5. It is necessary to press this view of the financial question once more, because it may be supposed that, after having laid down the new night-soil pipe into the harbour, the abominations of the entire halalcore system may be indefinitely prolonged.

The fact that the municipality, with a revenue of 300,000*l.* a year, can afford to spend so large an annual sum on mere hand labour and its appliances is enough to show that there is no financial reason for any delay whatever in carrying out the sewerage and drainage of the city.

6. The amount of labour required under the present system is stated as follows by the Officer of Health :—

	European Superintendents.	Native Superintendents.	Carts.	Halalcores.	Begarics.
Scavenging and drain cleaning	6	78	266	—	1,309
Night-soil removal	1	5	66	40	8
Night-soil collection	—	46	19	988	—
Total	7	129	341	1,028	1,317

These figures represent the average daily working strength of the establishments. The scavenging, or street cleaning, would, of course, have to be provided for under any system, but, deducting this branch, it may be safely said that all the rest ought to disappear from the municipal accounts, and the general oversight now exercised by the Officer of Health would cease to be necessary. He has nothing to do with superintending scavengers and night-men. His functions relate to other matters. It is not meant to undervalue the work done, even in its present form, for without it the public health would rapidly deteriorate. But it must be a costly and by no means efficient method of doing drainage and sewerage work when it has to be carried out by "2,481 men and women," many of whom have to be mulcted of fines out of their starvation pay by the Officer of Health in order to secure efficiency. The fines last year amounted to 407*l.* Any one interested in learning the difficulties of administering a sanitary system founded on erroneous principles may find instructive facts in Mr. Weir's report, and they will sympathize with him in his opinion when he says :—"If the milch cattle stables were removed from the city, "and if the night-soil carts ceased to pass through our streets, and sweeper's gullies no longer existed, how different would this city appear! How much sweeter would it be, and what a different appearance would its streets present!"

7. The community of Bombay must bear with these risks and nuisances until the city is sewered and drained, but the municipality will evidently have to see to it that after the sewerage is carried out the halalcore abominations are not allowed to continue.

The Officer of Health informs us that the scheme of sewerage, at present popular, provides as follows:—"Night-soil to be removed, as now, from the privies by hand, but, instead of the "night-soil being carried in carts to the Carnac Bunder, it is to be emptied into the sewers at "different central collecting depôts."

It may safely be stated that, if such a scheme be carried out, the sanitary condition of the city will have undergone no corresponding improvement for the vast outlay of keeping up two systems, namely, a sewerage system and a halalcore system. Whatever is done in the way of sewerage, it is a *sine quâ non* that halalcores must cease.

8. So far as can be learned from the reports of past years, as well as from the present one, there have been exaggerated theoretical views put forward as to the danger of house drainage from sewer gas. But every engineer knows how to prevent such occurrences, and it is doubtful if it would occur to any one who knows the subject to provide against the danger by laying down a costly system of sewers, and then to collect night-soil from houses by hand labour to pour into them.

The Army Sanitary Commission has long ago pointed out that in Indian climates provision must be made for freeing the surface of rainfall otherwise than by passing it into underground sewers, and that sewerage, properly so called, must be restricted to removing house sewage. The domestic arrangements for privies, water-closets, &c., must necessarily differ from those at home, which are applicable to people of very different habits than those of the population of India, but there is no excuse in this diversity for keeping up any remnant of the halalcore system for any house in Bombay which has been properly drained. What is apparently required in this case is the aid of a good sanitary engineer, who has had practical experience in dealing with such questions.

9. There are some remarks in the Officer of Health's Report on the present state of the Bombay water-supply which require notice.

It appears that Vehar water varies considerably in quality, and the Officer of Health is of opinion that the amount of vegetable impurity in the water will go on increasing until it becomes injurious to the public health. The Army Sanitary Commission has dealt with this question long ago, and pointed out how the amount may be lessened by proper attention to the gathering ground, and by filtering the supply, which has not yet been done. Not only so, but the water after reaching Bombay is allowed to run into "dipping wells," and is thus rendered impure. Another risk arises from the state of the subsoil through which the water mains have to pass. The Officer of Health says that the great water mains "run through sewers," and that "the water pipes in a portion of the city lie bathed in ordure day and night," and that accidental pollution from this cause has only been prevented by care of the Executive Engineer.

10. While fully acknowledging the great work which has already been done for improving the health of Bombay, it is necessary that pointed notice should be directed to matters capable of remedy, which under less careful management might lead to deteriorated public health.

That this is no improbable future consequence may be learned from the comparative death-rates in the following abstract given by Mr. Weir:—

		Death-rates per 1,000.				
		1871.	1872.	1873.	1874.	1875.
Cholera	- - - -	·41	·29	·14	·03	1·31
Small-pox	- - - -	1·43	2·88	1·11	·40	·38
Measles	- - - -	·43	·61	·20	·54	2·31
All other causes	- - - -	22·66	25·69	22·86	23·07	25·07
Total	- - - -	24·93	29·47	24·31	24·04	29·07

This abstract does not include the fever mortality separately, which is given under the head of "all other causes." The actual fever death-rate was 8·14 per 1,000.

A death rate of 29 per 1,000 in spite of all this sanitary work shows how easily the rate might rise from any relaxation of effort, and also the need of completing the water-supply and sewerage of the city as speedily as possible. As has been said before, "the fetching and carrying" system has shown all that it can do for Bombay.

11. Exclusive of still-born, the total registered deaths in 1875 were 18,734 against 15,496 during the preceding year.

There were 847 deaths from cholera against an annual average of 256 for the preceding five years.

Mr. Weir gives an account of the epidemic in some detail, and, in dealing with its predisposing condition, he appears to consider that poverty and its concomitant, weakened stamina, had much to do with the distribution of the disease. He could find no evidence in support of cholera water poison having been a cause of cholera. Overcrowding and bad ventilation were predisposing conditions. Different classes of the population, arranged according to their physical conditions, beginning with the poorest, experienced the following proportionate cholera mortality:—

	Death-rate per 1,000.
Mahrattas	- - - - 3·62
Mussulmans	- - - - ·74
Bhundarees	- - - - 2·40
Native Christians	- - - - 3·30
Kolees	- - - - 2·07
Mahars	- - - - 2·20

There were only four deaths from cholera "amongst that degraded race who from their cradle " live in the odour of ordure, and whose lives are spent in handling it." This fact is cited as refuting one of the common theories about cholera.

Mr. Weir's opinion that the causes of the outbreak "lay not in the soil but in the people" may be true as regards the surface geology, but assuredly there are facts in his report which leave grave doubts as to whether the sanitary relations of the soil ought to be included in this view.

12. Besides the general sanitary work, the following precautions were taken in affected houses.

The floors were dug up and sprinkled with carbolic acid powder, the walls lime-washed, and where necessary the roofs were taken off the houses and the people turned out. All drains were cleaned and disinfected, and impure wells were shut up by placing a guard over them. All these were excellent precautions.

The result of the experience is summed up as follows:—"The lesson to be learned from the " outbreak is plain. It teaches us that we need not go from Bombay to search for the causes of " the epidemic, that they are in our midst, and that they are to be found in a teeming poverty " stricken population, huddled together in overcrowded, ill-ventilated dwellings; and that, to " eradicate cholera, the masses must have more food and better dwellings, and a higher standard " of living must be adopted. . . . If sanitary improvements and an increasing and plentiful " supply of food advance together, we may look hopefully forward to the time when epidemic " diseases shall be no more in Bombay."

14. So far as this Commission is concerned, Mr. Weir's Report contains quite enough to justify an opinion that the present sanitary state of the city is very far from being such as to warrant expectation of immunity from epidemics.

14. Small-pox occasioned 248 deaths in 1875, a small mortality when compared with the habits of the people in dealing with this pestilence. Mr. Weir informs us that in three fourths of the houses in Bombay where there are small-pox cases "you will find the sick stretched on the floors " or on the beds, and gathered around them the other members of the family, who sit down " beside the sick, and if they happen to be children they take them up and place them on their " laps, fondle them, handle their clothes without the slightest hesitation or fear;" and as in the cold season there is overcrowding, and little ventilation, we have not far to seek for the reasons of those periodical aggravations of the disease which otherwise it is not easy to account for.

The people do not believe in the infectious nature of small-pox, and they regard the disease " as one of the ways by which Providence dispenses its choicest favours." It would be a subject of great interest to determine, by special inquiry, the exact amount of influence exercised by the popular manner of dealing with small-pox patients in these Bombay houses on the spread of the disease within the same house and among members of the same family.

These facts represent the small-pox problem with which the sanitary authorities have to deal, and apparently the difficulties can only be met by persuasion. Vaccination requires further extension, and if the people consider that small-pox has something divine about it, they will scarcely throw the same shield over foul air and crowding. The remedy for all this must be looked for in kindly advice, and the spread of intelligence.

15. Allusion has already been made to the fever mortality of 1875, which is arranged as follows:—

Enteric fever	39 deaths.
Simple continued fever	56 "
Ague	196 "
Remittent fever	4,953 "

The last item in this list suggests inquiry as to the nature of the fevers classed as remittents, and their complications.

Phthisis is credited with 2,364 deaths; diarrhoea and dysentery with 2,265 deaths; respiratory diseases with 2,562 deaths; all showing an increase over preceding years.

A list of district death-rates shows that the mortality differs greatly in different districts of Bombay. In 1875 the highest total rate in 30 districts was 4 per cent. in Kamatheepoora, and the lowest 1 per 1,000 at Middle Colaba.

16. Mr. Weir's Report is concluded by full tables giving an analysis of the annual death statistics, and altogether it is a useful contribution to the sanitary history of the capital of Western India, made by an officer who appears to be a worthy successor to Mr. Hewlett.

But the future permanent improvement of the city is really in the hands of the municipality, on the results of whose action in regard to water-supply, drainage, better dwellings, and generally improved sanitary condition of the city it will depend whether in time to come the somewhat flattering claim to greatly improved sanitary condition made on its behalf in the passage of their address prefixed to these remarks is to be sustained.

23rd May 1877.

(APPENDIX to Memorandum, by Mr. Rawlinson.)

The main sewerage of Bombay has been reported upon so many times that one approaches the question in despair. The cost of cleansing is, however, so great, and the abiding filth is notwithstanding so great, that it is to be hoped this state of things will ultimately compel proper works of main sewerage and house draining to be undertaken. Opening and cleansing covered drains is an item which ought not to appear in the accounts; with such a volume of water as there

is at command, every drain ought to be constructed so as to be capable of being cleansed by water.

As previously explained, it will be a great mistake to sewer Bombay rigidly on principles applicable to climates of moderate rainfall, because of the monsoon rains which deluge the surface, and which no practicable sewers could accommodate.

Any sewers in Bombay must therefore exclude storm water, which must continue to go off over the surface as at present.

With respect to house drains. Any elaborate system of house drain must be avoided, and the simplest conduit be laid, care being taken to so narrow the inlets as to prevent choking by use,—a 3-inch inlet to a 4-inch pipe.

Neither soil-pans nor waterclosets set up on the English plan should be attempted to be introduced in the poorer quarters, as they would not be suitable to the habits and prejudices of the Natives, who will not use a seat, but will stand upon it; this being the case, the privy should be a perforated stone raised, say, six inches above the floor, with the soil-pan beneath. The floor to be constructed of stone or of concrete, that the place may be washed. A single syphon trap as in the soil-pan, which can be flushed out by hand or by hose when necessary, will be all that is required.

The Turkish privies are arranged as above described, but without the syphon trap, and without the drain pipe and small capacity sewers. There are on the Continent, at the railway stations in Austria, latrine arrangements as described. All such latrines or closets must be hand flushed, the water tap being outside. A public scavenger would be required to flush and cleanse neglected and abused soil-pan closets, but this duty would be comparatively easy if only excreta and waste water are discharged down the closets. Wilful choking with solids, or in any way, may be the subject of a fine.

Drains and sewers laid in right lines, with manholes at short intervals, always at junctions, will give facilities for examination and for flushing. The sewers and drains should be so arranged that a choked drain or a choked sewer could be effectively cleansed without pulling up one yard of drain or sewer for cleansing purposes.

The system of sewers and drains should be on an uniform principle,—a lesser sewer or drain joining a larger, and the lesser always joining with its invert above or level with the water line of the larger sewer, or say never joining below the central line of the diameter.

Assume a main sewer, 4 feet diameter. A branch sewer would join 2 feet above the invert, and a 12-inch sewer would join the branch sewer one foot above its invert; and, with pipe sewers, a 9-inch would join a 12-inch, a 6-inch a 9, and a 4-inch join a 6-inch. One purpose of this arrangement being to transmit sewage from the tributaries of 4 inches diameter through branches increasing in diameter to the mains. The fall, or gradient, of a sewer or drain is not so much consequence as is the truth, soundness, and gradation of the drains and sewers. The drains must be truly laid in line and gradient, and be jointed and bedded in concrete, so that water flushing shall not burst the joints, nor the sewage leak at the joints, this truth and tightness being of the utmost importance to prevent leakage of fluids which would leave any solids to accumulate, and so obstruct the drain and in time choke it. Clay for jointing sewer or drain pipes should never be used in India, as it will crack, and probably dry to dust in some cases.

The excreta of human beings are only about the one hundredth part of the sewage, where there is an available water-supply of 25 gallons per head per day, and this is chiefly urine, the solid being only one sixteen hundredth—1 to 1,600. It is the accumulated excreta which cause the greatest nuisance, which, removed in detail, are so insignificant, and, with proper means, as suggested, may so easily be made day by day to pass rapidly away.

A soil-pan should not be within the dwelling house, but may be immediately outside. In India the Natives may not require a privy structure over the soil-pan, but merely a light fence or screen round it, which will be cheaper than a building, as shown on the sketch.

The ashes and other refuse must have a separate place provided for storage, but scavenging at intervals not longer than a week will remove all refuse before it becomes a nuisance.

Before ordering a general construction of house drains and soil-pans, arrangements as sketched, as trial samples, should be put up.

No. 14.

MEMORANDUM of the ARMY SANITARY COMMISSION on the HEALTH RETURNS of BRITISH TROOPS in BOMBAY for 1875.

These reports are chiefly of a departmental character, and do not call for remark. But there are several matters in the "observations" of Surgeon-General Inglis, transmitted with the statistical reports, to which the Army Sanitary Commission are desirous that attention should be directed. These are included in the following paragraphs.

1. The transport service from India to England in 1875-76 was performed by the transport ships "Euphrates," "Malabar," "Jumna," and "Crocodile," two voyages by each ship; one voyage each of Her Majesty's ships "Orontes" and "Himalaya," and a few other invalids were sent home in the Peninsular and Oriental Company's steam ship "Deccan."

The following were the numbers embarked in India:—

Officers	-	-	-	398
Ladies	-	-	-	121
Children	-	-	-	174
Men in health	-	-	-	4,690
Women, ditto	-	-	-	606
Children, ditto	-	-	-	2,001

The invalids embarked were:—

Men	-	-	-	-	2,464
Women	-	-	-	-	334
Children	-	-	-	-	805
Insanes (including 1 woman)	-	-	-	-	63

Besides these, there were 120 ignominy men and convicts sent home.

2. In a Memorandum of the Commission on the Report of the Sanitary Commissioner with the Government of India, printed in the 8th volume of the India Office Sanitary Reports, attention was called to the large proportion of invalids embarked in India during the cold season; assuming this season to last from the 1st October to the last day of March, nearly 95 per cent. of the invalids embarked in five years had done so during the cold season, thereby losing the advantage of the cold season in improving their health, while at the same time being exposed to risk from sudden change to the colder climate of England. There was a considerable improvement in this matter during the year 1875-76, for out of the total invalids, amounting to 2,464, the number embarked after the end of March was 1,048, or about 45½ per cent. of the whole number.

3. The number of troops embarked in the United Kingdom and arrived at Bombay during the trooping season 1875-76 in eight voyages of the troop ships already mentioned were:—

Officers	-	547	Men	-	7,581
Ladies	-	100	Women	-	742
Children	-	79	Children	-	953

together with 28 female servants.

Between the 1st November and the 17th December (probably arriving at their stations before the hot weather) there were disembarked at Bombay 272 Officers and 3,916 men, or above half the number; but the remainder, 275 Officers and 3,665 men, were disembarked on the 7th and 23rd February and on the 8th and 24th March, thus leaving England in the winter and early spring, and arriving probably at their stations in the Indian summer.

The great importance of the time of arrival at stations in its effect on death and inefficiency rates has been discussed by the Commission in their Memorandum on the results of late arrival to the 11th Brigade, Royal Artillery, during the year 1874.

The following were the casualties during the voyages from England to Bombay.

The only deaths out of 7,581 men were 2 on board the "Jumna," with 1,014 troops on board. equal to an annual death-rate on the whole number embarked of a little over 3 per 1,000. Unfortunately, the Assistant Quartermaster-General's return at Bombay does not specify the causes of death. There were no deaths among the 742 women embarked.

Among 953 children there were the following cases of sickness and death:—

	Strength.	Deaths.	
"Euphrates," 1st voyage	- 98	- 3	(of diseases caused by prostration; scarlet fever).
"Malabar," 1st voyage	- 157	- 5	(1 suffocation, 2 diarrhœa, 1 mesenteric disease, 1 meningitis).
"Jumna," 1st voyage	- 126	- 4	(out of 34 cases of measles).
"Malabar," 2nd voyage	- 140	- 2	(convulsions and measles).

All the other voyages were healthy.

The 14 children's deaths give an annual death-rate of about 17½ per cent., but apparently some of the fatal cases were due to the state of the children when embarked, and cannot be charged against the voyages.

In the case of the "Euphrates," the Medical Officer took the excellent precaution of landing one affected family at Gibraltar and other two at Suez.

The "automatic" ventilator, which depends for its action on the rolling of the ship, was in use on board the "Malabar," and appears to have been effective as long as the rolling continued, but the Medical Officer in charge says: "When we were going on an even keel I fancy its results were *nil*." That is, the great merit of the system is that, when the weather is very rough, ports closed and hatches down, in short, all natural ventilation cut off, this contrivance is at its best. But on board vessels having steam machinery there ought to be no difficulty in keeping air pure in every corner of the ship and at all times.

4. Unfortunately, the sanitary condition of British troops within the Bombay Presidency was by no means so good as was the health of troops on the passage out. This will be seen from the following data taken from the Surgeon-General's observations:—

Average strength	-	-	-	10,342
Admissions to hospital	-	-	-	14,188
All deaths	-	-	-	214
Invalided	-	-	-	628
Average daily sick	-	-	-	584

The death-rate was no less than 20·69 per 1,000, higher than in any year during the preceding 10 years, except 1865, when the rate was 36·34 per 1,000, and 1869, when it was 21·54 per 1,000. Including these exceptionally high death-rates, the average of the 10 years was 17·64 per 1,000, or 3 per 1,000 lower than in 1875. These rates may be compared with the death-rate among Officers in the Bombay Command during 1875, which was 19·28 per 1,000. The average constantly sick, 56·47 per 1,000, was not unusually high. The admission-rate was 1,372 per 1,000. The invaliding rate was no less than 60·72 per 1,000, but the Surgeon-General states that the increase is due to a change in the invaliding periods, whereby the number invalided, but not the number embarked, is shown. Any way, there can be no doubt that 1875 was what is called an unhealthy year for the Bombay Army.

5. The deaths among 9,777 men on active service at 22 stations amounted to 204, a little over 20 per 1,000. The death-rates at five of these stations gave the following results :—

	Strength.	Deaths.	Ratio per 1,000.
Baroda - - - -	357	20	56·02
Kurrachee - - - -	755	17	22·52
Poona - - - -	1,384	28	20·23
Mhow - - - -	1,256	25	19·90
Neemuch - - - -	436	25	57·57
Total - - - -	4,188	115	27·4

The remaining 17 stations, with an aggregate strength of 4,569, yielded 89 deaths, = a death-rate of 19·3 per 1,000, or 8 per 1,000 fewer.

These averages are both very high, especially for Bombay, and the next thing is to learn what was the cause of this.

6. The year 1875 was a *cholera* epidemic year, and this disease gave rise to the following mortality in the Bombay Army :—

	Cases.	Deaths.	Ratio per 1,000 Strength at Stations.
Men - - - -	83	54	5·5
Women - - - -	8	5	4·3
Children - - - -	13	7	3·

Had there been no cholera, the station death-rate among men would have been 14½ per 1,000. The excess of mortality in 1875 was thus due mostly to epidemic cholera, as is clearly shown by the following abstract :—

	Cases.	Deaths.	Per cent. of total Deaths.
Cholera - - - -	83	54	25·23
Enteric fever - - - -	42	18	14·49
Continued ditto - - - -	542	4	
Ague - - - -	3,919	1	
Remittent - - - -	321	8	8·88
Hepatitis and abscess of liver - - - -	388	19	
Phthisis - - - -	—	13	6·07
Sunstroke and apoplexy - - - -	61	23	10·28
Dysentery - - - -	—	9	6·08
Diarrhœa - - - -	—	4	

One fourth of all the deaths during the year were due to cholera. The enteric fever mortality was one third of the mortality from cholera, and this proportion was exceeded by the death-rate from diseases more or less connected with intemperate habits, viz., hepatic and cerebral diseases, which together occasioned upwards of 19 per cent. of all the deaths of the year.

There is not much information in the Report regarding removable local conditions allied to the prevalence of the more fatal diseases in this table, but there is enough to show a high probability that such conditions exist.

Cholera showed the following mortality among men at the stations where it appeared :—

	Cases.	Deaths.	Ratio per 1,000 Strength.
Neemuch - - - -	26	20	46·
Poona - - - -	17	10	7·2
Baroda - - - -	15	9	25·2
Mhow - - - -	10	6	4·7
Kirkee - - - -	6	3	6·5
Khandala - - - -	4	2	*250·
Ahmedabad - - - -	2	1	4·
Ahmednuggur - - - -	1	1	2·4
Nusseerabad - - - -	1	1	1·7
Delhi - - - -	1	1	—
First nine Stations, deducting } Delhi - - - -	83	54	10·28

* Only 8 men, 2 died ; they were sent there for quarantine.

7. These various death-rates prove that the intensity of cholera varied much at different stations, or that its local favouring conditions varied.

Out of 22 stations 13 escaped, and in those affected the death-rates varied between 1·7 and 46 per 1,000 strength.

Beginning with Neemuch, we find it stated that the F Battalion, 9th Brigade, Royal Artillery, 160 strong, had 23 cases and 18 deaths from cholera, a death-rate of about 11 per cent. of the strength. The battery was moved into camp 11 days after the disease appeared, and 3 cases had proved fatal. Two deaths took place in camp, and another move was made. There were then two fatal cases, and the camp was shifted the third time. This change was followed by eight deaths, and the camp had to be abandoned.

The question naturally suggests itself whether the battery should not have been moved as soon as cholera appeared in the station or vicinity; and the facts appear to show that the move after 11 days' delay was useless, if not injurious.

The practice at Mhow, where the disease broke out in the same locality as it did in 1872, was to vacate the buildings whenever a case occurred. In this way about half the regiment (the 68th) was in camp, and no cases occurred there. The disease was very malignant in character, and occasioned six deaths out of a strength of 477 men, = $12\frac{1}{2}$ per 1,000.

The experience appears to be in favour of immediate removal of troops from affected localities, and taking care that camping grounds are also at a distance from places where cholera prevails.

No account is given of the sanitary condition of affected stations.

8. The next most important death cause, viz., *enteric fever*, showed the following mortality at affected stations:—

Enteric Fever Deaths.	
Kurrachee	7
Poona	3
Belgaum	2
Tarraghur	2
Mhow	1
Deesa	1
Ahmedabad	1
Baroda	1
Total	18

The station at which the largest number of cases took place was Kurrachee. There were in all 11 cases, 5 in D battery, 4th Brigade, Royal Artillery, and 6 cases in the 56th Regiment.

The Medical Officer of the Royal Artillery states that the "enteric cases were doubtless due to some local cause which I have been unable to ascertain, there being nothing in the sanitary condition of the lines or vicinity to account for its origin."

Unless radical improvements have been carried out at this station since last year, this view of the Medical Officer is not in accordance with statements made in the Report and Health Returns for British troops in Bombay for 1874. It was therein stated, as accounting in some measure for seven cases of enteric fever at Kurrachee, that there was fœcal contamination of the air by a Native latrine and foul mud flats to windward.

The Medical Officer of the 56th Regiment gives a similar opinion as to the absence of apparent local causes. But he also makes an important statement on the development of enteric fever which has been received from other parts of India, and deserves notice. He says: "The six cases were admitted under the head of ague. The intermissions were well marked. In the course of a few days, generally about five or six, the intermissions ceased, the fever becoming continuous, with high temperature and diarrhœa; as the disease progressed, the symptoms of enteric fever were well marked, but in none of the cases were spots observed, although carefully watched for. Of the six cases four recovered and two died." Similar facts have been observed in this country. In one such case where fever cases occurred at a station they were, when admitted to hospital, of simple continued type, and become typhoid afterwards. But it was found in this instance that the air outside which supplied ventilation to the wards was polluted by emanations from a large sewage tank and pigstyes to windward. It may be suggested whether in such cases the surroundings of the hospital may not be to blame also in India.

9. *Intermittent Fever*.—This important inefficiency cause is subject to considerable variations in its incidence in particular years, and hence the experience of 1875 only represents the amount of fever for that year.

The lowest percentage of attacks was 9·09 at Ahmednuggur, but in 1874 it was 25 per cent. there. In like manner Mount Aboo had 44½ per cent. of its strength attacked in 1875, and 85 per cent. during the previous year.

The highest ague rate of 1875 was 105·86 per cent. at Bombay, more than the whole strength. But during 1874 the percentage was about 62 only. The other stations can be arranged in series between the extremes. All were affected, but, on the whole, the amount of intermittent fever is diminishing, as appears from the following admission-rates per 1,000 from this disease:—

Ratios per 1,000 Strength.	
1870	542·67
1871	518·36
1872	483·07
1873	410·94
1874	327·28
1875	378·90

The universal prevalence of these malarial fevers can be considered in no other light than as evidence of local malaria existing within or in the vicinity of stations, and as pointing to the urgent necessity for local investigation and remedy.

10. There is not much information in these papers on the subject of local causes connected with the appearance of these diseases, but the following points may be noted.

Colaba.—Infantry barracks too close together, not raised on sufficiently high plinths, and in some there are objectionable mud floors.

Baroda.—Barracks old, and defective in general construction.

Ghorpoorie.—Barracks having many defects, Government has ordered an inquiry, with a view to improvements.

Aden.—Guard-room accommodation defective.

Nusseerabad.—Surface drainage of Artillery lines "most defective."

Poona.—Surface drainage at Ghorpoorie generally unsatisfactory. This matter is under consideration.

Colaba.—Surface drainage "very much required;" some improvements being made.

11. *Ventilation*.—On the whole satisfactory, but at Ghorpoorie, Poona, and Colaba it is impeded by the bungalows being too close together.

12. *Warming*.—Cold very severe in Sind for two or three months in the year. Means of warming desiderated by Medical Officers.

13. *Flooring*.—At some stations (as Colaba, Ghizree, and Kirkee) there are still objectionable mud or earthen floors.

14. *Abution and Bath Accommodation*.—Requires improvement at Ghizree, Deesa, and the old Infantry barracks at Mhow (this last is to be remedied).

15. *Latrines*.—Dry earth is universally adopted, except at two or three stations. But suitable mechanical arrangements, which are part of the system, are not supplied, and the men neglect to use the earth. Surely this defect should be remedied.

16. *Water-supply*.—Stated to be "generally good and abundant." This fact apparently requires special chemical verification at stations which have suffered so much from cholera.

At Kurrachee a large filter has been provided, but the filter bed had been in use for above 12 months without renewal, and the impurities have "converted the sand and charcoal into a solid mass, through which the water will not penetrate; the filter has ceased to act, and is at the present moment quite useless." The old chatties had been called into use. These facts require only one comment, viz., that unfortunately no sanitary appliance is for ever self-acting. To ensure their continuous action, by inspection or otherwise, is an obviously essential part of the apparatus.

Nusseerabad had not yet received its water-supply.

17. *Hospital Accommodation: Colaba*.—The position of the hospital is reported "bad, being on low ground, and shut in by new Artillery barracks."

Ahmedabad.—The hospital had been destroyed by a flood, and was not yet replaced.

Wanowrie (Poona).—Site, plan, and surroundings of hospital reported objectionable.

Deolali.—Hospital accommodation quite inadequate during the trooping season.

Mhow.—"A female hospital is much wanted."

18. In connection with local sanitary defects, the following experience may be given. *D/C, Royal Horse Artillery*.—This battery left Kirkee, and was stationed in camp at Bombay at the arrival of His Royal Highness the Prince of Wales. The battery was very unhealthy. "The increase of admissions was chiefly from fevers, diarrhoea, dysentery, and hepatitis." The increase, especially in the three latter diseases, is attributed by the Medical Officer to the following cause:—"The ground on which the tents were pitched is said to have been extremely damp, having only a short time previously been covered with monsoon water. The heat in the tents, too, was great, 88° to 90° F., and when the battery returned to Kirkee, the change from the low-lying, damp encampment and moist atmosphere of Bombay to the elevated position and dry climate of the Deccan seems to have developed into activity the germs of disease sown in Bombay."

If going and returning from Bombay be a necessary portion of military duty on occasion, it is by no means evident that the other part of the proceedings described by the Medical Officer need have taken place.

The experience is useful as showing the persistent effects of badly chosen ground.

The *27th Fusiliers* suffered considerably from sickness at Poona, the persistent character of which led to a committee of inquiry into the state of Wanowrie barracks, which it is hoped will lead to the necessary improvements being carried out.

19. *Venereal Diseases*.—There are now lock hospitals at 12 stations of British troops in Bombay Presidency, and 10 stations are without them. The only statistical data in the present papers are those relating to the amount of disease among the troops, so that there are no means (on account of the departmental character of the returns) of testing the probable utility of these establishments by showing the nature and number of cases treated in them. There is, however, a table showing the amount of disease among troops for the last 10 years, as follows:—

Years.	Ratio of Admissions per 1,000.	Years.	Ratio of Admissions per 1,000.
1866 -	206.6	1871 -	160.0
1867 -	209.6	1872 -	148.8
1868 -	197.9	1873 -	179.4
1869 -	157.2	1874 -	164.0
1870 -	184.0	1875 -	160.5

These figures for the later years, during which lock hospitals have been in use, apparently show some reduction in ratios, but not much.

The admissions from all classes of venereal affections in 1875 were for protected stations 147 per 1,000, and for unprotected stations 199 per 1,000, showing an apparently more favourable result than in other parts of India.

20. *Women and Children.*—It will be seen from the following abstracts that the death-rates in soldiers families have been diminishing:—

Deaths per 1,000 strength.

	Years.	Women.	Children.
1869	- - -	41·12	140·72
1870	- - -	26·39	78·09
1871	- - -	18·04	68·55
1872	- - -	33·08	94·71
1873	- - -	15·90	50·91
1874	- - -	18·53	58·80
1875	- - -	18·03	76·73

The chief death causes in 1875 among women were cholera and fever, and among children, dysentery, diarrhoea, convulsions and teething, which occasioned 56 per cent. of the mortality.

21. *Sanitary Progress.*—A statement is appended to this Report, showing the action taken in the Quartermaster-General's Department to remedy the defects pointed out in it, from which it appears that several defects have been already remedied, and others of a more extensive character are under consideration.

There is also a return appended showing the number and description of new barracks, hospitals, &c., taken into occupation by British troops in 1875. This return comprises the following items:—

1. A permanent contagious diseases hospital at Mhow.
2. A permanent block of family quarters at Neemuch.
3. A similar block at Tarragurh.
4. Six single story barracks (semi-permanent) in the Artillery lines, Colaba.
5. Three temporary female wards, Bombay.
6. Three new upper storied barracks at Belgaum.
7. New barracks at Purandthar.

In conclusion, reference may be made to the preceding paragraphs to show the general results to health of the present condition of the stations. But the departmental character of the Surgeon-General's remarks have precluded him from entering into local details. Attention may nevertheless be called to the experience derived from cholera, enteric fever, and ague in 1875, as showing the high probability of the presence of local disease causes productive of malaria, atmospheric impurity, and water pollution at some stations. An unhealthy year is mainly due to the reaction of atmospheric causes on removable local conditions, and it is not satisfactory to find deterioration of health marked by higher death-rates and increased invaliding after so much has been done in the way of improvement. At all events, some inquiry into the subject appears to be called for.

5th June 1877.

No. 15.

MEMORANDUM of the ARMY SANITARY COMMISSION on the MEDICAL and SANITARY REPORT of the NATIVE ARMY of BENGAL for 1875.

This Report gives a very full and interesting account of the medical and sanitary history of the Bengal Native Army for 1875. It contains much detail of a purely departmental character, not requiring special remark by the Army Sanitary Commission, except in a few cases where practical facts of importance are given by Medical Officers to which attention may be called with advantage.

It is proposed to confine the following remarks to points of this class, and to the general results of the year's experience.

1. The total strength of the Bengal Native Army in 1875, including Madras troops, was as follows:—

	Present.	Absent.	Total.
Bengal Army - - -	53,617	9,177·5	62,794·5
Madras - - - - -	3,466·6	207·3	3,673·9
Total - - -	57,083·6	9,384·8	66,468·4

Out of the strength *present*:

The admission rate was, for—

Bengal troops - - - - 1,287·5 per 1,000
 Madras „ - - - - 897·7 „ „

On the same strength the daily sick were, for—

Bengal troops	- - - -	40·3 per 1,000
Madras „	- - - -	26·2 „ „

The death rates to *total* strength were—

Bengal troops	- - - -	16·3 per 1,000
Madras „	- - - -	14·2 „ „

When these rates were compared with the averages of the preceding 10 years they give the following results for Bengal troops :—

	Per 1,000 Strength.		
	Admissions.	Deaths.	Daily Sick.
Average of 10 years, 1865 to 187	1,384·3	18·5	43·8
1875 - - - -	1,287·5	16·3	40·3

This abstract shows improved health in the Native Army for 1875.

2. The death and inefficiency rates differed remarkably in different districts of Bengal Presidency. The highest death-rate, 29·1 per 1,000, took place in the Presidency district. The death-rate in Peshawur district was 23·4 per 1,000. The lowest death-rates, from 2·2 to 8·7 per 1,000, took place in Saugor, Allahabad, Rawal Pindee, Rohilkund, and Oude. The highest admission rate, 1,805·5 per 1,000, was in Peshawur district. The lowest, 696 per 1,000, was in Rohilkund. The daily sick were 66·8 per 1,000 in the Presidency district, and 26·2 per 1,000 in Rohilkund, which were the highest and lowest rate of the year.

3. An instructive illustration is afforded by Statement No. IX. in the Report of the difference between average death-rates and the actual facts. This statement divides the average death-rate of 1875, viz., 16·3 per 1,000, into the ratios due to 102 bodies of troops scattered over the Presidency. In 42 of these bodies the death-rate was under 10 per 1,000 strength, in other 34 bodies it lay between 10 and 20 per 1,000. In other 15 between 20 and 30 per 1,000. In seven it was between 30 and 40 per 1,000. In one the death-rate was above 45½ per 1,000. In another body it was about 51½, in another about 52½, and at Barrackpore, where the highest death-rate of the year took place, in the 10th Native Infantry, the death-rate was 64·4 per 1,000. Surgeon-General Fullerton Beatson, in his instructive report prefixed to those of the Regimental Surgeons, says, with respect to this table : “ It will be observed that the mortality of 43 regiments and batteries has exceeded 1·63 per cent. of strength, which was the death-rate for the entire army during the year 1875; and that 35 of them were stationed in the commands which I have already pointed out as being notably unhealthy for Hindustani troops.”

4. The following abstract gives the total admissions from the more important diseases in 1875 :—

Total strength Bengal troops	- - - -	-	62,794·5
„ Admissions	- - - -	-	69,036
„ Deaths	- - - -	-	1,026*
Diseases.	Admitted to Hospitals.		Died.
Ague -	-	33,262	89
Other fevers }	-	706	62
Enteric fever }	-	11	4
Cholera -	-	132	58†
Rheumatism -	-	2,556	2
Chest diseases	-	2,992	211
Dysentery -	-	3,703	38
Diarrhœa -	-	1,921	32

In round numbers, one half of the admissions and deaths were due to these diseases.

5. *Ague*. The great prevalence of malarial fevers is the first important fact in this digest. So far as is known, these fevers must primarily be traced to a malarial condition of subsoil due to defective drainage and the state of agriculture connected with it. On this important matter attention may be directed to the following remarks of the Surgeon-General, which appear to embody the results of the regimental reports :

He says, “ I have long been of opinion that the drainage (surface and subsoil) of many military cantonments is defective, and that it has been one, if not the principal, of the causes on which outbreaks of cholera and of malarial fever were dependent. * * *

“ I should like to see any one station of known unhealthiness *thoroughly* drained. The result might be worth the outlay. That the drainage of a good number of regimental lines was not efficient there is evidence in the sanitary reports; thus in the lines of the 10th Regiment Bengal Infantry at Barrackpore it is reported that at certain seasons the drains serve as inlets for the river water and that from tanks. They thus become reservoirs of the surface filth of the station, and give off most offensive odours when drying up” (the 10th Bengal Infantry, it may be remarked in passing, is the regiment already mentioned as having had a death rate of 64½ per 1,000 in 1875). Of the Sappers and Miners lines at Roorkee, it is stated that “ there is a

* 674 in hospital.

† Exclusive of deaths on furlough, which amounted to 28.

" great deal of solar evaporation when silt or badly constructed culverts choke the outfall. * *
 " At Gowhatty the lines are situated in the centre of a low swampy tract of ground from which
 " there is no natural drainage, and the artificial substitute for it is described as being as imperfect
 " as can well be imagined. The subsoil water throughout the station is at no greater depth than
 " one or two feet from the surface." (If stations with these fundamental defects must be occupied
 why should not the Burmese plan be adopted of raising the barracks on piles, say 6 or 8 feet
 above the ground level?) " The medical officer of the 25th Regiment Bengal Infantry at Meeran
 " Meer considers that the sickness of the regiment was caused by the heavy rainfall in October,
 " November, and the early part of December, conjoined with defective drainage. Wet encamp-
 " ing grounds along the line of march of the 4th Ghoorkas to the Delhi Camp were, along with
 " the effects of the climate, considered to have been the cause of a good deal of sickness in the
 " regiment. The fever cases which occurred in the 5th Regiment Bengal Light Infantry at
 " Meerut were considered to have been caused by the swampy condition of some ground close by
 " the lines after the rains.

" The lines of the 17th Native Infantry at Morar, situated between the confluence of the Morar
 " and Biswas rivers, are considered to be unhealthy."

Connected closely with the results of defective local drainage is a damp state of huts and hut
 floors, close to the level of which the men sleep. Given this condition, together with those defects
 mentioned in the drainage reports of the stations, the general results of which have been sum-
 marised in the passage quoted from the Surgeon-General's report, and we have the fundamental
 conditions on which predisposition to malarial fevers depends. These are of course intensified
 by defective diet, on which many men of their own choice try to live, defective clothing, a matter
 which will be again referred to, and great diurnal variations of temperature. Except the last-
 named condition, all the others admit of improvement or prevention, and a diminution of malarial
 disease might confidently be expected to result. In connexion with this subject, it appears
 necessary to call pointed attention to the case of the 10th Regiment Native Infantry at Barrack-
 pore already mentioned, as given in the inspection report as follows: " On the morning of his
 " inspection Mr. Cockburn inspected all the men of the regiment who were off duty, and they
 " were considered by him to be as a rule sickly looking and badly nourished, and four-fifths of
 " the men in hospital were found to have more or less enlargement of the spleen, and a large
 " proportion also were suffering from scorbutic symptoms. The excessive amount of sickness
 " during the year was chiefly due to malarious poisoning accompanied by a scorbutic taint due
 " no doubt to the want of a sufficiently varied dietary, and the abstention from fresh vegetable
 " food." There were 50 per cent. of the men in hospital. Even in hospital the patients retained
 money which ought to have been spent on proper diets. The facts are of so obvious a nature
 that it is only necessary to state further that marked improvement took place as soon as care was
 taken that the men fed themselves properly. The low state of the regimental health was in this
 case a predisposing condition to the attacks of malaria. There is no doubt that this was a
 typical case, and that its lessons ought to be applied practically in all Native regiments.

6. *Pulmonary Diseases.* In former Memoranda the Army Sanitary Commission called attention
 to the great prevalence of pneumonia in Native regiments, with a view to inquiry being made into
 its causes, and the present Report contains much useful information on this subject.

The following statement No. XIII., copied from the Surgeon-General's Report, will give an idea
 of the extent to which chest affections have contributed to the inefficiency of the Native Army
 of Bengal:—

Years.	Bronchitis and Bronchial Catarrh.		Pneumonia.		Pleurisy.		Other Diseases of the Chest.		Total Chest Diseases.	
	Admitted.	Died.	Admitted.	Died.	Admitted.	Died.	Admitted.	Died.	Admitted.	Died.
1871	1,668	66	624	149	233	13	366	7	2,891	235
1872	1,909	61	498	103	187	8	353	16	2,947	183
1873	1,792	52	536	87	238	13	307	9	2,873	161
1874	1,749	25	544	111	209	8	248	7	2,750	151
1875	1,769	18	701	177	189	11	263	5	2,922	211

The most fatal of these diseases, pneumonia, gave rise to 177 deaths in 1875, or 25 per cent. of
 the cases. These diseases are most prevalent and fatal in Upper India and on the Punjab
 frontier at stations where there is considerable variation of temperature. It is a mistake to
 suppose that Indian stations are always hot. In the present report it is shown that at Mooltan
 the temperature has been as low as 42° F.; a fact which indicates a great diurnal range. Long
 ago the Royal Commission on the sanitary state of the Indian Army called attention to the
 importance of this temperature element at many Indian stations; and its influence on the
 prevalence of pneumonia and other chest diseases is shown in the present report.

The Surgeon-General informs us that medical officers are not quite agreed as to the etiology
 of pneumonia. It sometimes appears in a number of simultaneous cases, putting on the appear-
 ance of an endemic attack, and some of the phenomena have been considered to admit of
 explanation by assuming the contagious nature of the disease, an assumption leading directly away
 from the means required for mitigating its attacks. Facts extending over a number of years are
 still required to elucidate all the causes of pneumonia. We must, however, deal with those which
 have been arrived at, and take what practical good we can get from them.

Here, for example, are one or two facts: the 5th Punjab Infantry left Dera Ghazi Khan, which
 has a sub-tropical climate, on October 15th, 1874, for Abbottabad which has a winter cold similar

to that of the South of England, and arrived there on November 23rd. The regiment had a few cases on the march, but after their arrival at Abbottabad the disease increased rapidly; it carried off between 20 and 30 victims until the middle of March, when, with genial weather, the attack subsided.

At Peshawur the medical officer says: "When the thermometer is down to 52° or 51° during a great part of the day, with a cold cutting wind, and rain hanging about, then is the time to expect cases of pneumonia."

Another medical officer says: "The cause of pneumonia and pleurisy I believe to be exposure to the cold. It has always been a matter of surprise to me how Natives, poorly fed and often indifferently clad, resist exposure to cold in open barracks and flimsy tents in which Europeans would be most miserable."

Suppose Native troops, under such conditions, removed from the hot steaming plains of Bengal to the frontier stations of the north-west, and exposed to their cold and variable climates, it is not difficult to predict what would happen.

At these stations one medical officer considers that pneumonia is their "bête noir."

The result of the investigation, so far as it has gone, is summed up practically by the Surgeon-General, as follows: "The medical officer of the Guide Corps, when remarking on the freedom of the regiment from pneumonia during the past year, states that he attributes it to the capital clothing and the care that was taken to ensure the men when off duty being warmly clad, and his experience, gained during some years service on the north-west frontier, leads him to look on neglect in respect of warm undress clothing as the principal if not only cause of pneumonia. I consider the principle is all but universally applicable. Insufficiency of the diet and scanty supply of warm under clothing are the chief agents in the production of the bulk of the diseases from which Sepoys suffer."

Restricting the application of the principle here laid down to the present question, the Commission is desirous that special attention should be given to ensure as far as practicable, that the Sepoy feeds himself properly in order that he may be able to render the service the State requires of him, and that he be suitably clothed to meet the requirements of variable cold climates he may be called on to serve in. If attention be paid to these matters there is every reason to believe that the amount of fatal chest disease in the Bengal Native Army will speedily be reduced.

7. *Cholera*. The year 1875 was a cholera epidemic year, and yet there were only 132 cases and 58 deaths among troops at stations. The cholera mortality at stations was thus less than one third of the mortality from pneumonia (177 deaths).

It is unnecessary to discuss this portion of the report under review as the facts have been already noticed on other papers.

8. *Conservancy*. Increased attention is evidently being given to the immediate conservancy of cantonments; but at a number of stations the ground in the vicinity is in such a condition as to be a source of risk to health. Take for example the following facts about Alipore: "The latrines for the lines have been condemned over and over again. They are nearly half a mile distant from the lines, and were in a most filthy condition; the smell at times, especially when the wind blows towards the lines, being exceedingly offensive. How far the condition of this latrine is conducive to or productive of bad dysentery so prevalent among the men at Alipore is in my opinion a question well worthy of consideration."

It certainly is so, as it has been observed that even in England with its colder climate dysentery has arisen from emanations of similar filth carried by the wind from a distance. Generally in India wherever there is filth smell there is danger of bowel disease.

The regimental reports give many instances in which ground about stations is fouled by the men. It may be suggested whether the cheapest and most efficient manner of dealing with this practice would not be to supply a sweeper to cover up all deposits of this kind at once with earth.

In this way the Native habit might be continued on selected areas of ground to be alternately cultivated without risk to health.

The Surgeon-General states that "nullahs in or near cantonments generally become the receptacles for filth of all kinds. Their sides are overgrown with jungle, and, except in very dry weather or in very dry climates, they generally contain a greater or smaller quantity of stagnant and very filthy water. These nullahs on this account require constant supervision, otherwise they may in all probability become causes of sickness." We entirely concur with this view.

9. *Water-Supply*. At most stations of Native troops the water sources appear to have been undergoing improvement. But there are complaints against the water in several reports. At Peshawur the water is reported as very impure.

Water used during the cold season at Edwardesbad is taken from an open channel, two miles long, which runs through cultivated fields. Other similar cases might be given, but there are also cases of improved health from the introduction of better water.

10. *Badly fitting Boots* caused 2,542 admissions to hospital in 1875. Several facts are mentioned in the reports on this old cause of complaint which appear to show that it is attracting the attention of the authorities but not with much success apparently, as yet, if we may judge from the statistics.

11. *Gymnastics*. The following passage from the Surgeon-Generals report contains satisfactory information on this subject. He says: "The training the Sepoys now undergo in station and regimental gymnasia wherever reported on has been highly useful in setting them up and in developing their muscles and general physique, and is moreover quite in keeping with the natural

“direction of the sepoy's inclination.” Every British and Native soldier in India should be trained in these exercises.

12. *Huts.* Although barrack accommodation has been extended during the year, little appears to have been done in improving the sepoys' huts, which can still be described by the Surgeon-General as “small, low, badly lighted,” and affording indifferent accommodation. The whole question of hutting is so intimately connected with the question of sites and subsoil drainage that these points require to be considered together, for there is no doubt that bad locality and inferior hutting accommodation have much to do with the existing ill-health and predisposition to malarial diseases among Native troops. If further proof of this fact were required it would be supplied by the following experience given by the Surgeon-General of the beneficial results of leaving localities of this class. He says: “Every one of Indian experience is aware of the benefit which accrues to health from marching and camp life in the North-West Provinces, Oude, and the Punjab during the cold weather, and the opinions recorded in several sanitary reports as to the good effects which camp life exerted on the health of the men (some of whom were much debilitated as a result of duty in unhealthy stations) fully corroborate this belief. All the medical officers agree that the marches in ordinary course of relief were attended with good results.”

13. Although, taking the year's experience as a whole, these reports generally show improving sanitary condition of stations and improved health of Native troops, it is impossible to overlook the large excess of malarial diseases prevalent among them, and the high death rate from chest diseases, especially from pneumonia.

There is no mystery about the removable causes of these death rates; they are, on the contrary, of a very obvious nature: these are dampness of sites, low damp huts as cherishing fevers, deficient clothing as leading to fatal chest diseases, and defective dieting of themselves by the men as reducing their disease-resisting power. Now all these causes of inefficiency in the Native Army are absolutely removable, although their removal may necessitate innovation on old systems.

There are many localities where the Burmese hutting system might be introduced with immediate advantage. Again, the importance of warm clothing in the northern parts of India cannot be over estimated. During the winter months the cold at night is intense relatively, and there is frequently a range of from 40° to 50° F. in the 24 hours. Pneumonia, pleurisy, and other chest affections, may well occur under such conditions, and fever too, if the men have previously suffered from malarious poisoning. Better protection against these extremes of temperature is essential. As regards food, sepoys in Bengal are apt to suffer from inferior food as they find rice cheaper than flour. They should as far as possible be induced to live on the food they are accustomed to, instead of on the cheaper less nutritious food.

The choice before the authorities appears to lie in one or two directions, either to leave matters to follow their own course, or else to recognize the great importance of the disease causes which have been brought so prominently forward in the report under review and to make an effort to deal with them in the best practicable way.

Lastly, improvements in station drainage, latrines, water supply, and sanitary regulation should be pressed forwards, and the Commission concur in the view of the Surgeon-General as to the practical advantage likely to result from the thorough subsoil drainage of some one unhealthy station, a measure proposed by them long ago as worthy of trial.

24th July 1877.

No. 16.

MEMORANDUM of the ARMY SANITARY COMMISSION on the MEDICAL and SANITARY REPORT of the NATIVE ARMY of MADRAS for 1875.

This Report consists of an instructive digest of medical and sanitary facts contained in a communication from Surgeon-General E. G. Balfour to the Madras Government, followed by reports on the medical and sanitary condition of each division, station, and regiment of the Madras Native Army for the year 1875. Much of the detail is, as usual, of a purely departmental character, not coming within the sphere of the Army Sanitary Commission, but not many reports on the same subject hitherto received from India have contained so much information on the sanitary state of the Native Army, or shown a more enlightened appreciation of the real importance of the sanitary element to the efficiency of Native troops.

It is proposed in the remarks which follow to call attention to the more important points in the Report bearing on this subject, and to the practical principles which may be deduced from them.

1. The average strength of the Native Army of Madras for the year 1875 was—

Total strength	-	-	-	-	-	30,256
Absent	-	-	-	-	-	2,465
Present	-	-	-	-	-	27,791

The number of “absent” amounted to 8·14 per cent., the largest proportion of any of the five years given in the Report, and is probably explained by “the progressive facilities for sending away sick men to a distance for change of air.” However desirable this measure may be, its probable effect in lowering the death and raising the apparent inefficiency rates of the Native Army is not to be overlooked.

2. The next abstract gives the rates per 1,000 from inefficiency causes for 1875, contrasted with the same data for the three preceding years :—

Years.	Ratio per 1,000.				
	Admissions.	Daily Sick.	Total Deaths.	Invalided for	
				Discharge.	Sick Leave.
1872 - - -	1,011·5	31·1	12·2	17·2	22·2
1873 - - -	874·6	29·1	9·2	19·4	18·2
1874 - - -	812·0	30·6	9·9	29·5	21·2
1875 - - -	798·2	30·2	11·7	30·1	24·0

The following were the total numbers of the chief inefficiency causes :—

	Admissions.	Deaths.
Eruptive fevers - - - - -	94	—
Continued ditto - - - - -	822	10
Malarial ditto - - - - -	7,804	50
Rheumatic diseases - - - - -	1,302	3
Diseases of eye - - - - -	1,015	—
Disease of lungs - - - - -	670	50
Diarrhœa - - - - -	855	21
Dysentery - - - - -	787	14
Skin diseases - - - - -	2,320	—

The mortality relative to strength from these diseases for the last three years has been :—

	Ratio per 1,000.		
	1873.	1874.	1875.
Eruptive fevers - - - - -	·03	·07	—
Continued ditto - - - - -	·2	·2	·3
Malarial ditto - - - - -	·8	1·4	1·6
Rheumatic diseases - - - - -	·03	·03	·09
Lung diseases - - - - -	·8	1·0	1·6
Diarrhœa - - - - -	·3	·4	·6
Dysentery - - - - -	·4	·6	·4

With the single exception of the death-rate from dysentery, all the other death causes showed higher rates in 1875 than in the two preceding years.

3. The following were the actual numbers invalided in the year for which the causes are assigned; but the total invalids were 729 for change, and 911 for discharge :—

	For Discharge.	For Change.	Total Loss.
Eruptive fevers - - - - -	1	1	2
Continued ditto - - - - -	1	11	12
Malarial ditto - - - - -	21	189	210
Rheumatic diseases - - - - -	67	68	135
Eye diseases - - - - -	48	7	55
Lung diseases - - - - -	30	63	93
Diarrhœa - - - - -	—	41	41
Dysentery - - - - -	2	23	25
Skin diseases - - - - -	11	8	19
	181	411	592

It is impossible to peruse these statistical data without seeing how large an influence local disease causes productive of malaria and dampness, together with climatic agencies, such as rainfall and variable temperature, exert on the efficiency of the Native Army in Madras and its outlying stations, and it is not surprising to find how large a space of the sanitary notes on particular stations is devoted to them.

4. The drainage defects are due to three causes :—

First. The position of lines in localities which scarcely admit of efficient drainage on account of lowness of ground, water-logged subsoil consequent on this topographical defect, and damp rising in the floors and walls of the men's huts.

Second. Want of subsoil drainage where the ground might be drained, leading to similar results.

Third. Defective attempts at surface drainage by cuttings in the ground, by which not only surface water but the sewage of huts is conveyed directly into the subsoil, thus increasing the evils which surface work of this kind is intended to remedy.

Each class of defects will come up in its place in the following brief abstract of sanitary notes on stations, to which attention may be called, beginning with the drainage.

(a) *Madras (Vepery).*—Lines low, and drainage defective. Huts not good.

(b) "*Cuttack* continues a hot-bed of malaria. The drainage of the lines could hardly possibly be worse. The ground itself almost a dead level; the drains simply shallow open trenches, into which flows all liquid filth from the huts, as well as surface drainage generally, percolating into the subsoil, and during the greater part of the year, when there is no rainfall to flush the channels, giving rise to most offensive odours." The reporter understood that the drains were about to be faced with stone. The site appears to be below the level of river floods, and the ground marshy as a natural result. It is doubtful whether any real drainage improvements are practicable in such a position, except at too great an outlay. The 41st Regiment, Native Infantry, at this station, out of an average strength of 633·5, had 1,017 admissions to hospital from malarial fever. It lost 56 men by invaliding and sick leave, which may account for its low death-rate, 5·6 per 1,000.

(c) *Sambalpur.*—"Drains are built in the V pattern, of stones which, not being set in chunam, permit earth contamination." Beyond the lines the channels are merely cut out of the earth, and emit at times a most offensive odour." The insalubrity of Sambalpur had been very marked during the year. The solitary cell is in a "most insanitary" state.

(d) *Berhampore.*—"The lines at Berhampore continue in *statu quo*, and the occurrence of 56 cases of cholera, with 19 deaths among them, in the right wing of the 2nd Regiment, Native Infantry, is a lesson which ought not to be forgotten." The drainage and the sewerage of the lines are very imperfect. This condition has frequently been brought to notice." At this station the death-rate was 21 per 1,000.

(e) *Vizianagram.*—"Drainage of lines defective on account of insufficient slope of main drain."

(f) *Palamcottah.*—The family latrines are situated just in front, or a little on one side, of the hut doors, and infect the air inside the hut. The drains are mere cuts in the ground, with little or no fall, and the house refuse percolates into the subsoil.

5. There is an interesting report on the Mysore division by Dr. George Smith, Deputy Surgeon-General, which contains much interesting information about troops and stations in this region of India. Amongst other things he has enunciated the following propositions:—

- (1.) "To the sanitarian cholera means dirt" (although to the ætiologist it may mean more), a motto which might very well be written up everywhere in India; "and truly," he says, "there is no lack of this in the Mysore Province and in the Ceded Districts."
- (2.) "The unit of sanitary administration in civil life is the house, in military life the sepoy's hut, and, until these houses and huts are placed in a sanitary condition, the mere sanitation of surroundings will have but little influence upon the mortality and sickness ratios." The truth of this proposition may be admitted if it is made to include certain things without which no house or hut can be healthy, viz., dry healthy site and plan, drainage and good water. On the other hand, as Dr. Smith argues, much benefit cannot be expected from such conditions if the house or hut itself is of a character inconsistent with healthy occupation.
- (3.) "It is a matter of some difficulty, and a constant labour, to keep the old lines and huts in a satisfactory state of sanitation." The huts are badly constructed and of mud. "The streets and lines are frequently much too narrow, and the total absence of artificial drainage leads necessarily to the extreme sulliage of the soil, and to the inevitable pollution of the water of neighbouring wells."

The remedies Dr. Smith suggests are the adoption of some uniform plan for the latrine and lavatory of the sepoy's hut, regimental latrines for both sexes, experiments on the dry-ash and dry-earth systems, and efficient artificial drainage of the lines. As regards the stations:—

(a) *Bangalore, Head Quarters, Sappers and Miners.*—Complaint is made of foul odours from the municipal drains running along the southern front of the lines, and of other sanitary defects in the vicinity.

(b) *Bangalore, 23rd Light Infantry.*—Drains throughout the lines are objectionable. They are mere open ditches cut or worn out of the soil, into which there is a constant flow of wash from the huts, and consequent percolation. The domestic privies are a "standing nuisance." With reference to these lines, Dr. George Smith states that the large "box drains" in the vicinity are "kept clean with great difficulty," and that "the lines, as a whole, exhibit all those defects which sanitary science condemns," only to be overcome by reconstruction. The Medical Officer reports strongly against the existing state of the conservancy in the neighbourhood of the lines. Forty per cent. of the admissions to hospital from this regiment were due to fever.

(c) Regarding sickness in the 36th Regiment, Native Infantry, at Bangalore, the Medical Officer reports that "ague, as usual, heads the list," but that this disease will doubtless diminish when the whole corps is properly huted.

6. While calling attention to these defects, the Commission desires, at the same time, to cite Dr. Smith's testimony to the fact "that the great and pressing subject of sanitation is securing the attentive consideration of all authorities, whether military, civil, or medical, and that fair, though not always rapid, progress is being made in reducing the principles of the science to practice." The chief difficulty is in dealing with the habits and prejudices of the Native troops, which are often opposed to sanitary procedure.

(a) *Mercara*.—The Surgeon of the 28th Regiment, Native Infantry, says that “the sanitation of the lines will never be fairly good until good brick and chunam drains are put up and the basin beneath the lines drained.” He makes the following remarkable statement:—“The principal causes of disease have been bad or insufficient food, cold” (the station is 4,500 feet above sea level), “thin and insufficient clothing when not in uniform, malaria.” This must be left as it is given for inquiry and remedy, if such be needed.

(b) *Bellary*.—In the lines of the 21st Regiment, Native Infantry, at this station, the hut sewage is conveyed by drain pipes into chatties placed outside, which are emptied morning and evening by the municipality. This was done to prevent the sewage passing into the subsoil. It exhibits house drainage in its most elementary form, and is better than fouling the ground between the lines.

(c) *Secunderabad*.—The following account of the drainage of Native lines is given by Deputy Surgeon-General Burn:—“Surface drainage in all the lines is defective, only shallow trenches along the sides of the streets exist, which soon get silted up, more especially in the monsoon.” Some lines are, it appears, built across the natural drainage fall.

(d) Of one set of lines, those of the 1st Regiment Light Cavalry, the drainage and other sanitary conditions are reported as eminently satisfactory, “and to these conditions was largely due the high state of health the regiment enjoyed.” The average strength was 202, out of which there were 111 admissions during the year; the daily sick in hospital averaged only 3, there were 2 deaths, 6 men were pensioned, and 2 went on sick leave.

In all the other Native lines at Secunderabad the drainage appears to be done mainly by surface cuts, and there is lodgment of water and damp during the rains.

(e) *Kamptee*.—The Medical Officer of the 2nd Regiment, Light Cavalry, says that his belief is “that the admissions from malarious causes would be diminished one half were a thorough system of subsoil drainage to be established. The subsoil is very retentive of moisture, and the houses are very damp in the rains.” The general sanitary state of Kamptee has nevertheless undergone improvement, for Surgeon W. E. Johnson, in charge of the 35th Regiment, Native Infantry, says: “Some years ago the station of Kamptee had the unenviable reputation of being unhealthy, but happily for the residents it is now one of the healthiest stations in India, and this change is no doubt due to the improved sanitary arrangements.”

(f) *Seetabuldee*.—The Deputy Surgeon-General says that “the lines are situated in a swamp, and have been condemned in every report forwarded, . . . and although everything has been done that can be done by the regimental authorities to improve the drainage, it still remains very faulty; . . . unless the present site of the lines is abandoned and a less objectionable one selected, it is not easy to suggest a remedy for the state of matters as reported.” He expresses his astonishment “that the rising piece of ground on the opposite side of the road from the lines should have been overlooked by the Committee when selecting a site for lines.” He says: “The site adverted to is in every way eligible, as regards soil, elevation, and natural configuration, for the most perfect drainage.”

One third of the entire number of admissions at this station was due to ague.

(g) *Hoshungabad, 22nd Regiment, Native Infantry*.—During the cold season the chief diseases are intermittent fevers, of which the predisposing causes are stated to be—“(1) bad housing; (2) want of proper warm clothing; (3) insufficient and non-nutritive food in many instances and the fact that the men and their families generally sleep on thin mats spread on the cold ground instead of on charpoys. . . . As really no system of drainage beyond merely the shallow drains on either side of the streets is carried out, and bearing in mind the retentive nature of the subsoil (black cotton), it is not to be wondered at that the walls and floors are always more or less damp during the rains.”

A test illustration of the effects of this ground damp is given regarding the Officers’ quarters at this station. The main surface water drain of part of the lines runs through the Officers’ compounds. During the rains this drain overflowed and saturated the ground, and several Officers were seized with fever.

(h) At *Saugor* the position of lines occupied by the 5th Regiment, Native Infantry, is described as “low, and in the rains little better than a swamp, and was formerly the site of a burning and burial ground. The huts are low miserable little buildings.”

(i) A matter of experience may be cited from the *Nagode* report as follows:—“The drainage of the lines is now very satisfactory; the old V-shaped drains, which it was found very difficult to keep clean, have been replaced by open saucer-shaped drains of masonry . . . These drains are swept daily and flushed with water twice a week.”

(k) At *Dorundah*, in Bengal, the sewage from the huts is passed into surface cuts and so into the subsoil; the Medical Officer very properly says “this must be a potent cause of disease amongst the men.” This station is 2,100 feet above the sea level, which to some extent neutralizes this defect, but does not justify it.

7. *Water-supply*.—There is no sufficient information as to the condition of the water used by Native troops. In one or two cases complaints are made, in others it is evident that wells have been improved, but the general impression produced by the paragraphs relating to this important subject is that there is little now to complain of.

8. *Conservancy*.—There are a few complaints of local nuisances, but as a rule the lines appear to be kept clean. The main difficulty arises in the latrine arrangements for families, which appear to be of a very unwholesome character, chiefly on account of the number of inmates crowded into the small hut which constitutes the Native soldiers’ barrack accommodation. From suggestions made in the reports this whole subject appears to require consideration, with the view of determining whether a remedy for the present state of matters might not be found in providing common latrine accommodation in suitable places for the lines, or in the introduction

of better domestic contrivances, involving speedy removal of all excrementitious matters beyond the lines.

9. It is evident from the general tenor of the reports, as well as from the statistical data contained in them, that future progress in the sanitary state of Native troops in Madras Presidency lies in the direction of improved position of lines, better huts, and efficient station drainage; the chief points in which have been abstracted in the preceding paragraphs.

The present position of the whole question, as regards the Native Army in Madras, cannot be better described than in the following extract from Surgeon-General E. G. Balfour's report, already referred to:—

“Of late years the efforts to improve the sanitary condition of the huts and lines of Native troops have been unremitting, and to the results of these may, in a great measure, be attributed the comparatively favourable state of health enjoyed by the Native Army during an unhealthy year. Scavenging, drainage, water-supply, ventilation of huts and lines, have all received careful attention; and although much remains to be done, nearly all has been effected that could possibly be carried out with the available means and under existing circumstances. In some cases the sites of lines are naturally bad, and so long as financial exigencies prevent the construction of proper drains, it is quite impossible to entirely prevent the pollution of the ground by sewage. Again, as to the huts, it is quite easy to describe what a sepoy's hut ought to be, but the Native soldier cannot afford to erect a more perfect and, therefore, more expensive dwelling than the one which he now inhabits. It would be a matter of economy were the State to provide quarters for the Native as it does for the European Army, but till that be done, we can only try to reduce the unhealthy features of Native lines and their surroundings to a minimum.”

10. Mr. Balfour's views are, no doubt, consistent with the facts, but it may be suggested that the sepoy might be advised, or, in cases where the Government grants assistance, required, to conform to such simple constructive sanitary principles in erecting his hut as shall obviate the defects referred to. Generally speaking, it is not so much money that is needed as an intelligent application of means at the sepoy's disposal. But, thanks to the energy of the authorities, much has been already done to remedy defects, and to provide more healthily constructed lines for Native troops. The problem would be greatly simplified were it possible to get rid of the crowd of people who follow the Native soldier and prey on his limited means of subsistence, or, at all events, to limit the number. The Native soldier in the Madras Army not only has to support his family out of his small means, but an army of paupers, many of whom are described in these reports as being quite able to find their own living. The result is that the servant of the State is badly fed, insufficiently clothed, his hut is crowded to excess, and the subsoil of the lines and huts in which he lives is fouled to a far greater degree than would be the case without them.

11. The reports clearly shew that some of the most important drainage works for Native lines could be executed by unskilled labour, if properly directed; and if the labourers are there and are fed by the soldier really at the cost of the State, it becomes a question whether this labour might not be made useful in draining wet ground, and for general improvements in the drainage of stations. There are, of course, some portions of the work requiring special material and more skilful labour in its use.

12. There are facts sufficient, in the preceding abstracts, to show that there is a large amount of drainage work required at most of the stations.

Not much has been gained in the way of experience in this matter, and the principles long since laid down by the Army Sanitary Commission on the subject may still be taken as a guide. These may be summarized as follows:—

- (1.) Station drainage for removal of rainfall must be effected over the surface.
- (2.) Mere surface cuts, except on steep inclines only, afford a more certain means of water-logging the subsoil.
- (3.) Efficient surface drainage requires that the rainfall and all other liquids received by the drains shall be kept out of the subsoil, and passed to the outfall as rapidly as possible.
- (4.) Box drains or V-shaped drains for such purposes, although greatly superior to mere cuts, are useful only so far as they are impervious and easily cleansed; and broad, shallow, impervious saucer-sectioned drains are the best for meeting the conditions of drainage described in the present Report.
- (5.) Some remedy for damp floors, even in existing huts, might be found in raising the floors above the ground level by clean wholesome earth, and further by raising the beds on charpoys, or some similar contrivance. In new huts means could be adopted to prevent damp in both floors and walls.
- (6.) The important question of latrines for families in Native lines requires to be dealt with.

Lastly, the principles for protecting wells from subsoil pollution may be again stated. They are as follows:—

The best wells to be selected for culinary and drinking purposes. The tubes of these wells to be protected by a layer of concrete round the tube to a sufficient depth to cut off the impure subsoil drainage. The tube to be raised two or three feet above the surface level, and the surrounding area concreted, with a slope away from the well, and with drainage for the removal of waste water. The well to be covered.

Water to be drawn, not by dipping everybody's vessel and cord into the well, but by an iron bucket and iron chain.

22nd May 1877.

No. 17.

MEMORANDUM of the ARMY SANITARY COMMISSION on the MEDICAL HISTORY of the NATIVE ARMY of BOMBAY for 1875.

1. The following table gives the leading statistical facts bearing on sickness and mortality in the Native Army of Bombay for four years ending 1875 :—

Years.	Average Strength.	Average Daily Sick.	Average Daily Sick per 1,000 of Average Strength.	Admissions.	Deaths.
1872 - -	22,903	1,040·0	45·4	36,309	226
1873 - -	22,967	876·2	38·2	29,035	165
1874 - -	22,750	835·7	36·6	26,621	176
1875 - -	22,819	772·7	33·8	25,475	213

The death column contains only the deaths in hospital. But the total deaths in 1875 were 279. The total deaths in and out of hospital in 1874 were 248. The augmentation of deaths in 1875 is stated by the Surgeon-General to have been almost entirely attributable to epidemic cholera in the Poona and Northern Divisions.

Otherwise the statistics show a progressive reduction of admissions and daily sick, which the same officer considers to have been the result of measures taken to preserve the health of the Army, except in notoriously unhealthy stations in Sind.

The ratios of loss and inefficiency for the last five years have been as follow :

Years.	Ratios per 1,000.					
	Admissions.	Daily Sick.	Total Deaths.	Invalided for Discharge.	Invalided for Change.	Loss by Invaliding and Death.
1871 - - -	1,295	43·1	14·3	31·2	21·0	66·7
1872 - - -	1,580	45·4	14·0	39·8	21·3	75·1
1873 - - -	1,268	38·2	10·7	43·5	21·1	75·3
1874 - - -	1,169	36·7	10·9	46·0	17·3	74·2
1875 - - -	1,116	33·8	12·2	42·7	18·3	73·2

These figures, although showing a reduction of late in certain elements of inefficiency, cannot be considered as altogether of a satisfactory nature.

It is true that the proportions of admissions and daily sick have been lower, and also, perhaps, the mortality, excluding cholera, but the losses by invaliding are very high, and point to weakened constitutions among the men, a point which will be referred to further on.

An interesting fact in connection with the admissions in 1875 is given with regard to the 20th Regiment, Native Infantry, showing the relation of the number of admissions to the actual number of men admitted to hospital. It is as follows :—

Strength - - -	-	-	621
Total admissions - - -	-	-	624
Number of first admissions - - -	-	-	369
Re-admissions :			
For the same disease - - -	-	-	83
For a different disease - - -	-	-	255

It thus appears that, although the admissions equalled the strength, the total occurred in 369 men, a not unimportant element in the question of efficiency.

2. The chief cause of admissions to hospital in 1875 was malarial fever, of which disease 10,566 cases were under treatment—not much less than half the strength of the Native Army. There were 22 deaths from these malarial fevers. An interesting point of comparison, showing the importance of this class of diseases, is given by the Surgeon-General. It is as follows : “The percentage of malarial fevers to the total diseases treated was, for the Presidency 35·2, for Poona 37·7, for the Northern Division 39·7, and for Sind 52·8.”

These percentages for the four military divisions may be taken as showing the relative prevalence of local causes of malaria in Bombay, including the influence of climatic changes.

The high ratio which this class of fevers shows in Sind is, unfortunately, not an isolated fact.

Of other fevers, there were 691 cases and 2 deaths from those of the continued type, and 150 cases and 1 death from eruptive fever.

3. *Cholera*.—Notwithstanding the great cholera epidemic of 1875, there was no case among Native troops in either the Presidency or Sind Divisions. In the other divisions the facts were as follow :—

	Cases.	Deaths.
Poona - - -	22	15
Northern - - -	98	56
	120	71

Mehidpur, in the Northern Division, has often been referred to by the Commission on account of its unhealthiness.

The 10th Native Infantry, 361 strong, at this station had from cholera among—

	Cases.	Deaths.
Men	43	24
Women	18	8
Children	13	7
Camp followers	8	4
	82	43

4. *Pulmonary diseases* yielded 1,491 cases and 43 deaths.

Diarrhoea and Dysentery.—Of the former there were 706 cases and 7 deaths; of the latter, 635 cases and only 2 deaths.

Scurvy yielded 198 admissions, a considerable proportion having occurred at Aden, attributed to low state of constitution arising mainly from defective dieting.

Rheumatism was prevalent as usual. There were 1,474 cases and 4 deaths from this disease.

5. These are the principal facts regarding the prevalence of disease during 1875. It will be seen that the chief disease cause has been malaria, and in examining the reports of different stations it will also be seen that there exist at not a few stations removable conditions, to the presence of which this disease cause mainly owes its origin, as well as other defects requiring attention.

In a Report so full of departmental detail as the present one, perhaps the best way will be to quote as briefly as possible the sanitary defects at each station, to which attention may profitably be directed by the authorities in India.

(1.) *Tanna*.—Latrines require improvement, "creating a most offensive stench to all around the neighbourhood." Not used whenever they can be avoided.

(2.) *Bombay, 20th Regiment, Native Infantry*.—Ground within the lines rocky and uneven; requires levelling to prevent accidents.

(3.) *Aden, Her Majesty's Aden Troop*.—No hospital. Hospital assistant lives and dispenses in a guard cell, unless it is otherwise wanted. No latrines, and sick men have to go a long way in the sun.

Aden, 2nd Grenadier Regiment, Native Infantry.—Rooms so hot that men sleep in open air, "rendering themselves liable to pneumonia, dysentery, and other acute diseases." No drainage, refuse water sinks into cesspits. Latrines require improvement. Water not good, on account apparently of volcanic impurities. Condensed water used. "But after filtration the water is collected in wooden casks which are placed along the sea beach, and, being exposed, is quite liable to contamination with sea water and other impurities." This surely admits of easy remedy.

It appears that carbonate of iron is used as a filtering material for the distilled water, rendering it ferruginous to the taste. This, it must be stated, is no part of Dr. Normanby's apparatus, in which animal charcoal only was to be used.

Native troops have suffered considerably at Aden from scurvy, apparently the result of inefficient dieting. The Medical Officer states that those whose pay is good, and can live comfortably, never have suffered. He suggests that the rations should be issued every day or two, instead of once a fortnight, as the men are tempted to convert them into money.

(4.) *Poona, Her Majesty's 1st Regiment, Light Cavalry*.—Subsoil so retentive of moisture (from absence of adequate drainage apparently) that the only escape for water was by evaporation in August and September, and the effect was "the prevalence of ague of rather a severe type," and "all the European Officers without exception suffered from a grave form of ague in common with the men." In this case drains were cleaned out and other ones made, and it must be hoped with advantage; but to be really successful the work must be done in a more permanent way, as pointed out by the Medical Officer.

Poona, Her Majesty's 8th Regiment, Native Infantry.—Dangerous and offensive nuisance from open sewers in sudder bazaar, a case of typhoid fever distinctly traceable to this cause. Water is supplied by the Kharakwasla canal, of good quality, but it will not be safe so long as it is conducted in an open channel.

There is, besides, a bad well, from which the troops take water, although forbidden to do so. (Why cannot the well be closed?)

The Medical Officer of this regiment states that "three fourths of the admission to hospital under the head of 'contusions' are caused by badly made and ill fitting boots." This complaint reappears in other reports, and has been frequently brought to notice by the Commission. He further calls attention to a fact common in the Madras Native Army, viz., that "the Mahrattas, especially those coming from the Konkan, who usually have large families," are habitually victimized by relations who come at frequent intervals to prey upon the sepoy's overburdened resources.

This is one cause of underfeeding and scurvy. The remedy proposed is working pay when engaged on field works, but it may be suggested whether the real remedy would not be found in making the idle relatives do part of the work.

Poona, Her Majesty's 17th Regiment, Native Infantry.—The hospital latrines of this regiment are bad.

(5.) *Kirkee, Sappers and Miners*.—"The conservancy for the new lines is that utterly bad and abominable system" of trench latrines. The reason of this denunciation is stated to be that in the rains "the field becomes almost a lake, and the drainage of it is almost directly into the river, about 200 yards above the spot whence all the drinking water for the lines is drawn."

The Medical Officer states that he has reported against this mischief month after month without avail.

The objection lies not against trench latrines if suitably managed and made in dry ground. But in this instance, as in many others, even where sites for stations have been selected, the fact has been overlooked that the site should be examined in wet weather after rains, as well as in dry weather. It is contrary to all sound sanitary principle to dig such latrines in ground liable to be flooded, especially if the foul drainage from it may pollute any water source, whether well, tank, or river. It is clear that in this case a mistake has been made, which ought to be rectified as speedily as possible by the adoption of some other system of latrines.

(6.) *Sholapur, Her Majesty's 19th Regiment, Native Infantry.*—This station is one of the most malarious in Bombay Presidency, for reasons long since pointed out on the spot. The Medical Officer of this regiment makes a remark of some importance on the relation of climatic to local causes in predisposing to malarial fevers which it might be well to follow up. The average strength of the regiment has been 688. In July 1874 there were 597 admissions from malarial disease, and in 1875 the number fell to 345. Seeing that all the local conditions were the same, what could have been the cause of this diminution?

The Medical Officer states that there was less rain in 1875, but also that it fell in heavy showers, with considerable intervals of fine weather, so that the ground did not get saturated with moisture, and that there was not the usual sudden change from a warm moist to a cold bracing air. As a single observation, this fact is important as showing that similar observations might possibly throw light on the relation of climate to ague, but it is, nevertheless, in accord with what is already known on this subject, and appears to show that the exceptionally malarial condition of the place might be remedied by the drainage proceedings proposed by the local Committee long ago, the object of which was to prevent the ground becoming water-logged, whether there was much or little rain.

(7.) *Asseergurh, Detachment of Her Majesty's 4th Regiment, Native Infantry.*—In this Report is given for the first time an account of the water supplied to troops at this station. There are two tanks, the "Sucker Bowree" and the "Mamoo Banja." Neither affords a sufficiently pure water for culinary purposes, and the attempts made at filtering the water of one of the tanks have been only partially successful. This has partly arisen from the construction of the filter, which, even as it is, has reduced the worst impurities by oxidation. Further attempts in this direction are to be made, and it may be well to keep in mind that filtration, properly so called, includes straining out all suspended impurities and oxidizing the soluble organic matter. For the latter purpose the filter must expose a sufficient surface to the air to renew its oxygen, and the water must pass through it slowly enough to become oxidized, and the filter should be emptied and have rest to enable the surface to be cleansed and renewed, and its oxygen replaced. It is possible that better filtration results may in this way be obtained, but otherwise a new source should be sought. Since this Report was referred to the Army Sanitary Commission, the tank has been examined, and it was then found that it had never been cleaned out within the memory of man. Of course, no mere filtering could remove the accumulated filth in the water.

(8.) *Sattara, Her Majesty's 4th Rifles.*—The following description of this station speaks for itself, but whether the proposed administrative remedy would necessarily lead to better sanitary work being done we have no means of knowing. The one requirement is that this state of things should cease as speedily as possible. "The defects of drainage in the lines are obvious enough. It was proposed to introduce a proper system of drainage, by which the surface gutters should be widened, deepened, faced with masonry, and covered to prevent their noisome contents from contaminating the air" (a remedy worse than the disease; there should be nothing in them to contaminate the air). "The present plan of sweeping the gutters, redolent of much impurity" and night-soil, judging by the sense of smell, is exceedingly offensive, and cannot be condemned in sufficiently strong terms. . . . Sanitation is at a discount, and nothing in a sanitary point of view will be done effectively until Government sanction the re-conversion of Sattara from a civil to a military station."

The water-supply is on a par with the sanitary work, as it appears, from a rough analysis of well water used by the sepoy, that it contains the enormous amount of 224 grains of solid matter per gallon, and that each gallon contains $34\frac{1}{2}$ grains of chlorine.

It is evident that the sanitary state of this place requires complete reform. The Medical Officer also proposes better lines and a hospital. The present "makeshift," he says, is virtually in the bazaar, the sanitary condition of which "is disgraceful."

(9.) *Dharwar, Her Majesty's 12th Regiment, Native Infantry.*—This regiment, 685 strong, was moved into a new cantonment, on "well selected, high, open ground," two miles to the north of the fort and town.

Water has been provided from new wells, and the analyses give some instructive details regarding the water.

In the sepoy's well there are 25·76 grains of solid matter per gallon, and in the Officers' well 10·08 grains per gallon. The former has ·28 and the latter ·84 grains of volatile matter per gallon, and the amounts of chloride of sodium are respectively 6·83 and 3·89 grains per gallon.

The organic elements are as follow:—

	In parts per Million.	
	Sepoys.	Officers.
Ammonia, free	·28	·26
„ albumenoid	·08	·13
Nitrates and nitrites	15·00	15·00
Oxygen required at 140° F.	·0350	·0560
With nitrous acid	·0402	·0201

The waters are perfectly clear, and contain no organisms, only a little red oxide of iron.

These waters have been obtained apparently from a subsoil which was formerly rendered impure by animal organic matter, long since oxidized and converted into nitric and nitrous acid compounds, although traces of ammonia are still present. It seems likely that casing the wells, and surrounding the tubes with concrete to a sufficient depth to cut off the immediate subsoil water, would be all that is necessary to render the wells quite safe. But care must be taken to keep all sewage impurities out of the subsoil, otherwise the presence of these in the water in a less innocuous form may be recognised at no very distant date.

The following have been the results of change of lines to the men's health :—

Strength	-	-	-	-	685
Admissions	-	-	-	-	363
Deaths—3 cholera, 1 bronchitis	-	-	-	-	4
Average number of sick men	-	-	-	-	18.3
" " " " " " " " " " " "	-	-	-	-	5.
Ratios per 1,000—Admissions, to strength	-	-	-	-	530
" " " " " " " " " " " "	-	-	-	-	5.83

The new lines were built by the regiment in two years, and it cannot be said that the results of the entire change were other than most satisfactory. Had there been no cholera there would apparently have been only one death during the year.

The statistical tables in the Report enable an idea to be arrived at of the causes of admission in these new lines, as follows:—

	Admitted.
Continued fevers	7
Malarious ditto	87
Cholera	3
Rheumatism	24
Lung diseases	18
Diarrhœa	9
Dysentery	6

These facts are striking enough when compared with admission causes among Native troops generally, and show how important an opportunity is afforded in this case for arriving at an estimate of the amount of inefficiency due to removable conditions.

(10.) *Ahmedabad, Her Majesty's 3rd Regiment, Native Light Infantry*.—The following points in this Report require notice.

There are two water sources,—the river and wells. The river water becomes impure from organic matter during the latter part of the hot season, and is used by the troops and bazaar people "to the detriment of their health." The remedy proposed is the obvious one of providing more wells.

The next remark of the Medical Officer speaks for itself. He says: "The boots still remain a source of continual admissions into hospital from shoe bites." The time appears not yet to have arrived for dealing effectually with this indefensible cause of inefficiency in the Native Army.

(11.) *Baroda, Her Majesty's 22nd Regiment, Native Infantry.*—The following dangerous nuisance requires removal. The Medical Officer says that the latrine trenches are about 200 paces from the hospital, and 100 yards from the nearest well, and "when northerly winds prevail the trenches become a perfect nuisance to the sick and to all the hospital establishment." Bad latrine arrangements in this instance lead to pollution of air, earth, and water.

(12.) *Rajkote*.—Complaints are made by the Medical Officer of No. 1 Company, Native Artillery, and also by the Medical Officer of the head-quarter wing of Her Majesty's 7th Regiment Native Infantry, of the following highly dangerous arrangement. "The hospital water-supply is "from a large well; the water from it is good;" there is one great objection, which may one day prove a source of great danger to the persons compelled to use this well,—the hospital latrine is situated only a few yards from it, being placed between the "prevailing wind and the well." The probable result of placing latrines and wells in proximity has been so long and so well known that it cannot be otherwise than a matter of surprise that such an arrangement was ever adopted, but what can be said of its continuance after attention had been pointedly called to it, and without result? The latrine should be removed without delay, cleansed out, and filled with rammed clay after quicklime has been thrown over its surface.

The statement as to the hospital well water being good is a doubtful one under the conditions mentioned, and there is besides an analysis given of water ("considered to be the best well in the "camp") used by troops, which shows 22·8 grains of solid matter per gallon, of which 15·26 are stated to be organic matter, and 2·95 grains of chlorine. There is apparently some error in transcribing the figures in the Report, but, if they are given correctly, all that can be said is that the sooner the station is supplied with better water the less will be the risk to health.

(13.) *Deesa*.—Sanitary work, including tree planting, appears to be progressing at this station. The only point which appears to call for notice is that the latrines of the 18th Regiment, Native Infantry, are at a distance of some 400 or 600 yards, which is certainly inconvenient at night. They are in the river bed, and everything soaks into the subsoil. It may be suggested whether some more satisfactory arrangement could not be arrived at.

(14.) *Mhow*.—The chief point of importance at this station is the trench latrine system and its results. It appears that the 25th Regiment, Native Infantry, has an area of about 250 yard square set apart for latrines on the trench method. These are not used in the rains, but they nevertheless give rise to nuisance, and an instance is given where emanations from latrines of the same kind were attended by an outbreak of cholera, and also by an isolated case of cholera, clearly the result of foul air currents from them. The Medical Officer asks whether, "even if "the wells escape contamination," the soil will retain "its deodorizing and assimilating powers "for an indefinite period?" The reply must be distinctly in the negative. The trench latrine

system, as practised in this case, is simply a process of manuring a definite area of ground, and it should be considered in this light and in no other. If manure of any kind is thrown continuously into ground and left there, the area will become no better than a laystall. Manure is generally applied to ground for the purpose of cropping, and only to the extent required for this purpose, and in such climates as exist in India the only safe way of working trench latrines is to keep this end in view, just as a cultivator would do. As the case stands, the Medical Officer holds that the trench system "does not suit the place, and has proved itself to be dangerous."

The Deputy Surgeon-General reports the lines of the 16th Regiment, Native Infantry, as "insanitary, narrow, and confined; the huts, as usual, deficient in plinths and in capacity;" and the lines of the 25th Native Infantry as "indifferent, damp, and unhealthy in the rains."

(15.) *Mehidpur*.—This most malarious station suffered severely from cholera in 1875. The connection between cholera and malaria has been observed in many places in India. There were in all 26 deaths among Native troops in 1875. Two of these deaths were from heart disease, and all the others from cholera.

Extensive drainages trenches were completed during the year, "so that no doubt the camp will not be as complete a swamp during the next rainy season as it has hitherto been." Excluding the losses from cholera, there was some improvement in health in 1875.

Out of 361 men there were on an average 24 in hospital. The admissions amounted to 858, nearly $2\frac{1}{2}$ times the strength; of the admissions no fewer than 500 were from fever.

It is to be hoped that the drainage operations will diminish this local cause of inefficiency, but Medical Officers appear to doubt whether the disadvantages of local position can be coped with in this way. The 10th Regiment, Native Infantry, is divided between Mehidpur and Augur, a comparatively healthy station.

There are occasional changes in the disposition of the regiment between the two stations, but the troops always carry the Mehidpur fever with them. There were 233 men of the regiment at Augur in 1875, who sent 247 cases of fever to hospital.

(16.) *Nusseerabad, Her Majesty's 23rd Regiment, Native Light Infantry*.—The Medical Officer calls attention to the following point, which has been brought to notice more than once already: "The lines being situated at the lowest end of the camp, drainage is not so perfect as in other parts, but the rain does not collect in the lines. A small temporary tank is formed near the lines in the rainy season; it is certainly desirable that this should no longer be the case." Trench latrines are placed in "close proximity" to this tank, and although it is not a recognized water source, it appears to be used for drinking purposes. It is evident that means should be adopted for abolishing the tank altogether.

(17.) *Kurrachee*.—The principal causes of sickness at this station are "malaria and exposure to cold." If the first cannot be yet dealt with, it may be suggested whether the last cannot be to some extent guarded against by proper clothing during exposure.

It is satisfactory to learn that a wholesome water-supply is about to be provided for this station.

(18.) *Hyderabad*.—Surface sanitary work appears to be well attended to. The principal defect is in the lines, where "the huts are level with the ground, and in consequence are often damp." Possibly the floors admit of being raised with clean earth, which would to some extent remedy this evil.

(19.) *Jacobabad*.—A very sufficient idea of the sanitary history of this station during 1875 may be realized from the fact that the four corps in occupation, with an aggregate strength of 1,530, furnished 1,374 admissions to hospital from malarial fever. The cause of this state of matters has been long known. The station is many feet below the water level of the Indus, and is liable to annual inundations, which not only keep the subsoil water-logged with stagnant water, but the wells are liable to surface and subsoil pollution by organic and mineral matters. As the Deputy Surgeon-General expresses it: "Drainage is at a minimum, owing to the uniform flatness of the ground; refuse water is disposed of by absorption and evaporation."

This in its turn leads to unhealthy changes in the temperatures and moisture of the local climate, and the result is that Jacobabad is one of the most feverish localities anywhere to be met with. The facts and their causes are so well known that it can serve no good purpose to discuss them, for the really important matter is to know what can be done. Can the irrigation be so regulated as to supply just so much and no more water than is needed? Is it possible to free the subsoil of superfluous water by any system of canal drainage, such as exists in very low districts at home? Would any good follow from tree planting all round the station, as is suggested by one Medical Officer?

There is one very likely palliative measure which might have been tried when the lines were constructed, viz., to raise the huts, like those in Burma, six or more feet above the ground level. All that we can do is to repeat what has been often said, that no effort should be left untried to render this station more fit to be occupied than it is at present.

Lastly, the present Report shows progress in the sanitary improvement of Native lines in matters of detail, although there is much still to be done in this direction, but it also shows anew that the great inefficiency cause is local malaria, and that the key to progress must be sought in the execution of local measures of drainage calculated to secure a dry healthy subsoil, and in adopting such principles of hut construction as shall enable the men to sleep above the level of the ground. The question of dieting Native troops, and the bearing of this important point on efficiency, should be taken into account, and the present defects as far as possible remedied.

Some attention might also be given to the peculiarities of Aden as a station, and their effects on health, both of British and Native troops. For some reasons, climatic and other, health is not so well maintained at Aden as it ought to be in a naturally dry non-malarial locality. Scurvy is apt to appear among Native troops, and the stamina generally appears to suffer. Length of service appears to be an important element, also dieting, water-supply, and recreation.

22nd May 1877.

MEMORANDUM of the ARMY SANITARY COMMISSION on the REPORT on LOCK HOSPITALS of the MADRAS PRESIDENCY for 1875.

1. There are 13 military stations in Madras Presidency at which lock hospitals were in operation in 1875. Of these, nine were under military and four were under civil control.

2. The strength of British troops, and the amount of diseases of syphilitic nature among them, stood as follows:—

Strength	-	-	-	-	10,118
Admitted for Venereal Diseases.					
Primary syphilis	-	-	-	-	739
Secondary ditto	-	-	-	-	363
Bubo	-	-	-	-	6
Gonorrhœa	-	-	-	-	780
Balanitis	-	-	-	-	21
Others	-	-	-	-	46
Total	-	-	-	-	1,955
Died	-	-	-	-	1
Invalided	-	-	-	-	27

3. Returns are given for six stations of British troops at which there are no lock hospitals, and these afford the following results:—

Strength	-	-	-	-	589
Admitted for Venereal Diseases.					
Primary syphilis	-	-	-	-	40
Secondary ditto	-	-	-	-	61
Gonorrhœa	-	-	-	-	53
Others	-	-	-	-	5
Total	-	-	-	-	159
Died	-	-	-	-	3
Invalided	-	-	-	-	3

4. The following are the ratios of admissions from the chief forms of venereal diseases at each class of stations:—

		Ratios per 1,000 Strength.			
		Primary Syphilis.	Secondary Syphilis.	Gonorrhœa.	All Cases.
Protected	-	73·03	35·87	77·08	193·22
Unprotected	-	67·91	103·56	89·96	270·00

One third of the primary syphilis and gonorrhœa at unprotected stations was due to a single station, Calicut, at which 98 men were placed during the year.

Among primary infective admission causes primary syphilis was less frequent by 5·01 per 1,000 at unprotected stations, and gonorrhœa was less frequent by 12·88 per 1,000 at protected stations. What has been said in previous Memoranda must, however, be repeated, viz., that the numbers at the two classes of stations are too diverse to be safely used for comparison, and one year's statistics are only good for the year.

5. The next abstract shows the ratio per 1,000 of total venereal admissions at protected stations for the last five years among troops:—

1871	-	-	-	-	178·75
1872	-	-	-	-	164·27
1873	-	-	-	-	149·81
1874 (Tonghoo included)	-	-	-	-	185·73
1875	-	-	-	-	193·22

6. The actual numbers of admissions for primary syphilis among troops and among women at these protected stations during the same five years have been:—

	Total Admissions (Primary Syphilis).	Lock Hospital Admissions (Primary Syphilis).
1871	592	592
1872	682	839
1873	656	962
1874	860	889
1875	739	643

It will be seen that there is no evidence of any real causative relation between the two groups of figures.

Supposing the numbers of troops and of women on the registers to have remained constant, it would almost appear as if the development of syphilis in the two classes of subjects followed two different series. If this were so, it would be in conformity with other observations made all over India, and would apparently lead to this very practical result, that, admitting primary syphilis to be an eminently contagious disease, the amount of it prevalent at any given time among a population depends on other yet unknown conditions besides the fact of contagion.

This view of the case has been put forward both by this Commission and by the Sanitary Commissioner with the Government of India, and is again referred to by Surgeon-General E. S. Balfour in the present Report as a point for further investigation. The result of preventive measures carried out in India for many years may now be taken as having conclusively shown that they are of very partial use in protecting troops from syphilis, and it may be found eventually that this peculiarity in the history of the disease may afford a clue to the causes of failure. With these remarks, which are intended, not to cause discouragement, but rather to indicate points for future inquiry, we shall proceed briefly to give the results, such as they are, of steps taken to improve the service during the year.

7. *Bangalore*.—The admissions among troops at this station were 181 per 1,000, as against 165 per 1,000 for a five years' average. The most important class of admissions, namely, those for primary syphilis, were a little over 66 per 1,000 strength, which was the average for five years.

At this station summonses are issued for women who do not present themselves at the hospital, and attempts are made to obtain information from the men in hospital, but the soldiers invariably have "some excuse" for not giving assistance in this matter. There is the usual amount of clandestine prostitution, and the registration is stated to be inefficient; and yet a sergeant and two special constables are employed on the duty.

The Medical Officer says that the working of the rules has improved, but constant vigilance is required. It is evident that the sources of infection at Bangalore have not been materially diminished by police rules.

8. *Bellary*.—This station has hitherto been one of the most severely infected in Madras Presidency, but in 1875 there was from some cause or other a remarkable diminution of syphilitic disease among troops. The admissions from these affections on a nearly equal strength were as follow:

1873	-	-	-	-	-	319
1874	-	-	-	-	-	386
1875	-	-	-	-	-	263
The admissions in 1875 were made up of—						
Primary syphilis	-	-	-	-	-	119 cases.
Secondary „	-	-	-	-	-	52 „
Total syphilitic						171 „
Gonorrhœa	-	-	-	-	-	92 „
Total						263 „

Nearly two thirds of the admissions were syphilitic.

This reduction appears to have taken place without any corresponding improvement in the preventive service. Complaints are made that this service is considered a subordinate one on the part of the police, that absent women are not apprehended, and clandestine prostitution exists. "The large number of venereal cases which occur among the police is a sure indication that they consort much with this class of women." The reporter proposes a separate preventive agency, and segregation of women who consort with soldiers. But the history of prostitution at Bellary, as given in last year's Report (1874), appears to show that some more extensive measure for reducing the number of prostitutes "devoted" to idols is needed.

9. *Secunderabad*.—If Bellary has shown a considerable reduction in venereal admissions in 1875 without any adequate improvement in the administration of the rules, Secunderabad shows a large increase with apparently greater activity in their enforcement.

The ratios per 1,000 of strength of venereal admissions at this station have been as follows:—

1870	-	-	-	-	-	133.51
1871	-	-	-	-	-	200.26
1872	-	-	-	-	-	191.36
1873	-	-	-	-	-	111.98
1874	-	-	-	-	-	112.24
1875	-	-	-	-	-	224.36

The following were the admission causes in 1875:—

	Admissions.
Primary syphilis	201
Secondary ditto	72
Gonorrhœa	223
Others	16
Total	512

The average strength of troops during the period of occupation was 2,282.

During the preceding year, 1874, the admissions from primary syphilis were 39, and from secondary syphilis 64, numbers which may be compared with those for 1875 as affording an additional illustration of the presumed fact that the amount of syphilitic disease is not solely due to contact.

At Secunderabad registration seems to be conducted with care, but here also unlicensed prostitution must bear part of the blame.

10. At *Kamptee*, with a strength of 1,024 British troops, there were 250 admissions per 1,000 for syphilitic diseases in 1875. At this station there appears to be an unusually active supervision by the police. There is not much disease among the registered prostitutes, but when clandestine prostitutes are laid hold of they are found to be "generally badly diseased." There is reason to fear that the troops conceal cases. There is evidence in this Report to show that to keep down clandestine prostitution would require a degree of zeal and hourly watchfulness which is never likely to be carried out.

11. At *Madras* there are about 1,100 women on the register, of whom 757 were admitted to the lock hospital. The strength of troops, including detachments and details, was 523, and the ratio of admissions for venereal diseases was 254·30 per 1,000 strength.

12. At *St. Thomas' Mount* the Medical Officer states that the rules "are good enough in themselves if carried out in their integrity." But "it is private prostitution that is the great difficulty." The average strength of British troops at this station was 368, and the ratio of syphilitic admissions 165·76 per 1,000 strength.

13. *Cannanore* is another station at which the rules appear to be actively enforced. The examinations are regularly made, and rigorous imprisonment of women is enforced for non-attendance. The average strength of British troops was 519·57, and the ratio of admissions per 1,000 strength equalled 119·32. The Medical Officer is not satisfied with the result, and requests that this institution may be placed "on a better condition, otherwise it will, in the course of time, be unavailing in averting disease."

14. *Trichinopoly* has virtually no acting cantonment sub-committee, and "no special measures for the control of prostitution and the prevention of danger from unlicensed prostitutes exist." Registration and the lock hospital are in operation, and, notwithstanding these complaints, the ratio of admissions among British troops was 164½ per 1,000 out of an average strength of 285½.

15. The experience of several other stations might be cited to show the extreme difficulty of carrying out successfully, or of enforcing, measures of prevention sufficiently stringent to answer the intended object. The cases are not like those of ordinary offences. They often spring out of the habits and religious observances of the people, which cannot be changed by legislation. Even in Madras itself, the seat of a Government, the Health Officer reports that "the rules for the guidance of the Health Officer are so voluminous and vague that there is not a tyro in the legal profession who cannot upset every prosecution made by the Health Department." And, in regard to the so-called protected stations, there is sufficient evidence to show that, with the present type of police officials, no energy likely to be exhibited by them will counterveil evasions practised by both troops and women. So far as past experience enables an opinion to be formed on these "protective" measures in Madras Presidency, it must apparently be that the results have scarcely justified the trouble, outlay, and interference with personal liberty which they have involved, and there is no evidence to show that they have materially lessened the amount of venereal disease among British troops.

18th May 1877.

No. 19.

MEMORANDUM of the ARMY SANITARY COMMISSION on the REPORT of the CHEMICAL ANALYSER to the GOVERNMENT of BOMBAY for 1875-76.

Mr. Lyon's Report shows a large amount of important and useful work done during the year connected with medico-legal cases, examination of Government stores, and water analysis, but it is only under the last section that any questions arise which call for remark by the Commission.

1. During the year, 170 samples of drinking water were analysed, from 27 cities, towns, and stations in Bombay Presidency. The first 45 analyses in the tables refer to an important question connected with the water supplied to shipping in Bombay harbour, discussed in other papers, and arose out of the abominable practice of discharging the cesspool matter of the city by a pipe into the harbour. The practice had given rise to great nuisance, as well as to suspected water pollution by absorption of foul matter in the atmosphere by Vehar water in the process of being transported by barges from the supply pipe to the shipping. This inquiry has been attended by important results, certain of which fully bear out a recommendation for filtering the water supply of Bombay long ago made by the Army Sanitary Commission.

2. To obtain the normal state of the Vehar water, as a ground of comparison with that delivered to the shipping, two samples were taken, one from the lake direct, the other from the waste pipe, after having been filtered through the substance of the dam by accidental leakage. The difference between the two samples is stated by Mr. Lyon as follows:—"The effect of this accidental filtration appears to have been (a) to destroy the dead leaf odour possessed by the water of the lake, and (b) to diminish the albumenoid ammonia, and increase correspondingly the free ammonia. These changes may fairly be interpreted as showing that the effect

“ of the filtration was to destroy by oxidation the greater part of the organic matter contained “ in the lake water.” There is nothing novel in this result. Its importance to the water-supply of Bombay consists in the proof that is afforded by an accident that the large amount of vegetable organic matter dissolved from the collecting area of the lake in an Indian climate, sufficient to confer a peculiar taint on the water, admits of being entirely removed by oxidation in passing through a filter, as long ago advised by this Commission for the removal of this and other defects in quality. The municipal authority, it is to be hoped, may profit by the result, and complete their water-supply by filtering it.

3. The next series of analyses gives the result of exposing the water while being received and conveyed in the water barges from the supply pipe to the ships. It is briefly to increase the proportion of free ammonia 36-fold, no doubt by absorption from the foul atmosphere near the water level. The fact is proved by a test experiment of exposing distilled water to the same air, which resulted in an addition to the water of .04 parts of free ammonia and .06 parts of albumenoid ammonia per million, neither impurity having existed in the water before. The whole series of experiments shows the danger of exposing a surface of drinking water to an atmosphere containing noxious vapours, even in the open air. But the amounts were increased about 10-fold by exposing distilled water to privy air.

4. The final condition of the water in ships' tanks showed that the Vehar water had, as already stated, been polluted more or less by absorption of foul air in the process of carriage from the supply pipe to the ships, that an additional quantity of organic matter had been added, probably from the barge tanks, and that the amount was between 25 and 30 per cent. greater in the ships' tanks than in the barges, showing that the tanks themselves required attention in cleansing.

5. The result has been to place the whole question on a scientific basis, although it must be admitted that common sense and past experience had long ago arrived practically at the same conclusions, namely, that the discharge of night-soil, either above or below the water of Bombay harbour, should be put a stop to, and a proper outlet for the sewage of Bombay provided without delay, and that a little more attention in the way of cleansing should be bestowed on barge and ship water tanks.

6. The remaining analyses, 125 in number, were made in Bombay of samples of water sent long distances, and after long delay in some cases, and although the results are no doubt accurate for chemical purposes, yet, in the absence of all local knowledge as to the immediate surroundings of the water sources, no satisfactory opinion can be formed by the chemist on the sanitary condition of the water. A curious illustration of the benefits of local inspection is given in the case of the water-supply of Asseergurh, which, although submitted to filtration, showed very large amounts of organic impurity when analysed at Bombay. In this case an inspection was considered necessary in order to explain the occurrence, and when the step was taken, the explanation was “ apparently an exceedingly simple one.” It is thus given by Mr. Lyon. The tank is filled from a catchment area within the fort, capable of yielding a year's supply, and “ this “ tank had never, within the memory of man, been cleaned out.” In a sanitary sense, this means that for unknown years the catchment area had been washed by the rains, and the washings, with all their surface impurities, formed the bed of the tank. No wonder that any available means of filtration should have failed to oxidize the organic matter, and there is no doubt that this case shows what is the condition, and its causes, of most Indian tank waters.

7. In other cases there is reason to believe that the analysis conducted in the manner described, and by itself, gave a very inadequate representation of the sanitary condition of the water source, and so far might tend to an erroneous estimate of the agency of the water in the production of disease. There are cases in which Medical Officers on the spot had every reason to suspect that the water was dangerous, while, after being sent to Bombay, nothing of the kind could be detected.

8. Mr. Lyon very properly says that “ it is anything but satisfactory to go on year after year “ analysing sample after sample, knowing perfectly well that the major portion of the analyses “ are for all practical purposes perfectly useless.” The remedy he proposes is to place all questions connected with the quality of waters in the hands of the Sanitary Commissioner, as part of his current duty, in which he would be aided by competent analysts, who would, on the spot, examine the water source and its surroundings, would then analyse the water, and trace any suspicious impurities to the local cause, and there and then point out the remedy. The necessity for this local analysis has been for a number of years urged by the Commission in their Memoranda on the Bombay stations.

9. For immediate guidance in dealing with the more important organic impurities, no better course could be taken than to follow the simple procedure laid down by Dr. Angus Smith in his tract “ on the estimation of organic matter in water,” long since printed and sent to India at the request of the Army Sanitary Commission. But more extended analyses should be carried out on the plan prepared by Dr. Macnamara, Dr. Angus Smith, and the late Dr. Parkes, printed in the India Office Blue Book which was issued in 1871.

10. As the Sanitary Commissioner of Bombay has been relieved of statistical work, and as the vaccination service has been required to undertake sanitary as well as vaccination duties, placing the examination and protection of water sources under the sanitary Commissioner would be nothing more than another very important step taken in the same direction, and with this and other sanitary duties the Commissioner's time would be usefully filled up, and his whole attention directed to sanitary work, which is an indispensable condition to its success.

31st May 1877.

No. 20.

MEMORANDUM of the ARMY SANITARY COMMISSION on the REPORT on SANITARY MEASURES in INDIA in 1874-75, together with Miscellaneous Information up to June 1876. (Vol. VIII. Presented to Parliament by command of Her Majesty.)

The present volume of the India Office Sanitary Reports contains an excellent and instructive digest of numerous reports received from India bearing on the public health of the civil population, and also on the health and improvement of military stations throughout the country. This is followed by the Memoranda of the Army Sanitary Commission on practical questions raised in the documents, showing the improvements required in each case, and the principles to be kept in view in dealing with them. The volume as a whole gives a sufficiently distinct account of the public health for the year, and of the steps taken towards removing disease causes. The facts are of a hopeful character, especially as regards Her Majesty's British troops, which, so far as can be gathered from the records, were never so healthy in any previous year.

In former Memoranda the Commission took occasion to point out that Indian reports contained too little detail regarding sanitary works, and consequently that in this matter the India Office annual digests were somewhat deficient in information. This defect has been to some extent remedied in the Report under review, and we are glad to observe that much fuller and in some senses very important details of works have been included in the more recent Indian reports, which will give a fresh interest to future India Office digests. The only way, however, to enable these reports to convey a satisfactory impression regarding sanitary progress is to make such provision for statistical work as shall liberate the Sanitary Commissioners entirely from details of this nature, and enable them to devote their whole time to the absolutely essential duties of inspecting and advising with local authorities in cities, towns, and districts within their sphere of work.

With the same view the civil surgeons and vaccination staff might be called on to render aid all over India. This improvement in sanitary organization has been carried out, we believe, in the Bombay Presidency and in the Central Provinces, and a great advance in sanitary work may confidently be looked for. The Commissioners will have a sufficient staff at work, and, by devoting their whole time to it, they will soon be able to furnish to the India Office the necessary details on sanitary improvement within their districts.

The India Office Report contains a defence of the Army Sanitary Commission against attacks made on it some time ago on the presumed ground that in doing Indian sanitary work it neglected certain etiological doctrines prevalent in this country regarding peculiarly Indian diseases. The Commission avoided any notice of these criticisms at the time, and it was evident that they were based on defective knowledge of the constitution and functions of the Commission. These have been explained in the present India Office Report, and the necessity for further discussion of the subject has thus been obviated, except to state that, as a public body entrusted with important functions, the Army Sanitary Commission has welcomed any really practical information which has come before it, and has at the same time endeavoured to turn it to account in the course of its work.

21st May 1877.

No. 21.

MEMORANDUM of the ARMY SANITARY COMMISSION on the MEDICAL HISTORY of the LAROOT FIELD FORCE (PERAK).

These papers contain a full and interesting account of the medical events which took place during the expedition to Perak between the 20th November 1875 and the 27th March 1876. Most of the detail is so purely departmental in character as to call for no remark from the Commission. The most interesting sanitary points are those connected with the country within which these military operations were carried out, and it is proposed to restrict the following remarks to them.

1. That portion of the Malay Peninsula within which Perak is situated is in latitude 4° N., and in longitude 101° E. The country is therefore strictly a tropical one, close to the sea on the west, and separated from the sea on the east by a mountainous country about 160 miles broad. Part of the military operations took place in a hilly district, but for all practical purposes as regards health the chief seat of the operations was in low, damp, jungly country close to river banks. The work on shore was commenced on 1st December, and during this month rain fell on 13 days. But the climatic records could only be kept for January, February, and up to 13th March 1876. They are given as follows:—

Temperatures.

	Highest.	Lowest.	Greatest Range.	Mean of Highest.	Mean of Lowest.	Mean Daily Range.	Monthly Mean.	Rainy Days.
January	90	72	16	86.77	75.22	11.25	82	16
February	95	70	21	91	73	17	81.2	14
March 1-13	93	71	19	87.30	73.88	13.72	79.43	8

The climate is described as "moist and relaxing; daily range of temperature very uncertain, "owing to cloudiness and the frequent occurrence of rain; wind as a rule gentle, and commencing in north in the morning goes round the compass in 24 hours; breeze always cool."

It may be added that the temperature ranges in the preceding abstract show that there must have been very considerable variations between the day and night temperature on particular days. The sensible qualities of the climate were that towards noon, when the breeze lulled, the heat became oppressive, and the temperature continued high till late at night. When compared with Lower Bengal the climate was decidedly moist, and fogs were very frequent.

The rain fell in drenching showers on the hills. There were frequent thunder storms.

The chief diseases of the country among Natives and residents are malarial fevers.

2. In a country possessing these characteristics, the head-quarters of the Laroot field force were established at Qualla Kangsa, on a kind of peninsula between the Kangsa and Perak rivers.

The subsoil was gravel resting on clay. Huts for the troops were formed of a framework of wood with thatched roofs, and sometimes thatched sides and gables.

The huts answered "fairly well," but they were hot through the day, and damp and chilly at night, due to fogs and the river.

The troops were clothed in cotton drill, but without flannel shirts. When the cotton clothing was put on in the morning it "felt damp and uncomfortable." The sanitary precautions connected with water-supply, latrines, surface drainage, cleanliness, and hospital arrangements appear to have been suitable under the circumstances, and a few instructions regarding the personal hygiene of the men were drawn up by the Medical Officers, and approved by the General in command.

3. The next point to examine is the result of the whole arrangements on the health of the troops.

So far as can be learned from the statistics, the operations of the force were included between the 4th December 1875 and 10th March 1876, a period of 98 days. The force employed consisted of—

33 men, 3rd Battery, 5th Brigade, Royal Artillery.
599 ditto, Buffs.
44 ditto, Naval Brigade.
119 ditto, Madras Sappers.
460 ditto, 1st Goorkha Light Infantry.

Total - 1,255

Out of this force the casualties were as follow :—

	Deaths
Killed in action	1
Died of wounds	5
	6
	Admissions.
Fevers	117
Dysentery and diarrhoea	167
Others	136
Wounds	8
	428
	20

It will be seen that the old experience in field service reproduced itself in the present case.

The admissions from diseases were $52\frac{1}{2}$ times the admissions from wounds, and the deaths from wounds were to the deaths from disease as 3 to 7. Excluding wounds, and reducing the results to an annual ratio, the admission-rate for diseases was 1,246 per 1,000 strength, and the death-rate was equivalent to an annual ratio of $42\frac{1}{2}$ per 1,000.

The casualties among Officers were as follow :—

Strength	50
	Admitted.
Sunstroke	1
Fevers	1
Dysentery and diarrhoea	9
Others	4
Wounds	1
Killed in action	1
	16
	3

The Sanitary Commissioner with the Government of India has called attention to the fact that the proper strength of the Buffs engaged at Perak was not 599, but 401, the remainder having been stationed at Malacca, and that out of 401 men the admissions were 93 and the deaths 13.

The results of the expedition followed the force to India after its conclusion, and led to the following numbers being invalided home:—

		Diarrhoea and Dysentery.	Fevers.	Others.	Total.
Officers	- -	2	—	—	2
Men	- - -	12	2	3	17
Total	- -	14	2 1/2	3	19

The 1st Goorkha Regiment, after having had 192 admissions and 5 deaths in Perak, sent the following cases into hospital after its return to India:—

Fevers	- - -	35
Dysentery and hepatitis	- - -	11
Others	- - -	54
		100

Twenty-four of these fever cases and four of dysentery took place in men who suffered from them before at Perak.

4. Considering that this force was sent into the field during the least unhealthy time of the year, it becomes a matter of importance to learn why it suffered so much from sickness in so short a time.

The facts already stated show that the most important cause of death and inefficiency was dysentery and diarrhoea, which gave rise to 40 per cent. of the disease admissions and 71 per cent. of the deaths from disease. The fever admissions were not so great proportionately for a tropical climate, so that the reply to the question must be sought in determining the cause of prevalence of these bowel diseases.

5. There are some important facts on this subject in the medical reports which require notice. Here, for instance, is one. An Officer exposed himself naked in a canoe on the river during a cool north breeze, and had a severe chill. He was seized with severe pains and spasms, with vomiting, and died a week after. Although the symptoms in this case were enteric, the history shows that fatal chill may readily occur in a hot moist climate from change of wind.

6. The following is an important statement of the Medical Officer in regard to the causes of dysentery. After describing the great severity of the cases, he says, "A very moist atmosphere, temperature high, and heat rather oppressive during the day, occasional puffs of a cool north breeze, a close evening followed towards early morning by a sudden fall in the temperature, and the advent of a cold northerly breeze; the proximity of a large river, and the occurrence of morning fogs; exposure to the sun, with the body perspiring profusely under exertion; a thirst that frequent and copious draughts of water only would allay; slime in the water of itself caused a tendency to diarrhoea; indigestible food; these various agents acted on the system in such a manner that a chill was all that was required to excite morbid action, and as large quantities of cold water was swallowed daily, the bowels suffered."

With regard to the effect of impure water, the Medical Officer of the Goorkhas states that these men did not drink the river water, but dug wells for their own use, which yielded good water. They, nevertheless, had 58 cases and 2 deaths from dysentery and diarrhoea. But, on the other hand, there is no information as to the chemical or microscopic characters of either water, and the facts, such as they are, lead to grave suspicions as to the purity of the river water at least, which we are told deposited a perfectly colourless and transparent gelatinous slime which rapidly choked the filters. Subsequently, all the drinking water was boiled, with decided improvement in its quality.

7. A fact of importance is stated regarding the duties. Besides those incident to the march, it was necessary to make clearings, and the men were engaged in this work from 6 a.m. to 5 p.m., with an hour's interval for breakfast and another for dinner. The result was that both Officers and men suffered. A subdivision in the hours was next tried without benefit. Towards the close of January the working hours were from 6 to 8 a.m. and from 4 to 6 p.m., leaving out the hot part of the day. When this arrangement was made, "the improvement in the health was marked, and after the middle of February, when fatigue duties were only performed in the morning, the admissions to hospital were very few, and bowel complaints almost entirely disappeared."

8. There appears to have been nothing amiss about the rations except in the tea, which was of "indifferent quality;" and as regards coffee, which, when properly made, is one of the most effective preservatives against fatigue and its results, it is not very satisfactory to be told that "it was issued raw, and as proper means of roasting were not available it was not much used;" to the extent, however, to which it was used under such an arrangement, "the men had an impression that it caused diarrhoea," which very possibly it did. There appears to be no reason why on expeditions coffee should not be issued roasted, together with a simple mill or crusher to grind it. When well made, coffee is a well known preservative of health on such occasions, but if ill made it may be positively injurious.

9. An attempt was made to discover the relative advantages to health of abstinence, temperance, and intemperance, but from statistics of disease given in the Report, the Medical Officer, while admitting that the numbers were too few for the comparison, expresses his opinion "that on the whole the temperate man has the best of it."

10. Lime juice was issued twice a week to Europeans, and likewise quinine. There appears to have been no scorbutic taint, but the quinine was not specially useful.

Dysentery was of a severe and obstinate character, and was not benefited by large doses of ipecacuanha.

11. Taking all the facts as they stand, the question suggests itself as to what lessons for future guidance can be deduced from the experience. Great care had evidently been bestowed on the sanitary arrangements of the force, and yet the results were not all that could have been desired.

It is so easy to be wise after the event, and to make suggestions which possibly could not have been carried into effect, that, while fully realizing the topographical and climatic peculiarities of the locality, perhaps the best way will be to put our suggestions in the form of the following questions.

12. Is a camp site on a low river bank, especially if between two rivers, the best site to select in a tropical climate?

Perhaps the following passage from the Report of the Commission on the causes of reduced mortality in the French Army serving in Algeria may supply an answer:—"On one occasion the Officer commanding a column placed his camp on marshy ground close to a river for the facility of obtaining water. Another column, commanded by an Officer of more experience, encamped on high ground, at some distance from the river, the Officer sending his men to the river to fetch water, at which they grumbled very much; but the result was that the latter column remained perfectly healthy, while the column which had encamped near the river was encumbered with a large proportion of sick, to the serious diminution, of course, of its fighting men."

13. Considering the low damp foggy locality, the nature of the temporary shelter, and the great difference between day and night temperature, would not the lighting of fires at night have been an advantage?

14. Might not some useful hints regarding the issue of coffee be obtained from the following practice in the Algerian Army, given in the Report referred to?—"All Officers, medical and others, gave a prominent place to the use of coffee (*café* soup) among the causes of improved health of the troops. Each man on march carries a small bag of roasted coffee, and there is a grinder or mill for every eight men carried by one of the squad in his knapsack. Before starting in the morning the soldiers grind and boil their coffee, putting into it sugar and bread, and eating it like soup (hence its name). It acts not only by affording an early nourishing meal excellent for marching with, but the stimulating effect of the coffee enables the men to resist fatigue, and to undergo much more exertion than they would otherwise be capable of doing."

15. As regards clothing during expeditions in these malarious countries, why should not the Algerian practice be followed, especially as it has a very direct bearing on the question of fever and dysentery? It is as follows:—"The chief improvement, so far as health is concerned, all are agreed, has been the introduction of a broad flannel belt covering the chest and abdomen. It is in one piece, fastened down the front, and suspended by braces. The use of it is obligatory in Algeria, and the men are inspected to ascertain that the regulation is obeyed. Before the introduction of flannel, the men used to suffer much from alterations of temperature, and from chills consequent on this, often ending in dysentery and other abdominal diseases, . . . and their introduction has, it is stated, led to marked diminution of dysentery and bowel affections." The Medical Officer of the Buffs distinctly states, from the experience of Perak, that "for jungle work woollen clothing would be better adapted." In fact, the importance of woollen clothing cannot be over-estimated. It is more essential in hot damp climates than in cold climates. Its object is not merely to prevent chill, but to equalize the temperature. A flannel shirt next the skin, and a so-called cholera-belt, should always be worn by European soldiers in tropical climates, especially when exposed on service to cholera, dysentery, and malarial poisoning.

It is to be regretted that this precaution was not taken in the present case, especially as a recommendation "that flannel be introduced as underclothing" was made by the Royal Commission on the Sanitary State of the Indian Army so long ago as in 1863.

16. As regards fatigue duties during expeditions, they must depend on the necessities of the service, but we concur in the opinion of the same Medical Officer that "the lesson taught was that in a similar climate fatigue duties during the heat of the day should be avoided when practicable."

17. While stating briefly what lessons may be deduced from the experience, the fact may be recalled that the Algerian Report of 1867 was laid before Parliament, and circulated by the Secretary of State, for the purpose of making known the reasons why the death-rate there had fallen from 80 per 1,000 to 13 or 14 per 1,000 among troops; and it may not be out of place to direct attention again to the experience it contains.

30th May 1877.

No. 22.

MEMORANDUM of the ARMY SANITARY COMMISSION on CORRESPONDENCE relative to SICKNESS and MORTALITY in BATTERIES of the 11th Brigade Royal Artillery. (Extract of Military Letter from Government of India, No. 199, dated 24th July 1876).

The excessive sick and death rates of this Artillery Brigade, and their effect in raising considerably the rates of the stations where the batteries were quartered, were noticed by the Army Sanitary Commission in their Memorandum on Dr. Cunningham's Report for 1874, published in the 8th volume of the India Office Sanitary Reports.

The present correspondence contains an exhaustive analysis of the facts, as well as of the remedies for preventing similar occurrences in future. But as the experience afforded by the case is too important to be allowed to pass from memory, it appears to be desirable to devote the present Memorandum to a brief record of its leading features.

1. The average annual strength of the 11th Brigade, Royal Artillery, in India, was 892. Its head-quarters, together with Batteries A, B, C, F, G, numbering 642 men, were landed in India from England on 20th February 1874. The D and E Batteries, containing 250 men, arrived there on March 11th. The head-quarters and A and B Batteries (263 men) arrived on March 2nd at their station, Barrackpore. C Battery, 129 strong, arrived at Dinapore on the preceding day, March 1st. On March 13th, F Battery, 121 strong, arrived at Saugor. On the 18th, E Battery, 124 strong, arrived at Allahabad. On the 19th, D Battery, numbering 126 men, reached Benares; and G Battery, 129 strong, arrived at Nowgong on March 23rd.

2. By the time these various batteries had reached their destinations and settled themselves in quarters, the hot weather was upon them. They left England in the depth of winter, and after a month's voyage they were in an Indian summer. This is one fact which applied equally to all the batteries.

Another was that under these conditions of climate the men had to follow their usual drill and occupations.

3. As regards the stations. Batteries A and B at Barrackpore had to use water which the Medical Officer describes as "obtained from tanks which are filled during the rains with the washings of the roads, parade grounds, surface drains, &c., and, of course, highly contaminated with organic matter. . . . In August it contained 50 times more ammonia of organic matter than a fairly usable water should contain."

4. At Dinapore the rains were excessive, and no corresponding drainage provisions appear to have been in existence, for the Medical Officer states that the station had been "completely under water and impassible in September," and the men had sour beer to drink.

5. A similar complaint about sour beer and porter is made by the Medical Officer at Benares, and "there are," he says, "some defects in the drainage about the stables; and a portion of the parade was under water a great part of the last rainy season, owing to deficiency in drainage." The barracks were also overcrowded.

6. Nothing is stated to have been amiss at Allahabad. And at Saugor it is stated that "an exhaustive examination of barracks and vicinity failed to detect any insanitary condition." No complaints are made about Nowgong.

7. Once arrived at the stations, it was found that a certain proportion of the men were far from possessing sufficient stamina for Indian service.

At Saugor, for instance, 99 men out of 152 were under 25 years of age.

At Nowgong nearly 55 per cent. of the battery was composed of immature men, and only about a fourth part of the men were in full vigour.

The Medical Officer at Benares states that there were men there "who should never have been embarked, who must have been sent out with organic and constitutional diseases existing."

These are the chief facts regarding the conditions to which this corps was exposed, and we shall next abstract the results to health and efficiency.

8. During the ten months succeeding the arrival of the brigade in India, out of 892 men average strength, there were 2,451 admissions to hospital and 41 deaths, besides 35 invalids. The total loss in ten months was thus 76 men. The causes of admission to hospital are not given in the papers, but the following is an abstract of the causes of death:—

Diseases.	Deaths.
Enteric fever	14
Sunstroke	7
Dysentery, half with abscess of liver	8
Abscess of liver	3
Remittent fever	3
Ague	1
Others	5
Total	41

The causes of invaliding were:—

Diseases.	Invalids.
Dysentery	10
Phthisis pulm.	5
Liver disease	5
Secondary syphilis	2
Heart disease	2
Others, including epilepsy, dementia, deafness, varicose veins, palpitation	11
Total	35

9. It is an important fact that, with the exception of Benares, every station occupied by the brigade had deaths from enteric fever. The numbers of enteric fever deaths were as follows:—Saugor, 4; Dinapore, 3; Barrackpore, 4; Nowgong, 2; Allahabad, 1. Bad water and malaria

are alleged as exciting causes of enteric fever at Barrackpore. The Medical Officer states that at Saugor enteric fever "made its appearance simultaneously with the maximum development of intermittent fever, and in all of the fatal cases enormous enlargement and disease of the spleen were observed. . . . The writer is convinced that enteric fever, at this station at least, should be regarded as the extreme effect of that series of causes to which the term malaria is applied."

At Saugor there were 12 attacks and 7 deaths among men and women, and all the fatal cases took place between 20 and 25 years of age.

At Nowgong one man was found affected with enteric fever on arrival, and all the cases took place shortly after arrival.

10. The Medical Officer at this station states that the influence of climate was "suddenly developed, . . . almost every disease incidental to debilitated constitutions having appeared in a more or less severe form, the chief being heat fever, erysipelas, ulcerated gums, diarrhœa, gastric irritation, and continued fever, and one case of modified small-pox."

The lowest daily sick-rate was about 9 per cent. at Nowgong, and the highest nearly 13½ per cent. at Barrackpore.

11. The main question before the Commission includes the reasons of these very remarkable facts.

Both sick and death rates of the Artillery Brigade much exceeded those of other corps at the same stations, who were exposed to precisely the same local conditions. What was the cause of this difference? The answer must be that the one condition which acted specially on the 11th Brigade, Royal Artillery, and influenced its various batteries widely separated by distance from each other, was arrival in India in the hot season, to which it must be added, that the casualties incidental to the introduction of immature youths suddenly to Indian service became more marked from this circumstance than they usually are in corps arriving in the cool weather. The experience, it must be hoped, is singular, but it is very important as showing the main results of these causes acting simultaneously.

12. There cannot be a doubt that drainage and other defects at stations must bear a certain amount of blame, and hence that these defects ought to be remedied without loss of time.

Nothing can be urged in extenuation of leaving the drainage of stations in such a condition that they are flooded in the rains. Water for Barrackpore is now obtained from the Calcutta Waterworks, but it may be suggested whether the water at other stations ought not to be examined.

It may be further urged, although it is more purely a departmental matter, that the causes of invaliding referred to above clearly show that men were included in the brigade who ought never to have left England, a fact which must also bear part of the blame.

13. In conclusion, the Army Sanitary Commission expresses its concurrence as to the influence of the following special causes of sickness and mortality in the 11th Brigade, Royal Artillery, stated by the Sanitary Commissioner with the Government of India:—

1st. That they were new to the country, and on that account suffered as all regiments new to India suffer.

2nd. That they reached their destinations late in the year.

3rd. That they contained a large proportion of young men.

And, as a means of preventing future losses from similar occurrences, the Commission concurs in the following suggestions of His Excellency the Commander-in-Chief, also agreed to by Dr. Cuningham:—

1. That batteries leaving England should arrive in India in sufficient time to admit of their reaching their destinations before the hot weather sets in.

2. That very young soldiers should not be sent out to India.

3. That Commanding Officers should be cautioned not to overwork their men during their first year in India.

14. It may be useful to add the recommendation on these points made by the Royal Commission on the Sanitary State of the Indian Army in 1863:—That no recruit be sent to India under 21 years of age, nor until he has completed his drill at home, and that recruits be sent direct from home to India so as to land there early in November.

This recommendation, made 13 years ago, was specially intended to prevent dangers and losses such as those which befel the 11th Brigade, Royal Artillery, three years ago.

It is very satisfactory to learn from the papers that the Government of India has concurred in the views of the Commander-in-Chief, and that arrangements have been made by the Home authorities "by which it is hoped that brigades of Horse and Field Artillery will in future be despatched early in the trooping season."

22nd May 1877.
